Handsome *Corcelids* were also exhibited by MISS DAVISON and MR. BOOTH.

GEN. R. HARMON, of Wheatland, exhibited a piece of *Domestic Linen*, also a beautiful *Hearth Rug*, displaying much taste and ingenuity in its manufacture. Discretionary premium, \$2.

MR. FILLIS also exhibited a beautiful *Hearth Rug*. Of *Butter*, there was a fine display; and all of it so excellent, that it was difficult to decide which was the best. The first premium was awarded to H. GAY, of Gates, \$5.

The second, to ALFRED FITCH, \$3.

For the best twenty pounds of *Honey*, to E. HUNTINGTON, of Rochester, \$5.

The committee would remark, by way of explanation, that owing to the late hour at which many of the articles were brought in, and the great press of visitors, the articles were not all properly arranged and labelled; and the committee may have overlooked some, or too superficially examined them. They hope and believe, however, that most of the immense multitude who witnessed the exhibition, were both pleased and benefited thereby; and that the good effects will be seen and felt in the community, by an increase of domestic industry and domestic comfort.

H. O'REILLY,

LEWIS BROOKS,

H. E. ROCHESTER,

Committee.

AGRICULTURAL IMPLEMENTS.

The number of implements exhibited, was quite limited, and the committee regret that there was no more competition in this department; although there were some valuable articles offered.

Of *Ploughs*, there were several kinds brought in for exhibition; but, with one exception, they were all taken away for the ploughing match, before the time for examination. The one remaining was a beautiful article, made by D. MOORE, of Victor—an excellent plough. No competition.

Gilson's Straw Cutter, manufactured by J. & J. B. GILSON of this city, was exhibited without competition. It is a beautiful and highly valuable machine, and the committee deem it worthy of a high recommendation.

Gilson's Root Slicer, made by J. HALL, is also a valuable machine.

Pitt's Machine for Thrashing and Cleaning Grain, was exhibited by MR. PITT, who is now introducing them into this county. This machine deserves the particular attention of farmers. It thrashes and cleans grain at one operation, and with great rapidity.

Messrs. J. PATTERSON & Co., of Chili, exhibited a *Fanning Mill*, of an improved construction and superior workmanship. Satisfactory evidence was shown the committee, that it was capable of cleaning three bushels of ordinary wheat per minute. There was no competition, but the committee awarded it a discretionary premium of \$3. (Some other fanning mills were brought in for exhibition, but taken away before the time for examination.)

Merchant's Drill Barrow, *Bance's Corn Planter*, and a *Corn Sheller*, all apparently excellent articles, were exhibited by M. B. BATHAM, from the Rochester Seed Store. Not for competition.

H. N. LANGWORTHY,
JOHN LAKE,
JAMES GAY,

Committee.

REPORT ON PLOUGHING.

The committee on the *Ploughing Match* respectfully report, that fourteen teams entered the field for competition (one a single horse team.) The contest was very spirited, and the immense concourse of spectators who left the attractions in the city to witness it, was sufficient evidence that a deep interest was felt in the performance. Unfortunately no suitable ground for the purpose could be obtained near the city, and the field selected was quite stony and uneven. Considering this circumstance, the work performed was mostly highly creditable to the ploughmen; and the ease which single pairs of horses broke up a very tough old meadow, was good evidence that the ploughs were of very perfect construction.

Some of the competitors ploughed their quarter of an acre in a very short time; and others, who were a longer time, did the work remarkably well. The committee found much difficulty in deciding who were entitled to the premiums; but after careful examination, and much reflection, taking into consideration the *manner* of execution, as well as the *time*, they decided as follows:—

(Note.—The quality of the work done by the different teams, is numbered from 1 to 8, and a table of the same is left in the hands of the secretary of the society.)

The first premium is awarded to JOHN H. ROBINSON, of Henrietta—land completed in 44 minutes—quality of work, No. 2.

The second premium to CHARLES BEER, of Ferrinton, (S. SHEARS, ploughman)—time, 40 minutes—quality No. 5.

The third premium to MOSES DEER, of Gates—time, 36 minutes—quality, No. 8.

The committee would recommend that a discretionary premium of \$5 be awarded to WILLIAM PACE of Riga, for superior ploughing, (No. 1)—time 61 minutes.

Also a discretionary premium of \$5 to JOSHUA HOWELL, of Chili, for very good ploughing, (No. 3)—time 51 minutes.

The committee deem it proper to observe that several circumstances were quite unfavorable to the performance, which they very much regretted, but could not obviate. In the first place, the land was not suitable for the purpose, being stony and uneven, although it was said to be the best that could be obtained near the city. In the second place, the circumstances by which the committee were to be governed, in giving their decisions, were not pointed out by the Society, and some dissatisfaction resulted out of the decisions, as supposed to suppose it.

more importance than the *quality* of the work; and on the other hand, some appeared to pay no regard to time, but were particular to do the work well. Again: some competitors considered the width and depth of the furrow of the greatest importance. In view of these difficulties, therefore, the committee would recommend that next year early measures be taken to secure suitable land, and that the executive committee previously designate the length of time to be occupied in ploughing, and award the premiums to those who do the best work within the time; also that they limit the width and depth of the furrow.

In conclusion, the committee are happy to state that they believe the ploughing match afforded much gratification, as well as some instruction, to the numerous spectators, and that the liberality of the Rochester ploughmakers will be duly appreciated by the farming community.

GEO. SHEFFER,

Committee.

The New Many Headed Wheat.

To the Editor of the *Amr. Farmer*:

Sir—I think it proper to take the earliest occasion to notice the new species of wheat, a drawing of which has just been published in the *American Farmer*, and copied into the *American and Pacific*, accompanied by a letter from Mr. Read. I do this for the double purpose of saving money and trouble to all concerned.—This new species of wheat is, without doubt, the Egyptian wheat, *Triticum compositum*. For a drawing and description of which, see Loudon's *Encyclopedia of Plants*. The engraving in Loudon and that in the *Farmer* present the same characters precisely. Besides, I have often seen the Egyptian wheat, and the head of the new species which has been exhibited to me, is identical with the Egyptian. This kind of wheat was introduced into England in 1799, and from that time to the present, has made frequent appearances in the United States. It has been called successively the *Egyptian*, *Syrian*, *Many-headed*, *Saw-headed*, *Road*, *Wildgoose* wheat. The name "Wildgoose" was given to it from the fact that a few grains of it were found some years ago in the crop of a wild goose that was killed on the shores of Lake Champlain. The name "Road wheat" was given to it because of its stout stem resembling small reed, or cane. It was received by the Philadelphia Society for promoting agriculture, in 1809, from General Armstrong, then our minister at Paris. Judge Peters took charge of a part of it, and grew it five or six years. It was at first very productive under his cultivation, a pint of seed sown in drills and hoed, producing one bushel and a peck of grain. But after the first three or four years, the Judge says it did not thrive sufficient to authorize extensive cultivation. At that time it was extensively distributed by the above named society. Judge Buell says he has seen extensive fields of it. In the *Domestic Encyclopedia*, published in 1821, it is stated that the Egyptian wheat does not yield as much flour as any of the other kinds, and that the flour is scarcely superior to that obtained from the finest barley. In March, 1838, it was selling in Albany, N. Y., at five dollars per bushel. It has several times been brought from Santa Fee, by travellers and traders. It appears to be cultivated in that country, probably owing to its better adaptation to the climate than other kinds.—That the Osage Indians might have obtained it from Santa Fee, is no way improbable. How it found its way from Egypt to Santa Fee, I cannot pretend to guess, unless a wildgoose also carried it from the former to the latter country; which, on reflection, is scarcely more improbable than the fact stated above, that one of these birds carried it to the shores of Lake Champlain. From all these facts, it would appear that if the wheat in question had been adapted to our climate, or was susceptible of acclimation, it would respect a good variety, and general cultivation would be for granted that it would be widely distributed.

The Agricultural Fair at Rochester.

The 7th of October was a proud day for Rochester and the farmers of Western New York. The weather was delightful, and the farmers all seemed determined to enjoy one glorious holiday. On the day previous, news came in from every quarter, that large numbers of cattle, horses, and other animals, might be seen along the roads, wending their way to the city; and early on the morning of the day of exhibition they began to pour in upon us like a flood, till, by 11 or 12 o'clock, it seemed that the whole surrounding agricultural population, together with their domestic animals, had assembled *en masse* in the city. Many of our tavern-keepers, merchants, and others, were taken by surprise, and all agreed that such a gathering of the nobility of the land had never before been witnessed in this place. Certain we are that we never saw so numerous a collection of enterprising, intelligent looking farmers, and what is more, we never saw such an assemblage where all appeared so highly gratified. Our space will not permit us to comment on the exhibition as fully as we would wish, and the reports of the committee render it unnecessary for us to do so.

"The Cattle Show," at Franklin Square, was truly grand—much superior to our most sanguine expectations. The great number and beauty of the animals of different classes, could not fail to gratify the heart of every good farmer, and convince all, that Western New York can, if she will, attain to the highest degree of perfection in agriculture; and the "Genesee country" may yet stand pre-eminent among the sections of the Union.

The Ploughing Match was an interesting spectacle, as many thousands who witnessed it can testify. We regret that the land was not more suitable, but are satisfied that no one was to blame in the matter, for we ourselves spent two days on horseback, looking for a proper field, but none could be obtained for the purpose near enough to the city.—This matter, as well as several others, will be better managed next year. The Executive Committee will profit much by the experience this occasion has afforded.

The Exhibition at Market Hall was very good, considering all the circumstances. The use of the large hall could not be obtained till 1 o'clock, and the articles were necessarily arranged in great haste; had it been otherwise, this display would have been more interesting. Another evil—if it may be so called—was the circumstance that many articles of domestic manufacture, and implements properly belonging to this exhibition, were placed in the Mechanics' Fair, which was held at the same time in the other part of the building. The display of Fruit, Flowers, and Vegetables, was very good, considering the lateness of the season, but it was not as fine as it might be, or as we hope to see it next year. The articles of domestic manufacture were most of them highly creditable to the exhibitors, but not as numerous as we were in hopes to have seen them. Indeed, were it not for its being the first exhibition of the kind, and got up at short notice, we should hardly feel satisfied with this department. We are certain that it did not do justice to the reputation of our farmers' wives and daughters. We will not admit that this was a fair representation of their skill and industry, and we expect to see this opinion sustained by the exhibition next year. Let it not be supposed, however, that we are of that class who believe that females generally can, or ought to spend their time in manufacturing curious specimens of skill and industry, or such articles as usually make up these exhibitions; for we know that many of them,—perhaps the majority,—have more important employment. We were forcibly reminded of this fact at the Fair, when, meeting a female friend from the country, whom we knew to be an industrious and skillful housewife, we asked

her if she had not brought something to the exhibition. "Oh yes," was the reply, "I have brought *my family*, and I am more proud of it than I should be of all the specimens of art in this hall." On saying this, she pointed to three neat and blooming girls, and two bright little boys. "There," said she, "do you want any better evidence of my domestic industry?" Our *Back-slap* was nongrassed for an answer; but had we been one of the committee on "Domestic Arts" at the time, we should certainly have voted her the highest premium!

The Address, by LEWIS F. ALLEN, Esq., was listened to by a crowded audience at the court house. The speaker said he came to the meeting without having written anything for the occasion, and he only intended to have a talk with the farmers about what he had seen that day, and make such suggestions as occurred to his mind at the time. He then gave an interesting extemporaneous address, about an hour in length; after which, on motion of Mr. HENRY O'REILLY, it was

"Resolved, That the thanks of the Society be rendered to LEWIS F. ALLEN, Esq., for the interesting and instructive address with which he has favored

the meeting, and that he be requested to furnish a copy for publication."

The address was entirely extemporaneous, and delivered without previous preparation, so that it was impossible for Mr. ALLEN to furnish a copy of it for publication. Still, as it embraced many highly important subjects, we hope he will commit to paper the leading thoughts expressed at the time, and send it us in time for our next number.

The second day was a Fair for the sale of Cattle, &c., but it was found that the sellers were far more numerous than the purchasers. A few fine cattle were purchased by LEWIS F. ALLEN, Esq., as mentioned in the report; besides which there were a few exchanges and sales of cattle, horses, sheep, and swine. A few animals were sold at auction, but the bidding was quite dull, and every thing tended to convince farmers, of what they were already conscious, that money is extremely scarce.

The Genesee County Agricultural Fair Came off finely at Alexander, on the 14th of October. We were unable to attend, and have been waiting a promised account of it, till our paper is ready for the press. So we must omit it till next month.

PITTS' MACHINE FOR THRASHING AND CLEANING GRAIN.

The above cut is a true representation of Pitt's Machine for Thrashing and Cleaning Grain. Its weight is 600 pounds, occupying a space of about 8 feet by 2 feet 4 inches. The whole machinery is durable and easily kept in repair. It thrashes and cleans all kinds of grain in the most perfect manner, performing the work at the rate of from 25 to 60 bushels per hour.

Four hands are required to attend the machine when in operation, viz: one to forward the bundles, one to feed, one to measure and put the grain into bags, and one to pitch the straw away as it comes from the machine. It can be easily moved from place to place, and attached to any horse power; and can be used in the field as well as on the thrashing floor; there being no loss or scattering of grain after it is once fed into the machine.

I offer the following certificates, from a few of the best and most respectable farmers in this vicinity, as evidence that my machine has given entire satisfaction to those who have employed it here and elsewhere.

The above machines are manufactured and sold by the subscriber at Albany.

JOHN A. PITTS.

The undersigned having purchased, used, and fairly tested, one of J. A. Pitt's Machines for thrashing and cleaning grain, feels confident that it is superior to any thing of the kind ever offered to the farmers of Western New York. The machine is now in operation at my barn, and propelled by one of Douglas's horse powers. If any one doubts the utility of this machine, I should be pleased to have him call and see it in operation. This, I think, will satisfy any man of its superior claim to a liberal patronage.

Chili, Oct. 12, 1840.

EDMUND FELLOWS.

I hereby certify that we have had J. A. Pitt's machine for thrashing and cleaning grain, in operation at our barn. Its performance was equal, in every respect, to the high recommendation it has received elsewhere. Many of our best farmers witnessed its performance; and all agree in the opinion, that it is one of the best machines for thrashing grain, ever offered to the farmers of Western New York.

Whitland, Oct. 13, 1840.

DANIEL ROGERS.

The undersigned, having fairly tested J. A. Pitt's machine for thrashing and cleaning grain, by thrashing on crops, consisting of wheat, oats, and barley.—I hereby certify that the machine thrashes and cleans well, at the rate of from 25 to 50 bushels per hour, with four horses, and four hands to tend the machine when in operation, viz: one to hand the bundles, one to feed, one to measure the grain, and one to pitch the straw away as it comes from the machine. The above machine is well adapted to field thrashing, as there is no scattering of grain after it is once fed into the machine.

We would respectfully recommend it as the best we have ever seen; and say to our brother farmers, witness its operation before purchasing any other, as we doubt not you will be benefited thereby.

JOHN DE GURNEY,

STEPHEN T. POST,

WILLIAM POST,

ALEX. McDOWELL,

JONATHAN DOTY,

ELIAS DE GURNEY.

Gates, Monroe County, New York.

We, the undersigned having fairly tested the utility of J. A. Pitt's machine for thrashing and cleaning grain, by thrashing nearly five hundred bushels of wheat from the stack, would respectfully recommend the same to our brother farmers, as the best machine for the purpose, that we have ever employed. It thrashes and cleans wheat well, at the rate of 25 bushels per hour, with four horses. The above machine, so far as we have been able to learn, has received the unqualified approbation of those who have witnessed its operation.

WM. CORNELIUS,

ORRIN SCOFIELD.

East Rush, Monroe County, New York.

N. B.—The above machines may be examined by calling on Edmund Fellows, of Chili, or Orrin Scofield, of East Rush.

JOHN A. PITTS.

The Premium Crop of Ruta Baga.

The certificate respecting Mr. Samuel Wood's crop of Ruta Baga, as reported by the Committee on crops, showed such a wonderful produce per acre that, notwithstanding the respectable character of Mr Wood, many persons besides ourselves, were apprehensive that some mistake had been made about it.— We determined, therefore, to satisfy ourselves, and accordingly took the pains to go to Wheatland and examine the crop. We found that it was indeed a fine crop—roots large, and standing close together, with small necks and tops; but at the same time we were convinced that the yield per acre could not be as great as represented. On inquiry we learned that Mr. Wood was not at home at the time the measurement was made, and could not inform us about the particulars; but on finding the persons who made the certificate, the mystery was soon solved by their saying that they measured tops and all, supposing that the estimates were expected to include the whole amount of crop produced on the ground. It is true the tops were small, but they were large enough to make considerable difference in the result. We measured two square rods, in different parts of the ground, and found the product of each to be 7 3/4 bushels of roots, divested of the tops. [One bushel weighed 62 pounds.] This would give a product per acre of 1240 bushels, which, while it is a very large crop, and entitled to the premium, it is much more within the bounds of reason than the former statement.

This instance of inaccuracy, affords additional proof of the absolute necessity of adopting some more definite plan for obtaining the account of crops for premiums; and the Society will doubtless take the matter into consideration.

We are satisfied, however, that there is no mistake about any other of the premium crops.—Eds.

Harvesting Potatoes.

Potatoes should be suffered to lie in the ground until they are fully ripe. There is nearly as much difference between a ripe potato and an unripe one as between a ripe apple and an unripe one. Unripe potatoes are uniformly watery and are some of the most indigestible materials that we meet with. This is so much the case that the stomach has been often known to reject this article while it retained all the other materials admitted at the same time.

When we have not too much work for the month of October, it is more prudent to let our late potatoes lie until that time than to dig them earlier—and when we dig them, if they are not wet, we should never let them lie in the sun or in the air. Any loam reasonably moist, may be allowed to adhere to them while they lie in the cellar, and we need not fear they will heat or rot, as turnips will when put in a great heap where the air cannot have access to them. Turnips are of a nature different from potatoes; they grow principally above ground, while all potatoes that are worth saving grow wholly under ground. We were once taught to dig our potatoes in the morning, throw them between the rows, and let them dry through most of the day—then to tilt them from the cart into the door yard to beat off all the dirt that might adhere to them. But experience has taught us that this is a branch of fancy farming, and will never answer for practical men.

When we lived on the Kennebec river, and sent up loads of potatoes to the Boston market, we often wondered that our Boston friends were not as fond of the Kennebec potato as ourselves—but on attempting to take in Boston some of the same potatoes we had sent here, we soon perceived the great difference between Kennebec potato in Boston and a Kennebec potato at home. Our potatoes had been too much exposed to the air, and though they had not turned green, as they would do when exposed in the sun, they were spoiled by exposure.

Our Kennebec and Penobscot friends should pack in tight casks all potatoes sent off to customers whom they expect to trade with a second time—and perfectly tight casks cannot be obtained, loam or sand may be filled into flour barrels with the potatoes, and the cost of transportation to Boston by water will not be increased by the filling.—Bost. Cult.

“DAIRY MAID,”

The property of JAMES GOWEN, Esq., of Philadelphia, Imported in 1832, from the Herd of Mr. WHITAKER, of Yorkshire, England.—(Copied from Farmer's Cabinet.)

This celebrated and beautiful Cow, is one of the greatest milkers on record;—and what gives her particular interest at this time, is the circumstance that a wager of \$500 is now pending between her and the Cow “Blo. so n.” a statement of the milking powers of which, we gave on page 143. We subjoin the particulars respecting this singular wager, from the Philadelphia papers. Dairy Maid is 5 years old—color, roan—thorough-bred Short Horn, and very beautiful. “In point and proportion, in breeding and milking, she is an object that might satisfy the taste of the most fastidious breeder.” “On a trial of a week, in the fourth month from calving, in June, 1839, she gave, on an average, more than 32 quarts of milk per day. The same season, seven months from calving, she gave, for a week, more than 20 quarts per day; making, on an average each week, 12 lbs. of delicious butter. Again, in 1840, the fourth month from calving, she gave in one week, on an average, more than 33 1/2 quarts per day.”

(We intend to give portraits of several of the fine animals exhibited at Rochester, as soon as the drawings and engravings can be prepared.)

From the Pennsylvania Inquirer.

The Cow Dairy Maid.

We a few days since availed ourselves of a leisure hour to ramble over and admire one or two of the fine properties in the immediate vicinity of Germantown, and afterwards called at Mount Airy, when we were not a little gratified with the sight of Mr. Gowen's celebrated cow Dairy Maid, and her two fine calves Leander and Allen a Dale. This cow is said to be the very acme in point and pedigree of the “thorough-bred.” She is of the Short Horn Durham Breed, imported in 1828, from the herd of that celebrated breeder, Mr. Whitaker, of Leeds, Yorkshire. The calves are the finest animals of their class we ever beheld. “Leander” is rising fifteen months old; his points are said to be perfect, while his size and figure are surprisingly striking. He is beautifully flecked red and white, and sired by the celebrated English Bull “Prince of Northumberland.” “Allen a Dale” is nearly four months old, is large for his age, and finely proportioned, is entirely white, like his sire, Col. Wolbert's unrivalled Collossia. These two young Bulls from such sires and such a dam as Dairy Maid, cannot but prove a great acquisition to the country, and a source of gratification to the gentleman who has paid so much attention to this important branch of agriculture.

Pennsylvania, abounding as she does in fertile valleys and rich soil, should not be deficient in fine cattle. We trust ere long she will be able successfully to compete with Ohio and Kentucky, which states, we believe, stand unrivalled in the Union for their superior breeds of cattle. We also hope the day is not far distant when our Legislature will consider it a paramount duty to foster and encourage the agricultural interests of our State, in order to promote physically and morally the best population a Commonwealth can boast of, and the safest and surest wealth that can be possessed by her citizens. After all, no stock is comparable to live stock—so said our friend Mr. Gowen, when he promised to give us the result of Dairy Maid's yield of Milk, and which we have now the pleasure of laying before our readers, especially for the benefit of our agricultural friends throughout the country.

Dear Sir—Agreeably to promise, I herewith furnish you with a statement of “Dairy Maid's” yield of milk for one week, from June 1st to 7th, inclusive. Last year, about the same period from calving, say in

the 4th month, I was induced to ascertain precisely, by measurement, the quantity of milk she was capable of yielding, from the circumstance of the apparent quantity she gave over and above what her calf consumed; and to test the truth of the herd who had charge of her from England, “that she would for months after calving give eight gallons of milk a day.” The result in June, 1839, proved he was right; she gave on an average more than thirty-two quarts per day, and made twelve pounds of superior well worked butter. She was not then in as high condition as she now is, I expect an increase in the butter, which will be reported when ascertained. Captain Cooper, Mr. Isaac H. Roberts and Dr. Uhler, can recollect that Dairy Maid was not in good condition last summer, which will account for her not yielding as much as she has done this season.

The first day of the last week's trial was excessively hot, and a heavy gust coming on about five o'clock in the afternoon, she was brought from the field and immediately milked; shortening her time, she gave but thirty quarts on that day. The yield, however, on the whole, is unprecedented, averaging over thirty-three and a half quarts per day. It is my firm belief, that had Dairy Maid been milked on the 1st and 2d months from calving, she would have given forty quarts per day. Very respectfully,

Your obedient servant,
JAMES GOWEN.

Mount Airy, 8th June, 1840.

Dairy Maid's yield of milk in one week, from 1st of June till 7th inclusive.

June 1st,	Morn,	12 qts.	Noon,	8 1/2	Ev'g,	9 1/2—20	
2d,	“	12 3/4	“	9	“	10 1/2—32	
3d,	“	13 1/4	“	9 1/2	“	10 3/4—33 1/2	
4th,	“	14 1/4	“	9 3/4	“	10 3/4—35	
5th,	“	14 1/2	“	10	“	10 1/2—35	
6th,	“	14 1/2	“	10	“	10 1/2—34 1/2	
7th,	“	14 3/4	“	9 3/4	“	10 3/4—34 1/2	
						Total,	235 1/2

Being on an average more than thirty-three and a half quarts per day.

We may add that Mr. Gowen's farm is one of the finest in all respects in the county of Philadelphia. It is beautifully marked out, admirably arranged in its various fields and crops, and in the highest and cleanest possible state of cultivation.

Dairy Maid against Blossom.—Though opposed to warring on any subject, Mr. Gowen's proposal to risk \$500 on his favorite cow, evinces a laudable gratitude towards her who has so well bottered his bread. The distinction he takes appears to be a fair one, in favor of the Dairy Maid. There have been many whose flow of milk was very abundant soon after calving, that in three and a half months have gone nearly dry. We should like to see more competitions of this sort.—For example, who will enter into a sweep-stake to produce the best milk cow at the next Fair of the Maryland State Agricultural Society: the cows to be milked, and the milk to be drunk with toasts at the agricultural dinner? For our own parts we would go further to see such a Blossom, or trace the milk vein of such a Dairy Maid, than to see the Queen Victoria.—*Im. Fur.*

Dairy Maid and Blossom.

To the Editor of the Philadelphia Inquirer.

DEAR SIR—On looking over the "Farmers' Cabinet" for this present month, I saw, for the first time, Mr. Samuel Canby's statement of one week's yield of milk of his Durham cow "Blossom," copied from the Delaware Journal, by which it appears that Blossom gave over 35 quarts per day, a result which affords me great satisfaction, inasmuch, as when I furnished you with the yield of my Durham cow, "Dairy Maid," for one week, showing 33½ quarts per day, I felt a little concerned, lest some of your readers might think that I had been rather poetical in my prose; but Mr. Canby's statement of over 35 quarts per day, covers my position, and must bring the sceptics to admit, that if his was possible, mine was not so impossible as they have thought it to be.

I fear Mr. Canby quotes my remark, that Dairy Maid's yield of 33½ quarts per day "was unprecedented," in the sense as though I had said that it could not be beaten, for he seems to place Blossom's yield in opposition to it. I did not intend a challenge by the remark, but simply that I believed it to be unprecedented at the time that I made use of the expression. I could not say so now, being informed of the yield of Blossom; but this is subsequent to the time I made the statement of Dairy Maid's yield public. Up to that time, for aught I knew, it was unprecedented, and Dairy Maid stood first in the rank of milkers—that she has yielded now, in appearance, to Blossom's exceedingly abundant fruit, is easily accounted for in the freshness of Blossom.

Dairy Maid calved on the 13th of February, and was milked for trial on the first week of June, being the fourth month from calving. "Blossom," according to Mr. Canby's statement, calved 16th of May, and I was milked for trial in the week beginning on the 13th of June, just one month from calving. Now, every breeder or dairy-man must perceive that "Dairy Maid's" giving 33½ quarts a day 3½ months from calving, after suckling a calf three months, which was the case, gives to "Blossom," who milked 35 quarts one month from calving, but a questionable triumph over "Dairy Maid."

Mr. Canby seems to hold out, if he does not actually throw the glove "for the credit of little Delaware," and as I am not slow in taking a hint, I shall not keep him long in suspense, if he will allow me to premise a few words. First, no one can have a higher opinion of "Little Delaware" than I have. In men she always was and now is able to compete with any State in the Union. In cattle she may surpass Pennsylvania, for we have been for a long time the best of the traders from the East and West, who, when speaking of a Dutch Pennsylvania Dairy, sum it up as consisting of "eleven horses and three cows." But notwithstanding all that, there are some good dairies in Pennsylvania, and some good cattle too, and it will not be the fault of some few citizens of Philadelphia and adjoining counties, if in a few years Pennsylvania cannot brag the whole Union. In the mean time, I'll try my hand at "Little Delaware," by proposing to Mr. Canby to put "Dairy Maid" in competition against his cow "Blossom," in a trial of one week's milking, to take place at any time over three months from calving, as may suit the convenience of their respective owners. If Mr. Canby's cow "Blossom" yields a greater quantity of milk in the week than "Dairy Maid," then am I to pay to the Delaware Agricultural Society, for its use, the sum of five hundred dollars—If, on the contrary, "Dairy Maid" yields the most, then will Mr. Canby have to pay to the Philadelphia Society for promoting Agriculture, a similar sum. Any communication relating to the premises will meet with due attention.

Very respectfully, your ob't servant,

JAMES GOWEN.

Philad. Aug. 17, 1840.

From the Western Farmer.

The disposition to Fatten of different Breeds of Hogs.

To be able to decide, as nearly as possible, what particular kind of hog, of all those imported into this country from other countries, as well as the productions of these by crossing them with one another, has the readiest disposition to fatten, is a point of very great importance and interest. Although we have not, at present, any statements from agriculturists and stock raisers in the western country upon this particular point in hogs, yet we have from foreign sources, and from other parts of the country, some data upon which to found a few pretty certain conclusions on the subject; and until we have further information in this matter, from those farmers who may be curious and patriotic enough to make the necessary experiments, we will content ourselves in laying before our readers all our knowledge derived from foreign trials of this kind, and from some acquaintance we have had with swine in England. In the first place it is hardly necessary to mention that the Chinese hog has been always distinguished above all the other breeds by its peculiar aptitude to lay on fat; but owing to its being but a poor breeder, the pure breed is but little cultivated. Of this breed there are two nearly distinct kinds, the white and the black. There is also a mixed breed of this kind, being spotted and mixed black and white; some of them have prick ears, like the true breed, and others have ears round at the ends, and hanging downwards. These are coarser than the former, but they, unlike them, are remarkably prolific, are good nurses, and will, with proper care, bring up two litters within the year. They are however, not good store pigs, rarely attaining any great weight, and much more difficult to fatten than the original stock of the Chinese breed.

The next in order of fattening propensities, after the true China breed, either white or black, seems to be the Woburn or Bedford breed, a new variety introduced by the Duke of Bedford. They are of various colors, well formed, hardy, very prolific, and have attained to nearly twice the weight of all other hogs, except the Chinese and Berkshire within the same given period of time—and even the Berkshire they have surpassed to some not inconsiderable amount. Then, as almost universally admitted, follow the Berkshire, too well known to require description. These crossed with the Chinese have produced a race possessing some excellent fattening and other good qualities, and are known in England as the *Tonkey breed*. The Berkshires are dispersed over the whole of England, and have therefore varied both in form and color; but the best are in the neighborhood of Tamworth, in Staffordshire, from the famous *Tamworth Boar*. The crosses also from this breed are very numerous in England, and are highly rated in their different districts. After the Berkshire in kindness of fattening, must be rated the *Essex half black pigs*, raised by Mr. Westery, of Felix Hall. They are short haired, fine skinned, smaller head and ears than the Berkshires; short snubly noses, very fine bone, broad and deep in the belly, and full in the hind quarters; the sows are good breeders, but they are not near such good nurses as the Berkshires. The *Lincolnshire* rank next, and in point of profit are hardly less than the Essex. They are white, and rather tender. This breed is much the same as the *Norfolk* and *Suffolk*. The *Sussex* breed is smaller than the Berkshire. It is a variety of the Essex, and is a very valuable kind of hog. It may be classed next in order for fattening propensities, and what is deserving of notice, arrives at maturity sooner than any other kind. The *Hampshire* fatten kindly to a very great size and weight.—The *Northampton*, *Shropshire*, and *Yorkshire*, are of large size, but fatten more slowly. The *Cheshire* are the largest at hogs except the *Rudwick*, which is the largest in the kingdom of Great Britain. The *Essex* and *Hertford* breed, as it is called, has taken premiums from the London and Smithfield cattle club, and is held in high estimation. We then classify the different breeds for fattening propensities (until we are further informed by sufficient comparative experiments) in the following order:—

1. The Chinese.
2. The Woburn, or Bedford.
3. The Berkshire.
4. The Essex half black.
5. The Lincolnshire, &c., &c.

We ought not to omit to mention that the Neapolitan stock of swine have a very great aptitude to fatten. In the meanwhile we copy from the *Franklin Farmer*, the following interesting letter from Samuel D. Martin, Esq., of Kentucky, on this subject, and it would seem that as far as his friend's experiments have gone,

that the Woburn breed of hogs, as we have stated stand pre-eminence in that most valuable characteristic—quickness in taking on flesh.

A PROPOSITION TO TEST THE RELATIVE DISPOSITION TO FATNESS, OF DIFFERENT BREEDS OF HOGS.

The hogs raised and fattened in Kentucky, it is believed, amount to more than two millions of dollars annually, and consume in the raising and fattening more than a million of bushels of corn, besides rye, oats, wheat, and grass.

It would be of great value to the state to have such experiments made as will test the value of the different breeds, and ascertain which is the best machine for turning our surplus grain into meat.

Some hogs will make double the quantity of meat out of a given measure of corn than will be made by others. Therefore it must be very plain, that the persons feeding bad breeds must suffer considerable loss. No man should keep a bad breed when he can get better. But it is to be regretted that sufficient experiments have not been made, to determine clearly which is the best breed.

I have made some experiments between the two most valuable breeds that I have, but they were not conducted so as to be clearly satisfactory. I put two Berkshires and two Woburns into the same pen, and fed them together. The experiment resulted in favor of the Woburns. But they were all fed in the ear trough, nor do I know what was consumed by each. In a trial lately made by William and Isaac Barlow of Jesamine, between two hours, the Woburn gained fifty pounds more in thirty days than the Berkshire. But here again we have no account of what each consumed. The trial was made for the reputation of the stock, and it is presumed that both had as much they would eat.

For the purpose of making a set of experiments that will be satisfactory, I would propose to the owners of other breeds, to furnish Woburn hogs or pigs, a row or sow, to be fed by some disinterested person, such a way as to ascertain which will come earliest to maturity, fatten easiest, consume the least food, and travel best to market.

I would propose that two or three pigs be fed; a certain allowance, and that the balance shall have much as they will eat. That they be kept in separate stalls, and an exact account be kept of what is consumed by each one. To be kept in this way until they are ready for market, and one of each kind be sent our most distant market, weighed at starting, at journey's end, and after they are dressed. The litters to be sent to our nearest market, weighed before starting, and upon reaching the place have their grain and meat weights ascertained.

If my proposition should be accepted, each party to pay the proportion of the expense of the experiment.

If the above proposition is not accepted, I will try a Woburn sow, or pig, against any other I like in the state that has no Woburn blood in it.

No proposition that has any thing like a bet or wager attached to it will be accepted by me, but I will feel to ascertain what the different kind of hogs will do.

S. D. MARTIN

The Value of Farm Labor.

Messrs. Editors.—Daniel Webster, in his speech before an Agricultural Society down east, gives the price of labor in the United States about three times as much as it is in England.

I apprehend that the price paid per day or month for labor, is but a poor criterion of its real cost. I read three Irishmen to dig a cellar at 1s. per cubic yard on finishing the job, it was found that they had cleared but 50 cents per day. My neighbor hired a Yankee to dig a cellar at the same rate in the same clay; he cleared \$1.50 per day. But for the example of Yankee, digging cellars would have risen at least per cent.

A friend from South Carolina, told me that he always hires Irishmen to work for him when he can get them, as one Irishman will do as much work as two slaves, who have no interest in their wages. This brings the value of slave labor (allowing the Yankee to have worked 50 per cent. too hard) at least one-fifth the value of free labor. This all would be an argument in favor of Negro emancipation. But the freed Negro must have some o

stimulus than a peck of corn a week, and one suit of bad clothing a year, to enable him to work well. This also should be an argument in favor of Negro emancipation, at least with the north: for aside of all moral considerations, the moment the Negro becomes a man, like his master he becomes a customer.

Apotopos of labor. The great cause why good farm laborers are so few in number, so extravagant in their wages, and so difficult to retain, is doubtless the low price of lands in the west. Such is human nature, under its best features of energy and hope, that to be our own master, with ill requited, endless toil, and manifold privations—is sweeter, far sweeter, to the imagination and the mind, than comfort and plenty in the house of a master, with well requited labor, and money at interest. SENECA.

Clover as a Manure.

Messrs. Editors.—It has been decided by high authority of late, that to plough in the dry crop as a manure, was much better than to turn under the crop before maturity. The experience of our Dutch farmers disproves this theory, and they are backed by equal authority to sanction their practice. Chaptal says that the green crop is clear gain, as it draws its sustenance from the atmosphere alone, and makes no draft upon the soil until it begins to ripen.

It is the opinion of the Dutch, that plaster is the loadstone which attracts this atmospheric sustenance to the clover. SENECA.

For the New Genesee Farmer.

The Fair, and Ploughing Match at Rochester.

Messrs. Editors.—As I believe your paper is open to a fair discussion of all matters connected with agriculture, I take the liberty of forwarding my humble remarks (which I shall make as brief as possible) on the great Agricultural Fair lately held at Rochester.

It gave me much pleasure to witness the Stock exhibited on that occasion in Franklin Square,—which, with reference both to the quality and number produced, reflected much credit on this section of the country. Having for the last quarter of a century, been in the habit of attending the great cattle shows and agricultural meetings in England, Scotland, and America, I profess to be somewhat of a judge of these matters, and am much interested in the welfare and prosperity of the society, whose show I lately attended,—being persuaded that the introduction of such valuable stock as these exhibited, into Western New York, must rapidly increase the real wealth of the country. The Fruit, Vegetables, &c., were also very fine, and must have been highly admitted by the many strangers who were present. In the Mechanics' Fair, too, was a splendid exhibition of articles. The agricultural implements shown, (although not numerous,) were very excellent, in my opinion; and I believe the fanning mills especially, could not be surpassed, if indeed they could be equalled, by any in the world.

But you must bear with me, if I cannot add my meed of praise to the manner in which the ploughing match was conducted. In the first place, the judges ought, in my opinion, to have followed the custom observed in all ploughing matches in Europe, which is distinctly to state what kind of ploughing is required, so that competitors may strive to work in accordance with the instructions given. They ought to have prescribed, for instance, that the furrows should be 9 inches wide by 5 deep, or 12 inches by 6, (which I believe the best made ploughs, under the hands of a good workman, are made to accomplish,) or any other size in proportion, they might deem advisable. Though the terms on which the ploughing match was advertised to take place, appeared to me very vague and indefinite, my love for such a trial of skill, induced me, though living at a considerable distance, to forward a

team to compete for the prize,—on the supposition that the ploughing done by the competitors would be judged of by its excellency, and not on the speed at which it was accomplished. Had I understood, on the contrary, that the prize was to be awarded to the workman who should *pare* the most land in the shortest time, I could have prepared an instrument for this purpose, to *pare* half an acre (though not to *plough* it, in my sense of that word) in half the time in which it was accomplished. But, till the Rochester judges set me right, I had conceived that *good ploughing*, to merit that name, consisted in the furrow being laid at the proper angle, with the red edge quite straight, so that a ten foot pole, straight-edged, applied from the center of the ridge to the furrow, shall touch the edge of every furrow. I grant that on the occasion to which I allude, a more miserable piece of ground for a good ploughman to show off upon, could scarcely have been selected. Besides, I contend that each competitor ought to open his own furrow, and not be obliged to begin upon those opened under the superintendance of a committee, who, in the present instance, got them run out (as if done by a boy) in a style which caused much loss of time to such of the competitors as endeavored to run their furrows straight.

Some of your readers may probably attribute these strictures to my disappointment at not obtaining the prize for ploughing. True, I was disappointed; but not as regarded the value of the prize plough. I have imported two of Wilkes's best iron ploughs, one of which was at Rochester. These being both effective and durable implements, I intend never to use any other upon my farm. Previously to making use of these iron ploughs, I rarely had more than 14 bushels to the acre; but since their use, I have averaged between thirty and forty bushels.

From my own observation and that of others, who have witnessed the manner in which wheat crops are put in, ploughing seems to be the department of agriculture, of all others, farthest in the shade, and most in need of improvement in your district of country.—Having been a member of various agricultural societies, and frequently on committees, I can bear testimony to the great advantages to be obtained by a farming community, by ploughing matches being properly conducted and judged of. They have been one great means of leading the farmers of Scotland to raise extraordinary crops from the generally poor soil they have to work upon; and enabling them, in this way, to pay a high rent for the use of their land. Were they, in the ungenial climate of Scotland, to plough after the manner of the Rochester ploughing match, they might look in vain for any return of their labor.

These remarks I forward to you from a sincere desire that the committee of arrangement will next year specify, in precise terms, the style in which they require the ploughing to be executed; and in the hope that hereafter judges may be appointed who will take a proper estimate of such miserable work as that performed by the yellow and sorrel team, which, in skimming over the ground within the hour, only tended, by the example, to perpetuate the superficial style of ploughing so prevalent in this section of the country, and to discountenance which, ought to be the aim of every well regulated society.

I am, gentlemen,

Your most ob'dt. serv't.,
A CANANDAIGUA FARMER.

(ANOTHER.)

Remarks on the Cattle Show and Fair of the Genesee Agricultural Society.

Messrs. THOMAS & BATHAM.—Perhaps it would be unreasonable to expect you to insert this letter in your next Genesee Farmer, seeing that it will be so fully occupied in detailing the proceedings of the late

show and fair at Rochester. But feeling anxious for the future prosperity of the society, and thinking no time equal to the present, whilst every circumstance as fresh on the memory, I would wish to suggest some alterations, which, I humbly submit, would be improvements on the late arrangements. In the first place allow me to congratulate you and the friends of agriculture generally, on the auspicious commencement of this institution. Every one present must have been gratified with the superior display of farming stock there exhibited. And, with regard to the field crops, the man who is not satisfied with the progress made in that branch of agriculture within the last few years, must be unreasonable indeed. I have a publication now before me, in which is a letter from Judge Mitchell to the author, informing him that he had grown within a fraction of 500 bushels of ruta baga to the acre; and he further says, "and I verily believe that on this mode of cultivation, that an acre of land which will bring 100 bushels of corn ears, will produce from 700 to 800 bushels of ruta baga." I know not whether Judge Mitchell be still alive, but if he be, what must be his astonishment and delight to learn that in about twenty years from the date of his letter, his anticipations are realized two fold. The same author, in speaking of a crop of ruta baga which he grew on 17 acres of land in England, says, "I ascertained to an exactness that there were 1,320 bushels to an acre, throughout the whole 17 acres. I never saw above half as great a crop on any other person's land, though we read of much greater in agricultural prize reports." So that the crop of ruta baga which gained the premium at Rochester, is not only the best that I ever heard of in this country, but ranks with the very best in England. I hope that the successful grower of this crop will be very minute in his statement for publication in the New Genesee Farmer, with respect to quality of soil, preparation of ground, time of sowing, after culture, distance of drills, if sowed in drills, and distance of turnips in the drills; also, whether the tops and roots were cut off before measuring, whether the bushel was heaped up, and the weight of a bushel. I feel that I ought to apologize for this long digression; but as the preamble is so lengthy, I will try to compress what I have to say, as much as possible. The alterations which I would recommend are these:—That the animals contending for the same premium, be placed as contiguous to each other as possible, for when they are of about equal merit, and placed at a considerable distance from each other, it is difficult for the best judges to decide correctly. Certainly every facility ought to be afforded to the judges, for after all it is but a thankless office. I also think that it would be more satisfactory if the judges were not made acquainted with the names of the owners of the animals—not that I mean to impute the slightest partiality to the judges at the late meeting—but it is desirable that they should be removed as far as possible from suspicion. In an agricultural society in England, of which I was a member, the judges were selected from some other county, and they did not see the animals until they were taken round by the secretary to give in their decision; and whilst doing so, no person was allowed to be near to them. With regard to the field crops, I think that unless a more uniform and satisfactory plan be adopted for ascertaining the exact amount of crop, it would be better to withhold all premiums on this branch of agriculture. For root crops, I would propose that weight be substituted for measurement; and if the same person could inspect the weighing of all the crops, there would be a better chance of arriving at a just decision.

As to the ploughing match, I cannot allow that the "race ought to be to the swift;" for it is more than probable that the worst ploughman will finish first.—Perhaps it would be well to fix a reasonable time for

completing the quantity set out, but if done within that time, the best ploughman ought, in my opinion, to take the premium.

DAVID THOMAS, in one of his many practical and sensible articles, published in the New Genesee Farmer, says, when treating on ploughing, and reprobating wide furrows, "that once well done is twice done." I think it would be well to act upon this principle in deciding any future ploughing match.—Ploughing is certainly the most important operation on the farm, and it is the very operation in which the farmers of this country the least excel, and this chiefly owing to the anxiety to do too much. Instead of encouraging this propensity, surely it would be more prudent to adopt Mr. Thomas's doctrine of doing less and doing it well. Apologizing for the length to which I have run this letter,

I am, Gentlemen,
Yours truly,

Ontario co., Oct. 12, 1840. C. B.

Remarks.—The foregoing letters, from two esteemed friends in Ontario county, contain some valuable suggestions which will doubtless have the desired effect, and accomplish good for another year. We must be allowed to say, however, that we do not think the implied censure of the Executive Committee is deserved, although we admit that many things connected with the Fair were not quite as they should have been, and might have been better managed. But let it be remembered the society is in its infancy, and the duties of the Executive Committee have mostly devolved upon a very few individuals; and those few, but little experienced in such operations, and unable to devote that time to the business which it required. Add to this, the extreme lack of funds, and the unwillingness of the majority of farmers to co-operate, and we think the wonder should not be that all was not managed in the best possible manner, but that it was managed at all, or as well as it was.

With regard to the ploughing match, field crops, and other matters, alluded to by our Ontario friends, a sufficient answer may be found in the reports and explanations of the different committees, and other remarks in this paper. We will simply add, however, that we think C. B. judges rather unkindly of the committee on ploughing. It will be seen by their report that they were governed in their decisions as much by the character of the work, as by the time employed in performing it; and we are certain that no person at all acquainted with the gentlemen composing that committee, will for a moment doubt their qualifications as judges, or suspect them of showing partiality. The work by the team from Canandaigua, besides being a long time performing, (50 minutes) was set down in quality as No. 5.—Eds.

DURHAM AGRICULTURAL SOCIETY.

The regular Fall Exhibition of stock and produce by this Society, took place at Port Hope, on Tuesday the 20th October, in presence of a large number of merchants and other inhabitants of the town, and adjoining townships of Clarke, Cavan, and Darlington.

The number of Mares, Colts, Oxen, and young cattle, was not only unusually large, but of the finest kind and quality. Several very superior English Sheep, imported by John GIBSON, Esq., and others, were on the ground, and a number of excellent specimens of the various breeds of Swine were particularly attractive; in fact, this part of the Exhibition was superior to that of any former occasion.

The samples of Butter, Cheese, Wheat, Rye, Oats, Barley, &c., were of the very finest quality.

Several pieces of excellent Cloth of domestic manufacture were produced, and from their texture, proved that this branch of useful industry is not neglected

The ground chosen for the display, in consequence of the annual number of cattle &c., was rather limited, and rendered the office of the prize judges more difficult. This will be guarded against for the future.

A good deal of stock exchanged hands for ready money. The following is a list of the prizes that were awarded and paid on the spot, and the names of the successful competitors:

Thomas Garnett, best Brood Mare,....	£3	0	0
Henry Monroe, 2d do do.....	2	0	0
Daniel Brand, 3d do do.....	2	0	0
James Blackburn, best Cow,.....	3	0	0
Robert Sutton, 2d do.....	2	0	0
Benj. Allan, 3d do.....	1	0	0
Alex. Broadfoot, best 2 year old Heifer,	1	10	0
Samuel Dickenson, 2d do do	1	0	0
Herbert Renwick, best 2 yr. old Steers,	1	10	0
Jacob Chout, 2d do do	1	0	0
Alex. Broadfoot, best 1 year old Heifer,	1	0	0
J. Boyce, 2d do do	0	10	0
Herbert Renwick, best 1 yr. old Steers,	1	0	0
John Ainley, 2d do do	0	10	0
Samuel Dickenson, best Ram,.....	2	0	0
John Gibson, 2d do.....	1	10	0
John Gibson, 3d do.....	1	0	0
John Gibson, best Ewe,.....	1	10	0
John Gibson, 2d do.....	1	0	0
Chas. Tamblin, 3d do.....	0	15	0
Henry Monroe, best Boar,.....	1	5	0
William Allan, 2d do.....	0	12	6
R. W. Robson, best Sow,.....	1	0	0
William Allen, 2d do.....	0	10	0
Alex. Broadfoot & } best 10 yds. Cloth,	1	5	0
Robert Sutton, } 2d do do	0	15	0
John Smart, 2d do do	1	10	0
John B. Wood, best acre of Turnips,...	0	15	0
R. W. Robson, 2d do do.....	1	0	0
Zabina Frazier, best sample of Butter,	0	10	0
John Ainley, 2d do do	1	0	0
Benj. Jacobs, best sample of Cheese,	1	10	0
John Belwood, best sample of fall Wheat,	1	0	0
James Laing, 2d do do	1	0	0
John Smart, best spring Wheat,.....	1	0	0
Robert Sutton, 2d do.....	0	10	0
Robert Sutton, best sample of Barley,...	1	0	0
John Ainley, 2d do do....	0	10	0
John Middleton, best sample of Oats,...	1	0	0
Robert Sutton, 2d do do....	0	10	0
£41 17 6			

After the business of the day was over, a large and highly respectable body of gentlemen belonging to the Society, adjourned to the "Queen's Arms" Inn, and partook, as customary, of a substantial and well-dressed agricultural dinner, provided by Mr. HASTINGS for the occasion. When the cloth was removed, the following toast was given from the chair by the President, DAVID SMART, Esq., whose connection with and exertions in behalf of the Society are dated from its commencement:—"The Queen and Prince Albert;" (nine times nine.) By the Vice-President, R. W. ROBSON, Esq.—"The Governor-General," after which a number of volunteer toasts were given, and the evening passed off in social enjoyment in perfect harmony and good feeling. The healthy state of the funds, the interest manifested by all and every one connected with the Society, its rapid and constant progress, are truly gratifying, and evince that the spirit of emulation, arising from these periodical exhibitions, must soon lead to vast and permanent improvements in stock and produce, and speedily place the agricultural character of this country on a par with any other portion of North America.

It was resolved that the annual meeting for the election of officers for next year, should take place at Port Hope, on Friday, the fifteenth day of January next, at 12 o'clock noon; and that the proceedings of this meeting should be published in the "Colonist" and "Columbia Star," and that other editors in the province, together with those of the "New Genesee Farmer" and "Cultivator," should be requested to copy the same. ROBT SUTTON, Sec.

Port Hope, U. C., Oct 20, 1840.

Remarks.—It gives us much pleasure to record the foregoing proceedings of our neighbors across the Lake. The Durham Society is one of the most spirited and useful in Canada. Aside from our personal knowledge of this fact, we want no better evidence than a reference to our subscription list affords. With the foregoing, we received two samples of beautiful premium wheat, from DAVID SMART, Esq., the able President of the Society.—Eds

The Agricultural Fair at Canandaigua.

On Tuesday, Oct. 20th, we, with several other citizens of Rochester, took a delightful rail-road trip to Canandaigua, in order to witness the exhibition of the Ontario County Agricultural Society. Our readers are aware that we had formed high expectations respecting this event, and we are happy to say, those expectations were more than realized. The reports of the Secretaries, which we subjoin, are so complete, and express our sentiments so correctly, that it is unnecessary for us to remark on the different departments of the exhibition. We will only say that Old Ontario has good reason to be proud of the display of her real wealth on that occasion; for, with the exception of the exhibition at Rochester, which was formed by several counties, there never has been so grand an agricultural display in Western New York. But above all, may she boast of the gathering of her true Nobility which were brought out on this occasion.—With such a number of intelligent and enterprising farmers as we saw there on that day, Ontario county can, and ought to attain to the highest standard of perfection in agriculture, and take the foremost rank in the rapid march of improvement. Let the Managers of the Society feel encouraged and be active: let every good farmer become a member, and every member arouse to the work—and the next, and each succeeding anniversary will show a greater, and still greater advancement, the results of which will be, an immense increase of true wealth in the county.

Ontario County Agricultural Society.

This Society, formed by the Farmers and the friends of Agriculture in this county but a few months ago, held their first annual meeting in this village on Tuesday of last week. (Oct. 20) Although organized so recently, the attendance of members and others was larger than we recollect to have seen at any of the meetings of the former Society, which existed in this county some twenty years ago. It far exceeded the highest expectations of all who had been active in the great object in view; especially when we consider that the effort was made at a time when the public mind was engrossed by the exciting political subject of the day. It was indeed a proud day for old Ontario, and the occasion was favored by delightful weather. It was 'a day's truce' to political strife—a 'green spot' on the rough surface of the times—pleasant 'neutral ground,' on which men could mingle, for the rational and exalting purpose of improvement, by imparting and receiving instruction upon the every-day business of life, and thereby securing the blessings and benefits of well-directed industry.

The interest manifested in the success of this new association, by so large a collection of our most respectable and independent farmers, was truly gratifying; and the numbers and qualities of the various animals exhibited, as well as productions from the field, and fabrics of domestic handwork, were an earnest what can be effected by the spirit and ingenuity of a people, already advanced in these 'graces of civilization,' and favored by a soil and climate, such as are enjoyed in this county.

It is a matter of regret with those appointed to give an account of the proceedings of the day, that they are unable to describe the various and numerous Farm stock exhibited, some of which were of the best blood. There were a number of superior Bulls, Cows, Oxen and Calves, which, with the pens of Swine and Sheep, excelled any ever brought together in Western New York, in the judgment of gentlemen who visited us from other counties. There were but few good Horses; and it was a subject of remark that the improving of these indispensable and noble animals, has been much neglected in Ontario.

The Ploughing Match, which was limited to ox teams, of which five took the field, excited a lively interest, and gave general satisfaction. It was a fine display of practised skill, as well as of strength, and the prize was well contested. The neat manner in which the furrows were opened, (marking out the quarter acres) by Alexander Porter, with his iron plough, was admired by the spectators. Mr. Godfrey's team ploughed the quarter acre in 42 minutes; Mr. Pieker's in 43; and Mr. Gates' in 38—but the first was pronounced best. [A member, who praised the rapid performances of the handsome oxen, expres-

* The gentlemen doubtless meant to except the late exhibition at Rochester.—Ers. N. G. FURSAU.

ses the hope that next year horse teams will be allowed to compete, as this would lead to a more extended improvement in the science of ploughing, so important in the business of agriculture.]

It is regretted again, that the several committees did not furnish such full reports of what they examined, as would enable the publishing committee to be more particular in describing the exhibition. But no one can be blamed; for the short notice of their appointment, the great number and variety entered for premiums, and moreover, the great concourse of people, rendered a perfect discharge of their duties impossible. In the general notice, which therefore can only be taken, many things of merit, it is feared, will be overlooked.

Of vegetable Productions, there was a good show—such as squashes, radishes, corn, wheat, beans, apples, &c. One member had samples of nine varieties of Potatoes; among them the Irish Cups, raised from a few imported from Ireland, where this ranks as the best. Another member produced seven sorts.

Of domestic fabrics, there were several that did high credit to female ingenuity—such as carpets, coverlets, flannel, cloth, linen, and an elegant shawl. Also, several parcels of reeled silk.

Of Mechanism, there were ploughs, thrashing and sowing machines, a straw cutter, &c. Also, some neat castings from J. L. Woodruff's furnace.

At 3 o'clock, the court room was filled by ladies and gentlemen, to hear an address on the occasion, by John Rankin, Esq. This was listened to with great interest, as the production of a practical and scientific farmer; and soon after its delivery, on motion of J. Garlinghouse, the thanks of the Society were rendered to the author for his useful and instructive address, and he was requested to furnish a copy for publication. [It will be printed in pamphlet form, and ready for members in about a fortnight.]

On motion of Jared Willson, Esq. the members of the Society then proceeded, by nomination, to the choice of its officers for the ensuing year, when the following gentlemen were chosen, viz:

- JOHN GREIG, President,
- Gideon Lee, 1st Vice President,
- Heman Chapin, 2d do.
- Peter Mitchell, 3d do.
- Joseph Fellows, 4th do.
- William Otley, 5th do.
- Irring Metcalf, 6th do.
- William W. Gorham, Recording Secretary,
- Oliver Phelps, Corresponding do.
- James D. Bemis, Treasurer.

TOWN COMMITTEE OR MANAGERS.

- Canandaigua—John McConnell, Charles Shepard, Henry Howard.
- Canadice—Hiram Colegrove, Josiah Jackman, Sylvester Austin.
- East Bloomfield—Flavius J. Bronson, Bani Bradley, Myron Adams.
- West Bloomfield—Reynold Peck, Jasper C. Peck, Bezalel C. Taft.
- Bristol—Francis Mason, Erastus H. Crow, Anson Packard.
- South Bristol—Franklin Crocker, Allen Brown, James Parmelee, Jr.
- Gorham—Fphraim Blodget, Nathaniel Smith, David Pickett.
- Hopewell—Theodore Crosby, Eli Benham, 2d, George Cayward, Jr.
- Manchester—Nicholas Howland, Edmund B. Dewey, Abner Barlow, Jr.
- Naples—Manson Watkins, Fphraim W. Cleveland, James L. Mortimer.
- Farmington—Russell M. Rush, Wilmarth Smith, Perez Hathaway.
- Richmond—Hiram Pitts, Hiram Ashley, Leonard B. Briggs.
- Phelps—Elias Cost, William Dickerson, Spencer Hildreth.
- Seneca—Abraham A. Post, Charles Godfrey, George Fardon.
- Victor—Samuel Rawson, Henry Pardee, Jared H. Boazhton.

The President of the Society then announced the awards of the several Committees, as follows, viz:

PREMIUMS AWARDED,

By the Committee on Grain.

- To C. B. Meek, of Canandaigua, for the two best acres of Wheat, 43 45-69 bush per acre, \$10 00
- To Bani Bradley, of East Bloomfield, for the two best acres of Indian Corn, 118 bushels per acre, 8 00
- To Anson Packard, of Bristol, for the second best, 106 17-60 bushels per acre, 5 00

- To Bani Bradley, for the two best acres of Oats, 77 26-32 bushels per acre, 6 00
- To Anson Packard, of Bristol, for the second best, 65 bushels per acre, 3 00
- To Francis W. Paul, of Canandaigua, for the two best acres of Peas, 38 1/2 bush. per acre, 3 00
- To William Burling, of Canandaigua, for the second do. 28 bushels per acre, 5 00

By the Committee on Roots.

- To Charles B. Meek, of Canandaigua, for the best half acre of Ruta Baga, 880 bushels per acre, 3 00

By the Committee on Ploughing.

- To Charles Godfrey, of Seneca, the owner of the Ox team which ploughed 1-4 of an acre best in an hour, 8,00
- To David Pickett, of Gorham, the owner of the second do. 6 00
- To Cyrus Gates, of Hopewell, the owner of the third do. 4 00

By the Committee on Horses.

- To George Fardon, of Seneca, for the best Stud Horse kept within the county six months preceding the exhibition, 10 00
- To J. C. Paul, of West Bloomfield, for the best Stud Horse raised and owned within the county, 10 00
- To Harvey Pratt, of Hopewell, for the best pair of matched Horses, not over seven years old, raised in the county, 10 00
- To Samuel Scott, of Seneca, for the best Mare, with a colt one year old past, raised in the county, 8 00

By the Committee on Bulls and Working Oxen.

- To F. W. Gooding, of Canandaigua, for the best Bull, over two and not exceeding five years old, 10 00
- To Guy Collins, of East Bloomfield, for the second best do., 6 00
- To Luther Brooks, of East Bloomfield, for the best yoke of Working Oxen, 10 00
- To E. Birdseye, of Hopewell, for the second best do., 7 00
- To E. S. Gilberie, of Richmond, for the third best do., 5 00

By the Committee on Steers and Heifers.

- To Elijah Bostwick, of West Bloomfield, for the best pair of three years old Steers, 7 00
- To David Cassort, of Canandaigua, for the second best do., 5 00
- To Perez R. Pitts, of Richmond, for the best pair of two years old Steers, 7 00
- To George Gooding, of Bristol, for the second best pair do., 5 00
- To George W. Pitts, of Richmond, for the third best do., 3 00
- To Silas Harris, of East Bloomfield, for the best pair of one year old Steers, 7 00
- To Myron Adams, of East Bloomfield, for the second best do., 5 00
- To George W. Pitts, of Richmond, for the best two years old Heifer, 5 00
- To Anson Packard, of Bristol, for the second best do., 3 00
- To James L. Monier, of Naples, for the best one year old Heifer, 5 00
- To George W. Pitts, of Richmond, for the second do., 3 000

By the Committee on Milch Cows and Calves.

- To J. C. Hathaway, of Farmington, for the best Milch Cow, 6 00
- To Heman Chapin, of East Bloomfield, for the second do., 5 00
- To Isaac A. Arnold, of Gorham, for the best Calf, 4 00
- To Stephen Hender, of West Bloomfield, for the second best do., 3 00

By the Committee on Sheep.

- To Edward Swan, of Richmond, for the best fine fleeced Ram, 5 00
- To George Cnyward, of Hopewell, for the best Ram, reference to ewes, 5 00
- To Edward Swan, of Richmond, for the best six Ewes, reference to fleece, 5 00
- To Charles B. Meek, of Canandaigua, for the best six Ewes, reference to carcass, 5 00

By the Committee on Swine.

- To Amasa Carter, of East Bloomfield, for the best Male Swine, 5 00
- To W. W. Herenden, of Farmington, for the second best do., 3 00

- To Amasa Carter, of East Bloomfield, for the best Sow and Pigs, 5 00
- To James D. Bemis, of Canandaigua, for the second best do., 3 00

By the Committee on Butter.

- To Joseph Garlinghouse, of Richmond, for the best Firkin Butter, not less than 50 lbs., 7 00
- To Perez Hathaway, of Farmington, for the second best do., 4 00

- To A. B. Rappleje of Farmington, for the third best do., 3 00

By the Committee on Cheese.

- To James Harland, of Manchester, for the best 108 lbs. Cheese, 7 00
- To William Childs, of Gorham, for the second best do., 5 00
- To Perez Hathaway, of Farmington, for the third best do., 3 00

By the Committee on Flannel, Carpeting, and Woollen Cloth.

- To William Otley, of Phelps, for the best 20 yard Flannel, 6 00
- To Thayer Gauss, of East Bloomfield, for the second best do., 5 00
- To Bani Bradley, of East Bloomfield, for the third best do., 4 00
- To Edwin A. North, of East Bloomfield, for the fourth best do., 3 00
- To J. J. Gellam, of East Bloomfield, for the best 20 yds Carpeting, 6 00
- To Thomas Williams, of Richmond, for the second best do., 4 00
- To William Bryant, of Manchester, for the best 20 yds Woollen Cloth, 8 00
- To William Otley, of Phelps, for the second best do., 5 00

By the Committee on Family Manufactures and Reeled Silk.

- To William Otley, of Phelps, for the greatest quantity of useful articles manufactured by any family, since the first of January last, and by females, from wool, cotton, flax, hemp, tow, or silk, 10 00
- To E. B. Dewey, of Manchester, for the second greatest do., 8 00
- To A. B. Rappleje, of Farmington, for the third greatest do., 6 00
- To William Childs, of Gorham, for the fourth greatest do., 4 00
- To Harlow Manson, of East Bloomfield, for the greatest quantity of Reeled Silk, raised by any family in the county since first January last, 10 00
- To Bradford Walker, of Canandaigua, for the second greatest do., 5 00

By the Committee on Thrashing Machines, Ploughs, and Harrows.

- To _____, of Canandaigua, for the best Thrashing Machine invented or introduced into the county, 10 00
- To Junia Ingraham, of Bristol, for the best Plough, 10 00
- To J. L. Woodruff, of Canandaigua, for the second best do., 5 00
- To Guy Hayes, of Bristol, for the best Harrow, 10 00

By the Committee on Discretionary Premiums.

- To R. P. Pitts, of Richmond, for an elegant piece of table Linen, 2 00
- To Miss Nancy Demill, of Richmond, for a beautiful down Cape, 1 00
- To Mrs. Lyman Herenden, of Farmington, for a handsome shawl, 1 00
- To Miss Zerunah W. Pickett, of Gorham, for superior needle work and embroidery, 1 00
- To Pierpont Seymour, of East Bloomfield, for a Sowing Machine, 5 00

It was moved by Jared Wilson, that the discretionary premiums be paid by the Treasurer.

On motion of John Rankin, it was ordered that the thanks of this Society be given to its Secretaries.

The members of the Society then appointed Oliver Phelps, James D. Bemis, and William W. Gorham, a committee to report and superintend the publication of the proceedings of this day: and,

On motion of John McConnell, it was voted, that they be published in the New Genesee Farmer, the Cultivator, and the several newspapers of Ontario county.

W. W. GORHAM, }

From the Farmers' Cabinet

Book Farming.

Str.—On a visit to a young and neighboring farmer, one who has left the busy town for the peaceful country," as he says, and who reads the agricultural works of the day in his own defence, I saw many things about his house and premises which even I—an old farmer, with perhaps a pretty strong opinion of prejudice, especially against book farming—at once could perceive were improvements upon the old plans adopted by my grandfather. I had called upon him to offer my services by way of advice, but I vow that before I entered the house, I was sensible that I had come to the wrong place for that business—so I made what is called a victim of necessity, and held my tongue.—Wife, Mr. Editor, before I left him, I found that he was the oldest in point of knowledge, and only wanted a little practice to render him by far a better manager than myself—I guess he talked like a book, and had chapter and verse at his fingers' ends for every thing he did, and something better than that too, for he had the modesty to listen, while I described some of our old-fashioned modes of management, which, however, he would demolish, although very judicious, in about half a minute, by turning to his books, which, I declare, he seemed to have the power to find just what he looked after; and the truth of his notions was, I am compelled to say, as plain as A, B, C. There is one thing, however, in which I think he is wrong; he says we do not, according to his calculation, plough deep enough—now, I think, if any thing, we plough too deep, and so I told him, but he only answered he was young, and was desirous of getting information by buying it, and was making experiments which would convince him of the truth or falsity of the theory; and then he asked me if ever I had given the thing a fair trial? which I was bound to say I had not; and there, Mr. Editor, these youngsters have the advantage over us—for nothing will satisfy them but rooting to the bottom of things; and it is in vain for me to say, as I did repeatedly, "he may be sure that I was right in my notions on that subject, and he would let it go."

His dairy cows which he had bought but the last year, were all of the proper age and in full milk; for he told me, as often as he was convinced that he had a bad milker, he sold her right away and bought another; for, added he, "my books tell me there is more than a hundred per cent. difference between a good and a bad milker, for while a good milker gives a profit, a bad milker gives a loss." This was phlegm to me, for I knew that one half my dairy cows were too old or too young, and the other half far from good—so I said nothing.

But there was one thing in which he shamed me, and that was the way in which he had changed the situation of his cattle yard, so as to prevent the damage of the dung from passing over the high road and down the ditch, as had been the case for the last age or two, and I think he had done so easily too, for, by digging up the bottom of the old yard two or three feet in depth in the centre, he had cast it hollow, and obtained by these means many hundred loads of the richest mould, exactly in the place where it was required, and all without the cost and labor of carting, to get as a sponge to soak up the draining during the winter; and now I found him turning it up with his long manure, a heap, I had almost said, as large as a little barn! this was killing two birds with one stone, you see, and I wondered how the idea could have entered his head—for I am sure it had never entered mine—but he took down a book where there was a picture of a cattle yard as natural as life, and pointed out the advantage of the alteration, and made a calculation of the saving it would be to him in the course of the year, in the article of manure, that quite astonished me; and then he went to work with his figuring to show me the quantity of capital would he had obtained, merely by digging; multiplying together, as he called it, the length and breadth by the height, and turning the whole into bushels, without ever loading a bit of it—I declare it made me feel all-over-like to see him go from Dan to Beer-sheba in about a whistle.

But there was a machine in a shed at the end of the home, that was a caution to me; it was a large grindstone set upon rollers, so true, that with a single finger it might be set off as though it would go for a month; now that was a tool which I had promised to get for the last ten years, but never found time to do it, although it has cost me hundreds of dollars, and something more than time, to go to the tavern a mile off, every time we want to grind a scythe, or hoek or axe, and operate upon an old worn out, rusty thing, about as smooth as the back of my hand, a quality which it never before struck me was chosen by the owner and

tenant of the tavern, for the purpose of keeping the noses of his customers so long at the grindstone, as to bring on a desire for drink; and, now I think of it, it is placed in the narrow alley! I would have passed without noticing it, but my young friend remarked, "there is the cheapest article I ever bought; it is large and cuts so readily that it is no labor to use; I guess it has saved me about the amount of a rent already; all our tools, from the knives of the table to the hoes, spades, shovels, and pick-axes, are kept sharp, and it is pleasure to work with them; at buytime and harvest, we generally give our scythes a touch every morning, which saves hours in the day and many a weary back, head, and neck-cuts the crops close and clean; I cannot calculate the value of such a convenience, because I have never been without one;" but I thought I could, and from that moment determined to get one right away. He had many other strange things about him, the knowledge of which he told me he had obtained from books; but as I must have tired you by this time, I shall reserve a farther description of them for another opportunity.

ONE OF THE OLD SCHOOL.

P. S. He had also what he termed *course of crops*, different from ours, which I must notice in my next.

From the American Farmer.

Henry.

This is a new term to us, and when we first noticed the article which is subjoined, we were at a loss to define its meaning; but we soon discovered that it was upon a subject that is too much neglected by our farmers, and laid it by for insertion in our paper. Our attention is again called thereto by the reception of a letter from one of the most eminent and successful agriculturists in the United States, the proprietor of the *Three Hills Farm*, near Albany, who, in discoursing of other matters, thus introduces the subject of poultry, which we think worthy the attention of all who wish to enjoy the luxury emanating from the "Henry." It is also particularly worthy the attention of those residing near the markets, where they can obtain an average price of 1-3 cents per dozen the year round for eggs, and \$2½ to \$3 per dozen for chickens. Mr. Bennett observes:—

"I am now paying particular attention to poultry, have built me a poultry house, and enclosed a yard for them to roam in. In this section considerable attention is being paid to poultry. Since I built my poultry house, several have followed suit, and I have no reason to regret the expense; for, from 60 hens we obtained in six months, 2600 eggs; whereas in former years, when I kept from 80 to 100 hens, 400 and 500 were all we obtained during the year. Besides they are not half as much trouble on the farm."

HENRY—NOT HENRY.

Henry—says our neighbor Adams of the *Temperance Gazette*, is to *hens*, what *piggery* is to *pigs*, or *rookery* is to *rooks*—he might have added—*hog-gery* to *hogs*, and *cowery* to *cows*. We are glad to find him so learned in these matters, and especially to see him willing to turn his knowledge to a *practical account*.

During a late visit in Windrop, he noticed the Henry establishment of Rev. D. Thurston, which, as he thinks it an improvement on the common method of keeping hens, he thus describes in the last *Gazette*:—

IMPROVED HENRY.

We are not sure that *Henry* is a *dictionary* word, but we suppose that our readers will understand it.—If not, we would say that *Henry* is to *hens* what *piggery* is to *pigs*, or *rookery* to *rooks*—a place where these chief feathered bipeds congregate, and perform the appropriate duties of their station. We lately met with one of these establishments, which seemed to us so excellently adapted to its purpose, that we have thought it worth a brief description.

First, then, in the upper part of the barn is an apartment 12 feet square, boarded so as to prevent the escape of what is put within it. Here the fowls are to roost, lay their eggs, and perform all their in-door work. At the distance of a rod and a half from the barn, on the borders of the garden, is another apartment, of about the same dimensions as the first, surrounded by a high fence made of lath stuff, sawed two inches wide, and nine feet long, and put on close enough to prevent the hens getting out. These two apartments are connected by a *covered way*, which passes from the sentinel of the barn, in what some would call a slanting direction, to the fence, about three feet from the top, and is continued down to the ground in the inside of the yard. This is made tight top and bottom, and on one side, but with open work on the other side. Through this covered way the inmates of

the establishment pass when they choose, taking the air and enjoying the prospect, and when they come into their out-door apartment, they moult, and flit in their favorite amusement of scratching dirt and devouring gravel.

The rest of the whole is, they are kept under perfect control, and yet enjoy at that liberty which is essential to their health and comfort, and when you want a fresh egg, you have only to lift a lid over a row of little apartments, in which their nests are made, and you will find at almost any time of the day, a plentiful supply. The hute chickens, too, as soon as they are large enough to make excursions abroad, will be ready to perform an excellent service in the garden, by devouring the grubs and insects.—Thus the inhabitants of our villages, and of our cities, even, who have "scope and verge enough" to possess a barn and garden, can keep as much poultry as they choose, without infringing in the least upon the laws of good neighborhood. Those who wish to inspect the establishment we have described, may be gratified by calling on Rev. D. Thurston of Windrop."

The plan, doubtless, is a good one. By such an enclosure, the fowls are kept from doing damage in cultivated grounds, are prevented from roving to their own hazard and injury, and will, if properly fed, lay their eggs and rear their young better, than if they enjoyed a more enlarged liberty. Care should be taken, however, when they are confined, to supply them liberally with water, gravel, lime, and animal food—such as fresh meat, worms, &c. In this way, people in large villages and cities can keep hens as well as though they lived on farms in the country. Indeed, it would be better for farmers if they would at certain seasons of the year, keep their poultry in such an establishment.

We do not know as we understand the necessity or the benefits of separating the yard from the barn, by the distance of a rod and a half unoccupied ground, connected by the "covered way" or tube leading from the barn to the yard. Our establishment differs from the foregoing chiefly in this particular. The yard is directly attached to the back side of the barn, from a wall of which a roof projects under which are poles for roosts. This is a shelter from the rains and winds. On a level with the floor of the barn, two holes are cut, several feet distant from each other, sufficiently large to enable a hen to enter one and skulk out of the other into the yard again if she wishes.—The hens like secrecy in these important matters.—Within the barn is a long chest, covered by a lid, having a communication with the yard by the holes aforesaid. The chest is partitioned off into nests where each hen is allowed to lay her eggs "alone in her glory," little expecting perhaps, that the top of her excellent place of concealment is liable to be opened, and her eggs taken away by human stratagem.—*Maine Cal.*

A Statement

Of the culture and product of Sugar Beet, Mangel Wurtzel, Field Carrot, and Sugar Parsnip, on the farm of James Gowen, Mount Arty, in the season of 1853.

Submitted and read by JAMES GOWEN, before the Philadelphia Society for promoting Agriculture.

The land set apart for these roots was part of an old apple orchard, and is a light, sandy soil, intermixed with mica, or Isinglass, and from which a crop of corn had been taken the previous year. It was ploughed as early in the spring as possible, say 15th March, and before ploughing was broadcast at the rate of thirty bushels to the acre. It was permitted to rest a few weeks, after which it had a tolerable dressing of well rotted stable manure immediately ploughed in.—Before harrowing, it was watered with a few cart loads, say one hundred and fifty bushels, good street dirt, applied lime fashion from the cart, by scattering with the shovel—then harrowed. The quantity of manure in all was not more than would have been used on similar soil in some condition for potatoes. The labor up to sowing, was two ploughings, two harrowings, and one rolling—the last operation deemed indispensable in such soil, and to render the drilling more perfect.

Half an acre was intended for mangel wurtzel—half an acre for sugar beet—half an acre for field carrots, and a quarter of an acre for sugar parsnip; but the seed for mangel wurtzel falling short, and there being an abundance of beet seed on hand, the latter was increased to more than half an acre, while the former stood less by as much as the other was increased.

The drill used when working for beet and mangel wurtzel, was provided with three teeth, set two feet

ix inches apart, cutting these drills of two and a half feet apart at one operation. For carrot and parsnip, our teeth were furnished, set two feet apart, cutting our drills, two feet under, at one operation. Seed sown continuously in the drill by hand, in quantity, for it about three times as much as plants would be required. All was sown between the 16th and 18th of April. When well up and properly developed, the beet and mangel wurtzel were thinned to six or seven inches apart, the carrots to three or four, and the parsnips to four or five inches apart.

The hoeing was performed with a cultivator, set rich duck feet or scalpers; it might be dragged by a stout man, but in the present case a light, short-treed orse was used, led by a careful man, while a thorough and held or conducted the scalper. The holder, or longman, should be of quick eye and steady hand, to be prepared for the slightest deviation of the horse which might bring the outline scalpers next the drill, which the inclination tended, upon the plants, which would prove as fatal to them as the weeds—the scalpers making clean work of all that come in their way. By this method of hoeing, and of keeping the ground clean and loose, much labor and time were saved, for in two hours as much might be done in this way, as would take a good hand to perform in a week, and then it would be better done by the scalper than by hand hoeing. An hour or two by the scalper, at proper and convenient periods, with now and then a steady hand weeding when coarse weeds were observable among the plants, were all the time and labor required at this important stage of culture. Taking the whole labor from the beginning to the gathering of the roots included, it would not be greater than that which is usually bestowed on a well worked patch of ground; nor can the manure used, be estimated, as to quantity and value, to be greater than would be required for potatoes cultivated in the common and usual way on a patch of ground in similar condition.

PROFITER.

1200 bushels, less than three-fourths of an acre, having in the patch, 100 large old apple trees, producing 100 bushels clean and close topped roots; a bushel (as over-Town, cut. gra. lbs.)	18	5	2	21
angel wurtzel, less than three-eighths of an acre, having six apple trees in the patch, 320 bushels,	9	2	3	12
old carrot, half an acre, having nine apple trees in the patch, 260 bushels,	7	8	2	8
gar parsnip, one-fourth of an acre, having seven apple trees in the patch, 120 bushels,	3	8	2	4
Total,	37	5	2	23

In less than two acres.—Would not be over one third three-fourths of an acre, deducting space of trees, allowance be made for trees and their shade, the above result must prove very encouraging to those who intend to turn their attention to the culture of green crops.

The drill and scalper were constructed at home, by the direction of Peter Keiffer, gardener to R. Gowen, who superintended the whole process of cultivation, and by whom the principal labor was performed, and this he did while having the care of a garden and neat green house. This is sustained show that the time consumed in raising the roots, is not so great as many might be led to imagine, and pay a well merited compliment to the skill and industry of Peter Keiffer, to whom the premiums should be awarded, if the crops be deemed worthy of such distinction.—*Farmers' Cabinet.*

On the superior advantages of growing Orchard Grass with Red Clover.
read before the Philadelphia Society for promoting Agriculture, March 4, 1840, by James Nease, M. D., V. President.

My attention was first called to this subject when reading the late Mr. Badley's notes on Husbandry, (769) in which he states the benefit to be derived from sowing together the two grasses first mentioned, and his remarks appeared so well founded in reason, that I was disposed to pursue the practice he recommended; but before trying the experiment I consulted the late Algonon Roberts, of Philadelphia county, one of our best farmers, on the subject, and was pleased to find him approve of the measure.

My question was, "which was the best grass to sow with red clover?" He answered at once, "Orchard grass," by reason of their blooming at the same time, and the orchard grass giving early and late pasture, which was a great object with him, as he devoted his attention to the supply of butter for the Philadelphia market. Joseph Cooper, of New Jersey, to whom I also applied for an opinion on the same point,

was equally prompt in favor of the union of the two grasses in question. Thus backed, I had no hesitation in deviating from the usual routine adopted in Delaware, and still continued very generally throughout Pennsylvania; and upon the first field of wheat which I laid down, viz: in 1825, I had sown the following spring, 12 measured plants of clover seed with one bushel and a half of orchard grass, previously well mixed. After the grain was removed, I saw with very great delight, both grasses thickly covering the ground, and nearly as high as the stubble; and late in the autumn had the satisfaction to see my cows enjoying a luxurious, succulent repast, after the fields which were sown with Timothy and clover in the vicinity had ceased to supply it. But this gratification was small, when compared with that I experienced the following spring, by beholding the orchard grass in full blossom at the same time with its companion, and the ground thickly set with both. Reserving a certain space for maturing the seed of the orchard grass, I had the crop cut when a few only of the clover blossoms were beginning to turn, being then sure of perfect maturity of the rest, and found that they, equally with the leaves, retained their connection with the stalk much better than when the grass was cut after the clover blossoms had assumed a darker hue. Another advantage attending this early cutting, is, that the stalks preserve their pliancy, and are eaten freely by cattle; whereas they are wasted when they become hard, from the mowing having been done at a late period.

My experience of six years of the union of the two grasses, enables me to say that the advantages of sowing orchard grass in preference to Timothy are as follows:—

1. Two crops in place of one.
 2. Good pasture late in the autumn instead of none.
 3. The curing of both grasses in full perfection, while when Timothy is sown, the clover blossoms and leaves are dead, black, and chiefly fall off in the curing of the hay, owing to the opening of the Timothy 12 or 15 days after the clover. Farmers will never cut their grass until the Timothy is fit for the scythe.
 5. Early pasture, even before the pestiferous, hateful wild garlic makes its appearance, or at least as early as the latter, and by its rapid growth, smothered or lessens this enemy to the products of the dairy. The same remarks apply to the autumnal growth of garlic.
- Orchard grass is upon a par with Timothy, in point of nutritive quality and animal palatability, and will command nearly as great a price as Timothy. Two crops, and the early and late pasture of the orchard grass make up for the small difference in the price of hay from the two grasses.—*Practical Farmer.*

From the Library of Health
Fruits as Food.

The New England Farmer, ever and anon, lends its support to the cause we serve—and most welcome is its friendly aid and encouragement. Below, is an extract from its editorial columns. We are not disposed to marvel at all because the writer has before his eyes, the fear of being called a Grahamite—a species of phobia which is exceedingly prevalent. The best prescription we can give for the disease, however, is that which has proved efficacious in other cases, viz: to go forward, mind our own business, do what duty requires, and then let them say what they please about us.

"Believing, as we do most strongly, in the conduciveness of vegetable diet to health, especially to the health of children and young persons, and regarding much lament as the foundation of many diseases and infirmities in its moral tendencies, pernicious as forcing to premature development the appetites and passions of the young, we consider the increase and multiplication of fine esculent vegetables, and their more general introduction upon the tables of our farmers, as a signal good. We are not anchorites, or in the more familiar language of the day, Grahamites; though we have no hesitation in saying, that we regard Mr. Graham as having rendered eminent and permanent benefactions to the community. We have no inclination at all to renounce or denounce entirely the use of cooked meat, (raw meat or half cooked meat or blood, we look upon as only fit for cannibals;) but the general habits of the country are, in this respect, excessive. Meat three times a day on many tables in the country, is certainly twice too often. Three times a week would be quite frequent enough, where there could be substituted an abundant supply of the best well cooked esculent vegetables. Health would be essentially promoted, and very serious drains upon the purse would be cut off."

There are few conductors of agricultural journals in the United States, but will bear testimony to the business of the following journals. Mr. Ellsworth has set a praiseworthy example to other public officers, by his active and efficient zeal in the promotion of the interests of agriculture. We cheerfully give place to this testimonial of approbation, and it is doubly increased in value, coming, as it does, from so able and distinguished a source.—from the pen of Henry Colman, of Massachusetts.—*Am. Far.*

So say we.—*Litt. Non Gen. Far.*
Henry L. Ellsworth, Esq.
Commissioner of Patents at Washington.

We have too high a respect for this gentleman, and too much self-respect, to meet, in speaking of him, the language of flattery; but we have no hesitation in saying that agriculture has not in the United States, a more efficient or devoted friend. He is full of information on every topic connected with it. He is taking all pains to extend his correspondence in all directions on this subject. He lays under contribution all foreign ministers and agents, all our navy officers, visiting different parts of the world, and all the members of Congress and strangers visiting Washington, to transmit him the most valuable plants and seeds which can be procured. He has already made most extensive collections; and after reserving samples for exhibition, he places the remainder in the hands of those who will be likely to give a fair trial and a good account of them. He is familiar, likewise, from his situation, with the various patented and improved improvements of agriculture, of which models are deposited in his office; and upon some of which he has had experiments tried with a view to test their utility.—Every friend to an improved agriculture ought to lend him, as far as practicable, his aid. No man is more accessible, and his objects are wholly disinterested and public. Agriculture is the great interest of the country, without which every other must languish, and upon whose success absolutely and entirely depends the prosperity of every other. H. C.

An Exhortation to Farmers' Daughters.

Our fears are, not that there are not many excellent dairy women in the land, but that the benefits of their knowledge and practice will be lost in the new generation that is springing up. Hundreds and thousands of farmers' daughters leave the homes of their mothers and seek other employments, as if with a disregard of that which may be practically more and more scarce. The occupation is stripped by the den and for young women as operatives in factories, as milliners or sewers, shoe-binders or straw-binders, or in some other mechanical occupation. How short do such as are thus employed come of the qualifications of the virtuous maid who obtains the best part of her education under the roof of her own father, from the instruction of the mother that knows how to do every thing coming within her province as the wife of a thriving farmer—who is entirely at home in all that pertains to the dairy, the economical use and due preparation of articles of food and clothing, and who suffers none of her household to "eat the bread of idleness!"

If not to the rising fair generation, to whom shall we look for the hands that are to supply so important a portion of subsistence as the products of the dairy? The farmer may keep his forty, fifty, or a hundred cows; if there be no help next to oversee and lead in the preparation of the milk after it goes to the dairy room—if there be no female to prepare the vessels, none to direct in the straining and setting of the milk, the extrication and disposition of the cream, the churning into butter, the separation of the buttermilk, the clean and perfect salting down—if all this is expected of men, and not of women; how miserably shall we hereafter drop away in the produce of a most profitable and most useful article in the production of the farm at that precise time when there is the most sure encouragement for the farmer to enter upon and persevere in the business of the dairy!—*Visitor.*

A farmer should never allow his wood-house to be emptied of wood during the summer months; if he does when winter comes, in addition to cold fingers, he must expect to encounter the chilling looks of his wife, and perhaps be compelled, in a series of lectures, to learn, that the man who burns green wood has not mastered the A B C of domestic economy.

The forms of good breeding have been properly compared to the cotton and other soft materials placed between china vessels, to prevent their being broken by collision.

Visitors at the Fair.

Not the least pleasurable circumstance connected with the late Fair in this city, was the large number of highly respectable agriculturists who attended from abroad. We only regret that our time and attention, together with that of the other officers of the Society, were so fully occupied with other duties, that we were to a great extent compelled to forego the pleasure of any friendly intercourse with them, and could not show them that attention which our feelings always dictate, and which was so eminently due to those who came from a distance to visit our city on this occasion. We hope however, that they will not attribute this apparent neglect to any want of friendly feelings on the part of the officers of the Society, and that they were sufficiently gratified with their visit to induce them to "call again" next year, when we hope to entertain them better than on this occasion.

As an evidence of the impression which the Fair made on the minds of those from abroad, we clip the following notices from the Hamilton U. C. Journal, and the New York Herald.

Agricultural Meeting at Rochester.

The great Agricultural Show, and Mechanics' Fair, of the Genesee country, took place at Rochester, on the 7th and 8th inst. From a Canadian gentleman who, with several friends, attended the meeting, we learn that the exhibition of works of art reflected high credit upon the artists in the various branches, and evinced a remarkable and rapid improvement in every department. The concours of farmers and others was great, and the Exhibition Hall, on Wednesday, brilliantly illuminated, enlivened by a good band, bedecked with works of art, and rich specimens of flowers and fruits, afforded to the crowded assemblage of ladies and gentlemen a rich and gratifying treat. The show of cattle, especially of improved Durhams, bore ample testimony to the attention excited among the Genesee farmers by this valuable breed. The herds of sheep hardly reached our friend's expectation, and he feels assured that many animals must have been withheld from the diffidence attending a first exhibition in a district. There were some excellent swine, both Berkshire and Leicesters. A ploughing match took place, which excited much interest. Fourteen ploughs, each with a pair of horses and reins, started upon a subject so rough as hardly afforded the ploughmen a fair chance of doing fine work.

L. F. Allen, Esq., of Black Rock, well known as a man of talent, and an intelligent agriculturist, delivered an address to a crowded audience in the Court House, in which he depicted with much force the simple and unfeeling pleasures of a country life, and reproached the too prevalent haste to be rich, which led thousands of young men to desert the plough, for wild and gambling speculations in the fields of commerce. Our Canadian visitors were most kindly and cordially received, and even at this notorious landing place, where so lately British subjects could scarce appear without being insulted, "The Gore" was welcomed by the strains of "Rule Britannia," and other national airs. Invitations hospitable and sincere, were pressed upon them by many newly acquired friends, and an honest desire expressed and exhibited to obliterate all unpleasant recollections and feelings. One thing, indeed, was lacking, but it is unjust to intermeddle with, or animalvert upon, customs and habits, because they happen to differ from our own:—There was no great public dinner, which at such seasons with John Bull is a *sine qua non*. It may perhaps be adopted by our neighbors upon a future occasion, and if it is properly managed, excluding all subjects of an inflammatory nature, no more effective engine for promoting good feeling and a common effort to forward the interests of an agricultural association, can be devised than by assembling its members and friends at a well regulated convivial board.—*Hamilton (U. C.) Journal.*

Agriculture—Politics—and other things.

As your paper is read by all classes of people, both in America and Europe, it is probably the best vehicle for the dissemination of agricultural intelligence. Yesterday was a proud day for the farmers of the Genesee country. It was the first exhibition of the Genesee Agricultural Society. At an early hour the city was thronged with the friends of Agricultural and Horticultural improvement, from the surrounding country; many eminent agricultural breeders of choice stock,

from Upper Canada, were present. Among them was Adam Ferguson, Esq., celebrated as an importer of fine cattle; amongst the gentlemen from the surrounding counties, well known as enlightened and scientific agriculturists, were John Greig, Esq., of Canandaigua—formerly from Scotland—and Lewis F. Allen, Esq., from Buffalo. The latter gentleman delivered an address to a large concourse at the Court House, which was listened to with profound attention and evident gratification. The exhibition of stock, especially of cattle, was said by competent judges to excel any thing of the kind they ever had witnessed. Several premiums were awarded, but as the Society is yet in its infancy, and is without public aid, the premiums were not as numerous as would have been desirable. To-day the Fair takes place, at which much of the fine stock exhibited yesterday will be sold.

It is cheering, in these times of political excitement, when the whole of the community is set by the ears by office holders and office seekers, to see so much spirit exhibited in the laudable effort to develop the agricultural resources of this most delightful country. The thanks of all true patriots should be rendered to those eminent gentlemen who devote their time and means to spreading agricultural knowledge. Agriculture is the basis of national and individual wealth, and its pursuit is ennobling in its tendencies. There is no other pursuit in which man can so well practice the maxims of sound Christian morality, and is liable to so few temptations to stray from the path of virtue. I have given you this slight sketch of the first exhibition of the Genesee Agricultural Society, thinking it might interest many of your readers, and perhaps induce you to devote some portion of your highly valuable paper to agricultural matters. Yours, &c.

Rochester, Oct. 8, 1840.

—N. Y. Herald.

Meeting of the Society,

The election of officers did not take place as advertised, owing to the impossibility of making a report at this time. At a meeting of the Society held at the Arcade House on the 8th of October, it was resolved "to amend the constitution so as to hold the annual meeting of the Society on the first Tuesday in February; at which time the executive committee shall make a report, and the officers of the Society for the ensuing year shall be elected." Also "to amend the constitution so as to add six managers to the executive committee."

The following gentlemen were then elected additional managers:—

ISAAC MOORE, Brighton;
HIRAM PITTS, Honcoug;
JOSEPH C. HATHAWAY, Farmington;
WILLIAM C. CORNELL, Henrietta;
EDWARD L. E. ROY, Caledonia;
DR. A. BALDWIN, Clarkson.

The Society then adjourned, to meet on the first Tuesday of February next.

H. M. WARD, Sec'y.

The Funds of the Society—Legislative Aid.

Quite a number of the persons to whom premiums were awarded, have generously made a donation of them to the Society; still, we are sorry to say, the funds of the Society are completely exhausted, and some premiums are yet to be paid. The amount offered as premiums by the committee, was much greater than the amount received from members; so that if the premiums are to be paid, the committee must suffer loss. This ought not so to be; the friends of the Society must exert themselves more another year, and obtain a larger list of members before the day of exhibition; and not leave the burden of expense as well as labor, to be sustained by a few individuals. What intelligent farmer is there, who will refuse to contribute his dollar to aid this Society and sustain the annual exhibitions? What farmer is there who attended the Fair on the 7th and was not instructed, and gratified more than enough to compensate for one dollar bestowed?

Appropos on the subject of funds. Why is it that agricultural societies ought not to receive some aid

from our Legislature, as formerly? Ought not the sovereign people to give their servants at Albany some instructions on this subject, the coming winter? What say you, farmers! What say you, correspondents? We should be happy to hear from some of you on this subject.

THE NEW GENESEE FARMER.

The Cheapest Agricultural Paper in the Union—Only 50 CENTS a year, (in advance.) 16 large pages monthly, with cuts. J. J. THOMAS & M. B. BATEHAM, Editors. DAVID THOMAS and others, assistants. SEVENTY CORRESPONDENTS.

The flattering encouragement which the New Genesee Farmer has received during the past year, has convinced the proprietors that the paper can be sustained in its *utmost soil*, and at its *economical price*; and while they express their gratitude for the assistance they have thus far received, they would now, with renewed confidence, appeal to the friends of agriculture in behalf of the Second Volume. The paper is so well known, and so highly approved, that it is unnecessary to speak of its *character*, further than to say, that it will not suffer by a comparison with any other paper of the kind in the United States. Each successive number has shown an increase of talent and correspondents. It has received during the past year, original communications from more than SEVENTY WRITERS, most of whom are well known practical farmers. It also contains the most useful selections from other agricultural journals, reports of the markets, &c.

The object of the New Genesee Farmer is to advance the great interests of Agriculture and Horticulture—to benefit the community in general, and farmers in particular. Experience proves that it is well calculated to promote this object; and therefore it is the duty of every friend of improvement to extend its circulation, in order that its influence may be felt throughout the agricultural community.

The friends of Agricultural Societies should especially encourage this paper; for, unless farmers read on the subject, and get their minds interested in their profession, they will not act efficiently for its advancement. The Societies formed last year in Western New York, and their fine exhibitions, have already given a new impulse to the cause in this section of country; and it is confidently expected that much more will be done the coming season.

All Postmasters are requested to act as agents, and remit money to the publishers.

Address, BATEHAM & CROSMAN.

Rochester, N. Y.

Publishers of newspapers who will give the above an insertion, will aid the cause of improvement, and shall have the Farmer sent them without an exchange. B. & C.

COPARTNERSHIP NOTICE.

THE Subscribers have this day entered into an agreement of Copartnership in the business of the Rochester Seed Store and publication of the New Genesee Farmer. All debts due to, or from the concern, previous to this date, will be settled by and with M. B. Bateham. The business will hereafter be done in the name of BATEHAM & CROSMAN.

M. B. BATEHAM,
C. F. CROSMAN.

Rochester, Oct. 1, 1840.

MOUNT HOPE GARDEN & NURSERIES.

ROCHESTER, NEW YORK.

East side of St. Paul-street, nearly opposite Mount Hope.

THE subscribers offer for sale a fine collection of Fruit and Ornamental Trees, Flowering Shrubs, Green House and Hardy Herbaceous Plants, Bulbous Flower Roots Double Dahlias, &c. &c. Orders sent per mail or otherwise will be promptly attended to, and all articles will be packed so that they can be transported safely to any part of the country. Gardens laid out and skillful gardeners furnished at short notice. Persons wishing assortments of any of the above articles to sell again will be supplied on very reasonable terms.

They would also inform the public that they are now removing their establishment from Buffalo and Sophia streets to the Garden as above, where they have new and more extensive Green Houses almost completed.

This establishment is intended to supply the Western States and Canada, with all articles in the line of Horticulture, and to prevent that delay and disappointment which almost invariably occur in obtaining them from the east; and in a short time, as soon as Trees, Plants, &c., can be arranged, a regular Botanical and Pomological Garden will be formed, of which due notice will be given to the public so that they may visit and inspect it.

Prices in all cases will be as moderate as at any other establishment in the country, and no fruit of inferior or doubtful quality will be cultivated.

HILLWANGER & BARRY.

Rochester, N. Y. Sept. 1, 1840.
N. B. A quantity of Morus Mutiliculis and Moretti, will be disposed of on favorable terms.

THE NEW GENESEE FARMER

AND GARDENER'S JOURNAL.

M. B. BATEHAM,
C. F. CROSMAN, Proprietors.

VOL. 1. ROCHESTER, DECEMBER, 1840. NO. 12.

JOHN J. THOMAS,
M. B. BATEHAM, Editors.

PUBLISHED MONTHLY

IN CONNECTION WITH THE ROCHESTER SEED STORE AND AGRICULTURAL REPOSITORY.

TERMS—FIFTY CENTS, per year, payable always in advance.

Post Masters, Agents, and others, sending money free of postage, will receive seven copies for \$3,—*Twelve* copies for \$5,—*Twenty-five* copies for \$10.

The postage of this paper is only one cent to any place within this state, and one and a half cent to any part of the United States.

NEW GENESEE FARMER.

Index to Vol. 1.

Our readers will find the *Index and Title Page* on the two middle leaves of this number. On cutting open the paper, these two leaves should be taken out and placed in front of number one; then the whole volume stitched together. Those who desire them bound, will do well to wait till next year, so as to bind two volumes together, as it will save expense, and make a better shaped book.

LOOK HERE!!

This number completes the first volume of the *New Genesee Farmer*. *The next number will only be sent to such persons as renew their subscriptions.* We hope therefore that all who desire the paper, and wish the cause success, will send in their names soon, *with the necessary accompaniment.*—**DO IT NOW;** and do not forget to ask your neighbors to do likewise. Subscription papers are in the hands of most of the Agents and Postmasters, and the money can generally be remitted to us without much trouble or expense.

Old Debts.

A few Agents and Postmasters are still indebted to us for Vol. 1.; and with this number we send their bills which we hope will be promptly paid. If any of the bills are incorrect, we will rectify the errors on being notified.

Uncurrent Money.

Bills on solvent Banks in this, and the Eastern States, are at par with us. Canada, Pennsylvania, and New Jersey, are about 5 per cent. discount.—Ohio, Indiana, Kentucky, and most Southern, money, is about 8 per cent.; and Michigan and Illinois, 10 to 12 per cent.

We hope our friends at a distance will take pains to send us the best money they can obtain. We do not *refuse* any of the above, when sent us free of postage, and nothing deducted for commission; but the amount of discount paid by us during the year, is a serious item.

Post Masters

have very generally assisted us by obtaining subscriptions and remitting money. For this they have our sincere thanks, and deserve the thanks of the community at large. We trust they will see good results from the circulation of the paper in their towns, and that they will feel disposed to continue their efforts in our behalf.

Subscribers in Canada,

should remember that their Postmasters cannot frank letters further than the lines; so that we are compelled to pay postage on all letters coming by mail from here. This we do not mind, if bills not under \$1 are remitted; but on small bills the postage and discount together, are too great a sacrifice.

Subscribers residing near the places mentioned below, may pay their subscriptions to the persons named.
Kingston—JOHN CREIGHTON, (Chron. & Gaz. Office,) and CHARLES HEATH.
Port Hope—D. SMART, Post Master and President Agricultural Society.

Toronto—LESLIE & BROTHERS, JAMES F. WESTLAND, and GEORGE LESLIE.

Hamilton—SAMUEL KERR, Merchant.

London—JOHN NORVAL, (at News-Room.)

In addition to the above, Postmasters and friends of the cause generally, are requested to act as agents
BATEHAM & CROSMAN.

To CORRESPONDENTS.—Several Communications arrived late, and are crowded out.

Acknowledgments.

We are indebted to Mr. CHARLES DOWNING, of Newburgh, N. Y., for a cask of fine calcareous Marl. We will make some experiments with it.—Also to Hon. ADAM FERGUSSON, for some interesting English and Scotch papers; from which we may make some extracts hereafter.

The Public Press.

We are under great obligations to many editors of newspapers who have published our Prospectus, or kindly noticed the *New Genesee Farmer*. To such we will continue to send it without asking an exchange; and if they desire it sent to a friend also, we will cheerfully add the name to our list. (Those who have not done so, but feel disposed to aid us, will confer a favor by inserting the prospectus below.)

Editors of Agricultural, Scientific, or Literary, papers, who generously give us an exchange, will please accept our sincere thanks.

ITEMS.

BRICK OVENS.—As these possess some advantages over cook-stove and other ovens, they continue still to be very extensively used. Improvements are consequently of importance. A great objection to them, is the large consumption of fuel required

in heating them. This necessarily results from their construction. They are usually two, or two and a half feet high inside. A large fire is therefore required to heat them throughout. This may be remedied by constructing them with a much flatter arch. None should be built more than a foot or fifteen inches in height, though they be three or four feet broad. A much smaller fire is then necessary for heating them, and the hot bricks being so much nearer the baking bread, throw out their heat to more advantage. In the common brick oven, the flue is made directly over the mouth, and all the air for the consumption of the fuel passes in at it, and flowing round through the cavity of the oven, escapes at the flue. In the improved oven here mentioned, there is not of course space enough for the air thus to pass in and out freely; it is consequently necessary to have another small flue at the further extremity. But care should be taken that the draft be not strong, or too much heat will be carried off by the current. Fig. 1, represents a cross section of the common brick oven, and Fig. 2, of the improvements.

SPLITTING WOOD.—By means of the following contrivance for splitting sawed store-wood, the work is rendered much easier, while there is a saving of more than half the time usually

required. Fig. 3, represents a flat block of wood, 6 or 8 inches thick, and about 18 inches wide and 2 feet long, through the centre of which a hole is cut 8 or 9 inches. This is the whole apparatus. The block to be split is placed in this hole in an upright position, and the axe is brought down upon it repeatedly until it is divided as finely as is wished,—the sticks being held to their place, and no replacing by the hand required.

GATE LATCHES.—In large gates, made to swing both ways, great accuracy is required in adjusting the hinges, so that when suffered to fall to, the latch may finally

settle in the notch, when the latter is made in the usual manner. Even where the gate is hung thus with the greatest care, a little settling of the posts, will throw the latch an inch or two out of the way, and thus prevent its fastening. Fig. 4, represents a mode of forming the notch, which remedies this difficulty. When the gate is suffered to fall shut, the curved sides of the notch offer no obstruction to the free passage of the latch, until by swinging a few times from side to side, the force becomes diminished, and it finally settles into the notch. The gate will thus fasten itself, though it be so bungled as to be an inch or two from the centre. This will be found a great convenience, especially to persons on horseback. A figure of this kind of fastening was published some years ago in the *New York Farmer*, but it appears to be little known.

Hints for the Month.

In wintering all domestic animals, let there be at least a sufficiency of food. It would be better to have too much, than to run any risk of putting them on short allowance. Therefore if you have not a very full supply, sell off a part of your stock, though at a low price, and the increased value of the remainder in spring, will more than repay all loss. The great error of most farmers is deficient feeding in spring.

But be careful not to waste your feed. Cattle are often half starved, when the food they consume, if properly managed, would keep them in the best condition. Is this incredible? Then try the experiment:—

You doubtless know something of the quantity of fodder to keep animals through winter, when they are irregularly fed—exposed to all weathers—stinted in drink—and suffered to tread the hay by forkful under foot in the mud, or to use it as litter in the night.

Well, reverse the treatment:—Provide comfortable sheds and stables for your cattle, sheep, and other animals. Remember that a want of comfort is always a waste of flesh. Give them a sufficiency of food and drink, with great regularity. A meal ten minutes later than the usual time, causes the animal to fret, and fretting lessens flesh. Most animals will drink several times a day, and should therefore have it as often as they want it. They should eat their hay from good racks, so that it may not be trampled under foot, trampled upon, nor blown away by the wind. And they should have plenty of clean litter as often as needed. With such management there will be an almost incredible saving of food.

Tight stables should always be ventilated. The breath and manure from animals always causes impure air, and this should be suffered to pass upwards through square or triangular tubes, made by nailing boards together. These may be placed in a corner, or beside a post, and occupy but very little space, where the hay loft is over the stable.

Coarse hay and straw are readily eaten by cattle, when urine is sprinkled upon them.

Corn-stalk fodder should always be cut or chopped,—otherwise the body of the stalk is wasted. This is the best part. It is sweetest and most nutritious. And it is the chief part in bulk. Chop it fine, and cattle will eat it, if the fodder has been well cured. A little meal or brine, sprinkled over, will be useful.

It is estimated that an acre of corn-stalks, cut and well secured, and chopped when fed, is quite as good as an acre of hay.

Farmers who have not yet threshed their grain, should keep a look out for the rat—they are eating up huge quantities, and will devour more than you are aware, if suffered to remain undisturbed.

Take good care that roots in heaps be properly ventilated. Heaps of ruta bagas, turnip, and sugar beets, potatoes and apples, when buried in the open air, should all have holes made in their top, for the escape of pure and heated air. These holes may be made about two inches in diameter, and filled with a little straight straw, not packed close, so that the air may escape freely.

Apples that lie in the cellar, gradually decay, during winter. Pick them over at least once a month, taking out the partly decayed ones for immediate use.

Many implements and tools will not be any more needed till next spring, and should therefore be snugly packed away. Ploughs, cultivators, barrows, wheelbarrows, horse-rakes, carts, hoe, chain, scythes, and every thing else not needed, should be put made in good shelter, so as not to occupy space required for other things. There should be a place for every thing, and every thing in its place, and then you will not waste precious hours, when in great haste, hunting for

something you cannot find. All this should be done early in the month, if not done already.

But, before the month is through, we hope you will do one thing for yourselves and us,—that is, not to fail sending in your subscriptions for the next volume of the NEW GENESEE FARMER: and if you can get a number of your neighbors to subscribe also, we shall, we can most sincerely assure you, like it all the better.

The Fruit Garden.

We suspect that but few people are aware of the great number of fruit trees that would grow well on half an acre: but it may be easily shown that a lot containing that quantity of land, would accommodate one hundred trees, if set fourteen feet and nine inches apart. It is true that some of the kinds which we shall name, would spread in a few years so as to crowd each other at this distance, and overshadow the whole surface of the ground; but we do not think these circumstances constitute any valid objections to such arrangement.

Most, if not all, of our fruit trees require frequent pruning. By removing the stunted branches, and encouraging new and vigorous shoots, much larger and better flavored fruit is produced; and it will generally be found that the most spreading limbs are the most proper to be amputated, independent of their interference with other trees. Not that we would recommend high training, for it is a great convenience to have the fruit within reach, so that neither a long pole nor a long ladder shall be necessary.

The overshadowing of the ground is in some respects beneficial. The grass will not be so injurious to the trees; and if hogs run within the enclosure, there would be little to complain of, while their manure would keep the soil in good condition.

To give our readers however, a clearer view of the luxuries which may thus be brought within their reach, and which would supply them through more than half of the year, including summer and autumn,—we will mention the kinds that may be accommodated on such a piece of land.

- 15 Cherry tree,
- 25 Pear do.,
- 12 Plum do.,
- 8 Apricot do.,
- 20 Peach do.,
- 10 Early apple do.,
- 10 Quince do.,
- 10

Now what farmer is there, who could not afford to appropriate half an acre for this purpose? But besides this, he would have a safe yard for his hogs when they are disposed to trespass. Their value in a fruit garden, as destroyers of insects, is of great account. The proportion of one, where hogs were not permitted, once remarked to us that much of the fruit was wormy; and in a remote part of our fruit garden, being frequented by them, the plums and cherries in some seasons are very inferior, while those which grow nearer to the trough, are generally free from such defects.

In some situations however, where the fruit garden is to be of great extent, perhaps it might be better to plant the trees in a different manner. If placed in rows thirty feet apart, more or less, and set five feet apart in the rows, the ground between them might be cultivated with the plough, excepting a space of three or four feet in width on each side of the rows. This might remain as a pasture for the hogs, while peas or any other vegetables that would furnish food for them, might be sown on the cultivated part. Our experience in this line would warrant us in saying that

such a system of culture would be economical and successful.

Flowers.

The frost and snows of autumn, as a prelude to winter, have left us many a withered flower, bright, but fading; and but few that are not withered. Amongst the latter kind however, the Christmas Rose (*Helleborus niger*) is the most conspicuous; and seems scarcely to regard the inclemency of the season.

It is now a proper time to examine the borders, and consider what plants would be benefitted by some protection. Many indeed will live without it, and yet well reward the florist for such care, by a finer bloom in the following season. This class chiefly consists of such as have green leaves in winter, and especially if recently transplanted,—as the pink, the English primrose, and the auricula; and no covering is better than the branches of the pine, the spruce, or the cedar. Straw is objectionable on account of its harboring mice.

At a time when the garden is so destitute of ornament, and so little to be said on the subject, it may not be amiss to offer some extracts from the letter of an eminent florist in the eastern part of the State, which we lately received, apprising us that the following rare plants were on their way for our garden.

Paeonia albiflora v. *Reevesii*,

— — — — — *Pottsii*,

Double white peach-leaved Campanula,

Double white Ayrshires Rose,

Double Michigan Rose.

"The *Paeonias* were imported by Mr. W——, of Boston, and he assures me they are true to their names, though varying from the descriptions generally given. The *P. v. Pottsii* is semi-double, of a deep crimson, with a mass of yellow stamens in the centre. The *P. v. Reevesii* resembles the *Whiteii* in the form of its flower, but its color is a fine blush.

"The double white peach-leaved Campanula is worthy of your care, but you need not expect it to do its best next year. You want a strong plant, and then it is fine indeed. I have also the double blue peach-leaved Campanula, but it is worthless.

"You will be pleased with the Ayrshire Rose when it gets to be a strong plant; and if I am not greatly mistaken, the double Michigan Rose is destined to be a general favorite. Mine was transplanted last fall, and consequently its bloom this season was inferior to what it would have been, had it not been disturbed; still there were some very beautiful flowers, and they appeared to possess the rare quality of retaining their freshness and beauty for some days under an intense sun. W—— (our neighbor) was delighted with it.—Of one thing I feel certain: the Michigan Rose is yet to be the parent of a great many superb varieties.

"I thought Breck's seedling Phlox would please you. He informed me, when in Boston this summer, that he had another seedling still finer, and I have the promise of a plant. With yourself, I have observed that the Phloxes, especially the tall ones, should be frequently divided and replanted.

"I have been long under the impression that *Gladiolus psittacinus* and *G. natalensis*, were one and the same thing; and Loudon confirms this opinion in his *Florus Britannicus*. I presume it varies greatly with the culture to which it is subjected.

"I agree with you in regard to this beautiful genus, and hope, in a year or two, to possess a number of them. They will then soon find their way to Aurora, if they do well."

The reference to our opinion in the last paragraph, related to treating these fine species like the *Tuberosae*; that is, to take them up in the fall, as soon as their foliage is spoiled, wrap them up in a cloth or paper, and hang them up in a cellar free from frost—or pack them away in dry sand. The next season, about corn planting time, they may be set out in the open border. With this treatment *Gladiolus natalensis* has succeeded finely.

The following sketches of some of these plants are abridged from Buis's Flower Garden Directory:

- Gladiolus floribundus*, large pink and white flowers.
- *cardinalis*, superb scarlet spotted with white.
- *byzantinus*, large purple flowers.
- *blaudus*, bluish rose color, hardy one.
- *cuspidatus*, white and purple.
- *racemosus*, rose and white.
- *psittacinus*, magnificent, striped with green, yellow, and scarlet—four inches in diameter.

The Farmer's Reading—his Social & Government Predicted.

Messrs. Editors—Your correspondent, H. M. C., is somewhat discourteous towards W. S. T. in his remarks on the use of "Rainy Days."

'Tis true that the mind of the farmer should be improved as well as his farm; but does the mere fact of his working at a carpenter's bench on a wet day, instead of spending it in reading, presuppose that he is not substantially a reading man? The greatest men are not often the greatest readers—none out of ten read only for amusement,—the duty of reflecting on what they read, is too severe a task for the great mass of men and women. I generally find that those who read most, reflect least. Give me the man who is judicious and even fastidiously select in his reading. Who believes that St. Paul would have been a better metaphysician, a more acute reasoner, if instead of working at tent making, he had employed the intervals of his apostolic labors, in reading Plato and Demophon?

Kotzebue tells us that during his banishment in Siberia, he learned more practical wisdom and self-knowledge, from a single volume of Seneca, than he could have done had he been immured (claustrated) in royal liberty. Confined, in a desert, to a single book on moral ethics, his fine, active mind was neither dissipated by indulgence, nor confined by variety.—reflection and self-culture was the necessary consequence.

We contend, that as society is constituted in the free States of the North, the life of the independent farmer is much more congenial to the offices of reading and reflection, than that of the man who is compelled to live in and undergo all the toils and hazards of a mixed society, with its modern soul-killing conventional forms, its godding business responsibilities, its true that "the face of the man sharpens that of a friend;" but this sharpening is not the result of intellectual collision which comes from study and deep thinking; it is merely a colloquial sharpness, verbal flippancy; the mind has less to do with it than the muscles of the tongue. The Northern farmer is not the life of a serf; he is a sovereign prince, free and independent in the midst of Nature's liberties. Why is it that he yet knows so little of her simplest laws?

The solution of this question can only be an were history. Under the feudal system, the rural laborer was an ignorant, besotted slave—magna charta gilded his chains—the protestant reformation moved and bettered his condition—the Plymouth pilgrims broke his fetters; but the prejudice against him has never yet been eradicated. The American revolution made us politically free, but morally we are still slaves to aristocratic delusion. To his shame be it spoken, the wealthy American farmer bows to this prejudice, instead of making his riches the means of disenfranchising his caste, by ameliorating their social condition, instead of educating his sons to preserve their own exalted calling, with all the lights that modern science has shed upon it, he gives way to the ignominious delusion that Law, Physic, Divinity, or even Archandize, confers more dignity, and commands more respect from this gay world of men and women.

But the dawn of a new day has commenced, which is to make the free rural classes of the North more respectable, both to their own eyes, and in the eyes of the world at large. The late revolution in the business community is hastening this result. Science and learning are fast coming to aid and stimulate the arm of agricultural industry, and the shackles of aristocratic prejudice are fast falling. Then the farmer, for the first time in his history, will be an independent, intelligent man; *adversus* not in name only, but in manly feeling—clinging to no aristocracy, moneyed, or hereditary—his wings only to that great Power of our religion, whose precept and example alone he should emulate him free. S. W.

The In-Active Character of Farmers.

Messrs. Editors—When I go by a farm which has rather a neat looking house, but a large, well painted barn, with ventilating blinds at the windows; a small, but well tended, garden, fenced in good order, unincumbered with alders and birches,—say I to myself, here is a thrifty Pennsylvania German farmer. If the house is finer than the barn, with the panels of the front door painted a bright yellow, fewer cabbages and more peach trees in the garden, I say him down a Jerseyman, particularly a T. I discover in his fields a little too much pigeon weed, and a sprindling of Canada thistles. The Yankee is less distinctive in the character of his domain and its surroundings. If rich, he always builds a high house, and paints it white. If shrewd and selfish, as Yankees are when thrifty, he is sure to copy more from the German than the German copies from him;—hence he learns that a little too much ploughing and harrowing in the wheat fallow, is better than not enough; that too early sowing, is better than too late, &c., &c. But for his life, the Yankee cannot learn his neighbor to imitate the simplicity, frugality, and outdoor industry, of the German farmer;—hence he has more weeds than cabbages in his garden. If his grocery bill for a cod fish, &c., is less than the German's, he patronizes the village merchant and milliner's shop, much more. The Yankee and Jerseyman will sometimes have an ambition for office, or a desire to be something more in the fashionable and intellectual world, than their fathers were. Not so, with the German; should he transcend his father's one step in intellectual improvement, he feels that his father's ghost would rise up and rebuke him. All language not daily spoken, and all books, except those of elementary instruction, he deems of no importance to any body but his priest; and to him he will refer you touching all matters intellectual and spiritual. The father was born a serf—a transatlantic and more kindly government, emancipates the being of the son but the iron is yet in his soul!!

Strange as it may seem, Germany is filled with more countries, in science and letters. The number of universities—where all that can be learned in the lit—to be found in a single principality, not larger than one of our counties, should make the ignorant, benighted American, hide his head. But the German peasant is only a laborer with the plow and hoe. In no respect of Europe, not even in feudal Russia, has the granding hand of the aristocracy more completely manured the rural laborer, body and soul, than in Germany. SENLCA.

Preserving Pork.

Messrs. Editors—The following hints respecting the preservation of pork, may be useful to some of your readers.

It is generally the practice of farmers, I believe, to scald their old brine, before putting it on their pork; and I should, lately necessary it is supposed to be, by many people, that nothing short of the price of their

pork, would induce them to use the old brine without first scalding it. Now, allow me confidently to say that the idea is erroneous, and the practice entirely unnecessary. If your old brine is sweet and good, and has kept your old pork good, depend upon it, it will keep the new. For what possible reason is there to suppose that brine which will keep old pork, will not keep new also? It may be said that the brine is full of matter which it has received from the old pork.—True, it is; and therefore it cannot extract the best juices of the new.

For eight successive years, I assiduously put down pork, and pouring upon it the same brine, without being once scalded; and the older the brine, the sweeter and better was the pork. The brine was always sweet, and had plenty of salt at the bottom.—The pork was laid down in the usual manner, with salt, and the old brine poured back upon it. The advantages are, having better pork, besides a saving of labor and trouble. P.

Seneca, October, 1840.

Manure—large Farms unfavorable to its Economy.

Messrs. Editors—There is more than one hundred loads of bog manure wasted in the Seneca outlet daily, from the distilleries at or near this village (Waterville.) Added to this, there are thousands of tons of Gypseous marl and plaster, wheeled into this outlet from the plaster mills below Seneca Fall—to say nothing of the fine white shell marl, which underlays the whole tract of the marshes below.

The high price of labor, and the low price of produce, is urged as the excuse by the farmers in the vicinity of these distilleries, for not availing themselves of the manure. Strange as it may seem, the proprietors of the distillery, *Great Western*, were threatened with a prosecution by a farmer adjoining, if he did not prevent the liquid manure from flowing his land.

The day probably far distant when the full value of manure will be understood in this county. There is a manure thieving delusion among farmers when they grow rich, which leads them to extend their domain, by buying out small farmers. If not, the system of large, badly worked fallows; manuring with green crops only; and letting large fields lie long in unprofitably sward-bound pasture; thus dispensing with the ten-fold stimulus of elementary manure, with more than ten-fold loss to man and beast; insulating the intention of nature, which is, *that nothing is lost*.

SENLCA.

Hoax on Cattle.

We copy the following remedy from the Farmers' Cabinet, but cannot personally vouch for its efficacy, but it is simple and deserves trial. The practice of thrusting a sharp knife into the side of the animal, for the escape of the vital, just forward of the hip bone, we know to be efficient, and has always proved perfectly safe, on a strong little farm, and soon long ago. Cattle sometimes become dangerously diseased, by wind in which, by overeating themselves on unripe and their remains should be borne in mind.

"Mr. Editor—In a late conversation with Capt. James Cooper of Hudsonfield, he mentioned a certain cure for broken cattle, which ought, I think, to be made universally known, for the good of the community. It is this:—

Make a twisted band of straw, three of the wrist, and place it in the mouth of the animal, drawing it tight, and making fast the ends over the head, just behind the horns: this will cause the horse to endeavor to rid itself of the inconvenience, by chewing the band, and the act of moving the tongue and jaws will open the gullet, and permit the pent-up air to escape. The efficacy of the mode here recommended, was tested a very short time ago, on a valuable cow belonging to the Captain, by one of his neighbors, who finding her

most dangerously affected in this way, instantly applied the twisted band of straw, and was quite astonished to find that, in a moment, the air rushed furiously out of the distended stomach, and in a few minutes more she was perfectly recovered.

Now, I consider your readers indebted to the Captain for this communication, to an amount far more than the value of a year's subscription to the Cabinet, but, in return, he only asks every one to do good, by communicating, by means of its pages, whatever they may know which would at all be likely to benefit the world by its publication." J. R.

Keeping apples for spring use.

We were much gratified last spring with the appearance of some apples which we saw at the house of our friend and neighbor Walter F. Shotwell—they were so fresh and unwithered. On inquiry respecting the method of keeping them, he gave us the following account:

They were kept in a cask. In putting them up, a layer of chaff on the bottom sprinkled with quicklime, received a layer of apples, followed by another stratum of chaff and lime, succeeded by more apples, covered in the same manner until the vessel was filled. It was then headed up.

It is well known to those who have been in the practice of burying apples in heaps, that the fruit comes out in the spring much fresher, and often better flavored than it does when kept in open bins in the cellar,—a part of the flavor in the latter case, doubtless evaporating. W. F. S.'s method has all the advantage of burying, with another which we will explain. When one apple among many in a bin, rots, the adjoining ones are contaminated; and not unfrequently a mass of rottenness occurs, surrounded by much sound fruit. Now the use of the lime is to absorb the gases generated by the putrefactive fermentation, and prevent such *lauren* from spreading.

The quantity of lime necessary for this purpose is not great, and less than a quart for a barrel is deemed sufficient.

It is not too late for our readers to profit by this method; and we would remind them that no casks but such as are perfectly sweet and clean should be used. Old salt barrels have the discredit of being particularly unfavorable to the keeping of apples. †

The King of the Pippins.

A few weeks ago, before we gathered in these apples, the tree was a splendid object—one of the most so in our collection. When small, it was injured by the borer; and in consequence the fruit was inferior in size and quality; but it has now recovered and we have seen no apple that is more beautiful.

The following description of it, is given in Lindley's Guide to the Orchard and Fruit Garden:

"Fruit above the middle size, inclining to oblong, broadest next the base; the outline tolerably free from angles, about two inches and a half deep, and three inches in diameter. Eye large, deep, in an even, very little plain hollow. Stalk an inch long, slender, about half inserted in a funnel-shaped cavity. Skin smooth, pale orange yellow, generally tinged with red next the sun, and faintly streaked with the same color. Flesh yellowish white, firm, breaking, very sweet, juicy, and highly flavored."

Lindley adds: "A very beautiful dessert fruit in November and December. This very excellent apple was brought into notice by Mr. Kirke of Brompton. It is hardy, and a plentiful bearer."

Our apple agrees well with the description, except that instead of being "very sweet" it is decidedly acid. Most of our pomologists however, appear to make no distinction between sweet and sour apples; and not unfrequently the juice is both "sweet" and "subacid" as in Lindley's description of the Borovitsky; or "saccharine" and "acid" as in the Baldwin according to Kenrick. This may be all correct; and yet to our comprehension the classification of ap-

ples into SWEET and SOUR would be much more definite; and much easier to be understood by the generality of readers.

As a beautiful fruit of good size and a great bearer, we can speak of the King of the Pippins in positive terms; but whether it will lose enough of its tartness in mellowing to become pleasant to our taste, is a question we are not prepared to answer.

The Jonathan Apple

Is another splendid variety. Our tree was planted out six years ago (a present from the late Judge Buel) and came into bearing very early; but it has produced no crop so fine as that of the present season. We would describe it as follows:

Fruit middle size, inclining to oblong ovate, contracted towards the apex. Eye closed, in a deep narrow depression. Stem slender, about an inch long in a deep cavity. Skin white when in contact with a branch or leaf, but streaked and mottled with red in the shade, with dark crimson next to the sun. Flesh white in some specimens—yellowish in others, delicate, juicy, rich, subacid.

Since writing the above, we have found the following account, copied into the second volume of the Genesee Farmer, which was doubtless written by Judge Buel, who did much to bring this variety into notice.

"The Jonathan, Philip Rick, or New Spitzenburgh, is an apple of recent origin, supposed a seedling, from the town of Woodstock, Ulster county, of uncommon excellence for the dessert. Within a few days, some of these apples have been compared with the Spitzenburgh, Seek-no-further, Vanderveer, and other esteemed varieties, by several amateurs of fruits, and pronounced to be superior to any of them, as an eating apple. B. March 2, 1832." †

Scraps.

CONDENSED FROM EXCHANGE PAPERS.

TO IMPROVE EARLY RIPENING OF SEEDS. An experiment was made some years ago by James Freeman of Mass. to improve the early maturity of seeds. The ense-knife bean was chosen,—the earliest selected for the next crop; "by means of which, while the bean did not degenerate in quality, the ripening of the seeds in five years was forwarded *twenty-six days*." The first year they required 112 days to ripen;—the 2d, 102;—the 3d, 90;—the 4th, 88;—the 5th, 86.

THE IMPORTATION OF SILK, into the United States, appears to be nearly double that of any other article, being, for the past year, to the amount of \$23,949,357. How long before its manufacture in this country will clog the market?

RATS AND MICE, according to the experiments of the American Farmer, are easily destroyed as follows:—Take a salted herring, freed from bones, and mix it intimately with as much arsenic as will lie on the point of a small case knife; spread this on places resorted to by these animals, but not by young or grown children, (of which latter there are many,) and they will soon vanish. We would however caution our readers against using this remedy, where the poison might be scattered by the wandering of these animals, so as to be in danger of doing injury.

London says they may be destroyed by *bird lime*, smeared round their holes, which will adhere to their sides, and make them scratch themselves, till they are *scratched to death!*

VALUE OF THE ROLLER. Judge Hayes, of S. Berwick, Me. says that his grass seed has never failed, where the ground was laid down with the Roller.

LARGE CALVES. The following are the names, ages, and weight, of nine Durham calves, furnished by Wm. Heyser of Springdale near Chambersburg, Pa., and from his imported bull *Colossus*, and cows of Whittaker's stock.

Lady Franklin,	19 days old,	250 lbs.
Napoleon,	21 "	262
Flora,	9 weeks,	360
Belina,	3 months,	460
Dahlia,	11 "	880
Franklin Comet,	10 " & 11 days,	936
Three calves, at one hour old, weighed, 115, 120, and 125 lbs.		

WEIGHT OF GRAIN. The legislature of Indiana has fixed the weight of a bushel of wheat at 60 lbs., Rye 56 lbs., Corn 56 lbs., Barley 48 lbs., and Oats 33 lbs.

MANGEL WURTZEL AND SUGAR BEET. A good hint. Soak the seed, and get them ahead as much as possible before sowing—which should be done on freshly stirred soil, and then they will get a start before the weeds.

HORSES AS MANURE. In the city of Paris and environs, there are 16,000 dead horses annually converted into manure. Let it not be forgotten that animal manure is the most powerful.*

LUCERNE. John Baker, in the Farmers' Cabinet, states that after repeated experiments in cultivating lucerne, sowing it at different seasons, and on various soils, he has abandoned it—in most cases, though successful for a time, his crops were entirely winter-killed. A deep light soil, and cultivation, may however ensure success. Experiments are needed.

DOCKING HORSES. As an instance of the injurious effect of thus mutilating this fine animal, it is stated that an English gentleman had a fine hunting horse, that would carry his rider over a five-barred gate with ease; but the tail nature had given him, not being in fashion, he was nicked;—the result was, that when he got well, he could scarcely carry him over two bars.

INGENUITY. At the late fair of the Worcester Agricultural Society, there was exhibited a box of shell work, displaying great skill, "covered completely over with every variety of shells, arranged in the most tasteful order and elegance." The committee did not have time to count these shells, but upon a rough guess, they would state the number at about eleven thousand seven hundred and eighty-four. At the same fair, Charity King, till within a year a slave in Maryland, and now 73 years of age, exhibited a bed-quilt which was favorably noticed by the committee; and we decidedly think she showed superior judgment in the occupation of her time.

SMOKING HAMS IN A PORK BARREL. A correspondent of the Farmers' Cabinet prepares his hams as follows:—He inverts his barrel over a pan or kettle in which hard wood is burned seven or eight days, keeping water on the head of the barrel, to prevent drying. He then puts in two-hundred weight of hams, and pours upon them a pickle, made by mixing, boiling, and skimming, in a boiler, 6 gallons of water, 12 lbs. salt, 12 oz. saltpetre, and 2 quarts molasses. In one week he has "*well smoked ham, very tender, and of excellent flavor.*" Will some of our readers try it—at least on a small scale? There appears no possibility of injuring the hams, and they can be smoked over again in a smoke house, if not done enough.

LIME. A farmer near Danville, Pa. raised 400 bushels of wheat from a field, which, five years ago, produced only 30 bushels. During these five years he has spread 1500 bushels of lime upon the field.

MILK COWS CLEAN. According to the observation of an accurate examiner, Dr. Seubler, the first drawn milk contains only 5, the second 8, and the fifth 17 per cent. of cream.

* To convert dead animals into manure, cover them with earth and lime; the offensive effluvia will be retained, and the earth form very rich manure.

For the *New Genesee Farmer*.

To the Farmers of Wayne County.

A stranger travelling among us, would doubtless be gratified with the many evidences of prosperity which our county exhibits. He could not fail to remark the comfortable and even elegant appearance of our farm houses, the rich and varied character of the soil, equally removed from the rugged and broken surface of the eastern, and the flat and heavy loams of the western sections of the State. But suppose that he should proceed farther, and inquire into our modes of farming; the products per acre; the quality of the stock we raise, and the accommodations we furnish them; the attention we bestow upon manures, with other similar questions,—would not candor oblige us to admit that our wheat crop does not exceed fifteen bushels the acre, when good husbandry would secure at least thirty? that few farmers pay much attention to the size and shape of their animals, when it can be easily proved that a good made beast, will generally afford handsome profits, while the rearing of a bad one, is attended with almost certain loss? that many are found ready to agree stoutly against stabling, as tending to the injury of their stock, when nothing is more evident than that this is demanded by the most rigid economy? and that as to manures, our barnyards are seldom constructed with reference to their reception or augmentation, when experience shows that neglect of this will inevitably bring ultimate ruin upon the cultivator?

If these be facts, and they cannot, I think be controverted, ought we not, as men regardful of our own interests as well as those of the country at large, to take some decisive steps to improve our modes of farming?—True, our lands in their virgin state, brought forth by handfuls, with but little labor bestowed; but that day has in most cases passed, and for us to pursue the same method on our deteriorated soil, would be little less than absurd.

Let us take warning by the example of the counties on the Hudson, which, though formerly fertile, were in many cases, by a course similar to our reduced to complete sterility; and their farmers have been obliged, by a laborious process, to renew that strength which had been so wantonly destroyed.

A small degree of effort on our part *now*, would be of incalculable advantage; but how shall that effort be directed? Chiefly, in my opinion, towards two objects. The first of these is the establishment of an efficient Agricultural Society.

The benefits of such a society can scarcely be overrated. Look at Scotland, fifty years since almost a waste; without fences, without buildings, without roads, and of course her people, in the general, miserably poor. Look at that country now—nowhere on the wide earth is the standard of agriculture more elevated,—her wilderness has truly become a fruitful field, and her deserts made to blossom as the rose. Her farmers, though subject to the most enormous rents, are surrounded by comforts, and roads, good at all seasons of the year, traverse every section of the country.

What has wrought this change? It is almost entirely owing to the efforts of the Highland Agricultural Society, aided somewhat by others. This Society, from a small beginning in 1784, is now able to offer to the community *seventeen thousand dollars* in premiums.

As a matter of course, their annual exhibitions show the finest cattle in the world; and their reports state that where little wheat was formerly grown, vast quantities are annually raised—"three entire counties averaging *fifty-one* bushels to the acre." Have we not here, brother farmers, sufficient encouragement to give exertion?

The second object to which we should direct our attention, is the general diffusion of information by means of agricultural papers. In the minds of many persons a foolish prejudice exists against these, as being merely theoretical in their character. But the truth is, a good paper is chiefly the vehicle by which intelligent, practical, farmers communicate with each other. It is perfect nonsense to suppose that a man's ideas are not as valuable when written, as when delivered orally. The amount of information capable of thus being calculated, would be worth millions to our country. I do not exaggerate. Let me adduce a single circumstance in proof. Western New York is supposed to have paid considerable attention to the construction of her ploughs. It was here the cast-iron plough was invented; but it has recently been found that the best ploughs sent from Rochester, to compete for the premium of the Massachusetts Agricultural Society, required double the force to draw them, as did those made in Boston! Let every farmer then in our country possess himself of a Prouty & Mears, or a Howard, plough, and what an amount of labor would be saved, and how much better the work would be performed. But a knowledge of this and other improvements will not readily become known, unless papers devoted to the subject are widely circulated. All of these, within my acquaintance, are truly valuable; but I should do injustice to my own convictions if I did not particularly recommend the "*NEW GENESSEE FARMER*;" which, from the number and ability of its editors, and most of its correspondents, and the happy union of scientific knowledge with practical skill, which its columns exhibit, will bear honorable comparison with the best conducted journal of its kind. Not occupied with heavy and merely theoretical articles, suited perhaps to another climate, its selections seem in general to be judiciously made, and adapted to our wants.—And then its price—*only fifty cents!*—the price of two bushels of apples. Why, the articles on fruit alone, from the pen of DAVID THOMAS, are worth, to any farmer, the cost of a dozen subscriptions. Let each subscriber then induce his neighbor to take it.

I hope that what I have written may not be attributed to a diatribal spirit; but rather to a sincere wish for the promotion of our common benefit.

WM. R. SMITH.

Macedon, Nov. 27, 1840.

A voice from "Niagara."

The following letter deserves the particular attention of the friends of agriculture; and we hope many of the readers of the *New Genesee Farmer* will take the advice of Mr. PARSONS, whom we are happy to introduce to them as one with whom most of them have long felt acquainted by the borrowed name of "*NIAGARA*."—Eds.

Editors New Genesee Farmer:

GENTLEMEN—I am very highly gratified that "it is now fairly proved, that the *New Genesee Farmer* can be sustained at a price which places it within the reach of all." And it is a fact which I most sincerely deplore, that so small a proportion of our farmers avail themselves of the advantages to be derived from a perusal of its pages; and to devise ways and means whereby this evil may be removed, has been a matter, with me, (and I have no doubt with many others,) of serious inquiry, and very deep solicitude.

If we set forth the great comparative value of such a journal,—if we adduce ever so many reasons why such a periodical should be in the family of every farmer in our widely extended country, the great majority of them never see or read such representations, because they do not take the paper. Now, what shall be done? In answer to this question, I would beg

leave to make one suggestion; and that suggestion I would make not to, or at, such as never see or read the *New Genesee Farmer*; but to its *subscribers*, its *friends*, its *patrons*, and its *readers*. The plan, or suggestion, is as follows:—Let every subscriber of the first volume take one or two numbers to each of his neighbors, and request such neighbors to read them, and then return them and get one or two more. By this time they will become interested in their perusal, and one-half will subscribe for the paper without solicitation. To those who are somewhat backward on the subject, just say to them, "Pay me fifty cents and the paper shall be sent to you for one year; and if you will say, at the end of the year, that you have not received a greater advantage than the amount of the subscription, bring me the 12 numbers, in good order, and I will refund you the money."

I make this suggestion, Gentlemen, because I have the most perfect confidence that it would succeed to the increase of your subscription list more than four fold. I have partially tried this plan, and I am determined to make the experiment still further. And I do assure you that I very highly appreciate your useful journal; for I have received great advantages from it and its predecessor. From the very commencement of my farming operations, I have been in the habit of reading agricultural journals, and they have, in innumerable instances, been a source of profit to me, as well as much rational enjoyment; and I hereby pledge to you my co-operation in the accomplishment of the most worthy object of your journal, so far as is consistent with my other avocations, both with my tongue and my pen,

Yours truly,

W. PARSONS.

Thorn Hill, near Lockport, Nov. 1840.

Wayne County Agricultural Society.

By the following notice, copied from the *Wayne Standard*, we perceive that the friends of improvement in that rich county are not disposed to relax their efforts for the advancement of the great interests of agriculture. There are enough able and intelligent farmers in that county to sustain a society with great spirit and usefulness, if they would only give their minds to the subject, and unite their efforts. This we hope they will do, so that we may have a good account of them next year.

We believe there is now a more general disposition to make vigorous and united efforts for the advancement of agriculture in Western New York, than ever before existed; and we expect to have the pleasure of recording great things of *OLD GENESSEE* next year.

WAYNE COUNTY AGRICULTURAL SOCIETY.

A meeting of the Wayne County Agricultural Society, was held, pursuant to public notice, at the house of V. G. Barney, in Newark, on Wednesday, the 15th of November, when an election of officers of the Society took place, which resulted in the selection of the following gentlemen:—

SAMUEL HECOX, *President*,
HAMILTON ROGERS, *1st. V. President*,
HARVEY MALLORY, *2d. V. President*,
DAVID M. KEELER, *Secretary*,
REUBEN H. FOSTER, *Corresponding Sec.*
JOSEPH A. MILLER, *Treasurer*.
SAMUEL E. HUDSON, } *Executive Com-*
A. L. BEAUMONT, } *mittee.*
CULLEN FOSTER, }

ESBON BLACKMAR and JOHN M. HOLLEY were appointed delegates to the State Agricultural Society, to be held at Albany, in January next.

The Premiums awarded at the Fair, were paid to such as were present and entitled to receive the same.

Resolved, That the next annual election of officers take place on the day of the next Annual Fair.

Resolved, That the proceedings of this meeting be signed by the President and Secretary, and published in the *Wayne Standard*, in the other county papers, and in the *Cultivator* and *New Genesee Farmer*.

SAMUEL HECOX, *Pres't.*

DAVID M. KEELER, *Sec'y.*

Chautauque Agricultural Fair.

The Annual Fair of the Chautauque Agricultural Society, was held in this village on the 14th and 15th days of October, which the presence of favorable winds would not permit us to report in detail. The quality of the animals would fully answer the reputation which the county has acquired for the excellence of her stock. The doings were numerous, though not so numerous as might be wished; would still reflect much credit to the committee. Since these classes were conducted, which shows that the husbandry of our county is best, is much to be desired. This means a reliable source of wealth to the county at no very distant period. Since the spirit of our own industry, manifested in Portland, was not seen here, it is to be regretted in the enterprise, of which we must hope these are but the elements of an enlarged effort to supply ourselves with a self-sufficient and foreign labor.

On the whole, the Fair was creditable to the enterprise of the Chautauque, considering that it was the first time that premiums have been offered, and we doubt not that they will be convinced by the effort, that an excellent agricultural society may be kept up in this county, which shall be eminently successful in promoting their people's welfare and interests. The interest of their meetings would be much promoted, if they had an intelligent agriculturist to deliver an address before them.

On the last day, which was devoted to the settlement of accounts and the election of officers, the following persons were chosen officers for the ensuing year:—

THOMAS B. CAMPBELL, *President.*

- JOHN MILLER, } *Trustees*
- S. W. BROWN, }
- ANDREW CLARK, }
- JOSEPH PRATT, }

E. P. UHLMANN, *Secretary.*
 JOURNAL TRACY, *Treasurer.*

- JOHN MILLER, } *Assessing Committee*
- ANDREW CLARK, } *on*
- E. P. UHLMANN, } *Domestic Animals.*
- JAMES BROWN, } *Assessing Committee*
- R. P. FINCH, } *on*
- S. W. BROWN, } *Domestic Manufactures.*

The Committee on Domestic Animals awarded to the following persons, the premiums set opposite to their names, viz:—

To Dorius Knapp, for the best Bull,	\$10 00
John West, for second best do.	6 00
R. P. Fenon, best Stud Horse,	10 00
Cornels Felt, the best Mare and Colt,	6 00
Simeon Youngs, best Bred,	5 00
Joseph Trevis, second best do.,	3 00
Charles W. Nelson, best Sow,	5 00
T. B. Carr, best pig and best do.,	3 00
Charles W. Nelson, for 100 Eggs,	5 00
Wm. Prentiss, best 24 for best Cow,	5 00
Daniel Morris, second best do.,	3 00
Joshua Burch, the best of Oxen,	10 00
James Brown, second best do.,	5 00
David Burns, best Hock,	5 00
J. R. Tracy, second best do.,	3 00

The Committee on Domestic Manufactures awarded the following premiums, viz:—

To John B. Cook, for best sample of Sewing Machine,	\$2 00
John West, best sample Betsy,	3 00
Wm. Smith, for sample Faded Cloth,	3 00
Abnah Cook, second best do.,	3 00
N. Thayer, best quilt, linen,	3 00
S. W. Brown, best do. do.	3 00

Agricultural Papers.

Many have expressed opinions as to the true character and importance of an Agricultural paper. Will it be to enlighten the farmer, or to entertain a very feeble interest in our people? It will not learn you how to work, or how to plough; neither will it inform you of work, or of any other thing, if you are averse or unacquainted to it. But a well conducted agricultural paper, as every citizen is present you facts by which, if you are ignorant of them, you are enabled to work to all possible advantage, thereby economizing your time and labor with increased profits.

Will it learn me to plough and mow? I will not learn you to plough the number of the plough, or to work in the furrow—these things it is possible you

have already learned, but it will place in your hands the secrets of the best plough, and it will present you with a copy of the *best practical farmers* as to the doings and manner of ploughing the various crops and soils, the time and weather when a plough, &c. &c.

Will it learn me to make corn? asks another.—If you told this you perhaps already know; but it will show you many more that there are many other crops, more profitable than corn; how to cultivate which, to the best advantage, perhaps you do not know. It will present you with the results of experiments on the cultivation of *the best practical farmers* with every variety of crops—and leave you to judge of their relative profit, and to your own choice, as to whether you will make corn or rye, potato or malted barley, buckwheat, wheat, hay, clover, or live stock, or all together.

A good agricultural paper, contributed to by practical and scientific farmers, will be an eye to you in so many points of view, that we are unable to know where to begin to enumerate them. It is a storehouse of general and special knowledge, to which the best of farmers may always draw something new and serviceable. For its contents are made up of the best opinions and best practices, the best results of the most careful and accurate experiments of *all the best farmers of the world combined.*

The leading object, indeed, in the publication of an agricultural paper, is to afford to farmers a common medium through which to impart and receive instruction. The opinions of the editor are of course entitled to no more weight than the opinions of any one contributor of equal merit, and they should occupy no more space than will barely serve to communicate his practical knowledge (let it be great or little) and the practical knowledge of others of which he is possessed, by a course of reading or otherwise.

Agriculture, including all its branches and ramifications, is not only a science, but in our view of it, a science not less difficult completely to master than what we termed the learned professions. Like all other sciences, it is constantly illuminated by new lights and improvements. There are few, very few, who have attained that perfection in it, which places them beyond the reach of being taught. But of the mass of farmers, we know of many who have reached great proficiencies in particular branches of culture, which have yet much to learn in others.

In the columns of our agricultural journals, they all meet to be compared as facts and practices. It is the medium through which they are all compared, whilst, at the same time, they all impart instruction to their fellow men.

The practical farmers learn through this medium, that there is a *great variety of soils*, each more or less generally adapted to certain species, and each more or less unsuited to certain other species of vegetable production. He learns through its geological descriptions, to what class of soils his lands belong, and through its chemical essays, how to analyze them for himself. Through the same sources, he is made acquainted with the chemical and other actions of the various manures, and learns what manures his particular soil requires, and how to apply them. Through this medium, he meets with all the improvements in the various implements of husbandry; with all the newly discovered modes of destroying the various predatory insects that prey upon his crops; with all the most approved remedies for diseases which beset and destroy the live stock, &c. &c. &c. In short, the farmer finds, in such a vehicle of conveying intelligence, every thing that pertains to strict agricultural economy, to enumerate all the points of which, would require volumes. We have only glanced at a few of them here, in the hope that the mind of the more judicious, capable, and reflecting, among our patrons will be given to a future and more detailed statement and illustration of the principles of this invaluable science. And we would here mention this as a leading object of the agricultural journals of the day—to mouse the *capable toe* to the point of diffusing throughout the *great mass* of farmers the existing knowledge now in their keeping, and of abstracting the benefits, both public and private, which must result from rendering it generally to be pursued. To this we will only append the forcible and just remark of the late Judge Emerson, that "which they are among the cheapest of periodicals of the day, no farmer of common intelligence can procure an agricultural paper, combined with ordinary ability, without being actually benefited, even in a penny point of view, to an amount at least ten fold greater than the price of his subscription."—*Southern Cultivator.*

High Wages and Taxation.

Mr. Eaton—I have read with very great pleasure, in the pages of the Cabinet, the excellent address delivered by the President of the Philadelphia Agricultural Society, at their late exhibition, and cannot but envy those who were able to be present at such "a feast of fit things." His view of the question of high wages is fully and convincingly correct, and the declaration of the late Mr. Gov. Walker, that his farm-work was one-twenty per cent. cheaper in this country than in England, is only a corroborative of what I have heard that gentleman say, "I need only to be informed what is the rate of wages in any country, to enable me to form a correct estimate of its prosperity and happiness; the thing always in exact proportion, whether high or low." And it is proverbial, that where low wages are, there are poverty and discontent—witness the present state of England and the whole continent of Europe—these being the causes of that stream of emigration which is ever pressing towards our shores.

The President's estimate of the difference in the value of land in this country and in England, is correct, as is also the difference in the rate of taxation, if it be confined to *direct taxation*, while the *indirect* impost which falls upon every thing that can be seen, felt, and understood, soon swells the amount far beyond the limit which he has assigned to it; for after the tax-gatherer and tything-man have made their appearance, and taken from the farmer fifty-three per cent. upon his rent, then comes *domestic taxation*, which, silently and imperceptibly, robs him of a great portion of the means of his existence, and renders him incapable of paying to his laborers more than is sufficient to procure them a bare subsistence; and were it not that labor is obtained there at about one-third part of its value, the farmer would not be able to subsist at all. No one in this country can conceive to what an extent taxation is carried in England; were they not indeed a "nation of shopkeepers," they must long since have sunk under it; their industry and perseverance have alone supported them.

The following sentiment in the President's address does him honor—may I be long live to witness its truth and justice, and rejoice in his country's welfare and prosperity! "Depend upon it," says he, "there is no surer sign of national prosperity than high wages and God grant that for a many long year it may be the lot of our countrymen, who subsist by the labor of their hands, to *work well, to be paid well, and to live well.*"

But I must copy from an English publication, "the following delicious moral on the 'Universality of Taxation.'" It is sufficient to convince every one of the preference due to this country over all others in the world; but it ought, at the same time, to operate as a warning to us how we indulge in a too great fondness for "national glory," a sin, by which all the old governments of Europe have been reduced to a state of poverty and confusion, and which will, in the end prove the ruin of many of them.

"We can inform Brother Jonathan what are the inevitable consequences of being too fond of glory:—Taxes upon every article which enters the mouth covers the back, or is placed under the foot—tax upon every thing which is pleasant to see, hear, see smell or taste—taxes upon warmth, light and locomotion—taxes on every thing on earth, and in the water, and in the earth—on every thing that comes from abroad, or is grown at home—taxes on the raw material, and on every fresh value that is added to it by the industry of man—taxes on the sauce which pumps man's appetite, and on the drug which restores him to health—on the crime which decorates the judge, on on the rope which hangs the criminal!—on the poor man's salt, and the rich man's spice—on the brass nail of the coffin, and the ribbons of the bride—on the bed board, couchant or levant, we must pay. The school-boy whips his taxed top—the beardless youth mangles his taxed horse, with his taxed bridle, on the tax-dropt road;—and the dymg Englishman, pouring his mebecine, which has paid seven per cent., into a silver spoon, which has paid fifteen per cent., brings himself back upon his chinny bed, which has paid twenty-two per cent.—and expires in the arms of a taxed apothecary, who has paid a license of one hundred pound sterling, for the privilege of practising his calling!—The whole property is then immediately taxed from twenty to ten per cent.; and, besides the probate, large fees are demanded for burying him in the Chancel; his virtues are hauled down to posterity upon taxed marble, and he is at length gathered to his fathers—to be taxed no more!"—*Farmers' Cabinet.* W.

* Sydney Smith's Works, &c. &c. 1:39.

Protection of Cattle.

KINDNESS TO ANIMALS IS A CHRISTIAN DUTY.

Cattle whose bills are kept well filled, have an active, vigorous circulation of the blood, which keeps them warm during the inclement winter season, provided they have access to an open shed to protect them from wet. It is much to be regretted, that so many barn-yards are destitute of open sheds, to furnish protection to cattle. Those animals which are furnished with warm stables during the night, suffer much more from want of protection from wet during the day-time, than if they were exposed night and day to the elements. An advantage of no trifling amount also, arises from open sheds in a barn yard protecting the manure under them from being bleached by rains, which depreciates its value one half. An accurate experiment has been made by an intelligent farmer on this subject, which resulted in proving that one load of manure which was protected in this manner, goes as far as two loads which had lain exposed to all the rains of the season. A rough shed costs but a small sum, and it matters not how cheap an rough it is made, so that stock can be kept dry under it.

Try it; go to work and erect one yet, before winter; it can be done in a day or two, at a very inconsiderable outlay, and it will pay for itself, with a hundred per cent. profit, before this time twelvemonth.

Have you water in your barn-yard for your stock, or do you permit your cattle to wander abroad for several hours every day, in pursuit of it elsewhere? If you have not, turn to page 314, Vol. 4, Farmer's Cabinet, and read, "A penny saved, is two pence earned." &c., then think and act, with out a day's delay, if you desire to thrive. But if you don't wish to improve your condition, go on in the old way, and let your stock get drunk where they can find it, and drop their manure where it will be a nuisance rather than a benefit, for this is the plan pursued by all careless, lazy farmers; and they are uniformly rewarded according to their works.—*Far. Cabinet.* AGRICULT.

The Hessian Fly.

DEAR SIR—I have this day finished a work which I never did before, and I hope may never be under the necessity of doing again. What your correspondent, "Vir," and "Edward Cross," as well as yourself, may think of the operation, I do not know. It is nothing more or less than this: A few days ago I started my teams and ploughs into a wheatfield, which had a most flourishing and promising appearance to a superficial observer. The wheat was sown on the 15th of September, but, owing to the dry season, it did not make as much progress as it sometimes does in the same length of time, yet, it was the best field, to appearance, in the neighborhood. Every person that passed along the turnpikes would stop, and enquire the reason of so unusual an occurrence, as ploughing up a fine wheatfield. Some think me mad; some advise one thing, and I scare another; all would beg me to leave, at least, a part unturned, to convince me, as they think, of my folly—but all to no purpose—because, had I left a part standing, this would have been a nursery for the fly to stock the whole field again in the spring.

Now the cause of all this mischief is the fly—the fly. Not a plant or sprout could I find in the field, but what had from two, or a dozen, or more, of nits, or eggs, at the roots; and I am confident, that henceforth the wheat would have been getting less, and the weeds more, until the whole would have been a thing but a mass of rank weed—an eye sore—that I had added to look upon. I have, however, some satisfaction in burying such a mass of corruption, and, if the season is favorable, hope to reap a better crop than if I had left the first remaining. This wheat was attacked by the fly as soon as up, and was certainly not diseased at that time, and, in fact, did not show symptoms of disease above ground, at the time I ploughed it under. The fact is, the season is favorable to the fly, and unfavorable to the wheat, attack it they will, no matter what kind of a soil, or how the soil has been cultivated. When the soil is highly manured, either with dung or lime, or both, it sometimes outgrows the fly, and they do very little damage; but if the wheat is kept back, as your correspondent says, to harden it, the fly has the advantage. Fortunately, the sample of wheat you sent me, with ten others, received from Boston, I did not sow until after the frost (23d September) and these are all clear of fly, as yet. I am afraid the fly will do much damage this fall and next spring; I see it in other fields besides my own. Respectfully, J. G.

October 23, 1840.

[*Farmers' Cabinet.*]

A Hen House.

A hen-house should be a building for that purpose exclusively; and for the accommodation of fifty hens and their progeny, in size about 10 by 12 feet, and 7 to 8 feet height of walls; with a door in the centre of the south or east end, made to shut as close as the doors of our dwellings; and a small aperture near the door, about 8 by 10 inches, and 2 feet from the ground, for the admission of the fowls. In each gable end, a window hole 18 by 30 inches, with a lattice, so as to exclude ravenous birds, and a shutter inside to be closed tight in winter, but to be kept open in the summer for the purpose of ventilation. The inside of the house should be plastered and white-washed as thoroughly as a butcher's kitchen. There must be no ground floor, but a tight floor on three sides, 3 feet wide, and well joined to the wall, about 4 feet from the ground. Above the floor place the roosts, two on each side, the outer one 12 inches from the wall, the other 15 inches from that. The roosts, if practicable, should be sassafras poles with the bark on, as this wood is found to be a slow conductor of heat, and is thought to be less liable to be infested with lice than most other kinds of timber, owing to its peculiar aromatic smell. Under the floor, place a row of boxes for nests 2½ feet from the ground. The boxes to be 10 by 12 inches, and 6 or 7 inches deep. In the bottom of the boxes put ½ of an inch of fine lime or ashes, then fill neatly full with fine straw. The interior of the house, should be thoroughly cleaned and white-washed early in the spring, and the ground well covered with sleeked lime or ashes. In cold weather, put a little fine straw on the ground. If at any time the house becomes infested with lice, clean and white-wash as before directed. On the ground place your feed boxes, which should not be very deep, but of sufficient capacity to hold half a bushel each, and keep them well supplied, the year round, with corn, buckwheat and oats, or other kinds of grain, having one box for lime and gravel in the winter. I am satisfied that whoever will adopt the above plan and regulations, will soon find themselves well paid for the expense.—*Ab. Cultivator.* P. of N.

Farms in England.

Nine-tenths of the cultivated lands of Great Britain are leased to tenants, who pay from two to five pounds sterling per acre, annual rent. Now admitting taxes and labor and other expenses to be no higher here than they are there, it will at once be seen that our common cultivation will nowhere do much more than pay the price of rent; but by superior productiveness, occasioned by superior cultivation, the British farmer is not only enabled to pay rents and taxes; finding every thing for husbandry, and all articles put upon the ground, and all utensils by which the ground is worked; but he obtains also, wealth from the pursuit of his calling.

Murwen stated the produce of an English farm of 894 acres, in the year 1841, to be £8,578—equal to \$35,909. On this ground were carried, in that year, the almost incredible quantity of 13,746 one-horse cart loads of manure, and in the next year 10,250 more! Suppose the rent of this farm to be twelve dollars an acre, the expense of manure and its application twelve dollars more, and the interest on outlay, taxes, and additional labor of cultivation, &c., twelve dollars more; still there will be left, as profit, ten dollars an acre; leaving a clear gain of about ten thousand dollars to the tenant.

A hay-farm, near London, of 160 acres, was rented for twelve dollars an acre, or 1920 dollars a year; the tenant commenced with a great outlay for manure—an outlay which would have been considered at least equal to the value of the land before it was manured, a large outlay for farming implements, and for accommodations and wages for laborers; and yet the tenant has consequently been accumulating riches from this farm, after paying all expenses.—*Monthly Visitor.*

Book Farming.

Do the words produce a sneer? Be that as it may—the thing, or what is often signified as that thing, is not contemptible. For, what is it? Not an attempt to comply with the advice and copy the example of every one who furnishes an article for an agricultural journal; not a description of every method of husbandry that is mentioned in print; not a departure from all the maxims of our fathers and neighbors; not a propagation of the theories contained in books, to the detriment of experience. No! I pay the stupidity of the man who thinks that if we use books, we must close our eyes against the light that is beaming upon us from other sources; or that we must be-

come mere theorists, and the victims of ruinous experiments. What does a man lose his own common sense, his prudence and his judgment, whenever he takes up an agricultural paper, or opens a book upon husbandry? Cannot one make himself acquainted with the doings of others, without losing his power to judge whether it would be well for him, in his circumstances, to copy their examples? Our brains are not so weak as this. The knowledge acquired from books does not make us all mad. But if it did, there would be more zest and true enjoyment in the learned man's course, than in that of him who has learned out, and who thinks that books cannot make him wiser. I ask what book farming is? Common book-farming is, learning by means of books, new facts, opinions, results of experiments, modes of operation, and the using such parts of the information as can be turned to profitable account in our individual situations. If this be folly, we are content to be called fools. An agricultural paper will be worth to you every month, if not every week, more than its annual cost.—*Mr. Putnam's Address.*

Prepare for next year.

There are causes at work, which will by another year materially advance prices, particularly of bread-stuffs and other provisions. It is the part of true wisdom to be in readiness to make the most of good fortune. It is a vexation to have one's dish wrong side up when it rains pottage. This fall let farmers make simple calculations and preparations for extensive sowing and planting next spring. Turn over sward land with the plough before the winter frosts set in. The action of frost upon the inverted soil is excellent; and besides, what work of this sort is done in Autumn is so much gained upon the labors of Spring, when every thing must be done in a hurry. As to wheat, we think there is reason to hope and believe that the worst days of the weevil's depredations are over. The past season was less disturbed by these vermin than the preceding. It may be we shall see and hear but little of them in the next year. Such scourges are, in the providence of God, seldom perpetual. At any rate, let us do our duty, and trust to Him for good results. If we do not sow, it is certain we shall not reap.

There is no danger of planting too many potatoes. If raised in locations too far for market, they may most profitably be consumed by hogs, neat cattle, sheep and horses, and they will pay for themselves well thus invested. In towns near the railroad or rivers, where vessels can come, they will always command market; for Maine potatoes are so much better than those raised west and south, that vessels will always visit us to take cargoes of them to Boston, New York, New Orleans and all along shore. The raising of potatoes at 25 cents per bushel, which is about the average in our market towns, is as profitable a business as our farmers can go into.

We must, too, prepare largely for corn. Say what you will about it, this is an excellent crop—not perhaps to sell, but to consume at home. And as for the old idea that Maine is no place to raise corn,—this is all moonshine. It is as sure as most other crops. It is well to depend upon some early variety, so as to make sure in a bad season. We know of some early sorts, which produce long and large ears of heavy corn. They were originally brought from Canada, and have attained a large growth and become acclimated by long culture in this latitude.

The Tree Corn. We are satisfied that this will yield more than other sorts; but ordinarily it is too late for our climate, and exhausts the soil too much by its exuberant growth. Last year, which was a dark season, it did not have a fair chance, and but little of it ripened hereabouts; but that which we planted this year was fully ripe long before we had any frost.—*Maine Cultivator.*

"Keep Moring."—Throughout all nature, want of motion indicates weakness, corruption, inanition, and death. Trenk, in his damp prison, leaped about like a lion, in his fetters of seventy pounds weight, in order to preserve his health; and an illustrious physician observes, "I know not which is most necessary to the support of the human frame, food or motion." Were the exercise of the body attended to in a corresponding degree with that of the mind, men of great learning would be more healthy and vigorous—of more general talents—of ampler practical knowledge—more happy in their domestic lives—more enterprising, and more attached to their duty as men. The highest improvement of the mind, without bodily health, can never present any thing more than half a human being.

A Letter of Encouragement.

FROM WM. GARBUTT.

A consciousness of doing good, and the approbation of those whom we esteem, will always be considered, by us, no small reward,—consequently the following letter afforded us much gratification. MR. GARBUTT has long been well known in this section of country, as one of the warmest friends of improvement, and was for a number of years President of the Monroe County Agricultural Society. We hope his advice and example will stimulate others to put forth new efforts in the cause, especially in old MONROE, who is far behind what she ought to be in the march of agricultural improvement.—Eds.

Editors New Genesee Farmer:

GENTLEMEN—The present month will complete your editorial labors for the year; and I cannot let the occasion pass, without offering you a word of encouragement. It is not probable that you have thus far received any pecuniary reward for your labors; but if the forwarding of useful improvements, the advancing of agriculture, and the elevation of the cultivators of the soil, affords you any satisfaction, (as I know it does,) then surely you have much reason to be gratified with the results of the past year. But this is not sufficient,—I sincerely hope that your subscription list for the coming year will be greatly increased, so as not only to afford you a compensation, but so that the beneficial influence of the paper will be exerted upon the great mass of farmers in our land. The New Genesee Farmer ought to be taken by every cultivator of the soil, and every well wisher of agriculture, especially in Western New York—"OLD GENESEE." The cost is so trifling, that no one can refuse to subscribe on account of the expense; and I am confident that nothing is wanting but a little prompt effort on the part of the friends of the cause, to double your subscription in this section of country within two months. I obtained some subscribers for you last year, and I intend to double the number for the coming year. Let every friend and reader of the paper do the same, and the work will be done, *and well done*. I intend to have the Farmer sent to a number of my friends who are not subscribers. I think I cannot make them a better "New Year's present."

Sincerely Yours, W. GARBUTT.

Wheatland, Nov. 25, 1840.

For the New Genesee Farmer.

Legislative aid to Agriculture.

Really it is too bad that the wants of the farming portion of community, should be so much neglected by those who profess to represent us at Albany. The scheming politician and speculating tradesman, may have every desire gratified; but the farmer, boasting of being the originator of most of the substantial comforts, and the real wealth of the country, must plod on without any assistance. Railroads and canals must traverse every section of the country; colleges and high schools receive their share of the Literature Fund; and the claims of the merchant receive special attention—and this is well—but when has a single dollar been applied to advance the particular interests of that class of community, without which railroads would be but splendid theories, schools would languish for want of support, and the merchant soon be compelled to substitute the spade for the ledger? Why is it so? Not surely because aid is not needed, or would not be highly beneficial. That man must be an ignorant rascal, as Sargent says, who does not see at a glance that a profuse liberality in this particular would be rigid economy; that one dollar taken from the treasury and judiciously expended for this object, would soon return to it in company with ten others.

It is much to be feared that this state of things is chiefly owing to the apathy of the farmers themselves. I was assured lately, by a gentleman, who, when in the Legislature, was deeply engaged for the promotion of Agriculture, that he found no difficulty in bringing the professional members, the mechanics and tradesmen, to his views, but the farmers always "smelt a rat;" they "would never drain the treasury in support of such visionary projects." This is certainly humiliating, and should arouse every intelligent mind to a serious consideration of the evils which necessarily result from sending those to represent us who are chiefly recommended by their strong devotion to the interests of party.

I was much gratified in reading this evening an account of the proceedings of the Philadelphia Agricultural Society, the usefulness of which has been materially increased by liberal donations from the State.

Why is it that hard and rocky Massachusetts is decidedly taking the lead in whatever relates to the productions of the earth? A few years ago, it was thought that her wet and sterile hill sides could produce little besides a scanty crop of rye or corn; now the culture of wheat is rapidly increasing. Their agricultural implements are far superior to ours, particularly their ploughs, their experiments on which, if published in the "New Genesee Farmer," will afford us unpleasant proof that half our strength in this important operation has been thrown away. This state of things has doubtless been produced chiefly by the exertions of the State and county agricultural Societies, which, under the patronage of the government, are able to offer the most liberal premiums.

If New York would, like Massachusetts, support an "Agricultural Commissioner," it would be worth more to the State than all the *Bank Commissioners* that ever existed. I sincerely hope that our different societies will take some decisive steps in the matter. Petitions should be circulated; they should express definitely what we want; and if I might be permitted to suggest, I would say, ask in the first place, for the appointment of a Commissioner paid by the Legislature, whose business it shall be to traverse the State, collecting information, and holding meetings; next ask for a sum of money, not less than two hundred dollars for each member of Assembly, to be paid to each county society. With these aids alone, in my opinion, the products of our State would in five years be doubled.

W. R. SMITH.

Albion, Nov. 27, 1840.

"The People's Colleges."

This is the name—the appropriate name—bestowed upon our Common Schools by one of our eminent statesmen. The Common Schools are emphatically the "People's Colleges"—the seminaries, good or bad, where the vast majority of the citizens of this great Republic are and ever must be educated. In view of this important fact—in considering the immense influence which the common schools must always exert on the people of this Republic and the improvement of mankind—who is there, with the heart of a Patriot or a Christian, that can refrain from contributing his or her influence in extending the beneficial influences of those invaluable institutions? And yet—we confess it with deep regret—how few, how very few, are there among us, who manifest, by their acts, any adequate degree of interest in the all-important subject—the subject of Education—a subject which lies at the basis of morals, and patriotism, and happiness—a subject which concerns most solemnly the temporal and eternal relations of mankind!

We are led to these remarks by a communication received from a valued friend, (E. B. PARKER,) whose object is to aid in arousing proper attention to our

common schools. While we concur most cordially in his philanthropic suggestions, we are happy to have it in our power to correct an error into which he has fallen. There is *not* a paper "devoted exclusively to the interests of Common Schools in Western New York." The "District School Journal," recently commenced at Geneva by FRANCIS DWIGHT, (published monthly, at only 50 cents per annum,) is established, as its name indicates, to promote the great cause towards which our friend PARKER is endeavoring to arouse attention in the communication above mentioned, which we have taken the liberty to send to Mr. Dwight for insertion in his valuable publication.

While we commend this "School Journal" to the energetic support of every man and woman who values the prosperity of our Seminaries, and hope that that publication may find its way to the hands of thousands of families throughout city and country, we cannot forbear from occasionally throwing some hints into the "Genesee Farmer," designed to promote the same great and good cause, without wishing to encroach on the peculiar province of that publication, or to change to any extent the agricultural character of our own work. It will afford us much happiness to assist in arousing a proper feeling on this matter, among the Agriculturists of our own highly-favored land. The welfare of AGRICULTURE cannot be more essentially aided than by the spread of knowledge through the medium of Common Schools. Talk as warmly as we may about the culture of the soil, that culture will be comparatively slow of progress if unaccompanied by improvement of the "immortal mind." ¶ The WINTER, which is now commencing, offers leisure and opportunity for mental cultivation, which we fervently hope will be thoroughly improved. ¶

We may add, in conclusion, that we design to devote a small space in each number of the "Farmer," to matters connected with the improvement of our Common Schools and Seminaries generally. O.

Preserving Hams.

MESRS. EDITORS.—There are various opinions in the world respecting the best method of preserving hams, and although my mode may not be the best in the world, it is one which I have long practised with very good success, and may be of service to some of your readers.

My recipe for making brine:—

For each 100 lbs. of hams, take 8 lbs. of salt, 4 gallons of water, 1 quart of molasses, and 2 ounces of salt petre; mix well together.

After remaining in the brine from ten to twelve weeks, they will be fit for smoking. Wash then clean before hanging them in the smokehouse. Some farmers burn maple chips, and others saw-dust, to create smoke, but I believe the majority agree with me that *corn cobs* are the best material for this purpose. The smokehouse should not be perfectly tight, as it will cause the hams to sweat and injure their flavor. After being smoked about four weeks, the hams should be taken out, and those intended for summer use sewed up in cheap cotton sacks, and hung in a cool place till wanted.

Hams preserved in this way will have a better flavor and keep longer than in any other way that I know of. If any of the readers of the Farmer know of a better method, I should be pleased if they would make it known.

Respectfully yours,

W. S. TUPPER.

South Venice, Nov. 21, 1840.

When a man looks learned and talks big, we invariably set him down as a ninny, and ninety-nine times in a hundred we are right.

Care of Animals in Winter.

MESSRS. EDITORS.—I missed the usual "Hints for the Month" in your last, and hope the cause of that omission will not long exist. At any rate, I hope you will not fail, in your next, to impress your readers with the necessity of providing proper shelter, as well as food, for their farm stock. Winter is again upon us, and in our anxiety to make ourselves and families comfortable, we often seem to forget that our domestic animals are susceptible of pain from cold or hunger, or that the more comfortable we keep them, the more thrifty and profitable they will be. The language of the poet on this subject is particularly appropriate, and should be borne in mind by every farmer. Speaking of winter, he says—

"Now farmers, to your flocks and herds be kind,
Oh deal out to them food with liberal hand;
Shelter them, too, from winter's blast severe—
And they will richly pay you for your toil."

W. GARBUTT.

Wheatland, Nov. 25, 1840.

Domestic Economy.

LARD, in trying, is very frequently injured by being scorched. This difficulty is easily removed by paring and slicing a few raw potatoes, and throwing them in immediately. The original whiteness will be restored.

In order that lard may keep well in warm weather, it is requisite that it be cooked enough in trying, but burning it is to be carefully avoided. *

A Thrifty Porker.

MR. WILLIAM SHOEMAKER, of Gates, near Rochester, killed a hog last week, 14 months and 5 days old, which weighed, when dressed, *five hundred nine and a half pounds*, (509½ lbs.) and made two barrels of clear pork. It was a cross of the Leicester and Lancaster breed. If any person has slaughtered a greater hog, of its age, we should like to hear of it.

Hoof Ail—Inquiry.

MESSRS. THOMAS & BATEHAM.—Will you or your correspondents inform us what is the true cause of Hoof Ail among cattle, which is becoming quite prevalent in this section of country; also, why it affects the hind and not the fore feet?

Why does cream rise on milk?

Also, tell us why it is that cream rises to the surface of milk, instead of settling to the bottom according to the law of gravitation, and much oblige

AN INQUIRER.

Brighton, Nov. 25, 1840.

Remarks.—The first question of An Inquirer we will leave for our correspondents to answer; but the second is not worth waiting for. Cream rises on milk exactly "according to the law of gravitation," for the simple reason that it is lighter than the milk, and of course the law of gravitation causes the heavier to settle and the lighter to rise. Cream is an oily substance, and, like all oils, is considerably lighter than water.

No Newspaper.

The time is coming when the man who has the means (and who has not?) and does not take a newspaper, will be looked upon by his neighbors as a fish without a fin, a crow without a wing, a blind horse, a mole, or what you please. Such an individual might do well enough to live in the manner of a Robinson Crusoe, but he has no excuse for thrusting himself among those who do take newspapers and are better informed, to gather whatever political or general intelligence they may choose to drop for him. We now have many such men, and might name them, but we refrain; but you, gentle reader, can point them out yourself.—*Am. Union.*

The Greatest Man.—The greatest man is he who possesses the right with invincible resolution, who resists the sorest temptations from within and from without; who bears the heaviest burdens cheerfully; who is almost in storms, and most fearless under menaces.

Rotation of Crops—fine farming.

We commend to the particular attention of our readers, the following description, from a correspondent of the Farmer's Cabinet, of an excellent specimen of farming by a man who commenced the world a day-laborer, and is now worth ONE HUNDRED THOUSAND DOLLARS. When thirty years of age he purchased, and paid for in part, a farm of one hundred and thirty acres, one hundred under cultivation, and in a very low state of cultivation. It was chiefly sand, and all upland. See what his farm affords now, and how he has managed it.

"When he commenced farming, he adopted a particular system of rotation, to which he has implicitly adhered from that time to the present, which is forty years, and his success is the best comment on the worth of his experiment. His mode was as follows: having divided his farm into eight fields of equal size, as nearly as possible, three of these fields are sowed with wheat each year, one with rye, one planted with corn, two in clover, and one an open fallow, on which corn had been raised the year previous. One of the clover-fields is kept for mowing, the other for pasture, both of which are ploughed as soon after harvest as possible, and prepared for wheat in the fall. All the manure which is made on the farm for one year, is hauled, in the spring, on the field intended for open fallow, which is then ploughed, and after one or two cross-ploughings through the summer, is also sowed with wheat in the fall. The field on which rye is sown, is that from which a crop of wheat had been taken the same year, and which had yielded three crops of wheat alternating with crops of clover.—Corn is planted on the field from which rye had been gathered the year previous, the stubbles of which are ploughed down in the fall. Clover-seed is sown early in the spring on two of the wheat-fields, those which have been most recently manured. By this method, each field yields three crops of wheat, two of clover, one of rye, and one of corn, every eight years. Each field, in the mean time, has lain an open fallow, and received a heavy dressing of manure, perhaps at an average of fifteen four-horse loads per acre. His crop is seldom less than fifteen hundred bushels, but often much more. His average rye-crop is about four hundred and fifty bushels, and his corn crop, annually, about five hundred bushels—all which grain, at the present low prices, would amount to more than two THOUSAND DOLLARS ANNUALLY—and at former prices to double that amount—and his farm is withal very highly improved." Yours, P. W.

Farmers' Daughters and Homes.

BY ANNETTE.

MESSRS. EDITORS.—In remarking on the causes of unhappiness and discontentment among educated farmers' daughters, and the reasons which lead so many of them to forsake their homes and seek a residence in the city, I before attempted to show that a *wrong system of education* is one of the most fruitful causes of these evils. My object at this time is to show that mis-education is by no means the only cause; and to inquire whether our *fathers* and our *homes* are not often as much to blame in the matter as our teachers and seminaries.

Many of the most respectable farmers in this country never enjoyed the advantages of early education, and have had no opportunity for acquiring a knowledge of, or taste for, the more refined comforts of life; especially those intellectual enjoyments so indispensable to the happiness of a well cultivated mind. They were brought up among the pioneers of this land, and their education consisted of the toils and privations incident to an early settlement in a new country. But now they find themselves in very different circumstances—in possession of a handsome competency, and surrounded by an enterprising and intelligent community. Public sentiment and the spirit of the age now require that the rising generation should receive a higher degree of education than was formerly deemed necessary: and therefore, in order that their children may appear respectable in the world, and be qualified

to fill their places in society with credit and advantage, they are sent to the best schools in the land, and much care and expense bestowed on their education.

Let us now suppose, as is often the case, that the daughter of such parents spends two or more years in a good boarding-school, where her mind becomes well stored with valuable learning; her manners and taste become refined and cultivated, and she is every way fitted to adorn society and bless her family and friends. But let her leave school and return to her home, and unless it is different from the majority of farmer's houses in this country, it is not surprising that she soon becomes unhappy and discontented, or at least, that she should wish to change her situation for one more congenial to her taste and feelings. The reason of this is obvious when we observe how few farmers take any pains to *make home attractive*—it is not loved because there is nothing about it to make it lovely. The educated and intellectual daughter finds nothing within or around it calculated to please the mind or delight the eye—nothing to gratify her taste, or call into exercise those faculties which she has long been cultivating, and which afford her the highest kind of enjoyment. No good selection of books and periodicals to furnish food for her active mind during leisure hours; no tasteful garden, with flowers, and shrubs, and winding paths, where she can luxuriate on Nature's charms; no fragrant rose or climbing honeysuckle asks her training care, and no shady bow or vine-clad arbor invites her to

"Converse with Nature, and commune
With Nature's God."

And what is worse than all, she seldom finds a congenial spirit with whom to share her pleasures or her griefs. On the contrary, even those to whom she has a right to look for kindness and sympathy, not unfrequently treat her with indifference, or ridicule what they consider her excessive refinement. Under these circumstances it is impossible for her to be happy or contented; and were it not for the pleasure that she derives from making herself useful, and the natural affection that she feels for her "kindred according to the flesh," home would be to her a prison-house from which she would embrace the first opportunity to escape. Yet the inconsiderate father wonders that his daughter grows tired of home and seeks enjoyment in a city life! Teachers and seminaries are made to bear the blame, and thousands grow up in ignorance who would otherwise enjoy the blessings of education.

Let no one suppose that this is merely an imaginary picture, for such cases are far too numerous. It is a ruinous error to suppose that a liberal education creates a distaste for rural life; on the contrary, it is calculated to make that life doubly pleasant, provided it is accompanied with those charms which the refined mind always associates with its ideas of a residence in the country. Let farmers who desire their children to follow their profession and love their homes, consider this subject, and see that their homes are rendered lovely. Then, and not till then, will the profession of Agriculture be speedily elevated to that rank and respectability which it so eminently deserves.

ANNETTE.

Maple Grove, 1840.

P. S. Will not my friend FANNY resume her able pen on this subject? I hope this communication will not excite her *combaticness* as much as my last.

A.

Remarks.—The subject which our esteemed unknown has introduced, is one of very great importance, and calculated to increase the happiness of the community. Our junior partner gently intimates however, that he hopes all of our readers will not consider it *invariably* an evil for a farmer's daughter to leave her home and take up an abode in the city.—*Eds.*

British Corn Laws.

The necessity of counteracting prohibitions on the part of the United States—a highly protective tariff does not in the end prove a bounty to the manufacturer, but to the consumer.

HARVEST IN ENGLAND.—“Our harvest in the South is over. Wheat will probably be a fair crop. Oats, barley, potatoes, and turnips in abundance.—The working of our Corn Laws is very striking at this moment. Last week but one, the duty on flour, was 1s. 7d. sterling; last week 2s.; to day, (15th Sept.) it has risen to 6s. 5d.; next week it will be 7s. 2d.”

The foregoing extract is from a letter lately received from England and published in the New York Emancipator of the 5th.

Such are the corn laws of England, that no grain or flour is admitted from foreign parts, unless, from bad harvests, prices advance so high as to threaten a general famine in the land. Last year, owing to short and damaged crops, American flour was admitted at a very small duty; but at this time we are shut out by a duty of at least \$2.50 per barrel; so that for the coming season we cannot hope to find a market in England for any part of our great surplus. Yet with all this particular policy on the part of England, no countervailing protection has been adopted by the United States. So far from it, by our compromise act, the duties on British manufacture has been lessened annually, and are to decrease until the year 1812, when the duty on no one article is to be over 20 per cent.

We are so far the friends of free trade, that if England would admit the broad stulls of the United States on the payment of a duty of 20 per cent. on its cost in the United States, we would be the last to complain of our compromise act, which is to reduce the duties on British manufacture to 20 per cent. But, as we have no reason to expect that England will do this, what resource have we but to create a home market for our surplus agricultural productions. And how is this market to be obtained but by such an impost on British manufactures, as will encourage all the young and rising branches of manufacturing industry at home.

For eight years, previous to 1839, the average export of broad stulls from the U. S. to England, was not more than \$3,000,000; while the import of manufactured articles, from Great Britain alone, in one of those years, amounted to \$80,000,000. It is supposed that the average import during those years, into New York alone, amounted to \$20,000,000 annually.

It is computed that there is imported into the United States, \$8,000,000 annually, in silks alone; about \$1,300,000 more, each year, than was received for all the wheat, Indian corn, rye, potatoes, hamsent, flax seed, hops, &c., exported in 1835 to every part of the world.

It is true that the cotton of the South pays for the greater part of our European imports. It is also true that the South complains that a tariff on imports is not only calculated to interrupt her free trade with her European countries, but also to compel her to pay a bounty to the Northern manufacturer,—in other words, making her rich at her expense.

But the doctrine, specious as it is in theory, is found to be suicidal in practice, and wholly repelled by the facts.—Under a protective tariff, our domestic cottons have fallen from 25 cts. to 6 cts. the yard. Confidence in protection, induced capital to be embarked in manufactures—profits induced competition, and this again induced renewed improvements in machinery, division of labor, and every species of economy and saving that Yankee ingenuity could contrive, until our cotton manufactures at this time, at the lowest known prices, amount to nearly \$20,000,000 per annum.

Thus we find that a protective tariff in favor of our cotton manufactures, has produced more than all the

benefits which its most sanguine friends had anticipated, while not one of the evils which its opponents predicted has yet been produced by it.

This protection our cotton manufacturers now no longer need, as under its influence, they have so far increased in numbers, in capital, and in mechanical skill, that they now stand on a par with the cotton manufacturers of England in the great South American market.

But at this time the friends of domestic industry do not ask for a tariff exclusively for protection. Such are the increased expenses of the nation, that a duty for the purposes of revenue might be so judiciously imposed as to act effectively as a protection to many of the younger branches of American industry.

To show the importance of the article the production and manufacture of Silk, it is only necessary to say that it has already commenced, in the absence of any impost on the imported article. Valuable cotton, wool and non, silk has so far been considered by Congress as an alien to our soil, which had no right either to acclimation or citizenship; but we trust the time has arrived when both the production of silk and its manufacture is to receive the paternal and fostering aid of government.

From late statistical tables it appears that the silk manufactures of England in the year 1837, amounted to 268 in number, employing 11,011 hands, showing an increase of nearly 18 per cent. in the last three years.

Silk goods to the amount of \$,000,000 of dollars, have been imported free of duty into these States in a single year. It may be urged by Mr. Calhoun and the advocates of free trade, that if the United States imposes a duty on French silks, France will lay a countervailing tariff on our cottons; but would it not be much easier for the United States to dispense with French silks, than for France to do without an article of such vital importance to her manufacturing interests as American cotton. The successful growing of the morus, multicaulis belongs only to the cotton growing States; hence the production of the raw silk ought to be as essentially their staple as cotton itself, and if they lack the skill or enterprise to produce the manufactured article, the north can help them.

Much has been said about the infirmity of the factory system, and its pernicious influence on the health and morals of the people. I have no time to attempt a refutation of the charge; I will only say that man is a gregarious animal and must follow his instincts. But even in the unhealthy atmosphere of an English manufacturing town, it is ascertained that the average length of human life is 19 years longer than it was a century ago. The manufacture of cotton alone has largely contributed to this, the laboring classes are now better clothed, better fed, and better lodged, than they were then, and that is the consequence.

S. W.

Important Ploughing: Trial of Ploughs.

The Massachusetts Agricultural Society, with characteristic liberality, invited a public trial of the question as to which is the best plough, offered a premium of \$100 for the best plough by turning the seed flat, and a premium of \$75 for the best plough to lap the furrows or lay them on an an. The trial took place at Worcester, Oct. 13, and was conducted with great care and skill, as will be seen by the report of the committee, which we copy from the Boston papers.

“The first operation was to run furrows so that we might have narrow lands of about six rods in length. The fifteen ploughs were brought on and used successively. Each competitor was allowed to furnish his own ploughman; to make his furrow of whatever depth and width he chose; and thus to give us his own specimen of the work of his own instrument. Each was allowed to turn several courses of furrows. The

Dynamometer, or measurer of the power required to draw the plough, was applied to each, through a two or more furrows. This power was not 1 down; the depth and width of these furrows were measured; and our eyes saw the work of each. About five hours were consumed in the trial thus.

After having taken some refreshments, several members of the committee, whose hands were not entire strangers to the plough handle, went to the field and very carefully tried each of the ploughs as either of them was disposed to follow. On the following day, also, they held several of the ploughs; and they all agreed in the opinion that the ploughs of Mr. Howard and those of Messrs. Prouty & Mears, are managed with great ease and comfort by the ploughman, and that each when left to itself holds on in its proper position and course, where the soil is uniform and free from stones. They agreed also, that the form and position of the beam-handle of Messrs. Ruggles, Nourse & Mason's plough is such that the ploughman cannot walk in the furrow erect and comfortably when the plough is in a position to make good work. They think too, that this plough when left to itself tends to narrow the furrow slice and run out; and therefore that a constant though slight effort on the part of the ploughman, is required to keep it in its place. It is true, however, that in the hands of a skillful holder, this instrument, in shallow and flat ploughing, makes as few *some work* as any that we have seen. But where all work is *handsome enough*, these must be considered best which make the smallest draft upon the strength of the team and the skill and comfort of the ploughman.

The power required to turn over a given quantity of earth by a plough, is a very important consideration. This power can be measured with great accuracy; greater than many of the committee had supposed before they witnessed the operation. The Dynamometer, inserted between the plough beam and the chain, measures with great accuracy the strength exerted by the team. Suppose the strength applied be the same that would be required to raise 335 lbs. over a single pulley; suppose also that the depth of the furrow is 6 1/2 inches and the width 13 inches. Multiply 13 by 6 1/2 and you have 84 with a fraction. Now if 335 lbs. of power will take up and turn over 84 inches of earth, then 112 lbs. will turn 28 inches. Tried in this way, the ploughs exhibited showed the following results. The power in each case is 112 lbs.

First Ploughs for tapping furrows.

By Charles Howard, Hingham,	20 1/2 inches.
By Ruggles, Nourse & Mason, Worcester,	21 “
By John Wilson, Deerfield,	21 1/2 “
By Steven's plough, Barre, Vt.,	20 “
By Jones Stewart, West Newbury, (Scott's Plough),	19 1/2 “
By Cornelius Bergen, Brooklyn, N. Y.,	18 “
By Barnaby & Moore's, Ithaca, N. Y.,	17 1/2 “
By E. G. Whiting, Rochester, N. Y.,	18 “

For flat furrows.

By Prouty & Mears, Boston,	27 1/2 “
By Charles Howard, Hingham,	25 “
By Ruggles, Nourse & Mason, Worcester,	24 “
By Barnaby & Moore's, Ithaca, N. Y.,	19 1/2 “
By E. G. Whiting, Rochester, N. Y.,	14 “
Another plough by Prouty & Mears,	26 “
“ “ “ Charles Howard,	24 “

The above table, containing results arrived at, not by estimation, but by measurement, is given to the public, in the full belief that it will be accessible to all farmers who may read it, and that it will be useful to many manufacturers of ploughs; for here are exhibited some remarkable and highly important facts. Taking the extremes, we find 112 lbs. power applied to one of Howard's ploughs turning over 20 1/2 inches of earth, while the same power at one of Mr. Whiting's ploughs will turn only 14 inches—a difference of more than 100 per cent. The structure of the plough therefore, must be an important matter to the farmer's outfit; and the committee think they may add, that the excellence of the work performed with the plough was, with few exceptions, in the direct ratio of the ease of draft. Had our outfit the gift of speech, their proverbial patience would hardly hold them back from saying to their owners—“Pay more attention to the structure of the plough.”

The committee cannot forbear to call the attention of farmers to the vast difference in the power required to move ploughs which are all doubtless considered excellent in those sections of the country from which they were brought. Ploughs were exhibited from places hundreds of miles distant from each other, and all subjected to the same test—a test as accurate as

des and figures make: and it is apparent that the work which one yoke of oxen can perform easily at the plough will require two yokes at another. Farmers usually and properly judge by comparison, and then holding the best plough they have ever seen, pronounce it the best in the world. We request them to weigh well such facts as are detailed in this report, and estimate the profit of saving one half, or even one third of their team labor. A saving of even more in one half is possible by the farmer of some sections of the country.

The Milk-Cow.

A DIALOGUE FOUNDED ON FACT.

V.—Capt. J., is it true that you have paid fifty dollars for a milk-cow?
Capt. J.—Yes indeed it is; and you would not get were you to offer me a hundred for her.
V.—Oh! it is a monstrous price, she can never pay never: I would not give more than thirty dollars for the best cow I ever saw.
Capt. J.—Come now, let us talk over the subject, and if we can't discover that it is quite possible to make a cow pay for herself, even if she cost fifty dollars. Can you tell me what is the interest on fifty dollars for a year?
V.—Why, three dollars, isn't it?
Capt. J.—And how many weeks are there in a year?
V.—Fifty-two, to be sure.
Capt. J.—Well, then, before I purchased this cow, butter cost me a dollar and a half a week, besides it I had to pay for new milk for my family; now I sell all this, sell a dollar's worth of butter a week, and have all the skim-milk for my hogs. Now, do you think I put the value of all this too high at three dollars a week?
V.—Well, perhaps not.
Capt. J.—Then, you see, I pay the interest of the dollars—the price of the cow—for the whole year, by one week's receipts. And am I right when I calculate I have the remaining fifty-one weeks' rests, with which to pay the principal and her keep?
V.—I guess you are, and I am fifty dollars the winner on our conversation upon the subject.—Farmers' Gleaner.

Great Crop of Corn.

Mr. W. W. Bridgman, of Belchertown, informs us that he has this year raised one hundred and sixty bushels of corn, weighing 41 lbs. 2 oz. per bushel, 24 bushels of Rohan potatoes, on one acre of land. In the culture of this crop, Mr. B. says:—"The manure which I prepared my land for this abundant crop, was as follows: I put on it 22 loads of dung ure, made in an unboiled stable. I planted the first week in May, and had it the first time the last week of the same month, when I found that wire-worm was making great ravages among it. I had a bushel of stone lime and put on the corn. In five days I perceived that it had changed its color, and in seven days I put on six bushels of ashes, which is all success which I pursued."

Mr. B. says farther, in answer to the inquiry for a remedy for kicking cows, that if the milker will keep his nails short, not one cow in a hundred will kick; and that the use of an ointment made of lead and white lead twice, will cure cracked heels.—Agr. Cultivator.

Scratching Hens.

We never allow our hens to run in the garden, and are taught from the egg, that the dinner pot should be as safe a place for scratching operations as the garden. But if hens will scratch, a down-caster says the way to prevent it, is to tie the two dew-toes of one foot together, over the middle one. It so narrows her understanding, that scratching is impossible.—U.

Others and Daughters.—It was a judicious resolution of a father, as well as a most pleasing compliment to his wife, when, on being asked by a friend what he intended to do with his girls, he replied, "I intend to notice them to their mother, that they may learn the art of improving time, and be fitted to become the wives, mothers, heads of families, and useful members of society." Equally just, but bitterly painful, are the remarks of the unhappy husband of a vain, idle, dressy slattern. "It is hard to say it, but my girls are to have a share of growing up good in any thing, they must be sent out of the way of my mother's example." The latter was no doubt a true remark, and one which experience had fully illustrated.

The Working-Man's Home.

"Tell me on what holy ground
May domestic peace be found?
Behold a daughter of the skies,
The onerful wings she flies
From the pomp of scepter'd state,
From the rebel-noisy haire."

COLUMBIA.

There is a peculiar zest in the working-man's enjoyment of home. After weariness, both of body and mind, he has a refuge at the close of the day—

"Dear tranquil time, when the sweet sense of home
Is sweetest."

There are languages, it is said, in which there is no such word as Home, in our mother tongue there is none more potent. It marks the sacred spot to which the cares and tumult of the world do not reach; and where, except in cases of extreme depravity, its views do not intrude. If there are garbled affections in the heart, they will break forth around the hearth-stone; if there is an hour of tranquility amidst perturbed life, it will be that which is spent with wife and children; if there is such a thing as friendship or love, it will be developed among these dearest associates.

Homeless men are seldom happy. If it was not good for men to be alone, even in a tent, it is bad indeed to be alone in such a fallen world as ours. But I will go further, and assert the moral influence of domestic institutions. As it regards public offences, the man who has a wife and children has not so much a greater stake in society. He has much both to gain and to lose. He cannot sin, or fall alone. As it regards private virtues, it depends much on the kindly affections, and these are in their very essence in the family circle. I think I have observed that when a man begins to go astray, he becomes estranged from home. The quiet look of the wife speaks daggers to his guilty conscience. The caresses of children are so many reproaches to the man who knows that he is wasting their very hereditary by his habits of dissipation. I think I have observed that the most rude and quarrelsome men are orderly and quiet when they go abroad with their wives and children. Such is the safeguard of virtue which is furnished by the influence of home.

I would have the house of the working-man his most delightful resort. To be so, it should be pleasing, even in its outside. Why should it not be a well-proportioned cottage, with its windows overlooking with sweet briar and honeysuckle, and its roof shaded by spreading trees? Why should not the little courtyard be carpeted with grass, and bedded with shrubbery? There are not luxuries of the rich alone. Yet it is too common for people to think that because they are poor they must be slovenly and dirty. A little whitewash, a little paint, a little tarring, and a few days of labor about the vines and flowers, will serve to change the whole appearance of the humblest enclosure.

But let us enter the working-man's home; and in order to meet the extremes of the season, I am supposing the case of the poorest. The walls should be white, the floor and wood-work should be painted, the movable should be in their places, and no most filthy utensil should be more conspicuous than necessity requires. These are essentials, but they bear directly upon what is more inward and more valuable. Every day is more cheerful in a neat than in a slovenly room. When work is over, and every thing in its place, the visitor is more welcome, the husband's looks are brighter, and an affectionate dog spreads itself through the circle.

The difference between England and America in the one hand, and the southern counties of Europe on the other, is included in a good measure on the habits of the farmer, and the absence of them in the laborer. The country boy has seen where the principle that every man's house is his castle. It is true, in increasing the one. Home is the temple of all the virtues of the people. For by home we mean something more than one's habitation; it is the family that makes the home. It is the peculiar blessing of the man of the wife; and this one circumstance makes a out of human, and a Christian. Sacred we look to the fountain not only of its pleasure, but of its moral excellence. The parent is each who has virtuous, sensible, obedient, and industrious wife, is a man of wealth. Home is the abode of our children. Have they meet us with their arms and hearts open, do we not ungrudgingly enjoy to see them at home, to return to it, and the more we can make them enjoy it, the farther do we remove them out of our way. No man therefore are better men than those who, or more

apt to become stable and wealthy citizens, than such as are well married and well settled.

A learned foreigner of Spanish descent, of high distinction in the politics of his own country, was once leaving the doors of a pleasant family in New England, where he had been spending an evening. He had observed the Sabbath calm of the little circle—its sequestered utility and independence; he had marked the freedom of affectionate intercourse between parents, and children, and friends, the cordial hospitality, and the refinement of every thing abroad to this central spot of home. As he retired from the lovely scene, he exclaimed, with a sort of transport, "Now I have the secret of your national virtue, and intelligence, and order; it is in these domestic retreats!"

"Domestic happiness, thou only bliss
Of Paradise that has survived the fall!
Though few now taste thee unimpair'd and pure,
Oh, to find long enjoy thee! too unfirm
Or too insatiable to preserve thy sweets
Unmix'd with drops of bitter, which neglect
Or temper shall in tothy chrysalis cup;
Thou art the nurse of Virtue, in thine arms
She smiles appearing, as in truth he is,
Heaven-born, and sanctified to the skies again!"

[Working Man.

Filing Newspapers.—How easy it would be, and how much satisfaction would be derived from it, and how much more orderly and business-like it would look, if people would just file and preserve their papers after reading them. It is true, last week's paper may be very stale stuff, but keep it for your grandchild to read, and he will find it a richer treat than wine of the same age.—Boston paper.

For the New England Farmer.

The Farmer's Saturday Night.

BY LEWIS C. ROBERTS.

"Nearly the morning's early beam,
The farmer drives his team,
Merrily, merrily to his toil,
Oh, how joyfully tilling the grateful soil.
His hand marks the furrow begins,
By which he yields the wine;
The glebe and high-land plow the ground,
In many a low, descending round:
With their "ding whop, and "ger, whoa, haw!"
He guides his oxen as they draw.
And when the sun is at high noon
Re-sings awhile, or hums a tune;
And to sing his oxen from the plough,
They crop the clover blossoms now—
While beneath the shadow of some tree,
He eats his dinner right cheerfully!—
At length refresh'd and gay of heart,
As a he goes to his useful art:
And would that all were free from sorrow,
Like him who owns the verdant furrow;
Health lights his cheek with manly grace,
And joy supreme illumines his face.
And when in the west the sun is low,
And perchance roll'd down his seat of snow,
Heaven spring from the low-land lyeke,
Whom from the flow of oak;
A hundred of flowers gathering, then
He eagerly turns his homing in,
To see the stable that await him there,
And the thousand joys that the farmer's are.—

The day on day rolls swiftly away,
And the early dawn and the evening's ray
Witness the peace of the farmer's life,
And the sweet content of his wife's strife;
The yellow corn, the yellow corn,
The bright yellow corn, from Plenty's horn;
And from the bright yellow corn,
What life has been for us, let the lawn!
Thou'st a day a year of his life there,
Gays the dower of his wife's hair;
And may it ever be seen in youth,
To thank the old man in south,
In our old time they say the too,
And a country man there go;
And they find him looking like the white,
The youth in the morning the white,
As ever they sing a glad home strain
"His Saturday Night, his Saturday Night,"
Saturday Night, with its sweet chime!
Saturday Night, in winter time!
When home are bright, and Kites are clear,
Are the highest Night in all the year.

IMPROVED LEICESTERSHIRE BUCK.

OWNED BY THOMAS WEDDLE, ESQ.

This is one of Mr. WEDDLE's last importation. He carries a large fleece, having sheared 14 lbs.; the quality of which is very fine for such description of long wool. Another Buck, imported at the same time, sheared 16 lbs. of wool, and is a remarkably fine animal.

PIEDMONTESE SILK REEL.

We have been requested to give a drawing of a Silk Reel. The above cut represents a *Piedmontese Reel*, which, with slight modifications, is most generally used and approved in the country. It is simple in its construction, and can be made by any good mechanic who has seen one to copy from.

The frame is 6½ feet long, made of 3 by 5 inch stuff; the connecting bars 20 inches long in the clear.—The legs are 2 feet 3 inches long—the upright posts 2 feet long.

A movable bar extends across the machine, and passes through the top of the two posts near the furnace. This is made to slide back and forth by a shaft with cogs on each end, one of which is acted upon by a bearer fixed on the shaft of the reel, and the other end acts upon a burr moving on the top of the turned post in front, and having a small crank attached. This gives a vibratory or zigzag movement to the slide, and places the threads across each other. The cost of these reels is about \$10, in Philadelphia and other places.

The principal objection to this reel is, that two persons are necessary to attend it. Several attempts have been made to construct them so that one person is sufficient, and with fair success; but these have not yet come into general use.

Farewell, Readers!

What does that mean? Is the New Genesee Farmer to be stopped? No, readers; it will be continued, improved and beautified. But we wish you to remember that this number completes the volume; and, according to the rules of our *Cash System*, we must bid you *farewell*, until you send in your names anew, accompanied with the "*Compliments of the Season*."

We have reluctantly laid aside the list of our old friends, and are now making out a new one. We hope to have the pleasure of transferring all the names from the former to the latter, and adding a large number thereto.—*Send in the names promptly*; so that we may have them entered correctly before January. We will then, with a new dress and smiling face, wish you a "Happy New Year," and continue our monthly visits through 1841.

"We have long been friends together;
Shall a trifle part us now?"

PUBLISHERS.

Genesee County Fair.

A letter from the President of this Society informs us that owing to the absence of the officers, the re-

port is not yet prepared for publication. We may expect it in time for our next. He says—"There was a fine spirit manifested at our Fair, and the Society will now go ahead rapidly. It is no longer a matter of experiment."

GILSON'S STRAW CUTTER.

This machine has been fully tested by a large number of individuals, and is pronounced decidedly superior to any other of the kind. They are for sale at the Seed Store. Price \$20.

Inquiry about Imported Sheep,
Will receive attention next month.

J. Patterson & Co.'s Fanning Mill.

A CORRECTION.—There was an error in the report on implements published in our last, which we wish to correct. In mentioning the superior Fanning Mill made by J. Patterson & Co., it reads "of Chili;" it should read, *of East Rush, Monroe county.*"

RICHARD GRASS SEED.—Just received from Pennsylvania, for sale at the Seed re.
BATEHAM & CROSMAN.

MOUNT HOPE GARDEN & NURSERIES,
ST. PAUL STREET,
ROCHESTER, NEW YORK.

THE Proprietors of this establishment offer for sale an extensive assortment of Fruit and Ornamental Trees, Flowering Shrubs, Green House Plants, Bulbous Flower Roots, Double Dahlias, &c. &c.
Gardens laid out, and Gardeners furnished on reasonable notice.—Persons requiring information on any subject connected with the business, will receive a prompt reply.
All orders, letters of inquiry, &c. must be addressed (post paid) directly to us.
Trees, Plants, &c., will be carefully packed, so that they may be carried to any part of the country in safety; and packages will be marked and shipped as may be designated in the order.
Persons with whom the proprietors are unacquainted, are requested to give a satisfactory reference, or name some person in the city of Rochester, who will guarantee the payment.

REMARKS.—The weather, during the past month, has been unusually mild for the season, and navigation did not close till the end. The millers generally ceased shipping flour about the 20th, since which time very little has been done in the wheat market, and the price has declined a trifle.

Pork is very plenty and fine, and the price low. Butter and Eggs are on the advance. Poultry will be in great demand soon—Thanksgiving, Christmas, and New-Year days come in rapid succession this year, and will be a caution to fat Turkeys and Chickens. Thanksgiving is appointed for Thursday, the 17th inst.; and certainly there never was more reason for heartfelt gratitude towards the Dispenser of all good, than at present. The earth has brought forth her increase in the most beautiful manner; while health, peace, and prosperity, have blessed our whole land.

The New York and other commercial papers, speak in the most encouraging terms of the prospects of the money market, and the revival of business generally. Confidence has become in a great measure restored, and a better state of trade will inevitably follow. The abundant crops of 1840 will nearly pay off our foreign debts; and so effectual a check has been given to extravagant importations, that similar embarrassments are not likely to occur again very soon.

A Monthly Publication, Devoted to the Improvement of

AGRICULTURE AND HORTICULTURE,

AND TO

RURAL AND DOMESTIC ECONOMY.

EDITED BY

ROCHESTER SEED STORE

AND

AGRICULTURAL REPOSITORY.

M. B. BATEHAM, PROPRIETOR.

Another year has been added to the successful history of this establishment, and the proprietor offers his renewed acknowledgements for the continuance of liberal patronage and public confidence.—He would now inform his friends, that having relinquished the charge of the *New Genesee Farmer*, (to abler hands,) he will hereafter devote his whole attention to the business of the Store, confident that he will thereby give increased satisfaction to his customers.

A full supply of all kinds of SEEDS are now on hand for the coming season; part of them raised in this vicinity the past season, by C. F. CROSSMAN and other careful seed-growers, and the rest obtained from the most respectable foreign sources. Knowing that success in this business must depend on *merit*, great pains will be taken to have all seeds just what they should be—*of the right kinds and the best quality*.

Of AGRICULTURAL IMPLEMENTS, GARDEN TOOLS, BOOKS, &c., there is a good supply on hand, but many more will be obtained in the spring, when it is intended to enlarge the establishment so as to allow more room for this class of articles.

MERCHANTS will be supplied with seeds for retailing, at very low prices. The usual number of Agents will receive assortments on commission as heretofore, during the winter.

✂ CATALOGUES will be printed hereafter.

Rochester, December, 1841.

M. B. BATEHAM.

M. B. BATEHAM, } VOL. 2. ROCHESTER, JANUARY, 1871. NO. 1. } JOHN J. THOMAS,
 C. F. CROSMAN, Proprietors. } M. B. BATEHAM, Editors.

PUBLISHED MONTHLY.

TERMS,

FIFTY CENTS, per year, payable always in advance.
 Post-Masters, Agents, and others, sending money free of postage, will receive *seven* copies for \$3.—*Twelve* copies for \$5.—*Twenty-five* copies for \$10.
 The postage of this paper is only one cent to any place within this state, and one and a half cents to any part of the United States.
 All subscriptions must commence with the volume. Volume 1 can be furnished to new subscribers. Price 50 cents.
 Address BATEHAM & CROSMAN, Rochester, N. Y.

Our Prospects.

We last month bade farewell to our subscribers for 1870, but felt strong assurance that we should soon renew our acquaintance. We are happy to say that appearances now indicate that our highest expectation will be more than realised. The names of our old friends, together with very many new ones, are now coming in with great rapidity. The success of the paper the past year, and the promptness with which the subscriptions are renewed, afford the strongest possible evidence that our labors are approved by the public, and encourage us to persevere with renewed energy.

Our most sincere thanks are due to the many Post masters and other friends of agriculture, who have kindly assisted us. We hope they may have the happy consciousness of benefiting others besides ourselves.

Uncurrent Money.

Bills on solvent Banks in this, and the Eastern States, are at par with us. Canada, Pennsylvania, and New Jersey, are about 5 per cent discount.—Ohio, Indiana, Kentucky, and most Southern, money, is about 8 per cent; and Michigan and Illinois is 10 to 12 per cent.

We hope our friends at a distance will take pains to send us the best money they can obtain. We do not *refuse* any of the above, when sent us free of postage, and nothing deducted for commission; but the amount paid by us for discount during the year, is a serious item.

Subscribers in Canada,

Should remember that their Postmasters cannot frank letters further than the lines; so that we are compelled to pay postage on all letters coming by mail from there. This we do not mind, if bills not under \$4 are remitted; but on small bills, the postage and discount together, are too great a sacrifice.

Subscribers residing near the places mentioned below, may pay their subscriptions to the persons named.
 Kingston—JOHN CREIGHTON, (Chron. & Gaz. Office,) and CHARLES HEATH.
 Port Hope—D. SMART, Post Master and President Agricultural Society.
 Toronto—LESLIE & BROTHERS, JAMES F. WESTLAND, and GEORGE LESLIE.

Hamilton—SAMUEL KERR, Merchant.
 London—JOHN NORVAL, (at News-Room.)
 In addition to the above, Postmasters and friends of the cause generally, are requested to act as agents
 BATEHAM & CROSMAN.

TO CORRESPONDENTS.—Several communications are unavoidably deferred. Our friends will greatly oblige us by writing earlier in the month.

☞ A certain correspondent is requested not to attempt to hoax us by sending articles as original which were published under the editorial head of the old Genesee Farmer; nor parts of such articles slightly altered.

Circulate the Petitions!!

Let the farmers, and friends of Agriculture in the Empire State, exert themselves during the present month, and send to Albany such an expression of their wishes as cannot be disregarded. When the yeomanry of the land *speak out* on any subject they are not to be trifled with. Let our Legislature remember that. ☞ See page 9.

For the New Genesee Farmer.

"Election is Over."

The strife of the contending parties has ceased.—And now, that the important question of "who shall be our servants?" is settled, it becomes an interesting consideration, "what shall those servants do on our behalf?"

We have heard much during the past year of the distress occasioned by "tinkering with the currency," of the disastrous results attending "odious monopolies," and "Bank aristocrats." The *poor people* have been greatly pitted by either party, and much has been said by way of condolence; much by way of promise. There is reason enough for all this no doubt; we have felt enough, and heard enough, and read enough to satisfy us that our sufferings *is* intolerable.

But now, brother farmers, for fear that all these fine professions may not be *quite* kept in remembrance let us, in the most respectful manner possible, remind our friends at Albany, that our wants are not yet relieved; and that while we are very glad to see all other necessary objects attended to, we also believe an enlightened policy would require that much more attention should be given to the encouragement of agriculture, than has been for some years past.

Nothing is wanting to secure this desirable result but a general alacrity among farmers in circulating petitions, which it is important to remember should be transmitted to the Legislature at as early a day as possible.
 ONE OF THE PEOPLE.

Clover in Orchards—Inquiry.

MESSES. EDITORS.—The opinion is quite prevalent among farmers, that Clover is injurious to orchards, but I cannot understand *why* it is so. If any of your correspondents can throw any light on the subject, it would gratify a subscriber.

SOUTH WEST.

Note.—The inquiry of South West should have been inserted some time since, but was accidentally mislaid.—EDS.

Meshanocks vs. Robans.

MESSES. EDITORS.—I have raised, the past season, thirty-six bushels of Meshanock potatoes from eleven square rods of ground. If any of your readers have done better, with Robans, or any other kind, I should like to know it; and if I am beaten, I will try again next year.
 Yours, &c., P. BRIGGS.

The Annual Meeting

of the Genesee Agricultural Society, occurs on Tuesday, the 2d day of February next. Business of great importance will then be transacted, and it is very desirable that there should be a full attendance. The Meeting will be held at the Arcade House, at 11 o'clock, A. M.
 H. M. WARD, Sec'y.

"A Happy New Year,"
 To you all, readers! We intended writing a most *exquisite and extraordinary* "New Year's Address," to fill up this page of our paper; and in order that our fertile brain might produce something that would immortalize our names, we kept the matter concocting all the very day of publication, when, lo! on asking the printer how much space had been reserved for our Address, he told us *only twelve lines!* So, gentle readers, forgive the disappointment we have occasioned, and we will, with all sincerity, wish you a very "happy new year," and do all in our power to increase your happiness, so long as we may be permitted to make our monthly visits.

A New Year's Gift.

We print several thousand extra copies of this number of the Farmer, and send them as a New Year's present to our numerous *unknown* friends abroad.—We hope they will duly appreciate our kindness; and if they will "please read and circulate," so as to obtain a few subscribers thereby, we shall feel most abundantly rewarded and truly grateful.

Effects of the Stock on Grafted Fruit.

A late number of the *Yankee Farmer*, contains some remarks of the editor, relative to the influence of the stock on grafted fruit, copied from a former volume, in which he lays down the following propositions:

1. "Stocks have an effect as to bearing years.
2. Stocks affect the scion in hastening or retarding the ripening of fruit.
3. Stocks produce defects on grafted fruit.
4. Stocks affect the color of fruit.
5. Stocks affect the quality of fruit.
6. Stocks have an influence in increasing or decreasing the size of fruit."

This subject is not new to horticulturists. An elaborate article by Dr. Mense of Philadelphia, affirming such influence was reviewed by us several years ago, in the 3d volume of the *Genesee Farmer*; but we did not think at the time, that the evidence was conclusive; and we have seen nothing since, to induce us to change that opinion. Still, we are willing to examine the subject anew with fairness and candor.

We should have been gratified if the editor had given in detail, the facts on which he founds those opinions; but as he has only done so in part, we would respectfully suggest that if these propositions are true, it would not be difficult to prove them by experiments faithfully recorded, from the commencement to the termination, and before witnesses of unexceptionable character. Statements of this kind would have a weight that solitary or imperfect recollections can never produce; and more especially where the observations are hastily taken, without a thorough examination of all the circumstances connected with the subject.

But we cannot properly omit on this occasion, the statement made by Professor Lindley, that "no such influence can be exercised." He adds: "Those who fancy that the Quince, for instance, communicates some of its austerities to the Pear, can scarcely have considered the question physiologically, or they would have seen that the whole of the food communicated from the albumen of the Quince to that of the Pear is in nearly the same state as when it entered the roots of the former. Whatever elaboration it undergoes, must necessarily take place in the foliage of the Pear; where, far from the influence of the Quince, secretions natural to the variety, go on with no more interruption than if the Quince formed no part of the system of the individual."

This decision is emphatic; and so far as we can perceive, the reasoning is as clear and conclusive as can be expected from theoretical considerations alone. If there are facts however, that come in conflict, their weight must be allowed, and the theory should then be revised and amended.

Bearing in alternate years is a habit chiefly observable among apple trees; for when the pear, the peach, the plum, and the quince fail to be regular bearers in this quarter, the deficiency is to be ascribed to unfavorable seasons, or the depredations of insects. The case is otherwise however, with some varieties of the apple; and we have supposed the habit was owing to the trees becoming through exhaustion, unable to produce blossom buds for the next season. In this indeed, we may be mistaken; but of two things we are confident; moderate bearers are commonly annual bearers; and those that we find unproductive, have generally borne profusely in the preceding season. As examples, we would name Yedder's pippins, and the Sweet Bough, or Harvest apple. The former is an alternate bearer; but the latter bears every year; and as we have half a dozen trees set on as many different seedlings, among which we have observed no variation in point of regularity, earliness or productiveness—

we feel at liberty to infer that these stocks have had no influence on the grafts.

But alternate bearers conform to circumstances in commencing their biennial course. We had six trees of a russet apple, all of the same variety, half of which bore abundantly at one time, and the other half in the following year. Now if alternate bearing is caused by excess in one season, and we prevent that excess by destroying a portion of the blossoms, we shall certainly prevent alternate bearing. How then can a stock subject to such conformity, induce a graft to alter its time of bearing? It appears to us, it cannot be.

There are some things in regard to the ripening of the same variety on different stocks however, that we are not prepared to explain. For instance, we have three trees of the Transparent Guigne cherry, one of which ripens a week or ten days before the others. The late trees stand near together—the other at the distance of sixty feet. The subsoil in that part of the fruit garden is very variable—small beds of sand in some places, and clay and stones in others; but we know not what the subsoil is under those trees. Neither do we know whether the stocks are all suckers of the Morello, or a part of Kentish* cherry. We may ascertain this next season. In the mean time we are quite as much disposed to ascribe the difference in the time of ripening, to the subsoil, as we are to the stocks.

It is well known however, that stocks have an influence on the ripening of wood, and tender sorts become hardier when grafted on hardy stocks—not because the latter exerts any specific influence on the former, but because the usual supplies of sap are withheld earlier in the season, and the wood has more time to mature. The same effect is produced when tender shrubs are planted in dry, sterile, rocky situations.

In examining appearances out of the usual order of things, great care is necessary to prevent us from drawing wrong inferences. When different trees derived from the same parent-variety, differ in their fruit, perhaps the first idea that occurs is a difference between the stocks, and the matter is settled too often we apprehend, without further examination. But let us not deceive ourselves. If the stock affects grafted fruit, its action must be regular, every year alike; for having neither leaves nor branches, it is less subject to vicissitude than any other part of the tree; and therefore no variation in the flavor, shape, or color of the fruit, can be justly ascribed to the stock, except it be regular and every year alike. If it is not so, we must search for some other cause; and even if it is so, there may be another cause. Several years ago, we had the Washington plum of a light but splendid red. The tree however, never produced fruit of that color either before or since. The cause therefore could not be in the stocks.

Again—we have three trees of the September pear (Summer Bon Cretien?) growing on pear stocks; and several branches of this fine variety on a Spitzenburgh apple tree. About nine years ago, the latter bore pears that were redder, and sourer, and more astringent, than the fruit from the other trees; and we fancied that the Spitzenburgh had imparted some of its qualities. The cause appeared very plain. Could it be in any thing but the stock? Yes—they never bore such fruit before or since; and the pears are as yellow, and as sweet, and as pleasant, as any that are produced by the other trees. The stock therefore could have had no agency in the matter.

We have two trees of the Summer Bell pear. For several years past, one has borne large fair fruit, chang-

*These two sorts as stocks, are well adapted to test this question.]

ing from green to yellow as it ripens,—while the other tree has produced reddish pears, but so knotty, astringent, and unpalatable, that we have consigned them to the hogs; and year after year there was no improvement. Well, what stronger proof can be wanted that the stock affected the graft?—Not too fast. That tree has begun to bear better fruit; and we have no doubt of its final recovery though the disease we can neither name nor describe.

The large White Currant is a delicious fruit; and we have had some dozen or fifteen bushels planted in a row, all from the same parent-variety, but about one half of them bear fruit very superior to the others—much sweeter and more juicy or melting; and every visitor who has tasted them, concurs in this opinion. And they are regularly so, every year alike. Well, is not this a clear proof of the effects of the stock on the graft?—No—they have no stocks—they stand on their own roots. †

Culture of the Peach Tree.

It has been mentioned by writers on the culture of the peach tree, that hot water poured round the trunk at the surface of the ground, will destroy the worm. We have not yet tried it, but we intend to do so; and in the mean time we would suggest to our readers, that it may be done at any time during the winter or spring when there is no snow and the soil is unfrozen. We think the work would be more thoroughly done however, if the gum be first removed, so that the hot water may enter the habitation of this insect.

Soot has been found excellent for this tree. In one case that has come to our knowledge, its pale leaves were changed into a dark green by this application round its roots; and though the effect may in part have been caused by the destruction of the worm, it has doubtless, acted also as a manure. Those who have stove pipes to clean and peach trees to cultivate, should save the soot for this purpose.

One of the most deplorable conditions that a peach tree can be placed in, is to stand in a meadow or grass ground which is annually mowed. Sometimes we see them in door-yards where the grass grows strong, but where neither pigs, nor sheep nor cattle, are allowed to enter. A half starved tree however, is no ornament in front of a house; but we will not find fault without proposing a remedy. Cultivate a circle round each tree, of two or three feet in diameter; and hoe in manure from the stable, the hog pen, the hen roost, the leach tub, or the wood pile, not forgetting the stove pipe, and the tree will soon compensate for the labor by its beauty and productiveness. †

A Tariff for Revenue made to subserve Protection. The importance of encouraging the Culture and Manufacture of Silk.

MESSEURS EDITORS.—The assertion that Domestic Cottons have been cheapened instead of becoming dearer under a protective tariff, is proved by the present extreme low prices of the article. It is not my purpose, however, to advocate the same measure of high tariff for the protection of every other branch of American industry. The falling off of the revenue on imported cottons, as home production supplied their place, must now be made up by increased imports on other articles of foreign growth or production. Instead then of laying a duty on tea and coffee, as is suggested by the Editor of the *N. Y. American*, why not collect a revenue from such articles as can be produced in the United States? Tea and coffee, although luxuries, are the luxuries of the most precious of all classes in the United States—the independent, well paid, laboring classes. Besides this, tea is not now, as formerly, paid for exclusively in the precious metals; but in the way of trade, either indirectly through England, or directly with China. Neither

is tea or coffee indigenous of the United States; and the latter article is always received in payment or exchange for articles of the growth and manufacture of the United States, to which is often added the commercial advantage on our part, of two freights and two profits. Such as these, are essentially the articles of free trade.

Without enumerating the articles on which an increased duty for revenue, might be levied to an extent sufficient to answer both purposes, namely, *revenue* and *protection*, I will now only advert to the article of Silk, both raw and manufactured; the more especially as the production of the raw material is introducing a new staple to the South, where the strongest opposition to the protective system is found; and where the over production of cotton at this time has induced ruinous low prices and extreme pecuniary embarrassment.

Almost coeval with our Constitution a bounty on codfish has been paid by the government, to encourage the raising of wealth from the ocean. I do not say that the like stimulant should be given to encourage the cultivation of the waste places of the land.—The exhausted and abandoned tobacco lands of Virginia, and the extensive tracts covered with the large leaved pine in the Carolinas.—But these lands are well adapted to the culture and growth of all the varieties of the silk mulberry, from the succulent, broad leaved, *morus multicaulis*, to the more hardy alpine variety.

If imported silks, instead of being admitted into the United States as they now are, free from duty, should be subjected to a permanent impost, sufficient to encourage the silk culture and manufacture at home; and by the duties collected on those necessarily imported, until the domestic article supplies their place, who can calculate the advantages which will accrue to the social independence of the people by such a consummation.

To him who lives in a manufacturing village, belongs the faculty to see and feel the extended influence of its trade; the fruits of its industry, and the variety and extent of its consumption of the products of rural labor.

One of the peculiarities (call it not an evil) growing out of the equality of our institutions, is that extravagance in dress which pervades the poorer classes in the United States. If this is an evil, it is indigenous to our moral and social atmosphere, and not to be eradicated. It is one of those passions of the soul, without which industry, in the great mass, would be deprived of more than half its stimulus and aliment. Let our government then, by a wise and fostering policy, enable the people to produce that which they must have, but cannot pay for if purchased abroad.

S. W.

Dutch Dairies.

The Journal of the English Agricultural Society, contains a long and interesting account of the Holstein Dairy system—of those splendid manufactories of "the best butter in the world." Its length precludes the publication of the article in full, but a few prominent features may not be useless nor uninteresting to many of us, who, *comparatively* speaking, make butter without any order or rule. The Dutch carry on the business on a large scale, the larger dairies varying from 100 to 400 cows, and the churning is done by horse-power.

Good butter makers often differ in their modes of operation, but in one thing they always agree, and always will; that is, *cleanliness* and *purity*. The Dutch understand this, and attend to it most rigidly in the construction and management of their buildings. These are, a milk cellar, a butter cellar, a churning house, a cheese room, and a kitchen for washing all vessels, and cooking for those engaged in

the dairy work. The milk cellar is made to front the north, and is shaded by trees from the sun; and in choosing the site of the dairy, particular care is taken to place it beyond the reach of every thing calculated to generate bad odors, or in any way to taint the atmosphere. The floor is sometimes flagged, but is generally of brick, neatly fitted, so that no water may lodge in the joints, and slightly inclined, to facilitate mopping, "which is never omitted to be done twice a day, notwithstanding that every avoidable impurity is carefully guarded against, and every drop which may fall at the time of the milk being strained, is instantly wiped up." A great improvement has been lately made, by dividing the floor into compartments or squares by brick ledges 3 or 4 inches high. In these, the milk dishes stand, and they are filled twice a day with cold water, by means of a pump, a small sluice being at the lower extremity of each, for the escape of the water. This is of great value, preserving the milk much cooler in summer, and more completely effecting the separation of the cream. We would suggest the use of water-lime mortar in the construction of these squares, as being cheaper and better.

The milk cellar is sunk 3 or 4 feet in the ground, and is 16 or 18 feet high, the best having an arched roof of masonry, as being more conducive to coolness, and are furnished with two rows of windows on the north, east, and west side, to admit circulation of air. The lower row are lattice, with blinds, and gauze frames, to exclude insects; the upper glass, which can be exchanged for gauze when needed.

The building for the cheese room is entirely separated from the milk, butter, and churning cellars, and is placed as far as practicable from them, a tainted air affecting the quality of milk and butter, to a degree, which is, in general, little suspected.

The persons required to manage a large dairy, are, an overseer, a cooper, one or two cowherds, one or two swine herds, a head dairy woman, and dairy maids in the proportion of one to eighteen cows.—The overseer has the general charge of the cattle, of the swine, and calves, and sees that they are properly cared for, the cows milked clean, that every thing is in its place, and that every man does his duty. The head dairy woman must understand thoroughly the whole management of the dairy house;—she must observe accurately when the milk is to be skimmed; the degree of acidity it must attain before churning; the temperature during churning; and must attend to the operations of working, salting, and packing the butter. She must be punctiliously clean herself, and keep every one else so. In large establishments, she has full employment, and needs the assistance of one or two of the more experienced dairy maids. The dairy maids, besides milking their 18 cows, washing vessels, &c., work in the garden in summer, spin in winter, wash, bake, and cook. They rise at 3, and sometimes at 2, in summer, but are in this case allowed two hours sleep at mid-day. Girls in this country, we presume, would hardly be willing to work so hard.

Each dairy maid marks her own particular cows by a colored ribbon tied round their tails. They bring their milk from the field to the cellar, by a wagon, drawn by one horse, having long bars attached, in which iron hooks are inserted, and on these the pails, containing 30 or 40 quarts each, are hung so as to swing free of each other. The milk is effectually prevented from spilling, though they get many a rude jolt, by thin circular plates of wood, floating upon the surface.

The particular process of butter making is too valuable to be abridged, and we quote it entire.

"It has already been stated as a rule, that the

cream must be removed from the milk before any acidity is perceptible, if butter of first rate quality is looked for; and it has been found by experience that a cellar temperature of from 60° to 62° Fahrenheit, is the most favorable; a complete disseverment of the cream then taking place in 26 hours: whereas a great degree of warmth, though it quicken the separation, still more hastens the souring process, which operates injuriously not only on the quality but the quantity of butter. In a cold temperature, the separation is effected much more slowly, so that 48 or even 60 hours may be required; this, however, is the longest period that may be accorded without incurring the risk of imparting a rank, unpleasant flavor to the butter, which even if not perceptible on its being first churned, manifests itself very shortly afterwards.

"The commencement of acidity in milk, is indicated by a very slight wrinkling of the cream, and a scarcely perceptible acid taste. So soon as these signs appear, the work of skimming must begin, even though the milk have only stood 24 hours; and the cream is poured through a hair sieve (which is kept for this purpose, and must never be used to strain up the new milk with) into large barrels, containing about 240 quarts each (usually sufficient for one churning) in which it remains till the necessary sourness is attained, which in summer follows in 24, in winter seldom under 36 or 48 hours; unless when the small quantity of milk admits of it being partly strained at once into the cream barrel, and the remainder added without skimming from the milk pans when cool.—This method, undoubtedly, gives at all seasons the greatest return of butter; but as is generally believed, not of so rich a quality as that produced from cream alone; and, moreover, in a large dairy, during the time the cows are in full milk, would occasion much additional trouble, an almost ceaseless churning, and a total prevention of cheese making. The cream having attained its requisite acidity, during the advance to which it must be frequently stirred with a small churn staff to prevent it coagulating, technically called becoming cheesy, the next object of the dairy woman's skill is, the degree of warmth or coolness which must be imparted to secure good butter. In warm weather the churn is rinsed with the coldest procurable water, in which a piece of pure ice is often thrown, and sometimes, though more rarely, cold spring water is added to the cream about to be churned, which operation is then always performed either very early in the morning or late in the evening. In cold weather, on the contrary, warm water is applied, both to rinsing the churn and to the cream itself. The churning being completed, the butter is taken off by means of a large wooden ladle, and carried in a tub directly to the butter cellar, where, in a large trough, hollowed out of the trunk of a beech or oak, very smoothly polished off inside, and provided with a plug hole at the lower extremity, (beneath which a small tub is placed to receive the expressed milk,) the butter is slightly worked, and salted with the purest salt, then moulded with a wooden ladle into a mass at the upper end of the trough, and left for some hours to soak and drain. In the evening it is thoroughly kneaded and bent, or rather slapped, the dairy maid repeatedly lifting a piece of 3 to 4 pounds, and slapping it with force against the trough, so as to beat out all the milky particles: and thus, lump after lump being freed from extraneous matter, the whole mass is spread out, receives its full proportion of salt in all about 1½ oz. per pound,) which is worked with the utmost care equally through it, and again moulded into one compact mass. The butter in Holstein is seldom if ever washed, as water is believed not only to rob it of its richness and flavor, but as being itself susceptible of putrefaction, to be equally inimical as milk, to its preservation. When a sufficient quantity is ready to fill a cask, the several churnings are once more kneaded through, a very little fresh salt added and packed into the barrel, which is made of red beech wood, water tight, and previously carefully washed and rubbed inside with salt. Much attention is paid that no interstice shall remain either between the layers of butter or the sides of the cask. A cask is never begun to be filled until it can be completed, as thus alone the butter can be exactly of the same flavor and color, which is probable one reason why small dairies, under whatever management, never produce such good butter as large ones, as the small churnings must remain long exposed to the air, until the requisite quantity is in readiness.

The qualities of first rate butter are considered to be, 1st, a fine, even yellow color, neither pale nor orange tinted; 2d, a close, waxy texture, in which extremely minute and perfectly transparent beads of brine are perceptible; but if these drops be either large

or in the slightest degree tinged with milk color, it indicates an imperfect working of the butter; while an entirely dry, tallowy appearance, is equally disapproved; 3d, a fresh fragrant perfume, and a sweet kernelly taste; 4th, good butter will, above all, be distinguished by keeping for a considerable time, without acquiring an old or rancid flavor."

Two Good Farmers.—

Not too good farmers— for those that are merely good, are almost as rare as white blackbirds. When we say "good," we do not mean what is commonly understood,—industrious, money-making men,—but who perhaps apply a large portion of their labor to very bad advantage; but those whose whole course, in all its departments, is such as accurate and repeated experiments have proved best adapted to the soil and climate; which not only affords the greatest profit each year, but is constantly improving instead of exhausting the land.

These two specimens are given in the late report of the Farm Committee of the Hartford County Agricultural Society, published in the New England Farmer. The first is that of John B. Davis, of Derby, whose farm consists of seventy-five acres, and from which the following very respectable average annual receipts are derived.

Apples and Cider,.....	\$500
Hay,.....	200
Potatoes,.....	100
Pork,.....	80
Sheep,.....	75
Grain,.....	75
Wool,.....	25

Two men labor on the farm the year through, with occasional additional help, but no precise account of the amount expended, was rendered.

It will be seen that the orchard is the most profitable, the trees being kept in the finest condition, to which frequent tillage doubtless contributes. *Five hundred dollars* were received last year (1839) for winter apples of the choicest varieties, and forty dollars for cider sold, besides thirty barrels kept [for what purpose?] and apples fed to hogs, cattle, and horee. All the farm, except the woodland, has been subjected to the plough, although hay is the chief object aimed at in cultivation. Only small portions of the land are tilled, on which the cultivated grasses have become less luxuriant. The routine of crops adopted is, 1st, corn on sward with manure; 2d, potatoes with manure (sometimes followed by turnips); 3d, rye or oats or grass seed. For the corn, (which is Dutton and White Flint,) twenty double loads of manure are spread on the grass before ploughing, and afterwards holes dug in each hill in which a small handful of plaster and ashes is dropped and mixed with the soil at planting. The average crop is seventy bushels an acre. The potatoes are planted with equal manuring, and yield two hundred bushels. The rye yields twenty-five, and the oats seventy bushels, two and a half bushels of the latter being sown to the acre, which is ploughed in, harrowed, and the grass seed covered with a bush.

About twenty acres are kept in madow, which continue in grass from six to eight years, and the average crop is estimated at two and a half tons to the acre.

Of manure, seventy-five loads are made yearly, and fifty purchased; one ton of plaster, half a ton of shell lime, (which is added, as indispensable, to the compost,) and fifty bushels of ashes are also used.

The stock consists of two yoke of oxen, two milch cows, seven hogs, thirty-five Bakewell sheep, and one horse.

The other farm, is that of Wm. K. Townsend, of East Haven, on New Haven harbor, and consists of 43 acres of salt grass, and 118 acres of upland. The report of this farm, by the committee, we have read

with great satisfaction, and, did our limits admit, we should be glad to give it entire. Such a report, mere matters of fact statement as it is, is more calculated to inspire a taste for farming, than all the fine declamation and eloquent reasoning we ever heard or read. As it is, we must content ourselves with a statement of some of the most interesting facts.

The buildings are arranged with a strict regard to convenience, being erected "after approved models, and they show conclusively that much labor may be saved by judicious arrangements, with but trifling additional expense. For each implement of husbandry, a special and convenient place of deposit is also provided." The fences throughout are good. The soil is sandy and gravelly loam, naturally light and thin, and left in wretched condition by its former occupant. Successive portions have been reclaimed from this condition, by careful and thorough tillage, collecting the stones into strong and durable fences, and applying a heavy coating of manure. With the exception of two fields, which have not thus been reached in the regular order, the farm has been greatly improved. "After such improvement, however," say the committee, "these lands are not, as is too often the case, again reduced to their former condition, or rendered still less productive, by injudicious and excessive croppings, without any return to the soil; but by such subsequent careful treatment, as every good farmer ought to give his land, they are kept constantly improving."

The corn crop, by measurement, has averaged seventy bushels the acre; potatoes, two hundred and fifty bushels; rye, twenty-five bushels; oats, (rarely raised,) forty-five bushels; and barley, thirty-two bushels. Great crops of pumpkins are also obtained, by planting in large mowed hills ten feet apart each way, six or eight seeds, the two most vigorous shoots being allowed to remain.

Three hundred double loads of manure are annually made on the farm, of which more than fifty are from the hog-pen. It is always applied unfermented, except to meadows and root crops, where compost is used. Three-fourths of a ton of plaster are yearly spread upon the meadows and pastures, and fifty bushels of shell lime applied to the compost heap.

Great profit has been derived from the breeding of improved stock, consisting of Durham cattle, "Thin Hind" hogs, and Bakewell sheep. The use of the revolving horse-rake in securing hay, of the cutting box for feeding stock, and of stables for cattle in winter, has effected a great saving.

Accurate and regular accounts of all operations are constantly kept, from which the following statement is taken of cash received the past year, over and above the consumption of a large family:—

Fruit,.....	\$ 200
Vegetables,.....	50
Neat stock,.....	1,310
Hogs and pigs,.....	585
Wool,.....	50
Milk, butter, and calves,.....	2,143
Rent of stock,.....	50
Gross income in 1839,.....	4,388
Deduct cash paid for labor and feed of cows,.....	1,452
Nett income in 1839,.....	\$2,936

The great profit thus secured, appears to have resulted from the establishment of a well digested system of farming, faithfully and energetically carried out, and from the guiding of all the operations by constant and accurate accounts.

Improving Sandy Land.

Messrs. Editors—I find that your paper affords a valuable medium, through which we, who are young

or inexperienced, can obtain information. I therefore wish to ask one or two questions.

My farm is situated on the oak openings of Monroe county. The soil is what may be called a light, sandy loam—some parts nearly pure sand. One side borders on a flat marsh, part of which, to a considerable depth, consists of very black earth, which I suppose to be vegetable mould, formed probably by the decay of leaves and wild grass, which latter grows very abundant all over the marsh.

Now, I wish to inquire whether this black earth will make a dressing for the upland, of sufficient value to defray the expense of carting it on; and if so, how and when is it best to apply it?

I also want to ask what kind of a fence can best be made across the above mentioned marsh, where fence timber is very scarce, and money ditto.

A YOUNG FARMER.

December, 1840.

Hoven Cattle.

Messrs. Editors—The cure for this complaint which you copied from the Farmers' Cabinet, will, in slight cases, prove effectual; but in severe cases, resort must be had to other methods.

The contrivance of Dr. Morris, of England, first published in 1793, is the most effectual, and may not be known to all of your readers. It consists of a flexible tube, made of wire, covered with soft leather.—Dr. M. found that the distance from the fore teeth to the first stomach of a large ox is six feet; therefore the tube should be a little more than that length. On this being thrust down the animal's throat, so as to enter the first stomach, a large quantity of feated air, or gas, will be discharged, and instant relief afforded.

If this instrument is not at hand, recourse must be had to tapping. Take a sharp pen-knife and introduce it into the puncture, between the hock bone and the last rib on the left side. To assist the escape of the gas, a quill, or small tube, may be introduced into the orifice. As soon as it ceases to escape, a pitch plaster should be applied upon the place; and, if all is done with care, but little injury will result from the operation.

The following cordial may afterwards be given with advantage:—Take 2 ounces of Anise seed, Diapente, and Elecampne, in powder; 2 ounces tincture of Rhubarb, and one ounce of spirits of nitre. Mix and give in a quart of warm gruel.

Respectfully yours,

AN ENGLISH EMIGRANT.

Near Albion, Orleans co.

For the New Genesee Farmer.

Curing Hams.

What! another method? Yes, we answer, and request the incredulous to try it before they condemn. On the day, or day before, killing your hogs, scald your tub, (a pine tub is preferable,) and turn it over a smothered fire of corn cobs or maple chips. If this process is skilfully done, it will thoroughly infuse the smoke into the wood. Let the tub be wet or moist when smoking.

When your hams are perfectly cold, sprinkle the bottom of the tub with salt, and pack in the usual manner, with little or no salt. Pour upon the hams a pickle (perfectly cold) sufficient to cover them. To six gallons of water add six pounds salt and one fourth pound salt petre. This completes the whole process of curing; and your hams for winter and spring use, are much better than when cured and smoked in the old way. The process of keeping hams in a tight and over heated smoke house, is the great cause of their premature decay.

If the hams are to be kept during the next summer, the brine must be changed and more salt added. H.

For the *New Genesee Farmer*.

To the Farmers of Niagara County.

Purely from the desire that agricultural knowledge may be disseminated, and our husbandmen thereby rendered more prosperous, intelligent, and respectable, do I address you a few thoughts, through the columns of this paper. I am well aware, however, that I am by no means the proper man to perform this task successfully; for I acknowledge myself but a child in practical agriculture; a farmer of only eight years experience, while many of you have devoted a whole life thus far to the pursuit of husbandry. I know my ignorance, I am deeply sensible of my destitution of agricultural science, and, indeed, I am no less deeply ashamed of it. Nevertheless, I have felt towards this department of business an ardent attachment, as also towards the farming community, for these many years. And if there is about me anything of the nature of pride, it is not of the manner in which I pursue it, but of the calling in which I am engaged.

There is to me a substantial pleasure in agricultural pursuit—a satisfaction, peace of mind, a tendency to contentment, freedom from vexations, and an influence, which leads a man into close intercourse with his Maker, which is no where else to be found in any earthly avocation. It is a calling, the enlightened and scientific pursuit of which gives more substantial independence, more dignity, more stability of character, and generally a greater competence than any other.—It is a fact, not to be controverted, that agriculture, in the broad sense in which I would use the term, is the foundation and support of all others. Would a statue fall on the removal of the pedestal? So surely would commerce, mechanics and manufactures, were they without the support of agriculture. She is the only produce of material wealth, and therefore every other trade and profession is, either directly or indirectly, dependent upon her, and they can advance but a step without her.

But it will readily be conceded, that the peculiar advantages and qualities which are set before the farmer, and which for the most part are attainable by him, are possessed only by a comparatively few. And why? Is it not for the want of agricultural science and intelligence! If this be the fact, ought we not to make use of all the means within our reach to remove it!

And how can this be done more surely, more effectually, or more cheaply, than by the general circulation of agricultural papers? There can be no question that very great advantages are derivable from this course. Some of you, I know, will accede to this statement; for, not long ago, a respectable and an observing farmer, whose residence is not five miles from my own, said to me, that merely in passing through the country he could tell whether a farmer was in the habit of reading agricultural journals, by the general appearance of his farm, fences, buildings, stocks, &c. And again, I heard a farmer say, not long since, (and a thorough-going, business man he was too,) that he wished there was not an agricultural paper to be had, for by their influence the crops were so superabundant as to ruin the market. And besides; it was the estimate of the late Judge Buel, that every additional subscriber to such journals, increased the annual product of the soil at least ten dollars. So that five hundred thousand new patrons (only the farmers of New York and Ohio) would add five millions of dollars to our agricultural productions.

On the same calculation, suppose the twenty-five hundred farmers in our county, who are without an agricultural paper, were all to become subscribers, at the commencement of the new year, a net profit would be added to their annual income of more than twenty-three thousand dollars. And I have no doubt

the amount of happiness, and useful entertainment would be ten fold greater than that.

A paper, like the *New Genesee Farmer*, at fifty cents a year, (less than one cent per week) is so low that none can find an excuse for not taking it. We do not consider our true interests, when we neglect to take so valuable works at so small an expense; at least, from my own experience I do not so judge. I refer particularly to the *NEW GENESSEE FARMER*, in preference to other papers of the kind, for the reasons that it is, in my estimation, ably conducted journal; that it is offered at so very low a price; that it is published in our own neighborhood; it is acquainted with our own soil and climate, and it is better adapted to the agriculture of Western New York than any other.—And if we who are in the habit of reading such journals, would induce one half of our brethren of the plough to become subscribers, I have no hesitation in the opinion, that more than twenty times the cost of the paper would be their advantage. SHALL WE TRY?

Yours respectfully,

Thorn Hill, Dec. 1840.

W. PARSONS.

Hints about Common Schools.

Pursuant to our promise for devoting a portion of our paper, regularly, to the promotion of Education, we now insert some paragraphs from a friend in reference to *Common Schools*. Elsewhere, in our columns, there will be found some articles of a general character respecting the advantages of education.

TEACHERS OF SCHOOLS.

Much as we hear of the difficulty of procuring good school teachers, we believe that an ample sufficiency of well-qualified instructors may be had at all times,—if proper encouragement be offered to those who labor faithfully in our schools.

Offer FAIR WAGES, and treat with PROPER RESPECT the person whom you engage to discipline the "immortal minds" of the rising generation around you. Such a course would command for our schools much of the talent usually devoted to other pursuits—pursuits which generally at present offer pleasanter and more profitable inducements for the exertion of such talents and qualifications as are necessary to constitute a GOOD TEACHER. "Supply" would readily follow the "demand" in this, as in the legal and medical professions, and in other pursuits, IF THE INDUCEMENTS WERE—as they ought to be—RENDERED EQUALLY STRONG.

ARE YOU A PARENT?

If you are, the love which you bear your children should stimulate you to cast a friendly eye towards the school-house wherein the children of your neighbors are instructed along with your own. Your presence occasionally in the school-room, with a few remarks from you, showing your respect for the teacher and your solicitude for the welfare of the scholars, would promote the progress of the school far more than the money which you pay in taxes for its support.

DUTIES OF TRUSTEES, ETC.

Were our Common Schools regularly visited by even one in a hundred of the persons who profess the most zealous regard for the rights and welfare of the people, a spirit of emulation would be incited that would soon benefit teachers and scholars in a manner that would shed incalculable blessings on the population of the State.

Even of the Trustees of Schools—the men elected specially to promote the welfare of the system of Public Instruction—there are thousands in the State who scarcely enter the school-house for any purpose during the year! How can any honest man satisfy his conscience for such criminal disregard of the solemn duties devolved upon him as a Trustee for promoting the spread of knowledge and morality among the youth committed to his charge?

Genesee County Agricultural Society's Exhibition and Fair.

HELD AT ALEXANDER, OCT. 11, 1840.

The First Annual Exhibition and Fair of this Society was very numerously attended and the competition spirited, considering the time it had been in operation. The Society was not known until after the middle of July, and it had become so late in the season that there could be but little competition except in animals, and of them there was a fair show.

The premium for the best short-horned Latham bull was awarded to Mr. B. Murphey, of Le Roy; and he well deserved it, for it is a very fine animal.

The premium for the best Devonshire bull was awarded to Mr. Vernon of Le Roy. On his imported bull.

The best Durham bull calf was adjudged to L. E. Heston of Batavia. The calf was from the herd of P. A. Remsen, Esq., of Alexander.

Mr. Heston also drew the premium on the best yearling steers.

Mr. Beck, of Sheldon, who exhibited a fine herd of Devonshires, drew premiums for best bull calf, best yearling bull, best cow, and best three year old steers, all Devonshire. Mr. B. sold several of his animals on the ground at very fair prices.

P. A. Remsen, Esq., drew the premium on the best short-horned Durham cow.

To Mr. S. Allen was awarded the premium for the best common cow.

Mr. A. Toney of Alexander, received the premium for the best yoke of oxen; and Mr. C. Dickison the second best.

Mr. Samuel Heston of Batavia, received the premium for the best four year old steers, and the second best yearling steers.

There being but little competition in horses, Mr. J. Hammond received the premium for the best breeding mare, and Mr. Ward of Le Roy, the premium for the best span of working mares.

There was a very fair exhibition of Swine. Mr. J. S. Harrison of Darien, received the premium for best boar and sow and pigs; all Berkshire. Mr. O. T. Fargo the premium for second best boar: Essex half black.

In Sheep there was a fine competition. Best buck, for wool, was awarded to Mr. L. E. Heston, of Batavia, and best buck, for butcher, to Mr. J. Heston, of the same place, for South Down buck. Gen. Stanton of Middlebury, had the premium for the best pen for three or more ewes.

In Field Products there was but little competition. The best acre of Winter wheat was awarded to Mr. Lewis Clark of Darien; product 60 bushels 10 lbs.—Best acre of Spring wheat to Mr. H. Bramard of Alexander; product 36 bushels 1 qt. Also the best acre of corn; product 82 bushels 5 qts. Best acre of potatoes to Mr. A. R. Taylor; product 400 bushels.

In the Domestic Arts, there was of necessity but little competition; the most in silk, however. There were some fine specimens shewn of silk in various stages of manufacture, from the Cocoon to very fine reeled.

The premium for best 10 pounds of Cocoons was awarded to Col. S. Danham of Batavia. Best specimen of reeled silk to Mr. Hart of Le Roy.

Mr. L. E. Heston received the premium for the best piece of domestic flannel. Mrs. J. Heston of Batavia, received the premium for the best 25 lbs. of butter—Mrs. E. Bishop of Attica, the premium for the best cheese.

Discretionary premiums were awarded to Mrs. E. Bishop of Attica, for specimens of linen in thread, stockings and napkins, and they were very fine indeed. Mrs. Herrick of Bethany, for specimens of silk tow stockings. Also to Mr. Churchill and Mr. Duncan for specimens of filled cloth.

Mr. L. E. Heston, Mr. J. Heston, Mr. Vernon, Mr. Beck, Mr. Remson, Mr. Bramard, Mr. Clark and Mr. Bishop, donated their premiums to the Society.

An address was delivered by the President, and the following persons elected officers for the ensuing year:—

THOMAS C. PETERS, Esq., of Darien, President. Gen. P. Stanton, Middlebury, E. Bishop, Attica, E. J. Pettibone of Elba, Truman Lewis of Onondaga, Phical M. Ward, Perry, Holland Earle, Penn-broke, F. P. Pendle, Batavia, Jesse W. Drummond, Le Roy, Vice Presidents.

C. P. Turner of Batavia, Secretary. Thomas Biddle of Darien, Corresponding Secretary. Lewis E. Heston of Batavia, Treasurer. And a Manager for each town.

Respectfully yours,
T. C. PETERS.

My Summer Crops.

Messrs. Editors—According to my promise, I now send you an account of some of my crops of the past season. My object in thus exhibiting my farming operations to the public, is not that I think them extraordinary, but that I consider it the duty of each member of society to do that, as an example, which he would have others also do. Knowledge, by communication, becomes common property. The plan of comparing thoughts and notes, leads to correction of errors and adoption of truth; and also enables us, by taking advantage of the experience of others, to avoid many things which it would otherwise require our own experience to convince us as being fallacious; by which we also avoid not only loss from failure, but also that vexation of mind, which is the attendant of loss. And for this reason, we should tell "the truth, the whole truth, and nothing but the truth." All important truths, whether of failure or of success, in the operations of the farm, should be given to the public, that they may become known to all.

ROBIN POTATOES.

These I planted on the 2d of May, on a clover sod, without manure. The amount of seed was about three quarts short of three bushels of whole potatoes, cut into pieces of one or two eyes, and spread over three-fourths of an acre of land. The rows were four feet apart, and the cuttings were placed sixteen inches distance in the rows. The manner of planting, was to make the holes from two to three inches deep with the corner of a hoe, which can be done about as fast as a man can walk, with one stroke of the hoe; a child to follow and drop the cuttings, one in a place; and a boy to cover up, level, with loose earth. I planted thus shallow, in consequence of having about lost a crop of potatoes last year, on rich land, by having planted deep, as I had been advised by a brother farmer. When the potatoes were about six inches high, they were weeded with cultivator and hoe; then plastered, and on the 15th of June they were capaciously killed, as the distance between the rows allowed. No more labor was bestowed upon them till they were dug in the last of October, when they yielded me two hundred and twenty-eight bushels; equal to an increase of seventy-eight fold.

I have used these potatoes in my family, and pronounce them equal to the best for the table; they are dry, mealy, and well flavored.

With regard to the value of these potatoes, they are superior to other varieties, inasmuch as far less seed is required; there are fewer small potatoes; they can be planted with about half the labor; owing to their size and to their growing in a cluster close to the foot of the stalk, they can be dug with much less labor; and in no respect do they yield to any others in point of intrinsic excellence.

INDIAN CORN.

I had two pieces of corn:—the first, two acres and seven-eighths, was clover sod, on which I drew eighty loads of long manure, and ploughed under. The seed, the red blaze variety, after soaking twenty-four hours in soap suds, and being rolled in plaster, was put into the ground on the 20th of May. The rows were three and a half feet apart each way. During the season, plastered once, and went through with the cultivator twice each way, followed each time with the hoe. About the middle of September, cut up the corn at the roots, carted it off the field, and stooked it for ripening, and at the husking got four hundred and sixteen bushels of ears, which yielded on shelling, thirty-five quarts of corn from two bushels of ears; making two hundred and twenty-seven and a half bushels of corn; equal to seventy-nine bushels and six quarts per acre. The other piece, two and a quarter acres, was of the same character, equal-

ly good, clover sod, as the other, but was not manured. It was ploughed and planted six days later; the seed was of the same kind, prepared in the same way; but owing to the ground having become quite dry, at least one-third of the seed failed, which would not have been the case had it not been soaked. The after culture was the same as that of the first field, and the yield was forty-seven bushels per acre.

FIELD PEAS.

The latter part of April, I put in two and a half acres of Gold Vine Peas, (having obtained the seed at Mr. Batcham's Seed Store,) from which I harvested sixty-three bushels; equal to twenty-five bushels per acre. The land was neither good nor bad, but indifferent. Adjoining, in the same field, and at the same time, I sowed two acres to Marrowfat Peas, from which I harvested thirty-two bushels, or sixteen to the acre. Many of the vines of the Marrowfats became mildewed, and were consequently barren; whereas the Gold Vines remained perfectly bright through the summer, and every vine was prolific; many bearing from eight to sixteen pods.

Owing to the superior excellence of the Gold Vine Peas, and their scarcity, I have reserved the crop for seed; which I unhesitatingly recommend, and offer to my bretheren of the plough for six shillings per bushel.

SPRING WHEAT.

The Italian and Siberian varieties were very badly shrunk.

HALF BLOOD DURHAM CALF, OSIRIS,

Was dropped April 26th. At three and a half months old he weighed 380 lbs.; at five months old he weighed 470 lbs.; and to-day, Nov. 26th, at seven months old, he weighs 650 lbs. And this is a "skim milk calf;" taken from the cow at a week old; fed on new milk two weeks more; from that time till the first of Nov. fed on sour skim milk and hasty-pudding, and from that time to the present, on boiled potatoes and hay.

Now, Gentlemen, I have done my duty to myself and to my brother farmers; I have told them what I have done, and now I wish they would reciprocate the favor; and if they can tell a greater story than I have, I will attempt another year to be even with them.

Very respectfully yours,

EDWARD WILBUR.

Pittsford, Nov. 26, 1840.

REMARKS.—In behalf of our numerous readers, we tender Mr. Wilbur many thanks for the foregoing communication. One page of such statements, containing the results of actual experience, is worth more, in our estimation, than a whole volume of theorizing speculations. We unite with Mr. W. in the desire that many of our readers will reciprocate the favor, and send us accounts of their farming operations, whether successful or otherwise, during the past season.—Eds.

Biddle's Address.

Editors of New Genesee Farmer:

GENTLEMEN—I have read with much edification, the address delivered before the Philadelphia Agricultural Society, by NICHOLAS BIDDLE, Esq.; and I sincerely believe you would confer a favor on many of your readers by giving it a place in your columns.

Yours sincerely,

A LOCKPORT FRIEND.

REMARKS.—The address alluded to, is indeed a most excellent one; and we should be glad to publish it entire, would our space permit, and were it not for the circumstance that many of our readers dislike long articles. As it is, we select the most interesting and important portions, and omit those of a more local character. We have no doubt that most who read the following, will wish we had published the whole.

After congratulating the society on their exhibition, and what they had accomplished—the aid received from Government, and the bright prospects before them; and alluding to the numerous advantages possessed by the farmers of Pennsylvania, the eloquent speaker proceeds thus:—

"Having thus spoken of the advantages which we enjoy, I proceed to the less agreeable but more profitable inquiry, why our farms are not so productive as they ought to be—and I make the comparison between Pennsylvania and England, because I think England, on the whole, the best farming country in Europe; and our English friends must understand, that while we amuse ourselves occasionally with some of their peculiarities, we pay them the highest compliment we can, by proposing them as the constant models of our farming. Now why is it, that with all the natural advantages in our favor, the English farmers beat us? I will tell you what I think of it.

"In the first place, we do not do justice to our own profession. Farming is not liked, either among the young people, because it is considered a lonely exercise from gaudy—or among the calculating, because it is thought unproductive. This last is, I think, a total misapprehension; and as I regard its correction essential to our success, I venture to say that farming ought to be more profitable in Pennsylvania than in England. The common notion is, that the high price of labor in Pennsylvania, make farming unproductive, and the opinion is repeated without examination, till at last it is generally believed. Now the productiveness of farming, like the productiveness of every other occupation, depends on the expense of raising an article and the price you can get for it when it is raised.—These expenses are the rent for the land, the taxes, the manure, the prices of laboring cattle, of laboring implements, and of laboring men.

"The land which can be rented in America for two or three dollars, could not be rented in England under ten or twelve dollars an acre—so that already the land itself costs three or four times as much. When you have got possession of the land, the tax-gatherer and the tithe-man soon make their appearance, and take from the farmer fifty three per cent. on his rent. Here there are no tithes, and the tax, out of the immediate vicinity of the city improvements, would scarcely be one-tenth of the English tax—so that while on an English farm of two hundred acres, the rent and charges would be about \$3,000
The same rent and charges would here be 7,000

Making at once a difference of \$2,300
Next, all manures are cheaper in Pennsylvania—cheaper in themselves, and rendered more cheap by the facilities of transportation.

Laboring horses are about one-fourth cheaper in Pennsylvania; and, moreover, the work which two horses do in England, is generally done here by one. Cows, too, are much cheaper here.

"Laboring implements are cheaper and better, the wood being so much lower-priced and durable. Of all these elements of work, there remains only laboring men who are cheaper in England; they are cheaper by about 30 to 35 per cent.; but even say that wages are 50 per cent. higher in Pennsylvania than in England. But then, although the nominal rate of wages is higher, yet you actually get more work done for the money. The climate gives you more long working days than can be relied upon in the climate of England, where out door work is necessarily much suspended, and the American laborer works better, for the very reason that he is paid better. And the proof, which seems decisive, is that although money wages are higher here, piece-work, contract work—whether to dig a canal or to reap a field, is done cheaper in America. And, accordingly, one of our most intelligent Philadelphia county farmers, Mr. Walker, always declared that his farm-work was done twenty per cent. cheaper in Pennsylvania than in England.—But supposing it to be higher—labor is only one of the elements—for we have seen that the rents are three or four times as high—taxes ten times as high—manures, implements, cattle, all dearer—and far overbalancing any difference of wages were it even real.

"Let us now see what are the prices obtained for what is raised. Wheat is higher in England—flesh markets are higher. But wheat forms only one-fourth of the crop—and, on the other hand, the great staple, wool, is dearer here—potatoes are twice or thrice as high here—and, therefore, the English compete with us in our own market—turnips, cabbages, all vegetables, generally dearer; so that, after all, taking the average, farm produce is not higher, or very little

higher, in England, while all the materials of raising it are much higher there—so that, on the whole, farm labor ought to be as lucrative in Pennsylvania as England.

"With regard to wages, it may sound strangely, yet I believe it to be true, that the real interest of all farmers is, that wages should be high, and for this reason. A laboring man is not a mere machine—a human poor-boy, into whose mouth is put a daily number of cents never to re-appear, but a living being with wants and desires, which he will not fail to gratify the moment he possesses the means. If he can earn only a scanty pittance, just enough to keep him alive, he starves on accordingly—his food, bread and water, a half-fed, half-clad, wholly untaught animal, with a useless mouthful of carnivorous teeth. But if his wages increase, he instantly employs them in comforts; in clothes for himself and family; and as he rises in the scale, ventures on the taste of meat. He employs a tailor—a shoemaker—a hatter—a butcher—and these in turn, purchase the materials of their trade from the farmer himself. The laborer becomes thus a customer of himself, and the buyer of other customers—and the farmer receives back, with abundant interest, the difference which he advances in the first instance between high wages and low wages. It is for this reason that one of our shrewdest farmers used to say, *yes, give our laborers good wages, and they will buy our beef.* Thus, too, the bounties of Providence go around, a beneficent circle—and, after making the laborer better fed, better clad, better taught—in short a better man, the farmer himself is richer for the very benefits he dispenses. Depend upon it, there is no surer sign of national prosperity than high wages—and God grant that for many a long year it may be the lot of our countrymen who subsist by the labor of their hands, to work well—to be paid well—and to live well.

"And now we come to the reason why our crops do not equal those of England. It is, that our farms are all too large—too large for the means we employ in farming them. Agriculture is the only pursuit I know, where the owner does not employ his capital in his business. He rents or buys a large farm, and then has nothing left to stock it with. He might as well rent a large store without goods enough to fill a single corner of it. In England, it is supposed necessary, before renting land, that the tenant should have a working capital, of thirty or forty dollars an acre, to employ. It is calculated that, besides lime and other enriching substances, the cost of the mere animal manures applied to the soil of England, amounts to three hundred millions of dollars; being more than the value of the whole of its foreign commerce. Yet the grateful soil yields back with interest all that is thus lavished upon it. And so it would do here, if we would only trust the earth with any portion of our capital. But this we rarely do. A farmer who has made any money spends it not in his business, but in some other occupation. He buys more land when he ought to buy more manure; or he puts out his money in some joint stock company, to convert sunshine into moonshine; or else he buys shares in some gold mine or lead mine. Rely upon it, our richest mine is the barn-yard, and that whatever temptations stocks or shares may offer, the best investment for a farmer is *live stock and ploughshares.*

"Another thing which we should strive to amend, is the unfermlike and slovenly appearance of our fields. Clean cultivation is like personal neatness to an individual, a great attraction to a farm; but who can see without mortification, our fields of Indian corn and potatoes, just as they are verging to maturity, outtopped and sullied by a rival crop of weeds which seem waiting with impatience for the removal of the real crops, when they and all their seed may take exclusive possession of the ground. The rule of farming should be, never to let any thing grow in our field which we did not put there; and the value as well as the beauty of the crop would more than pay the expense of removing these noxious intruders.

"Nor do we pay sufficient attention to our gardens. We are too often content with a small enclosure where a few peas and beans and a little salad are left to struggle with a gigantic family of weeds, not to speak of the frequent inroads from the pigs; and what can be saved comes at last on our table the scanty companions of the masses of animal food which form almost our exclusive subsistence. For such a wilderness, how easy would it be to substitute the cheap and wholesome luxury of many vegetables which would grow without the least trouble, and, while they gave variety to our tables, would diminish our excessive and expensive use of animal food.

The same want of neatness pervades the exterior of our dwellings. We look in vain for the trim grass-plot, the nice border, the roses, the climbing vines, and all the luxuriance of our native wild flowers. These cheap and easy works—which seem trifles—make up a great mass of enjoyments; they are the innocent occupation of the young members of the family—the elegant luxury of them all; and they impress even a passing stranger with a sense of the taste and ease of the farmer.

"In fruits, too, we are deficient. Our climate invites us to plant; and there is scarcely a single fruit which will not grow in the open air, and all of them prosper with a little shelter. Undoubtedly there are insects which infest them; but these, care will exterminate. Undoubtedly some species are short-lived; but it is easy to provide a succession—and even many productions which we used to think uncongential to our climate, will succeed if we only try them. For instance, I am satisfied, from my own experience, that every farmer may have his patch of grapes quite as readily as he can his patch of beans or peas. He has only to plant his cuttings, as he would Indian corn, at sufficient distances to work them with the hoe-harrow. They will live through the winter without any covering and with less labor than Indian corn, because the corn requires planting every year, while the vines will last for a century. He will thus provide a healthy pleasant fruit for his family use, or a profitable article for the market.

I have spoken of farms and of farming, let me add a few words about the farmer. The time was when it was the fashion to speak of the Pennsylvania farmer as a dull, plodding person, whose proper representative was the Conestoga horse by his side; indifferent to the education of his children, anxious only about his large barn, and when the least cultivated part of the farm was the parlor. These caricatures, always exaggerated, have passed away, and the Pennsylvania farmer takes his rank among the most intelligent of his countrymen, with no disposition for improvements beyond the natural caution with which all new things should be considered before they are adopted. But an unwillingness to try what is new, forms no part of the American character. How can it be, since our whole government is a novelty; our whole system of laws is undergoing constant changes—and we are daily encountering, in all the walks of life, things which startle the more settled habits of the old world. When such novelties are first presented, the European looks back to see what the past would think of it—the American looks forward to find how it will affect the future—the European thinks of his grandfathers—the American of his grandchildren. There was once a prejudice against all these things—against what was called theory and book farming—but that absurdity has passed away. In all other occupations, men desire to know how others are getting on in the same pursuits elsewhere, they inform themselves of what is passing in the world, and are on the alert to discover and adopt the improvements. The farmers have few of these advantages; they do not meet daily at exchanges to concentrate all the news of commerce; they have no factories, where all that is doing among their competitors abroad is discussed; no agents to report the slightest movements which may affect their interests. They live apart—they rarely come together, and have no concert of action. Now, this defect can best be supplied by reading works devoted to their interests, because these may fill up the leisure hours which might otherwise be wasted in idleness or misemployed in dissipation; and as some sort of newspaper is almost a necessary of life, let us select one, which, discarding the eternal violence of party politics, shall give us all that is useful or new in our profession. This society has endeavored to promote such a one in the *FARMER'S CURSER*, a monthly paper, exclusively occupied with the pursuits of agriculture—where we may learn what is doing in our line over all the world, and at so cheap a rate, that for a dozen stalks of corn, or a bushel of wheat or potatoes, we may have a constant source of pleasing and useful information.

"I think, however, that we must prepare ourselves for some startling novelties in farming. We were taught in our youth to consider fire and water as the deadliest foes. They are at last reconciled, and their union has produced the master-work of the world. Steam has altered the whole routine of human labor—it has given to England alone, the equivalent in labor of four hundred millions of men. As yet, commerce and manufactures alone have felt its influence, but it cannot be that this gigantic power will long be content to be shut up in factories and ships. Rely

upon it, steam will ere long run off the track into the fields, for of all human employments, farmwork is at this moment the most dependent on mere manual labor. Be not, therefore, surprised if we yet live to see some steam plough making its hundred furrows in our fields—or some huge engine, like the extinct mammoth, roving through the western forests, and mowing down the woods, like a cedar in the harvest-field. Wild as this seems, there is nothing in it stranger than what we have all witnessed already. When Fulton and Oliver Evans first talked to us about the steamboat and the rail-road, we thought them insane, and already we enjoy more than they ever anticipated in their most sanguine moments. One of these applications of steam—the raising of water for agriculture—I have already attempted in my own small way. You know that the greatest enemy of our farming is the drought of mid-summer, when all vegetation withers, and the decaying crops reproach us with suffering the insignificant rivers by their side to pass away. In the southern climates of the old world, men collect with great toil the smallest rills, and make them wind over their fields—the hand-bucket of Egypt, the water-wheel of Persia, all the toilsome contrivance of manual labor, are put in requisition to carry freshness and fertility over fields not wanting them more than our own. With far greater advantages absolutely nothing has yet been done in that branch of cultivation; may we not hope that these feeble means of irrigation may be superseded by steam, when a few bushels of coal may disperse over our fields, from our exhaustless rivers, abundant supplies of water.

"All these improvements which may adorn or benefit our farms, are recommended to us not only by our own individual interests, but by the higher sentiment of our duty to the country. This is essentially a nation of farmers. No where else is so large a portion of the community engaged in farming; no where else are the cultivators of the earth more independent or so powerful. One would think that in Europe the great business of life was to put each other to death; for so large a proportion of men are drawn from the walks of productive industry and trained to no other occupation except to shoot foreigners *always*, and their own countrymen *occasionally*; while here, the whole energy of all the nation is directed with intense force upon peaceful labor. A strange spectacle this, of one, and one only, unarmed nation on the face of the earth! There is abroad a wild struggle between existing authorities and popular pretensions, and our own example is the common theme of applause or denunciation. It is the more important then for the farmers of this country to be true to their own principles. The soil is theirs—the government is theirs—and on them depends mainly the continuance of their system. That system is, that enlightened opinion, and the domestic ties, no more stable guarantees of social tranquility than mere force, and that the government of the plough is safer, and when there is need, stronger than the government of the sword. If the existing dissensions of the old world are to be settled by two millions of soldiers, all ours will soon be decided by two millions of voters. The instinct of agriculture is for peace—for the empire of reason, not of violence—of votes not of bayonets. Nor shall we, as freemen and members of a domestic and fireside profession, hesitate in our choice of the three master influences which now rule the world—force, opinion, and affection—the *cart-ridge-box*, the *ballot-box*, and the *hand-hoe.*"

Post Office.

There are more than 21,000 Post Offices in the U. States. By the law of the land, the annual compensation is not to exceed \$2000. In only thirty-nine offices does the regular commission or per centage allowed to a Postmaster amount to that sum. Of these, seven only are in the New England States; six in New York; four in Pennsylvania; two in Maryland; two in District of Columbia; three in Virginia; three in Georgia; two in Alabama; three in Ohio; and one in each of the States of North Carolina, Louisiana, Tennessee, Kentucky, Michigan, Indiana and Missouri. In eighty Post Offices, the compensation ranges from \$1000 to \$1200. A very large number of Postmasters receive a compensation ranging from \$500 to \$1000.

INCREASE OF POPULATION.—According to the official returns in the hands of the U. S. Marshals, giving the population of the whole State of New York, it appears that, in 1830, the State contained 1,918,698—in 1840 it contains 2,429,476 souls. Increase in ten years, 510,778.

"The rust of the hand (dleness) is the blight of genius."—*Socrates.*

BERKSHIRE SWINE.

The experience of the past year, we believe, has fully sustained the claims of the Berkshires for superiority over other breeds of swine. We do not deem it necessary to devote much space to their praise; but lest some of our readers should suppose that Rochester is "behind the age" in this species of improvement, we give, below, correct portraits of two pigs, belonging to Col. Amos Sawyer, of this city, which received the first premiums at the late Fair of the Genesee Agricultural Society. In our next we intend giving a more particular account of this breed of swine, together with portraits of two full grown animals, belonging to Col. Sawyer.

The above is the likeness of a sow pig, 7 months old, weighing 170 lbs.; got by a boar formerly owned by Mr. Lossing, and sold to Ohio for \$200.—(NOTE.—The curve, or hollow in the back, seen in this cut, is not usual with the breed, except when young.)

This is a boar pig, same age as the other; weighing 155 lbs.; got by Mr. Allen's "Prince Regent."

IMPROVED DURHAM SHORT HORN COW "GAZELLE,"

WITH HER HEIFER CALF "HEBE."

THE PROPERTY OF THOMAS WEDDLE, ESQ.

Gazelle is three years old, roan color, with the red and white indistinctly and richly blended; and is an excellent handler. The cut exhibits the symmetry of her form, which in its true proportions and full development of all the fine points, is not often found in such perfection in one animal. She is not particularly large, but short in her legs and fine in her bone, of great width and remarkably straight both on her top and below. She has indications of a good milker, but having brought up her own calves, neither the quantity or quality have been particularly tested.

GAZELLE was bred by Thomas Weddle; is by his imported Rover (alias Charles—1816) from the herd of the Earl of Carlisle; dam, his imported Prize (alias Crocus) from the herd of Henry Edwards, by Romulus, (2563;) gr. dam Prize, by Mulbro', (1189;) gr. gr. dam Tulip, by Regent, (544;) gr. gr. gr. dam Primrose, by North Star, (459;) gr. gr. gr. gr. dam by R. Colling's White Bull.

HEBE is nine months old, color pure white; by American Comet, possessing all the choice points and frame of her dam; a fine mellow hide, and of course handles admirably.

Hints for the Month.

The most important hint, we believe, which we can give to farmers at this season of the year, is to avoid working without pay. Working for half pay, too, is to be shunned. To remove as far as possible from such unprofitable labor, it should be the aim of every one to make his work tell to the best advantage. A man may be wonderfully industrious, rising at four, and laboring till eight at night, but unless he gets a full return, it is still rather discouraging. To enable him to do so to profit, let us enter a little into detail.

The farmer works for half pay, who suffers his domestic animals to eat, drink, and sleep, exposed to all the fury of rough winter in this northern region. He has labored to obtain his stock—paid full price for them—and his hay, straw, grain, and roots, (if he has any,) have cost him their due share of sweat and fatigue. Now, a want of care,—suffering his animals to shiver in the winds, treading their hay under foot, starving them at one time, and over feeding them at another,—will cause the consumption of twice as much food as will keep them in good condition if properly managed, and he will have poor, weak, and perhaps diseased ones, as the reward of his labor next spring. He will work for half pay.

Let all your animals therefore be well supplied with shelter—with racks—feeding troughs—clean litter—and good watering places; let them be kept clean and fed regular; and save your hay by the free use of a good straw cutter,—if you wish to avoid unrequited labor.

Shelter, will prevent cattle from suffering from cold, thus reducing their flesh—will prevent disease—and keep them in better condition for the same amount of food given. It is absolutely necessary where animals have been suffered to become weak and diseased. In sheep, it will not only prevent emaciation, disease, death,—but increase the quantity and improve the quality of the fleece.—Good racks for feeding will prevent a great waste of hay. Feeding troughs are necessary for roots, meal, and chopped straw. Clean litter is not only indispensable to the health and comfort of the animal, but exceedingly valuable in the manufacture of manure, and should therefore be used freely. During severe weather the most manure will be made by not removing it from the cattle stable, oftener than once in two or three weeks, the successive layers of straw absorbing and retaining more effectually the liquid parts, except the stable floor has been expressly constructed for this purpose; but in continued moderate or thawing weather, the stable should be daily and thoroughly cleaned. Good watering places are especially necessary, as animals often suffer the want of water from the inconvenience in procuring it. Springs are better than running streams, the ice often shutting out the animal from the latter, unless some one can break it several times a day for them. Under drains, from wet portions of land, by forming artificial springs at their foot, make excellent watering places in winter, as well as improve the land. Cleanliness is highly important, filth often being the first step to disease, as well as the last. And regularity in feeding is also very necessary, as every animal has a clock in its head, by which it accurately registers the times of feeding—or at least appears to do so. Dr. Franklin said that creditors were a superstitious sort of people—great observers of set days and times; domestic animals appear to be equally so—rigidly observing appointed periods; and doing penance for their owners by fretting away large quantities of their flesh, if these periods are not strictly observed.

The farmer works for full pay, who employs himself through winter in doing work which most otherwise be done in summer to the detriment of all order

and all profit. Such a farmer takes time by the fore-top—cuts his stove wood and has it well seasoned and in abundance by next summer—cuts next winter's wood, and has that also well seasoned, thus saving one third of weight in drawing, more than half its value for burning, and prevents cold rooms, smoky fires, and long faces, on cold winter mornings. He puts every thing in order about his premises which can be—lays up fallen rails on fences—repairs his stone walls where needed—nails loose boards fast, on his board fences and gates, especially those next the public road, so as not to be troubled by all the vagrant cattle and ill-bred colts of the neighborhood, who are ready to pilfer every thing in an eatable shape that they can lay their rascally mouths upon, without regarding the rights of *meum and tuum*. He procures seed for next season, repairs and puts tools in order, and attends to a hundred other things sufficient to keep him busy. And every farmer would find enough to occupy all his time during the short days of winter, at full, or even *double pay*, by constantly keeping a *memorandum* of what needs doing in his pocket, on which every thing, as it occurs to him, is at the moment recorded; especially if he employs his long evenings in reading and storing his mind with useful facts and information, derived from the experience of others.

Petitions for Legislative Aid.

The following extract is from a letter not written or publication, but we give it as a specimen of quite a number received by us during the past month. It will be remembered that Mr. Parsons was President of the Niagara County Agricultural Society as long as it was in existence.

"On the subject of 'Legislative aid to agriculture' in this State, I am glad the subject is beginning to be treated. I am a most decided friend to such a measure.

If only one hundred dollars would be appropriated each Member of Assembly, to be expended, together with an equal, or greater amount collected by the County Agricultural Society, and (for the *Empire State*) two or three commissioners appointed, of the plan pursued in Massachusetts, I have no doubt the sum thus expended by the State, would soon be returned to her treasury, in tolls alone, with an increase of fifty per cent. I hope measures will be taken, without delay, for bringing the subject, at an early day, before our Legislature, in a strength of voice, and a fullness of expression, that will not be regarded. There is, in my opinion, no question, that such an appropriation can be obtained at the next session, if the voice of the farming community could be so expressed.

And the farmers would, most undoubtedly, so express themselves, if the subject were but fairly brought to their consideration.

Yours, &c. very respectfully,

Lockport, Dec. 18, 1840. W. PARSONS.

There seems to be but one opinion as to the propriety of petitioning for Legislative aid—and not much difference of opinion as to *how* that aid can best be obtained. After consulting quite a number of experienced individuals on this subject, we drafted the following petition with a view to meet the wishes of the majority, and believe it will give general satisfaction. Several hundred of them have been printed and sent to Post masters and others who it was supposed would circulate them. Any persons who desire to sign or circulate them, and do not find one at the post office, may write a copy.

It is hoped that all who receive the petition, will give it their prompt and efficient attention. Take your horse and sleigh, and in half a day you can call on a whole town or neighborhood, and get a score or more of signatures, (and also a number of subscribers to

the New Genesee Farmer.) Try this, and we trust the result will be such as will convince you that your time was not mis spent.

The petitions should be sent to some member of the Assembly, at an early day of the sitting of the Legislature. Where several are circulated in one neighborhood, the names can be cut off, and all attached to one petition.

To the Honorable the Legislature of the State of New York in Senate and Assembly convened:

WE, the subscribers, being mostly Farmers in the County of ——— do humbly present—

That, as AGRICULTURE is the origin and foundation of all real wealth and prosperity, and the chief source of human sustenance, its improvement is a subject of the highest importance, and demands the particular encouragement of Government. And, past experience having shown that the improvement of Agriculture is best promoted by County Societies, Exhibitions, and Premiums; which the same experience has shown cannot long be sustained by individual contributions: we do therefore pray your honorable body to encourage the formation of Agricultural Societies in each County, and grant a small appropriation from the public fund for their support—according to the ratio of population—say one hundred dollars annually to each Member of the Assembly; to be continued for the term of ten years, subject to such regulations and restrictions as may be deemed necessary, and conditionally that an equal amount be raised by the Society.

And we further pray your honorable body to provide for the appointment of three or more Agricultural Commissioners, for the term of three years, whose duty it shall be to visit each County in the State, and encourage the formation of Societies, deliver addresses and write communications on the improvement of Agriculture; and make an annual report to the Legislature.

Your petitioners humbly conceive that such appropriations would tend greatly to promote the prosperity and honor of the EMPIRE STATE—increase its wealth and productions—augment its canal tolls and revenues, and enhance the value of its lands. We do therefore confidently hope that your honorable body will grant our request; and that a law for that purpose will be passed during the present winter. And, as in duty bound, we will ever pray, &c.

SCRAPS.

CONDENSED FROM EXCHANGE PAPERS.

IMPORTS AND EXPORTS.—During the last ten years, imports have been \$41,000,000 of wines, \$118,000,000 of silks, and \$84,000,000 of iron; total \$243,000,000.

In 1839, exports of domestic productions were but \$97,000,000; imports were over \$170,000,000.

Why not raise our own silk, manufacture our own iron, and so forth, and save our hard money?

THRASHING CLEAN.—Henry Colman says, that in passing wheat that was considered *well thrashed* by the flail, afterwards through a good machine, he has obtained at the rate of two full quarts to the bushel, or one sixteenth of the whole: reminding him of the Irishman's straw, who on being asked the cause of the fine condition of his horse replied, "He has nothing to eat but white straw, and that not half thrashed."

A NOBLEMAN PLOUGHING.—At the late exhibition of the English Agricultural Society, an American plough, (the kind or name not mentioned,) sent there on purpose, was tried. It was "huddled in a masterly manner" by the Duke of Richmond, but was commended for its simplicity only, but not for its efficiency.

COSTLY AND PROFITABLE.—Wm. P. Curd, Esq., of Fayette County, Ky., has 14 Berkshire, and 3 Irish

Grazier breeding sows; and 4 Berkshire, and 2 Irish Grazier boars; which cost him *three thousand dollars*. Was he a fool for paying this enormous sum? Let us see—during two years 31 silver cups have been awarded at different fairs to these hogs. From them he has already sold 110 pairs of pigs at \$40 a pair—equal to \$4,400. 254 sows, some of which have been sent 200 miles, have been bred to his boars at \$10 each—making \$2,540. So much for having the very best animals. And his customers will find it quite as profitable before they are done with farming.

CROPS IN OHIO.—A. B. Allen, in a late number of the Cultivator, writing from the valley of the Scioto, says the crops are so abundant, that corn commands only, 12½ to 15 cents, and wheat 45 to 50 cents per bushel; and that hay in the country is \$2 to \$3 a ton.

LARGE CROP OF PUMPKINS.—E. Hecsey Derby of Boston, planted 70 square rods of ground, in well-manured hills 9 feet apart. A heavy crop was the result. Some of the pumpkins weighed 112 lbs. The weight of the whole crop was no less than 22,220 pounds, or at the rate of more than 50,000 lbs. to the acre—about 50 wagon loads of ordinary size.

IMPORTANCE OF ROTATION.—M. S. Kirkbride gives, in the Farmers' Cabinet, the produce of a lot of ground, cultivated for the last three years with sugar beet, as follows:—1st year, 42 tons per acre; 2d year, 25 tons; 3d year, 21¼ tons.

RATS AND MICE.—A correspondent of the Farmers' Cabinet, estimates, at a very moderate calculation, the amount of depredations caused by rats and mice, in the State of Pennsylvania, at \$600,000, annually. He recommends terriers and ferrets as the best means of destroying them.

MONEY CHANGING POCKETS.—Henry Colman says that in consequence of the English having blockaded Canton and the rise in the price of teas, that the profits of a single Canton ship are stated at 300,000 dollars! and that three commercial houses in Salem have realized by this advance of price the vast amount of 1,500,000,—"if any farmer can enumerate such a sum."

For the New Genesee Farmer.

"Agricultural Commissioner."

The importance of having a State officer of this kind can scarcely be overrated. Most farmers are so much occupied with their needful labor as to leave them but little opportunity for ascertaining the nature or value of the improvements in their profession, which are constantly taking place.

If a qualified individual could give his entire attention to whatever pertained to the interests of this important subject, a great amount of valuable information would soon be placed within reach of all. New implements, or those already in use, would be subjected to rigid examination, and their comparative merits ascertained. The purchaser then, instead of relying upon the interested manufacturer, would receive a valuable article without paying double its worth—Thousands of dollars are annually expended in our country for labor-saving machines which prove to be inferior or worthless.

The Commissioner, by frequently visiting the several counties, would become familiar with the methods of farming adopted in each, and prepared to recommend whatever experience might justify. He would examine the different varieties of seed, and establish their relative value; and the monthly reports would convey a definite idea of the condition of some portion of the State.

He would hold frequent meetings for the purpose of imparting information and encouragement, assist at the formation of societies, circulate agricultural papers, and, in short, by every means in his power endeavor to make the knowledge of each individual a part of the common stock.

W. R. S.

The following very just remarks should be well understood by every experimentalist in agriculture.—Although applied only to manures by the writer, they are not less applicable to every thing else connected with the cultivation of the soil. Experiments often produce quite different results, from the difference of soil, climate, season, or other circumstances connected with them, which may be all essential, but which are entirely omitted or indefinitely mentioned in the statements of those experiments.

From the British Farmers' Magazine.

Reporting Experiments with Artificial Manures.

In all our agricultural publications now issuing from the press, we see many accounts of experiments made for ascertaining the value of certain substances recommended as manures, either for top-dressing or ploughing in. Some of these accounts are elaborately, and, no doubt, faithfully written; and sometimes favorable, or, as it may happen, unfavorable. Sometimes, too, we are told of the same material having contrary effects on land of precisely the same character, especially if situate in different parts of the kingdom. Now these discrepancies may often arise from ignorance or want of consideration of the peculiar effect or action of the material employed.

Besides the various substances which have been used as manures from time immemorial, there are others, chiefly minerals, which are brought into use with various success. The reports of such trials are not always uniform; and defective in so far as the character of the weather or season following the application is omitted to be stated. In my own practice I have used soot extensively for top dressing wheat, and have harrowed and rolled it in; but if a dry spring and summer followed, the soot was of no service. I have used chalk and lime as dressings for light gravelly land; but if a wet season succeeded, little or no immediate effect was observable. The same result followed the application of salt, on the same description of land, under the same circumstances of season. And the reason for the non-efficiency of these three last named substances was perfectly obvious: all three are ready absorbents of water from the air, and in dry seasons are eminently useful to growing crops; whereas, in a showery time, the crops need no such assistance.

Saltpetre and nitrate of soda are at present fashionable top-dressings; and those best acquainted with these substances affirm that they are often injudiciously used. On wet tenacious land they can never be so efficacious as on dry sandy or gravelly soils; nor in wet seasons so much as they certainly must be in dry. If I be not mistaken in attributing to them such effects, they will always be considered as doubtful fertilizers; because they must be used before it can be ascertained, except by conjecture, what sort of season is to follow.

Mr. Cuthbert Johnson observes, that the "agricultural uses of saltpetre have not been examined so carefully or generally as they ought to have been;" and G. Kimberley, Esq., of Trosworth, "regrets that it has been hastily adopted, without reference, in many cases, to season, soil, climate or quantity; and as a few fortunate experiments have started into a fashion the use of these articles, so one or two unseasonable or improper applications have at once condemned them to neglect and oblivion."

Such reports show decidedly how necessary it is to know precisely the effects of those artificial manures; whether as the food of plants, or improvers of the staple; whether as exciters of vegetation or solvents of the nutritive matters already in the soil; and also under what circumstance of weather or season they are most active, or altogether neutral. These are questions for the agricultural chemist to prosecute; so that no farmer need work in the twilight, or be in doubt concerning the direct effects of any manure which comes recommended from competent authorities.

And in all future reports of experiments made with any of those uncommon articles of manure, the reporter should not omit to state what kind of weather has prevailed during the experiments; for the effects, especially of saline substances, are very much determined by the state of the weather.

J. MAIN.

[Our respected correspondent is right. Much of the success or otherwise, of these, and many other manures we could name, must depend on peculiar circumstances of soil and season. We have heard saltpetre abused one year, and highly extolled in another; although tried on the same soil, the same description of crop, and by the same person.—Ed.]

Wheat and Hay-stacks protected from Lightning.

The following ridiculous method, from an English paper, is going the rounds in this country, but we trust no intelligent farmer will be deluded by it. It consists merely in placing a broken glass bottle on the highest point of the stack, glass being a non-conductor. It must be evident to any one, acquainted with electricity, that this can afford no protection whatever, and would no more prevent the downward descent of a thunderbolt upon the stack, than a spade-full of turl would stop the cataract of Niagara. A non-conductor is *negligent* in its properties; and a conductor can only carry the electric discharge safely to the ground.

Ice Houses on the Ground.

J. S. SKINNER, Esq.—DEAR SIR—In your paper of the 12th, you ask for information relative to the construction of ice houses above ground. The information below is not from actual experience but from actual observation. In New Orleans and Mobile, they are all above ground—in the former place, from the same cause, to a greater extent than what you complain of. Their having succeeded so well there, is the cause of their being used in the latter place, where, in 1858, there were two—one built for the purpose, a common frame building, the other an old brick warehouse. I have examined both, being desirous to know how ice houses could be fitted above ground to keep ice from rapid evaporation. I found there was an inner partition made of boards, space, I think, four feet; this divided into two parts, the one next the outside filled with rice chaff, the other with charcoal; nothing on the floor but straw and chaff. On the garret floor there were several scuttles, or trap-doors. The ice was hoisted up through them, and then taken down a pair of steps fixed on the outside the building.

The keeper also slept in the garret part. He informed me the evaporation was very small, much less than he could have expected. Even in that warm climate, I do not think it necessary to have them earthed outside; but a shade of trees I think would be of service.

Perhaps in this climate, a space of two feet, filled with chaff and charcoal, would be sufficient. I think wheat and oat chaff would be a sufficient substitute for rice.

Respectfully,

D. GRIFFITH.

Since the preceding very obliging communication was received, we have conversed with R. Peters, Esq., of Philadelphia, to whom the subject is practically and philosophically familiar. He satisfied us that in all situations it is better to build above ground, with a view to more perfect preservation. When the house is built below the surface, the earth is of a temperature and consistence to make it a conductor, instead of a non-conductor of heat. The great, if not the sole object, in a work, is to get your ice enclosed in a space which is surrounded by the most perfect non-conductor of heat! and that is most easy and practicable, by building one house within another, not permitting them to touch at any point, leaving between the two a space of say 15 or 18 inches, to be filled in compactly as the houses progress from the bottom, with charcoal or tan. We intend to have a foundation or floor of sand, rising say 12 or 18 inches above the ground, on the outside of the building, and on the sand place a covering of tan bark. The melting of the ice may be expected to be absorbed by the sand, any surplus passing off, under the sills. The house we think will be best covered with a very thick covering of fodder or marsh grass that will turn the rain—being ventilated at each end—Who sees any objection to this plan? As for shade we shall choose to build in a situation exposed to the sun, where evaporation will be most active, and moisture least liable to accumulate.—*Amer. Far.*

National Gallery of American Manufactures.

The new Patent Office, lately erected at Washington, is a very large and splendid building, and one which will long reflect credit on the nation. Besides containing ample room for the numerous models and specimens of patented inventions, provisions have been made in it for a national gallery of American manufactures, agricultural productions, &c. For this noble project, the nation is mainly indebted to that well known friend of improvement, the Hon. H. L. ELLSWORTH, Commissioner of the Patent Office. We

rejoice that the business of executing the liberal plan of the government, in the formation of this institution, has devolved upon one so eminently qualified for the task. And there can be no doubt that, under the supervision of this able and patriotic gentleman, a collection will in a few years be formed, that will prove highly useful, as well as honorable, to the nation.

We take particular pleasure in publishing the following notice, forwarded to us by Mr. ELLSWORTH on account of the prominence which he gives to agriculture. This art of all arts has long been too much neglected by our Congress and State Legislatures, and it is pleasing to see, of late, so many indications of a disposition to give the subject something of the consideration which its importance demands.

PATENT OFFICE, NOV. 20, 1840.

Notice is given that the Hall in the new Patent Office, for the exhibition of manufactures, is now completed. The Hall is spacious, being 273 feet long, 6 feet wide, 30 feet high, and fire proof.

Agents whose names are annexed, will receive forwarded, free of expense, articles which may be deposited with them. These articles will be classified and arranged for exhibition, and the names and address of the manufacturer (with the prices when desired) will be carefully affixed. Few, it is presumed, will neglect to improve the opportunity now presented, of contributing their choicest specimens to the *Nation Gallery of American Manufactures*, where thousands who visit the Seat of Government, will witness with pleasure the progress of the arts in these United States.

If fairs in limited sections of our country, have excited interest, what must be the attractions of a national exhibition, enriched by daily additions.

The agriculturist may be gratified to learn, that commodious rooms are provided for the exhibition of agricultural implements, and also for the reception of seeds for exhibition or distribution.

The Commissioner of Patents, being authorized to collect agricultural statistics, avails himself of this opportunity to solicit information of the condition and character of the crops in the several sections of the country. These data will aid him in presenting his annual report, the aggregate amount of product of the soil, and it is hoped that the public may be guided in some measure from the evils of monopoly, showing how the scarcity in one portion of the land may be supplied from the surplus in another.

Names of agents who will receive and forward packages for the Patent Office. Collectors of the Customs at Portsmouth, N. H., Portland, Me., Burlington, Providence, R. I., Philadelphia, Baltimore, Detroit, Charleston, Savannah, N. Orleans, New Buffalo, Cleveland. Surveyors of the Customs at Hartford, Ct., St. Louis, Pittsburgh, Cincinnati, Louisville, R. I. Eddy, Boston, Mass.; David Gardin (Custom House,) New York.

HENRY L. ELLSWORTH,

Commissioner of Patents.

Editors are very respectfully requested to give above an insertion in their papers.

Education for Farmers.

The following just remarks are taken from an address delivered before an agricultural society in Ohio.

"I well know the fondness of a parent's heart, and am a parent and can appreciate a parent's feelings, and there seems to me nothing unnatural in the desire of a parent that his children should occupy honorable and useful stations in the world. But still the farmers greedily er who suffer their sons and daughters to be brought up with a feeling of contempt for the toils of the husbandman—who suffer them to feel that because their parents have been able to confer upon them, it may be a college education, that heretofore the axe and the hoe are implements unworthy their touch. The fostering of such feelings of pride in the bosoms of your children, is fraught with most dangerous consequences to them. Show to them by your efforts to apply the benefits of science to the culture of the soil, by the interest which you manifest in extending improvements, and by conferring the benefits of your experience upon others, that you regard your calling as useful, important, honorable, respectable, and instead of crowding your children as too many misguided parents do, into the lower professions, or into the commercial ranks, let them feel that you are not ashamed of your occupation, that you feel that it ought not to be despised, and that you regard it as honor enough for them to be well qualified

to tread in your footsteps, and to perfect and carry out the improvements which you have commenced. So they will come up to take their places in society, feeling, and truly too, that the occupation of the agriculturist is both honorable and respectable—and so they will be kept in a great measure from the indulgence of a foolish pride, and from encouraging in their rears a vain ambition which can never be realized. And you may be sure that in subsequent life they will be called to fill such stations of honor or of trust, as they may seem to be fitted for, by their talents, their equipments and their worth. At all events, they will be useful, respectable and substantial citizens, contented and happy themselves, and dispense happiness and comfort to all around them. How much better, how much more rational, how much more honorable and respectable thus to be, than for young men to start off with the idea of being fine gentlemen, and attempting to live upon the scanty pittance furnished them by their wits. Such unhappy and misguided young men, soon become the small politicians of your villages, or the brawlers of the grog-shop, and will soon end their career, if not in crime, in neglect and insignificance.

"The fostering, building up and sustaining of the Common School system, is to the farmer of paramount importance. To the Common School must he look, mainly, for the education of his children, and for the support of such schools should he be willing to make one of the largest sacrifices; or rather he should not call any thing which he does in that behalf a sacrifice. Let efforts be at once made to introduce into our common schools, all those desirable improvements in education which the experience of the ages suggests. Let none but suitable and competent instructors be engaged, and whatever the cost of such may be, let the expense be cheerfully met. Let not instruction be confined to the mere elements of education, such as reading and spelling, but let the physical and natural sciences be introduced, and proper instruction given in all those higher departments which are calculated to expand the minds, and make business men and women of your sons and daughters. Let elementary books on agriculture be introduced into the schools, that the education of your children may be part at least, an agricultural education, and however learned or renowned they may subsequently become in the world of letters, they never will despise the calling to which their fathers were attached.—Let the standard of the moral character be elevated. Let the cultivation of the religious affections and principles not be neglected. Thus educated and thus reared in habits of industry, they may be safely sent forth to enact their part on the stage of life."

Why don't he do it?

When the Farmer *knows*, that a gate is better, and a time and labor saving fixture cheaper, than a set bars and posts, and without calling on a carpenter can himself make one, *Why don't he do it?*

When he has no other fastenings to his gates and iron doors than a rock rolled against them, and in a single evening after supper is able to make a better, *Why don't he do it?*

And when he knows it's better and more profitable to have good fences than poor, *Why don't he do it?*

Or if he thinks it will not quite cost to make good fences, and only thinks so, and thus mere guess work, and by calling on Mr. Townsend of East Haven can ascertain the facts in relation to it, *Why don't he do it?*

Or if he wishes to see some of the most approved appliances pertaining to farm buildings and the keeping and feeding of stock, &c. &c., and can do so by calling on the above named gentleman, *Why don't he do it?*

Or when he sees the boards dropping from his barns and out buildings, and like heaps of rubbish lying in es about his premises, and need only nailing on again, *Why don't he do it?*

Or if he is afraid of the expense of nails and says crying up the maxim of Doct. Franklin, to save the pence and the pounds will take care of themselves," and he knows that the same Doct. Franklin so said that "many men are penny wise and pound foolish," and he is not careful to think of the precept contained in the latter, *Why don't he do it?*

If it is a saving of nearly half the manure of a farmer's stock, by keeping them shut up in yards, instead of running at large through most of the winter, *Why don't he do it?*

If he knows that many of his fields would be greatly improved by ditching, and by the removal of large lumps and stones, *Why don't he do it?*

And when he knows that his pastures would yield early double the feed, and of a better quality, if the

bushes were all cut and subdued, *Why don't he do it?*

And if he can add fifty per cent. to the product of his clover fields, and even his pastures, by the use of Gypsum, *Why don't he do it?*

If a farmer of fifty acres has (as he should have) use for a good corn shelter and one of the many improved fanning mills, and he has not already obtained both, *Why don't he do it?*

And if it is cheaper, actually cheaper, to burn dry wood than green, and to use a stove instead of an open fireplace, *Why don't he do it?*

And finally, if every farmer is not a subscriber to an agricultural paper, *Why don't he do it?*—*Farmers Gazette.*

Cure for "Disease in Swine."

MESSENGERS. EDITORS—In the November number of the Farmer, I observed an inquiry from Mr. Webber of Michigan, respecting the cause and cure of what appears to be the *Blind Staggers* in Swine.

As to the cause of this disease, I am not able to speak decidedly; but suppose it to arise from a determination of blood to the head. Leaving the cause, therefore, to able hands, I will proceed to the cure. Catch the hog, and with a sharp knife, make an incision through the skin, 2 or 2½ inches in length, vertically on the forehead, about 1½ inches below the top of the head, and insert into the wound and under the skin, as much fine salt as possible. Repeat the application hourly, and it will very soon effect a cure.

Respectfully your's, &c.

ZECCHARIAH CONE.

Batavia, Dec. 18 10.

Sowing Orchard Grass Seed.

I should have answered your inquiry (in No. 10,) respecting the quantity of Orchard Grass Seed required to sow an acre, &c., but I have been long absent from home, and seeing the opinion of Dr. James Mease, President of the Philadelphia Agricultural Society, in your Nov. number, I have only to say, that my opinion does not differ much from his, and I fully agree with him on the advantage of sowing Orchard Grass and Clover together.

Yours, &c.

ZECCHARIAH CONE.

Beets for Cattle.

As experience, and not speculation, is what farmers need, I will give my observations in feeding beets to my cows during the two past winters. In 1838 I put up about 300 bushels of Mangel Wurzel beets, 100 bushels of turnips and some potatoes for the purpose of experimenting in feeding my cattle through the winter. I knew nothing but that what I learned from books, as I was acquainted with no farmer (nor am I yet) who fed with roots. At first I was at a loss to know how to feed them, whether in a raw state or cooked, but having determined to try both plans, I commenced the work and each did well. Young animals are peculiarly fond of the raw beets and thrive astonishingly on them; but for cows that give milk, they are better boiled, particularly if a steamer can be used in the process. Though milk cows should have raw beets once in every two or three days if grass cannot be had.

The turnips and potatoes were given precisely as the beets; but I could not determine that either had the preference over the other, as the cows gave about the same quantity of milk, and their condition did not seem changed by either. In feeding the same animals with beets, it was easily told that one-third less than of the turnips or potatoes would make them give the same quantity of milk, of better quality, and they showed better keep. The beets made the milk better, the butter better, and the cows look much better. On one half bushel of beets per day to each cow, with straw and a little meal or bran mixed in, they continued in good condition through the winter, gave as much milk as in the summer, and the butter was as full as good as in May. My experience during the past winter (1839-40) while I fed on roots, only confirmed my former conclusions.—*Western Paper.*

Our Trade with France.

The New York Express of Wednesday, says—"The export of specie has, in its operations, been quite remarkable. Exchanges on all Foreign places, France excepted, have been in favor of this country. No specie has been wanted, and very little has been

shipped to any other place. France has, particularly, for the last three months, been receiving large sums in silver. The question naturally arises, how is this? Why is it that while there is a perfect reciprocity in trade with any other country to such a degree, that we neither receive nor pay any considerable sum in specie, France should bring us in debt at once full three millions of dollars; and taking it she takes not gold, which we can spare, but will have all silver, a description of coin that we cannot spare. The great secret is, in the immense introduction of silks. The duties being now removed, this description of goods comes in at very reduced rates. Fashion unfortunately clothes our females in silks, and even the males take a large quantity.

"Our great staple, cotton, is the principal article that is sent in payment, and at the unprecedented low rates it is bringing in Europe, it falls short of a sufficient sum to pay for our indebtedness. To England, besides the vast sum we pay for goods, we have to provide for a large amount of interest, and with all this running against us, we are enabled to square up with produce; and yet with France, from whence we receive but little else than silks and wine, which contribute but little to our national revenue, we are constantly in debt. Nor is there much prospect of any favorable change, so long as fashion runs in favor of silk goods. So long as they are admitted free, and so long as cotton continues at the present low rate, it is hardly possible that there can be any change for the better."

Exercise, a Moral Duty.

The faculties with which our Creator has endowed us, both physical and intellectual, are so dependent upon exercise for their proper development, that action and industry must be regarded as among the primary duties of accountable man. "In all our conceptions," says an ingenious writer, "exertion is connected with success and renown." A triumph without an enemy combated, and a victory won; a prize where no course is marked out and no competitor starts with us in the race, are not ones which do not find a ready admission into our minds. Such is our constitution, that, according to our usual train of thinking, that where there is no exertion, there can be neither honor or reward. Progress in moral and intellectual excellence is our duty, our honor, and our interest. To be stationary, or to retrograde, is disgraceful. We came into the world feeble in body and in mind, but with seeds of improvement in both; and these seeds grow, according to the cultivation they receive from exercise. The body grows in stature and in strength, and the mind gradually expands. But exercise is requisite to the development both of our corporeal and mental capacities. In the course of years indeed, the body grows; but without exercise, it is lumpy, feeble, and inactive; and the mind, wholly undisciplined, remains in a weak and infantile state. The exercise which is requisite in order to bodily health and vigor, and the evolution of our moral and intellectual powers, is not only the chief means of our improvement, but also the main source of happiness. Without exercise of body and of mind, there can be no happiness.

In one respect the farmer has the advantage of almost all other classes of the laboring community: his evenings belong to himself, while the mechanic has to labor from morning till 9 o'clock in the evening, the farmer's day commences with the rising and closes with the setting of the sun. Although the industrious farmer finds many little jobs of work, to which he very economically appropriates his evening leisure, yet the greater part of the long winter evenings he can appropriate to his amusement and instruction. In no place do we see more cheerful contentment: around the blazing fire upon the farmer's hearth. There, at the merry apple paring, or at the neighboring collection, or even in the family circle alone, do we find social happiness in its pure simplicity. What an opportunity this, for an acquisition of knowledge! What farmer who improves these opportunities can but be intelligent? And what instruction so interesting as that which gives him a knowledge of his own employment? Here we would suggest the importance of every farmer having a supply of agricultural books and papers. It seems to us that no one can be insensible to their utility. If this should be a suggestion of self interest, which we do not deny, still we believe it coincides with the interest of the farmer. We will not enlarge on this subject, as we apprehend it would not convey that knowledge which we recommend. We will barely say, that we expect our subscribers to increase as the evenings lengthen.—*Silks Culturist.*

CENSUS AND STATISTICS OF GENESSEE COUNTY.

Table with columns: TOWNS, Males, Females, Total, Horses, Cattle, Sheep, Swine, Baskets of Wheat, Pounds of Wool, Bushels of Potatoes, Tons of Hay, Pounds of Sugar, Pounds of Val. dairy Products, Measure of Capital. Lists towns from Alabama to Weathersfield.

CENSUS AND STATISTICS OF LIVINGSTON COUNTY.

Table with columns: TOWNS, Population, Horses, Cattle, Sheep, Swine, Poultry, Baskets of Wheat, Bushels of Potatoes, Tons of Hay, Pounds of Sugar, Pounds of Val. dairy Products, Measure of Capital. Lists towns from Avoon to Sparta.

Statistics of Monroe Co., next month.

In addition to the above, there was raised in this county, in the same year, 55,532 bushels of barley, 691,672 bushels of oats, 4,609 bushels of rye, 19,247 bushels of buck-wheat, 231,576 bushels of Indian corn, 4,520 pounds of hops, 21,452 pounds of hemp and flax, 180 pounds of cocoons, and 1283 pounds of wax. The number of cords of wood sold, was 23,558. The amount of pot and pearl ash manufactured in the

county, was 303 tons. The value of poultry \$24, Of the population of the county, 117 are free sons of color, viz: 67 males, and 50 females, were residents of the county on the first day of last. There were also resident in the county on the day of June last, 135 Revolutionary and Invalid Pensioners.

Decay of Ruta Bagas--Inquiry.

Messrs. THOMAS & BATHAM--When I harvested my ruta bagas this fall, I found nearly one third of the roots, and as they had not been exposed to frost or much wet, I am at a loss to account for their decay. They were harvested about the last of September, and appeared sound and good, (except that the leaves were yellow,) but on taking hold of the leaves to pull them up, the tops came off, and showed that the necks were rotten.

Many of my roots were more or less injured by grubs, but I could not perceive that this caused their decay. If any of the readers of the Farmer can explain it, I should be pleased if they would do so.

Yours, &c.

SILAS PRATT.

Child, Dec. 1840.

The Fruit Garden.

In our last volume we treated of several particulars respecting the Fruit Garden; and we now continue our remarks for the purpose of calling the attention of independent farmers to the subject. In so favorable a soil and so fine a climate as that of the Genessee country, it has often been a cause of regret to us, that so many hundreds--yes thousands--of wealthy freeholders should be destitute of the delicious fruits that such a garden can supply. A few years ago, a friend of ours from a distant land, came to join us in a journey of three hundred miles. It was in the last month of summer, when the Fruit Garden yields its simple luxuries in abundance, and he was delighted with the treat. We remarked to him however, before we set out, "Now is the time to feast--nothing of the kind can be expected till our return." Did it turn out so? perhaps some of our readers would ask. Exactly--to the letter. There was fine fruit without doubt, in the

district through which we passed, but we saw it though we shared the hospitality of many noble friends in easy circumstances.

When we planted our Fruit Garden, we had not directed our attention to the position in which the different kinds of trees could be most advantageously planted but we soon discovered that the nectarine, the plum and the apricot, ought to have been set as near to the hog-trough as possible, on account of the Cure. We have already remarked that in the remotest part of the inclosure the fruit was more injured by this insect, though we may add that in a small garden arrangement will be of less importance.

The position for particular, trees will be of great consequence however, on another account whether the garden be large or small. Until our countrymen generally acquire a higher-toned morality; we shall consider robbing a garden as mean as to rob a hen-roost, it will be safer to set the late pears or grapes

on the outside. The rich colors of ripe fruits are attractive; and the further we can place them the gaze of animals who have no higher aim than gratification,—the better. On this account a yard should not be a fruit-yard, except for such as may be gathered green, and ripened in the e. We have no knowledge that thieves in this ter look far enough a-head to steal unripe pears, nter apples.

erry trees should be set in the rear of the recta- , plums and apricots, but still as near to the hog- h as possible, after these kinds are accommodated. sider the hog-trough indeed, as an important dge to the Fruit Garden. Where hogs cannot mitted however, *poultry* may in some measure y their place. If both are excluded, then use the : and the hoc—shake the Curculios from the tree eets spread for the purpose, and show them no er.

erry trees should also be set near together—that t scattered in different parts of the garden, on nt of the birds that come to plunder. A leisure our may be well spent on a seat from which shot reach them. We know indeed it is the fashion e day to extol their services, and to decry every pt to lessen their numbers; but people who are d away by such fancies, cannot have duly con- d the subject.

e cedar bird has been called "a friendly, useful, ent visitor;" but we have yet to learn in what t he is better than a crow or a rat. He may de- nsects in some districts, as it has been asserted, t in ours. We have carefully watched him, in years, and have even had his stomach examined what he lived on, but nothing was found in it uit. He comes as a plunderer, and deserves a erer's reward.

The Garden and Shrubbery.

he open ground at this dreary season, flowers— ost tender part of the plant—would be sadly out ce; and therefore ornament can only be expect- the bark, the leaves, or the fruit.

the bark of the *striped maple* is generally admired. : streaks on a ground in which shadings of red en occasionally prevail, always meet the eye, where the red becomes clearer on the twigs and increasing intensity envelopes the buds. The on the contrary, is seen on the old bark; and especially on old trees, which are sometimes six in diameter.

red dogwood (improperly called the red willow) a ornamental. Seedlings vary much however, ard to brightness; and not one tenth of those w with in the swamps are suitable for transplant- Though naturally a sub-aquatic, it does well on on soil; for through winter and the early part of when its bark is the brightest, the ground is ntly wet.

poplar-leaved birch has a white bark, though veral years before the small branches assume color. The leaves are delicate, and the whole showy and ornamental.

golden ash has fine yellow bark, changing a greenish color early in autumn. This tree is ired a variety of the English ash (*Fraxinus ex-*) and its height in London is marked thirty feet. ive one of very vigorous growth about eight feet much admired.

ergreens are admirably adapted to embellish a tend in winter. Among these, the *silver fir* of e will stand in the front rank. It is nearly al- the *balsam fir*, but has a larger leaf more d- striped with white on the under side. Both are beautiful.

Next to these we should place the *white pine* which often becomes the tallest tree of the American forest, where it has room to spread; however, the rich silky green of its foliage, is more distinctly visible and ornamental.

Not far behind, is the *white spruce*, growing naturally in swamps like the balsam fir, but soon becoming reconciled to a dry soil. Two or three years in a nursery, give it a new set of roots; and when these are acquired, with reasonable attention, it is almost sure to live when transplanted. It also attains a great height in favorable situations.

The *Norway fir* from the north of Europe, famous for its timber, is another fine evergreen with darker foliage; but perhaps not darker than the *black spruce* which is often found in mountain land and a cold soil. Near these may be placed the Chinese and American *arbor vita* with fragrant leaves; and the *English yew*, remarkable for its duration and slow growth.

The Scotch fir, so called is properly a pine—that is, it has two leaves in a sheath. This species and the Norway fir, supply the deal boards of England.

But we have not forgotten the *hemlock spruce*. Men who are long employed in clearing land, are apt to consider every tree that stands in their way as worthy of death; and we apprehend that but few arboriculturists can be found in this class. Against the hemlock, the prejudice has been unusually strong. Without stopping to inquire on what it rested however, we shall express our conviction that this tree deserves a place among the finest evergreens when it can clothe itself with foliage from the ground. It bears training well; and the most beautiful hedge we have ever seen was of hemlock.

The *common Juniper* retains the green of its leaves in winter much better than the *red cedar*; and as it inclines to grow low with prickly leaves, it might serve for a hedge on the top of a ditch. It may easily be increased by layers or by seeds.

An evergreen, little known in this district, but remarkable for its beauty is the *tree box*. It appears to agree with our soil and climate; grows densely, and a hedge of it, in front of a mansion would be superb.

In sheltered situations the fruit of the *pyracantha* retains its fine scarlet; but the severer blasts of winter destroy its color. On the *bush cranberry* however, these have no effect; and its clusters hang in all their brightness till the commencement of mild weather in the spring.

No shrub however, is more beautiful in winter on account of its fruit than the *barberry*; and none is safer from the depredations of birds. The berries are very acid. Many people have been deterred from planting it because of its supposed influence in blighting wheat; but this charge is proved to be unfounded. It has neither philosophy nor fact to support it.

Items in Domestic and Rural Economy.

To prevent horses, which are disposed to break their bridles, from doing so, place a pad within the strap that passes back of the head, the inside of which is lined with cotton or linen, and in which the points of three or four very sharp nails, pointing inwards, are concealed. When the horse draws hard upon his bridle, these prick him, and cause him to desist.

Stoves, for heating rooms, will throw out much more heat for the amount of fuel consumed, if, as soon as the wood gets well burning, the draught below and above the fire, is closed. For less heat is swept by the draft up chimney. On this principle, the blacksmith increases the heat of his forge, by sprinkling water upon the ignited coals, and preventing the flame from rushing out; and also, green wood on a common fire often prevents the rapid escape of heat up the chimney, for a similar reason. All stoves should

therefore be provided with a valve above us will as below the fire.

Cracks in stoves and stove pipes are readily closed by a paste made of ashes and salt with water. Iron turnings or filings, sal ammoniac, and water, make a harder and more durable cement.

An excellent cement for broken glass, is made by grinding together linseed oil and white lead, to the consistency of a paste.

Nails are prevented from rusting by heating them, and dropping them while hot in oil.

Gates work much better for having the hinges and latches greased. To keep them so, bore a hole, and plug up a quantity of grease in the gate post, where it may always be at hand when wanted.

Ice, on door steps, may be easily removed by throwing salt upon it, which will cause the ice to crack to pieces.

Cattle should be duly supplied with salt during winter, which is often forgotten.

Hay and oats may be economized by feeding horses ruta bags, which they soon learn to eat.

An excellent and cheap paint for rough wood work, is made of 6 pounds of melted pitch, 1 pint linseed oil, and 1 pound of brick dust, or yellow ochre.

Cream which churns with difficulty in winter, if too sour, will speedily produce butter by the addition of saleratus. If too cold hot water may be applied—but it is better to warm the cream and keep it so. If the thermometer shows 70° of Fah. it will soon come. When minute granules of butter appear and it does not gather readily, throw in a piece of butter, and it will "lump" together in a trice.

Stumps in fields are made to rot, by placing earth upon them.

Farmers' Homes and Children.

A much esteemed correspondent has sent us a reply to the communication of ANNETTE, in our last; but we think it is written under a misapprehension of the subject; and, as it is not very courteous withal, we are compelled to decline its publication. The writer styles himself "an old home-spun practical farmer," and says that he "has neither been an indifferent nor a disinterested reader of what our columns have from time to time furnished on the subject of the education of children, with a view to qualify them for the business of practical farming." He admits that "Annette has detected and exposed a crying evil, and pointed out the remedy;" but still it appears to him to be "all moonshine," and he is fearful that the expense of "making home attractive," according to the suggestions of Annette, will lead farmers into the "frightful swamp of bankruptcy, want, disgrace, and misery."—We admit that there are many farmers in our land, who cannot afford the necessary time or expense for the pleasures and comforts spoken of; neither can they afford to educate their daughters in a boarding school; but at the same time there are many others who can well afford these expenses, and are not compelled to spend all their time in toiling for the necessaries of life. It is a great mistake however, to suppose that much expense is necessary in order to make a dwelling pleasing and beautiful. It need not "all be set up or established upon the most modern and fashionable foundations." On the contrary, almost any man who has the taste and disposition, can find the time and means to surround his home with most of the attractions mentioned by Annette, without any danger of bankruptcy or ruin.

We cheerfully comply with the request of our correspondent, in publishing the following article from the *National Aegis*; and, in return, we ask him to read the article on the next following page, entitled the *Working Man's Home*.—EDS.

From the National Aegis.

To the Young of both Sexes.

It is of great importance that persons, in early life, should prepare themselves for the part they are to act in society. There is a strong desire in both sexes to rise to respectability, and this is highly commendable; but many persons err in their attempts to gain their object.

A principal cause of the failure of young people to reach the object of their desire, is, the attempt to *get rich without labor!* In this way, they often aim at an object without the means to accomplish it. Thus, or many years past, young men have entered on business with borrowed capital, to an extent never before known; they have calculated upon the profits which were precarious; they have neglected to calculate the chances of sudden declensions in business; they have entered upon house-keeping, with extravagant purchases of furniture; they have mostly *failed*, and reduced themselves and families to poverty. The failures and the distress which have occurred in this country within a few years exceed every thing probably that ever before happened.

Young friends, learn wisdom. It is not the order of Providence that mankind should have blessings and prosperity without labor. It is best for mankind that this should be the order of things; good moral habits are formed by industry; sudden acquisitions of property tend to prevent the formation of such habits, they are often ruinous to morals. Moderate acquisitions of property generate good habits—the habits of prudence, of foresight, and correct calculation of what is practicable.

The desire of reaching a respectacle standing in life has led many to renounce labor for books, with the expectation that they can live by learning. But the number of persons who can gain subsistence by learning is comparatively small. The professions are full to overflowing; unless that of the gospel ministry may be excepted. By far the greatest part of mankind are destined to labor, without which society cannot be supported.

In forming a plan of business for life, therefore, the first requisite is to determine the course to be pursued, the occupation which is to be followed, and then to devote all possible attention to gain the qualifications essential to success in that occupation. In this preliminary to success, persons very often make great success.

If a young man is to be a farmer, he must begin when a boy, and continue in that business. He must gain knowledge by experience, and muscular strength by labor. Books and learning will never make farmers.

If a young man is to be a mechanic, he must begin his art when young, and persevere in it, and be thoroughly master of every part of his business. Books and learning cannot supply the want of labor and experience. Farmers and artisans cannot be made in the school house or college. Most of the studies cultivated in our seminaries of learning, however useful to professional men, are not applicable to all the common occupations of life. This the writer knows by experience.

It is with female as with males: they desire to live without labor, and thousands of them fail of obtaining a good settlement in life, by aiming at what cannot be obtained. Hence, the high schools often become nurseries of old maids. The daughters of wealthy men, who are sure of the means of living without labor, and such as are fortunate enough to marry men of influence, may be justified in devoting many years to *languages and sciences which they are never to use*; but how small, comparatively, is this number!

Most of the people of this country possess small estates, which, when divided, will not support their children. Hence it often happens that children, whom the father can support in genteel style, fail, at his death, of the means of subsistence. Hence, probably, no country presents so many instances of young persons of both sexes, *educated above their condition*, as the United States. Many persons and families, within the knowledge of the writer, have been ruined or doomed to struggle with adversity all their lives from this mistake. They begin wrong, they expect to be gentlemen and ladies without the means of supporting themselves in such style.

Equally mistaken are many of the daughters of poor families. Some of them enter manufactories, where they get good wages, and dress in rich attire; neglect to gain a thorough knowledge of house-keeping, the very knowledge they most want to insure them a good sentiment. Young men of industry want wives that are good house-keepers. They do not seek females for their dexterity in tending spools; but

for those who are accustomed to do all the work of a family, and to make an economical use of money. Such wives are useful auxiliaries in supporting a family; whereas such as are not accustomed to housework often check or prevent the prosperity of their husbands; sometimes they ruin them.

Much less do men, in the ordinary occupations of life, seek for females who have studied geometry, algebra, rhetoric, zoology and the higher mathematics. Such sciences are of no use to them in discharging their duties, as wives, mothers or housekeepers; they are soon forgotten, and if not, never used; nor do they ever become subjects of conversation. In the course of thirty years observation, the writer has never known a female thus educated to make the least use of such sciences; not even in the families of the affluent. Books on such subjects, read in after life, for the purpose of gratifying curiosity or enlarging the knowledge of the works of nature, may be useful for these purposes among those who have leisure, but not being necessary to qualify females for these duties, should not be a part of school education.

In no particular is the folly of females more remarkable than in their estimate of labor. They seem to think it disgracing to labor in the family as domestics, when they will labor in manufactories without objection. They do not consider that the proper sphere of females is in the family, and that they cannot fill that sphere without serving an *apprenticeship*, and they should no more disdain it, than young men should disdain to be apprentices to mechanics. The young of both sexes must be subordinate to those who are older, for it is from experience and knowledge of older persons that they are to qualify themselves to be respectable masters and mistresses themselves. Girls who have no property should seek to be domestics for two or three years in respectable, well-ordered families, for it is in these they are to learn, not only to do all kinds of work, but to improve their minds and their manners. It is the best, if not the only chance which many of them can have, thus to improve, and become respectable mistresses of families.

All young persons should have a competent English education, and for this purpose, they should have access, not only to the Bible, but to the best writings of Watts, Addison, Cowper and Mrs. Moore. In wealthy and well conducted families the poorest girls may have this advantage. By avoiding domestic service, they deprive themselves of advantages which they can never have in any other business. The pride of females often condemns them to poverty and a single life. Many and many a female fails to gain a comfortable settlement in life, merely because she is too proud to submit to the apprenticeship of learning the duties of a house-keeper in the character of a hired domestic.

FRANKLIN.

From the Maine Farmer.

Signs of the Times.

We sometime ago, under this head, made some remarks in regard to the change of feeling at the South, respecting a "judicious tariff" on certain articles, which do not now pay any duty, or but very little; such as silk, wines, &c., which may be considered articles of luxury, and not of necessity. We were not aware of treading on the *political toes* of either party—but it so fell out that we received sundry *hearty kicks*, from individuals belonging to both of them.

No note it be, gentlemen; we have always been used to "*more kicks than coppers*" from our youth up, and this getting thumped from both sides of the *way*, is pretty sure proof that we are in the right. At any rate, one thing is certain, and you may all put and make wry faces as long as you please, about it. You must have a tariff, and a pretty strong one too, or you must support your government by a direct tax. Now, which do you like best? When the last tariff was adopted, certain articles were admitted almost or quite duty free, because it was alledged that they could not be produced in this country. Among them, as we before observed, were silks. Since that period, the experiment has been pretty thoroughly tried, and it has been found that we can produce silk here with ease, but the French, on account of labor being so much cheaper with them than with us, can sell cheaper than we can, and thus defeat us in the market. Very well, this might do, if they would meet us on reciprocal grounds—that is, take our produce, or some of it, duty free. But this they decline doing. The song with them is—Free trade for us, and heavy duties for you.

The tobacco planters are getting their "*blood up*," and the following from the American Farmer shows what they mean to do. There will probably be, ere long, a modification of the tariff system, and we trust the different interests of the South and the North

will meet and act with more union on a subject of such vital interest, to every son and daughter of the nation.

THE BALL IS IN MOTION.—The Tobacco Planters are on the *qui vive*—to speak in plain English, on the *look out*. Their interest in Congress, if zealously combined, is strong enough to make itself be understood—and if not strong enough in numbers, let it log-roll, as a last resort, with some other than can make it so.

The Planters of Charles County, Md., were to have held a meeting yesterday for the appointment of delegates to the convention.

The proceedings of a meeting in Dinwiddie, Va., will be found below, with some introductory remarks from the National Intelligencer. The Lynchburg Virginian, alluding to the proceedings of this meeting, and remarking on the onerous duties levied on our Tobacco, by foreign powers, observes:

"Other nations are depressing our productive interests by monopolies and onerous restrictions. In reciprocity for all which we have pursued the most liberal policy—the luxuries of foreign lands have entered our country almost duty free. We should no longer submit to these oppressive duties. It is time for us to obtain their repeal, or counteract them by similar restrictions. If we cannot by our example induce other nations to adopt the enlightened policy we have pursued, why we have no alternative left but to try the retaliatory system."

Massachusetts Statistics.

From the returns of the valuation assessors of the several towns in the State of Massachusetts, as published in the Boston Atlas, we compile the following interesting statistics:

Population.—Whole number of males and female 610,814, being an increase in ten years of 129,292.

Polls.—Rateable polls of 16 years and upward 172,927, male polls not rateable 12,065, ditto pauper 1707.

Buildings.—Whole number of dwelling houses in the State 96,227, shops and stores 23,019, barn 63,806, other buildings worth over \$20 and upward 26,573.

Distilleries.—Whole number 73, breweries 15.

Mills.—Grist 757, saw 1371, paper 98.

Manufactories.—Splitting mills and nail machine 424, iron works and furnaces 133, small arm man factories 12, carding machines 651, fulling mills 18 rope walks 64, glass factories 4, card factories 34, superficial feet of salt works 14,897,815.

Cotton Factories.—Whole number 343, looms 16 638, spindles 624,540.

Woolen Factories.—Whole number 201, loom 3032, spindles 113,457.

Other Factories.—Bleaching 10, linen 2, silk works for printing calico and silks 12.

Agricultural.—Tillage land 259,058 acres, the produce of which is, wheat 101,178 bushels, rye 453,70 oats 1,226,300, corn 1,775,073, barley 149,004, ho 237,941 pounds, hemp 7 tons, flax 2, broom corn 58 upland mowing land 410,930 acres, the produce which is 467,537 tons of hay, fresh meadow land 184,822 acres, the produce of which is 135,930 ton salt meadow land 39,305 acres, the produce of which is 26,203 tons.

Various.—Superficial feet of wharves 8,402,28 tons of vessels 498,057, ounces of plate exceeding \$ in value 153,670.

Pride and Extravagance.

A slight exposition now and then of the way which we "simple republicans" live, will do no harm for the means of acquiring information as to our rational income and outgo are not always within the reach of the people. The last annual report of the Secretary of the Treasury contains some information of much value to the general reader, and goes to show that we are not exactly the plain, calculating, money-making people, that some modern travellers have pronounced us. Our institutions, it is true, are republican, as they partake of the nature and spirit of a government, but society is the mere apex of foreign aristocracy, and we are as fond of our luxuries as any other people. "Hard times" is a stereotyped complaint, and the embarrassed condition of the country is made a great political subject. This is all right enough, the contending parties must have some weapons to fight with, else how would the conflict proceed? But while all these complaints were making we last year paid to France and England, principals the former, *twenty-four millions* of dollars for silk, Gro de Nap, Gro de Rhine, Poul de Soui, and Ti

ni shawls, a large part of which consisted of articles used merely for ornament.

In the younger days of our beloved country, the American girls did not dream of such things as Taghi shawls—their mantles were the products of their spinning wheels and looms—but with education comes refinement, and of course its motely cousin, fashion. More than two millions were paid last year for silk and worsted, seven millions for worsted stuffs—one million for laces, nearly the same for leg- n and straw hats and bonnets, being about twenty- millions of dollars for the ladies alone! whose city and nice ideas of fashion must be gratified.— are the gentlemen without their share of foreign uries. Three millions for wine, being six millions gallons, and one million for cigars—the quantity ed away being ninety-three millions! Including ee, tea, spices, spirits, &c., amongst the luxuries, e than fifty millions of dollars, nearly one third of entire imports, expended in luxury and extrava- ce.

Our citizens have lost millions of dollars in endeavoring to establish the silk business in this country, as great morbus multianalis mania will prove, yet s are imported into this country free of duty, and sequently we are encouraging foreign manufac- s to the utter ruin of our own, and acquiring a s for foreign luxuries, when we would most assu- display more patriotism, were we to advance the ucts of our own industry. The St. Louis Ga- zette, in a very sensible article on the subject, remarks It has generally been considered the most just and nable policy to tax the luxuries of life, if taxes t be laid, while, by our present tariff, we tax the sseries of life and introduce luxuries free of duty. tax the poor man's salt and clothing, and release ich from a tax on their habiliments. We give oyment to foreign silk growers, and reduce our to beggary. Is this in accordance with the ge- of republicanism! Not certainly, as we under- it. In our trade with England and most other ns, our exports pay for our imports, but France s us in debt ten or twelve millions annually.— more Ocean.

The Workingman's Garden and Grounds.

All thriving trees confess the fruitful mould,
As yielding apple ripens here to gold;
For the blue fig with luscious juice o'erflows,
With deeper red the full pomegrant glows," &c.
HOMER'S *Odyssey*, book vii.

was certainly an exaggeration of Mrs. Trollope r, that no one could ever hear two Americans talk minutes without the word *dollar*. So Bonaparte erated when he called the British "a nation of ceepers." Be it so. Caricatures often tell the . Even the hideous concave mirror, though it gerate ever so much, shows me some grand blem- in my face. I have tried the experiment, in- ing the crowded streets of our cities, to catch the inent word of the passer-by. The catalogue is ed, and consists of such as these, "Ten per —" "doing a good business"—"money mar- —" "operations in property"—"exchange"— "ck"—"thousand dollars"—"credit"—"profits" rtune," &c. &c.

A man is so practical that he will not wash his without "value received," I entertain no hopes ing him over. I have no *purchase* for my in- tent. Now cleanliness is a sort of decoration:— ive, perhaps, but the condition of all the rest — less follows very closely; a cleanly child is usual- at. The cleanly housewife is sure to produce in uttage a certain trim and symmetrical arrange- which gratifies the eye. This is neatness bud- into beauty. This transition ought to be seized wherever it appears. The pleasant little chil- who are yonder playing in the dust may be taught ep themselves clean, and then to be neat. This path towards decoration. Taste needs develop- . These creatures may be bred to enjoy orna- , and thus we may get a race of people, even g the poor, who will begin to beautify the land. in the hope of seeing cottages along our multi- and dirty railways, each adorned not only with a surface and a close fence, but with roses, pinks, s, and all the pretty vegetable gifts of a loving dence; gifts which our yeomanry have too much hed to green-houses and ballads.

The ways of adorning a house by rural aids are va- e, and so well known as scarcely to need enumera- . They may be adapted to the lowliest habitation vilized man, no less than to the villa or the cha- Nothing but love for domestic beauty and ordi- tact are required to rear a thousand tasteful abodes

along our highways. And if but one provident house- holder will begin, we shall find that, humble as his habitation may be, he will soon be imitated by his neighbors. Fashion itself, the cause of so many fol- lies, may be brought in aid of virtuous enjoyment.— Let some working man make the trial, by holding up before his mind rural decoration as a distant object.— Let him secure to himself a house and garden where he is willing to spend his life. Let him, as his means allow, have it tight and finished, and by all means duly enclosed. This is the frame-work; after this en- sue the details. Let him learn the economy of a lit- tle timely paint, and of a fence or hedge which will withstand the assaults of wind and beasts. From day to day, as he may be able to snatch a moment for breathing the fresh air, let him remove unsightly ob- jects and make an entrance upon positive ornament.— How easy it is to set out clumps or rows of trees, for shade and fruit, flowering shrubs or evergreen hedges! How agreeable to the wife and little ones, to be called out to join in dropping the cheap flower-seed or train- ing the luxuriant vine!

Among these ornaments, the highest rank is due to Gardening; including in that term the rearing of val- uable trees. Children should be early taught that when they set out a fine tree, or insert a graft, they are do- ing a favor to posterity, and beginning that which shall continue to make others happy when they are in their graves. It has always been pleasant to me to see the house of the industrious citizen embowered in flowering vines and trees. And on Saturday evening, a season when so many forsake their work only for the potter-house or the tavern, the man who possesses such a retreat will have a strong inducement to seek his delightful home, and meet his little household among the smiles of natural scenery.

There are many very precious maxims of life which need to be pointed out; they are overlooked by the mass of the people. Once indicated, they are believ- ed and embraced. Among these is the following:— *Simple ornament hinders no good use.* The watch runs as well in a comely case, as it would in a deal box. The draught is just as savory out of a chased tankard. And every good of household life is unim- paired by nestling among green foliage, climbing honeysuckles, and parterres of flowers. I long to see this acted upon by our people. I long to see them snatching a few hours from the noisy throng of idlers, and the delirious mirth of the bar-room, and spending them on the little innocent decorations of humble but delightful home.

The time required for beautifying a house and en- closure is really so little, that it scarcely admits of being brought into a calculation. A few minutes at day- break, in the spring and autumn, will in the course of a year work wonders. A few snatches of time after labor is ended may be spared by the busiest man. If his work has lain within doors, or has been of the sed- entary kind, a little exercise and air, enjoyed in prun- ing and trimming his vines, will be restorative to his health and spirits. This is better than mere repose.— Nature abhors a vacuum of employment. Is not this positive gain? Health is "the poor man's riches;" that which conduces to it is worth more than money. Even those who are athletic, or who work at trades which give them constant motion, do not the less need something of this sort. It is not mere muscular ex- ertion which preserves and restores health. There may be great bodily effort with no better result than fatigue. What every man requires when the day is done, is gentle recreation, something between work and play, which shall break the train of moody thought, repair the waste of nervous elasticity, and put the jaded mind in good humor with itself and others.

When the artizan, after his evening repast, goes out to water his flowers, every thing he touches is his own; and nothing so much his own as the trees he planted or the shades he gathered. He is refreshed and tranquilized, and grows into the love of home.— These pleasures are mightily increased, when he sees around him his children partaking in his toils and joys, and cheering one another with the merry laugh to work or sport; while the wife's voice, heard within, as she sings contentedly over the cradle, adds a lovely music to the scene. This is a picture, of which the original may be found in many a poor but happy fam- ily; would that it were so in all! Under such shades as these, domestic quiet loves to dwell; and in such a spot religion finds its sanctuary.

Contrast with this a case which we are often called to witness. The mechanic or laborer has worked hard all day. At the close of his toils he turns his face homewards. But he has not provided or cherish- ed at his dwelling any strong attraction. No refine- ment of taste has ever softened his spirit. It has been

too much his practice to pass his leisure hours else- where. He feels the need of some relaxation. He is languid from fatigue, and sullen from the disgust of labor. In such a condition he is easily attracted to the bar-room. There, amidst the odors of liquor and tobacco, he forgets his previous hardness and anxie- ty, to become the victim of an unnatural and danger- ous excitement. The glass, the jest, and the song make the evening fly swifly. Late at night he wends his way home, if not drunk, yet humbled, discontent- ed, and peevish. No children greet him with their joyous laugh; the neglected little creatures are asleep, and the sad wife is awake only through anxious ex- pectation of her husband. Am I extravagant in tra- cing much of the misery in such a case to the want of taste for those little things which makes one's home desirable? As a general observation, I have never seen idle or profligate sons issuing from within the cottage pining which has been adored by their own infant hands. And, on the other hand, it would re- quire a stoical love of virtue for its own sake, to make any youth love the foul, smoky, fenceless cabin of a thrifless father. Sweeten home, and you close mine out of ten doors to temptation.— *Working-man.*

Silk.

In May, I hatched a lot of silk worms, numbering about 6,000; fed them on the White and Black mul- berry; after the last moultin, I lost about half of them by crowding them too thick upon the shelves and being unable to ventilate the room in three or four days as we have had this summer; but the remainder wound about one bushel of cocoons of a fine quality, which at the present price, would pay at least \$4 per day, in- cluding all the time in feeding for the whole.— *Alb. Cul.*
C. M. L. A.

LACONIC ADVICE.—Mr. Hillyard, who for twenty- one years has been the President of the Northampton- shire Farming and Grazing Society, the annual meet- ing of which was held on Wednesday, in presenting a prize cup to Mr. J. C. Elliott, gave him the follow- ing laconic piece of advice:—"Now, young man, take this cup, and remember always to plough deep, and drink *shulloic*."— *Eng. paper.*

PLOUGHING.—The whole series of furrows on an English statute acre, supposing each to be nine inches wide, would extend to 19,360 yards; and adding twelve yards to every two hundred and twenty for the ground travelled over in turning, the whole work of one acre may be estimated as extending to 20,416 yards, or eleven miles and nearly five furlongs.

Apology for Cultivating Flowers.

BY MRS. SELA SMITH.

I deem it not an idle task,
These lovely things to rear,
That spread their arms as they would ask,
If sun and dew are here—
For simple wants alone are theirs,
The pure and common too—
The bounty of refreshing airs,
The gift of liquid dew.

And they return for every ray,
A gayer smile and look;
And greenly as the clear drops play,
They murmur of the brook;
And thus our thoughts away they lure,
Where woods and waters gleam,
And mountain airs are strong and pure,
And sing the bird and stream.

Frail, grateful things! how fondly they
The nurtured leaf outspread,
And more than all my care repay,
When from its folded bed
Some pink or crimson blossom press
To thrill me with delight,
To fill my very eyes with tears,
Its beauty is so bright.

Nay, 'tis no idle thing, I trust,
To foster beauty's birth,
To lift from out the lowly dust,
One blossom of the earth—
Where barrenness before had been
A verdure to disclose,
And make the desert, rich in sheen,
To blossom as the rose. {*Ludite Companion.*

Early Importation of Sheep.

"A Subscriber" asks for information respecting the Sheep imported into this country from Spain, by Col. Humphrey, of Connecticut, "40 or 50 years ago"—particularly as to where, or from what flock they were obtained.

We have looked over a large number of agricultural works, but find no definite information on this subject. The most that we can learn is, that in 1805, or 1806, Col. H. imported about 100 *Merino* sheep from Spain. They were said to have originated from the same breed as those imported into this State from France, a year or two previous, by Chancellor Livingston, but differing from them essentially in their character. Those from France were longer, had straighter legs, longer necks, and bodies more barrel shaped. Their wool was equally fine, but somewhat longer, and the sheep were more delicate in constitution. Those from Spain were short legged and slab sided, with short necks heavily dappled; the wool fine, but short; constitution more hardy than those from France.

If any of our readers can give the particular information desired, we should be pleased to have them do so. In the mean time perhaps the above may be of service to our correspondent.—Eus.

Post Masters

Have very generally assisted us by obtaining subscriptions and remitting money. For this they have our sincere thanks, and deserve the thanks of the community at large. We trust they will see good results from the circulation of the paper in their towns, and that they will feel disposed to continue their efforts in our behalf.

The Public Press.

We are under great obligations to many editors of newspapers who have published our Prospectus, or kindly noticed the *New Genesee Farmer*. To such we will continue to send it without asking an exchange; and if they desire it sent to a friend also, we will cheerfully add the name to our list. (Those who have not done so, but feel disposed to aid us, will confer a favor by inserting the prospectus below.)

Editors of Agricultural, Scientific, or Literary papers, who generously give us an exchange, will please accept our sincere thanks.

THE NEW GENESEE FARMER.

The Cheapest Agricultural Paper in the Union—Only 50 cents a year, (in advance.) 16 large pages monthly, with cuts. J. J. THOMAS & M. B. BATEHAM, Editors. DAVID THOMAS and others, assistants. ONE HUNDRED CORRESPONDENTS.

The flattering encouragement which the *New Genesee Farmer* has received during the past year, has convinced the proprietors that the paper can be sustained in its native soil, and at its economical price; and while they express their gratitude for the assistance they have thus far received, they would now, with renewed confidence, appeal to the friends of agriculture in behalf of the Second Volume. The paper is so well known, and so highly approved, that it is unnecessary to speak of its character, further than to say, that it will not suffer by a comparison with any other paper of the kind in the United States. Each successive number has shown an increase of talent and correspondents. It has received during the past year, original communications from ONE HUNDRED WRITERS, most of whom are well known practical farmers. It also contains the most useful selections from other agricultural journals, reports of the markets, &c.

The object of the *New Genesee Farmer* is to advance the great interests of Agriculture and Horticulture—to benefit the community in general, and farmers in particular: Experience proves that it is well calculated to promote this object; and therefore it is the duty of every friend of improvement to extend its circulation, in order that its influence may be felt throughout the agricultural community.

The friends of *Agricultural Societies* should especially encourage this paper; for, unless farmers read on the subject, and get their minds interested in their profession, they will not act efficiently for its advance-

ment. The Societies formed last year in Western New York, and their fine exhibitions, have already given a new impulse to the cause in this section of country; and it is confidently expected that much more will be done the coming season.

The 2d Volume commences Jan. 1, 1841.
All Postmasters are requested to act as agents, and remit money to the publishers.
Address, BATEHAM & CROSMAN,
Rochester, N. Y.

ENGLISH MARKETS.

The latest news from England, dated 4th Dec. is of but little importance as it respects the Markets. The Money Market was said to be somewhat improved and Cotton a shade higher. The duty on Wheat was 2s. 8d per quarter, and on Flour 14s 10d per bbl.

LONDON, Dec. 2.—The Corn market keeps declining; this week's average of English wheat is 60s per qr. In Flour, scarcely any thing doing: we quote it nominally 30 to 33s duty paid, and 35 to 27s in bond. Sailed hives have declined 2d per lb; dry are maintained.

LIVERPOOL, Wool Market, Dec. 2.—Scotch: A fair demand was felt for most classes of Scotch this week, and the rates previously obtained were steadily supported. A good spring inquiry from the United States would materially add to the firmness of the trade. Our foreign wool market was somewhat brisker this week, and a tolerable number of transactions took place at the rates of Saturday, the 21st ult.

MANCHESTER.—The accounts received this morning from Manchester are of a more cheering character than any received for some time past. Money was becoming more plentiful, and bills more easy of discount, owing, it is said, to timely interference by the London discount brokers, who had taken off a great number of the bills of the foreign houses, and thus relieved the local money market. The prospects of trade were also improving. The extensive Mediterranean market, in consequence of the events which have occurred in Syria, was again considered to be opened, and orders have arrived from the United States, with anticipations of more and larger by the next packets.

NEW YORK MARKET—Dec. 22.

FLOUR, GRAIN, &c.—The receipts of Genesee and all other sorts of Flour through the Hudson are closed. The stock on hand is variously estimated from 225,000 to 300,000 bbls. There is a constant demand and prices rather stiffen. The sales of Genesee are at \$4 91 a \$5 for common brands; 500 Ohio in good order round and flat hoops, sold on Saturday at \$1 06; Michigan \$1 75. Fancy brands of Genesee and Ohio range from \$3 25 to 5 75. Some sales were made of Brandwine Flour at \$5 50, and of Georgetown at \$5 25. Rye Flour is \$3 a 3 25, and Corn Meal \$2 25 per bbl. Small sides were made of prime Ohio Wheat at 107 cts. Rye closed at 57 a 59 cts. One of the last sales of Corn was a cargo of Southern new at 52 cts. wt.; old Southern is held at 55 cts; Jersey might bring a little more. Northern Oats have advanced a little and command 40 a 41 cts per bushel. Jersey sold at 33 cts. There were no sales of Barley.

MONEY MARKET.—There was a pretty large business transacted at the Stock Exchange, and prices generally well sustained. United States Bank was sold at 66, buerly 30 days; Delaware and Hudson went up 1/2; North American Trust do. 1/2; Vicksburg Bank do. 1/2; Canton Company down 1/2; Paterson R. R. up 1/2; New Jersey R. R. do. 1/2; Stonington R. R. do. 1/2; Harlem down 1/2.
\$5000 Exchange on Philadelphia sold at 98 1/2, and \$2000 do. at 98 1/2 per cent.

\$2000 Indiana bonds sold at 74 for next week. The Philadelphia Banks have notified to the parties making the loan, that they are in readiness to receive their portion of the two and a half millions, and issue Post Notes forthwith.

The Richmond Whig of Tuesday says—"Money matters are tight this week, and will continue to be so for some weeks to come. Discounts will be comparatively small until the yearly reports of the Banks are made."

MOUNT HOPE GARDEN & NURSERIES,
ST. PAUL STREET,
ROCHESTER, NEW YORK.

The Proprietors of this establishment offer for sale an extensive assortment of Fruit and Ornamental Trees, Flowering Shrubs, Green House Plants, Bulbous Flower Roots, Double Dahlias, &c. &c.

Gardens laid out, and Gardeners furnished on reasonable notice.—Persons requiring information on any subject connected with the business, will receive a prompt reply.

All orders, letters of inquiry, &c. must be addressed (post paid) directly to us.
Trees, Plants, &c. will be carefully packed, so that they may be carried to any part of the country in safety; and packages will be marked and shipped as may be designated in the order.
Persons with whom the proprietors are unacquainted, are requested to give a satisfactory reference, or name some person in the city of Rochester, who will guarantee the payment.
ELLWANGER & BARRY,
Rochester, Dec. 1, 1840.

TIMOTHY SEED WANTED, At the Rochester Seed Store.
BATEHAM & CROSMAN.

GILSON'S STRAW CUTTER.—This machine has been fully tested by a large number of individuals, and is pronounced decidedly superior to any other of the kind.—They are for sale at the Seed Store.

REMARKS.—After several weeks of unusual dullness a bad going, we were, a few days since, favored with a good fall of snow, and now the gliding sleighs, with merry bell make Old Winter appear gay and cheerful again, and prepare us for a "happy new year." Business has greatly revived; and, although there is, as usual on "pay day," much complaint about the scarcity of money, we have great reason to be thankful that there is no complaint about the scarcity of bread.

WHEAT is now brought in to a considerable extent, and the price has advanced a trifle since our last. Flour remains the same.

PORK still comes in most abundantly, and sells at a rate better price than last month. The largest sized hogs now sell at \$1 per 100 lbs.

POULTRY has been very fine and abundant during the holidays, and sold readily at 6 to 7 cents per lb. Eggs are very scarce and dear: Grocers have paid as high as 1 1/2 cents per dozen for them during the past week.

CLOVER SEED begins to appear, but the price is not yet established: \$9 per bushel have been paid for some small lots.

The Editors.
In order that our readers may understand who are responsible for the different editorial articles appearing in this paper, we mention that those marked thus * are written by J. J. THOMAS, Macedon, and those marked thus † by DAVID THOMAS, Aurora. M. B. BATEHAM & F. F. CROSSMAN, Rochester, are the publishing editors. M. B. BATEHAM is the selections, notices, and is responsible for the selections, notices, and all articles not otherwise mentioned.

To Correspondents.
Our acknowledgments are due to several new and able correspondents whom we shall be happy to hear from frequently. At the same time we hope our old friends will not forsake us. We are glad to hear our correspondents generally willing to sign their names in full. Should esteem it a favor if they would all do so, especially when relating facts or experiments.

The First Volume.
The first volume of this paper is almost daily asked for. It is now ready for sale, and therefore state, that it is furnished, stitched in a paper cover, for 50 cents. Postage, within the State, 12 cents—out of the State, 18 cents.

Our Success.
We are far, fully equals our expectations; and we take pleasure in returning thanks to the numerous Post Masters, Agents, and others, who have generously aided us by their subscriptions or remittances of the same. We have not time, nor do we deem it necessary, to acknowledge all who have contributed; but we do so, when

desired. If the papers arrive, they may know that their letters reached us; but if they do not arrive within a reasonable time, we hope they will notify us.
Careful persons are employed to enter the names and read the papers, and great pains are taken to have it done correctly. We hope and believe there will not often be cause for complaint in future.
Post Masters and agents in Canada, who wish to send us instructions respecting the direction of the papers, are requested to direct their letters to the Post Master at this place; otherwise we are subjected to postage.
Post Masters and Agents are particularly requested to write the name of the Post Office, County, and State. It is sometimes almost impossible to decide what State the place mentioned is located in.

Uncurrent Money.
Bills on solvent Banks in this, and the Eastern States, are at par with us. Canada, Pennsylvania, and New Jersey, are about 5 per cent discount.—Ohio, Indiana, Kentucky, and Illinois money, is about 2 per cent; and Michigan is 1 1/2 per cent discount.
We hope our friends at a distance will take pains to send us the best money they can obtain. We do not refuse any of the above, when sent us free of postage, and nothing deducted for commission; but the amount paid by us for discount during the year, is a serious item.

Subscribers in Canada.
Should remember that their Postmasters cannot frank letters further than the lines; so that we are compelled to pay postage on all letters coming by mail from there. This we do not mind, if bills not under \$4 are remitted; but on small bills, the postage and discount together, are too great a sacrifice.
Subscribers residing near the places mentioned below, may pay their subscriptions to the persons named.
Kingston—JOHN CRAIGTON, (Chron. & C. Office.) and CHARLES HATH.
Port Hope—D. SMART, Post Master of the Agricultural Society.
Toronto—LESLIE & BROWN.
Lans and George LESLIE, Post Masters, JAMES F. WEST Hamilton—SAMUEL J. KERR, Merchant.
London—J. J. THOMAS, (at News-Room.)
In addition to the above, Postmasters and friends of the cause generally, are requested to act as agents.

BATEHAM & CROSSMAN.
The Annual Meeting of the Agricultural Society occurs to-morrow, but it is thought that nothing more will be done than to elect officers. The arrangements for the coming season will be deferred till it is decided whether the Legislature will grant any aid.

Hints for the Month.
Every farmer knows, that any suggestions for work at one time during winter, are generally applicable at any other time. We believe, therefore, that the best hint we can now give, is, just to turn back to the two last numbers of our paper, and read again what is there written. We do not of course expect you will find any thing new, especially if you are good farmers, (as we hope all our readers are, or soon will be.) but good farming, remember, does not depend so very much in finding out new things, as in making a good use of what we already know. So then, gentlemen, we hope you will excuse us, if we tell you pretty often some of these old things, if we can only help you to get on better.

Just remember what we said,
1. About feeding cattle regularly, so as to prevent their fretting their flesh away;
2. Of giving them a sufficiency at all times, for the same reason;
3. Of providing good shelter for them;
4. Of supplying them constantly with good water;
5. Of keeping them rubbed clean, and plenty of good warm clean litter under their feet;
6. Of feeding them very often with salt;
7. Of cutting their fodder with a straw-cutter;
8. Of mixing their dry food with roots; and
9. Of keeping their stables ventilated, but excluding the cold wind from entering at the smallest crack.

Let pigs, sheep, and all other animals, be fed very much in the same way, (except that the sheep need not be rubbed or curried, nor the pigs kept in stables, though we think there is commonly a very great waste, both in the feed and the flesh of pigs, by suffering them to be so much exposed to the weather as they usually are.)

There are a few other things we wish to remind our friends of during this month, such as trimming such thick-topped apple trees—procuring grafts of the very best fruit they can find, for such will grow quite as well as poorer—making the grafting plaster—pruning their hardy grape vines, before the bleeding season commences,—the sooner the better—treeding snow from around young fruit trees, to prevent the mice eating the bark, and destroying them. Also, cutting up the wood for seasoning, and for summer use; repairing tools, &c., as hoes, ploughs, rakes, wagon racks, harrows, cultivators, forks, shovels, rollers, as well as repairing and oiling harness; looking over apples in cellars, and removing the partly decayed; and keeping their eyes open to all things which need doing, and both hands ready at all times to do them.

And now, one thing more, and that is, let every farmer resolve, and resolve effectually, to conduct his farming operations a little (at least) better this year than he has ever done before. Cannot he do it? It is well worth trying, at all events, and if gone about earnestly, will be pretty sure of success.

Damp Stables.
A correspondent of the Farmers' Cabinet states, that on taking possession of a newly purchased farm, his horses became poor, diseased, and incapable of labor; his cows became sickly, their milk diminished, their butter became bad, four lost their calves, two died of scours in spring, with other attendant evils. The dampness of the stable, which was built under large trees in a low situation and with a northern aspect. It was immediately torn down, and another erected on a drier situation, when, as was expected, all these evils vanished at once.—Stables made of stone, are more liable to this difficulty.

Cheese are preserved from the fly by a coating of

The Sponge Apple.

Some years ago, we set a graft on a young apple tree in the orchard, which now bears abundantly, and the fruit has become a general favorite; but the name under which we received it has been lost, and if any correspondent will restore it, we shall be much obliged. We subjoin a description. On account of its shriveling when long kept in an open bin, we gave it the *provisional name* of the sponge apple—to be expunged however, when the right name is known.

Fruit above the middle size, inclining to oblong, but broadest near the base, slightly ribbed, some, three inches deep and three and a quarter in diameter. *Eye* in a narrow depression, closed. *Stem* very short—less than one third of an inch, in a broad but very shallow irregular cavity. *Skin* green, streaked and checkered with very pale red on the sunny side. *Flesh* greenish white, extremely tender, tart but excellent.

We have seen no apple that this resembles, in shape, in color, or in texture. The singular tenderness of its *flesh* reminds us of the Bellflower; but they differ in almost every other particular. The Sponge is more than five times as productive, and generally fair.—Like the former however, it should be carefully hand-picked, and not allowed to fall from the tree, as it is apt to get bruised. It appears to keep well through the winter; and if barrelled or buried, we have no doubt of its remaining fresh and unshriveled till spring.

The Napoleon Pear.

In years past, we endeavored to cultivate fine winter pears; but when the trees came into bearing, it was found we had only been collecting trash. In every instance the fruit was left for the pigs; nothing fit for human lips to touch, was amongst them; and when asked if there were not good *winter pears*? we have had to answer: we have read of them, but never saw one.

Well, at last we have found one; and some may be gratified to hear it. From a small tree marked Napoleon, in bearing for the first time, we secured *two pears*; and about the middle of December, they were mature. In some respects they differ from Lindley's description, and some doubts still hang over their identity; but what follows, was exact:—"finally [the skin] changes to a pale green, when the flesh becomes *very melting*, with a *most unusual abundance* of rich agreeable juice." They were the most juicy pears we have ever tasted.

We shall notice here, only one of those discrepancies: Kenrick says "It ripens with us in September." Lindley says "Ripe the middle of November, and remains in perfection several days." Ours ripened a month later.

Vat or Box for Boiling Sap--Inquiry.

Messrs. Emmons—Having understood that there had been a Vat or Box used for boiling sap in making sugar, and wishing to see a description of it, I thought of making inquiry through your valuable paper; hoping you, or some of your subscribers, might give me the required information. I wish to know what would be the most convenient size and depth; how it is made, with a board bottom covered with sheet iron, or with sheet iron bottom alone? If the latter, what would be the easiest way to make it water tight? If the former, will the sap boil equally as well? Also, whether they will take in sap as fast as a caldron kettle holding the same quantity, and the probable expense of one?

I would also like to know the quantity of Timothy seed required to the acre, to seed with Timothy alone, for mowing.

By answering the above, you will much oblige

A SUBSCRIBER.

For the New Genessee Farmer.

Watering Places--Hoof Ail.

Messrs. Emmons—In an editorial article in the December number of the "Cultivator," page 1-4, are remarks on the subject of watering cattle in winter; some of which appear to be objectionable. The sentiment to which I refer is, "that it is no disadvantage to cattle to go a suitable distance to water, but rather a benefit, as promoting circulation in the feet, and thus preventing diseases of the extremities."—The same idea is advanced in the February number of the same paper, page 22. And putting both articles together, we should conclude the "suitable distance" for cattle to travel for their water in winter, was from fifty to one hundred rods. And the *advantage* set forth is the *exercise*, which prevents what is called the hoof ail.

"Now it strikes me very forcibly," as the judge says, that this course, both in theory and practice, is, to say the least, somewhat objectionable. It is the opinion of many, that cattle should not be compelled to go out of their yard for water; and the following among other reasons are adduced. If water cannot be obtained by cattle without travelling one fourth of a mile, they will many times suffer exceedingly for the want of it, rather than go so far for it. If good fresh water can be had by them without going out of the yard, they will drink very much *oftener* than in the other case, especially in cold weather. Again. The oldest and strongest cattle will generally go first to water. When they have drunk, they return, and on their way meet others in the narrow snow-path, and of course drive them back. In which case, the youngest and most feeble of the herd will have much trouble and vexation in obtaining water at all. And again.—The amount of manure which is dropped, and for the most part lost, in such case is very considerable in the course of the winter: and it is by many farmers esteemed a matter of no small importance, that *all* the manure should be saved. Some say, even, that they may as well waste the food of cattle as the food of plants.

And besides, when cattle go to a spring to drink, especially if the snow is deep, there will generally be great difficulty in reaching the water on account of the bank of snow and ice, unless they step into it, which cattle are very unwilling to do. I have seen many watering places where cattle, in order to obtain a drop of water, were obliged to get down upon their knees, and even then obtain it with the greatest difficulty.

Neither do I believe the *exercise* of this travel of cattle a considerable distance to water, is of any advantage in preventing the hoof ail. But I am very strongly inclined to the opinion, which was advanced some time since by Gen. M. Brooks, of Mount Morris, and also by Heman Chapin, Esq., of East Bloomfield, to wit, that the "foot ail," or "hoof ail," as is called, is the result of the *freezing* of the feet. And it would seem more probable that the feet would become frozen by being first wet or covered with mud, than if they were kept dry and clean.

I believe, therefore, most sincerely, that if cattle are kept in a well enclosed, comfortable yard, with open sheds, or hovels even, for their protection from storms, where they can have free and uninterrupted access to good water, and plenty of salt; the yard kept constantly littered with straw, so as to make it always dry, and the cattle put up every night in a stable filled to their knees with the same article, they will *never* have the "hoof ail."

I know that with many, a very strong prejudice exists against wells for the supply of water for cattle.—And probably, a stronger prejudice prevails against the labor and trouble of drawing it. But the expense of thus furnishing water for cattle in winter is compara-

tively trifling; when, by an under-drain or other contrivance, running water can be conveyed to the yard, so much the better. And in many cases this may be done with very little cost. But when this is impracticable I would pump water for all cattle, horses and sheep, rather than compel them to go abroad for it, even though the distance did not exceed thirty rods.

There are several farmers of my acquaintance whose cattle, if they have any water at all during winter, are obliged to travel from one fourth to two fourths of a mile for it, and when they arrive at a spot where water can be found it is only to be obtained by them through a hole cut in the ice, which may be from six to eighteen inches in thickness.

I have a good spring of water about sixty rods from my barn, and for two or three winters drove my cattle to it every day, especially in cold weather. But I have dug a well contiguous to my cattle yard and a pump in it, I find much less trouble to furnish water for my stock in the yard than it was, even to visit the spring every day to see that it was attainable there. And besides, there is much less quarreling among cattle, and it is so much more comfortable for the drink from a trough conveniently situated, I would not be without this appendage to my barn even though it should cost me a hundred dollars.

And moreover, all the manure of the whole lot in the yard, intermixed with the straw and litter of, in good condition for spring use, which is a matter of no small importance.

These, and such like, are the reasons why I am opposed to the practice of sending cattle from fifty to one hundred rods for water in winter, expressed, however, with due deference to the opinions of more experienced herdsmen.

WINTER PROTECTION.

I am aware there are many farmers who think the matter of no consequence, whether our domestic animals are afforded any protection from the severity of the winter. It is probably true that most will *live* through the winter without it, if they are fed. But are we not taught a lesson on this from the habits of wild animals? Not one of them as my recollection extends, is without, or does provide himself with comfortable shelter for the winter. Are we not told, also, from a proverb which should not be disregarded, that the merciful is merciful to his beast? And where is the Providence is made comfortable, can be unmerciful to his domestic animals, from which he receives his food and his raiment, and afford them that protection from the chilling blasts of winter, by which they are rendered comfortable not only, but are thereby rendered much more profitable.

Another very great advantage of stabling cattle is the saving of feed from waste. I have seen many otherwise respectable, throw their hay upon the ground when covered with mud and filth, for the foot of the horse and sheep, all in the same yard. In such case one half, at least, of the hay, was trodden into mud and water. But where cattle are stabled, having his mess by himself, and then the weaker animals unexposed to the encroachments of the older and stronger, consume their food with ease and contentment, without annoyance and waste.

And still another advantage to be derived from the course of a plentiful use of straw every day in the yard and stable is, the animals are kept dry and comfortable, but the straw is not to a good account. There are many farmers who seem not to know what to do with their straw, after year it is suffered to accumulate in immen-

the barn, till it becomes a nuisance. But if it is scattered in the yard for the cattle to pick upon through the day, and used for bedding in the stables, thus become impregnated with the liquids of the yard and stables, and mixed with the animal manure, and thereby the quantity of manure for use will be greatly increased. By such a course of stock, say of fifteen head of cattle, seventy sheep, and three horses, will supply three hundred of good manure for the corn and potatoe crop the next season. The straw, thus spread frequently in the yard, to some extent, is eaten by the stock, the excremental juices of the yard, becomes saturated with, and its value thus rendered four fold more than if it were applied in its dry state.

Yours &c. W. PARSONS.
Hill, near Lockport, Dec. 1840.

Hoof Ail--Its Cause and Cure.

SIRS, EDITORS—I observed in one of your papers an inquiry respecting the cause of the disease Hoof Ail, in cattle; and having paid some attention to the subject, I will cheerfully give you the result of my observations and the prevailing cause here, which you are at liberty to publish, if you think they will be of service to any of your readers.

In the winter of 1836-7, this disease made great havoc among the cattle in this vicinity. Freezing weather was at first assigned as the cause; but afterwards the contrary soon led to the abandonment of this opinion, and ergot was substituted as the chief agent.

It is an opinion well established, that ergot, or *Secale cornutum*, has given rise to this disease in the human species. This circumstance of similarity which exists between it and the disease under consideration, afford good reason for supposing that the causes may be similar.

It may sometimes be found in large quantities in rye or spear grass—whether it differs in its properties from ergot of rye, I am not able to say, but I presume it does not materially. This is well known, is apt to run out in Timothy grass, consequently it grows in excess in old fields, and to the ergot growing on it, the disease is attributable. I have made many inquiries, but have not had a case occurring where the animal had been fed on hay containing it.

In confirmation of this—Mr. W. had 50 head of cattle fed upon hay from old meadows—the greater part of which was June grass. Only one of the 50 escaped the disease. A tenant upon the same farm, kept his cattle within 20 or 30 rods of the preceding, but upon hay of marsh grass, and they escaped the disease. Mr. C., on the adjoining farm, had his cattle fed on grass among his hay, but not so much as Mr. W. by two or three of his cattle were affected. The greater part of April, when, being out of hay, they were fed some of W.; and in a few days five of them died of the disease. Another neighbor, Mr. B., had his cows well, but in spring, being out of hay, he also procured some of Mr. W.; and he and his cows all that had eaten it became affected with the disease. Mr. K., on an adjoining farm, fed his cattle straw, and none of the disease appeared in them. Dr. Stimson says he fed his cattle ergot containing a large proportion of June grass. His attention was given them, but many became affected with the disease; and it continued to increase until he stopped feeding the hay, and gave them clover and other food, after which no more appeared.

I mention numerous other cases, affording abundant evidence that this disease is caused by er-

got on June grass, but I fear it will make this communication too long to enumerate them. I will remark that in this section of country, this grass had an abundance of ergot growing upon it last season; and consequently we may expect to see cattle affected with Hoof Ail again this winter. Indeed it has already made its appearance amongst my father's stock. He commenced feeding a lot of hay found to contain ergot, to some calves, on the 2d or 3d of December; and on the 12th, 9 of them had the disease. We immediately changed their food, and cut off the points of their hoofs, so that they bled freely. They are now doing well.

This treatment generally effects a cure, unless the disease has been of long standing. The disease rarely affects the fore feet. I have never seen an instance, but have heard it asserted that it will sometimes occur. Respectfully yours, N.
St. George, U. C., Jan'y. 1841.

From the Cultivator.

Cure for Hoof Ail.

MESSRS. EDITORS—Perceiving in your last number, an inquiry respecting the Hoof Ail in cattle, I am happy to have it in my power to communicate one which never fails in afflicting a cure in two or three days.—Blue vitriol, finely pulverized, and applied to the diseased part of the hoof, once a day for two or three days, is all that is necessary. In the case of a cow of mine, one application was sufficient, and I presume would generally answer the purpose. The disease here is called by some of our farmers, "fouls," and by others, *hoof ail*. If the case alluded to by your correspondent, is the same disease, you can depend on my remedy. Yours very respectfully,

H. E. HUBBARD.

Middletown, Ct. 1840.

Period of Gestation in Cows.

One of the most satisfactory experiments relating to the subject, on record, is the one made by Earl Spencer, and the particulars of which are given in the second number of the English Agricultural Society's Journal.

The table given, contains the results in the case of seven hundred and sixty-four cows, and the following statements abridged from the paper, will exhibit some of the most important of the details.

First. It appears that the period of gestation varied from 220 days to 313 days; or no less than 90 days.—Lord Spencer was, however, unable to rear any calves produced under 242 days. All under 260 days, and over 300, he thinks are decidedly premature, or irregular.

Second. As 314 cows calved before the 253d day, and 310 after the 255th day, the average period of gestation must be considered as between 284 and 285 days; although the time stated in the work on cattle by the London Society, states it at 270 days.

Third. It appears, that omitting those considered as premature or irregular, the cows whose period of gestation did not exceed 286 days, produced 223 cow calves, and of bull calves 234; while from those whose period exceeded 286 days, the cow calves were only 90, and the number of bull calves was 152. This certainly gives some support to the opinion prevalent among farmers, that when a cow exceeds her usual time, the produce will be a bull calf.

Fourth. There were 7 cases of twin cow calves; 5 cases of twin bull calves; and 11 cases of twin cow and bull calves. Earl Spencer has never had a case in which the sexes were different, in which the heifer was a breeding one; they have uniformly been what are termed *free martins*. The cattle of which the above record has been kept, are the pure improved short horn breed, and of the finest herds in Great Britain.—*American Farmer.*

From the American Citizen.

Our Wheat Interests--A Public Meeting.

We have read, with attention, the proceedings of the Convention of Tobacco Planters of the United States held last month, in the city of Washington.—We published an outline of the views expressed, and the measures adopted, by that convention, in our last number; and we ask all our readers to examine them carefully. It seems to us that they ought to produce a strong effect upon the public mind, and the wheat growing States—that they ought to awaken us to a sense of our stupid neglect of the greatest outward interest which the Creator has bestowed upon us; and that we

should feel excited to confer together henceforth often and extensively, to promote this interest.

We feel ever the grain growing interest in the United States, is now, under all the embarrassments besetting it, six or eight times greater than the Tobacco interest, and can be soon extended three-fold by just and prudent means. This interest connects itself with the great tide of life in all countries, more vitally and much more beneficially than the Tobacco interest can. Shall we not then labor to cherish it by all the fair means in our power? It is not enough to sow, and reap, and grind, the finest wheat known to earth's broad bosom, with labor and skill, in all the requisite processes of tillage and machinery and manufacture, exciting the admiration of the world—and to multiply railroads and canals, and vehicles of transportation upon them, with a rapidity transcending the creations of fairy land; but we must actively apply our common sense, and that extensive knowledge of facts which we now possess, or can easily obtain, to the task of extending the markets for this most essential of the necessaries of life.

Solomon says, "As goods are increased, they are increased that consume them." This truth is demonstrated by the experience of all ages. And the facility with which wheat is raised in this and the neighboring latitudes, in a wide belt across the Union, is the chief cause of the rapidly augmenting population, every where working the soil in these regions. But we should not be content with this source of our increasing numbers, wealth and strength. There are frequent communications between all civilized nations, and these have, within a few years, been extended beyond all former precedent. The United States are coming into close contact with all the world. And in the trade of the world, surely the nations which furnish the greatest supply of the things most essential to the subsistence and comfort of human beings, may, with no extraordinary displays of practical wisdom, enjoy a fair share of the benefits of the world's trade. We do not now, and never have enjoyed such a share. Let us strive to obtain it.

We import an immense amount of various articles from Great Britain annually,—of which the value has been chiefly derived from the industry of her subjects. In this way her industry supercedes ours to a vast extent. And these importations are chiefly consumed in the wheat growing States. Yet she will take none of our flour, the article on which our industry is chiefly laid out. Shall this state of things be perpetuated? We have her interests as much in our country as she has ours in hers, and perhaps more; for the high price of her bread stuffs, always artfully exorbitant to favor the landed interest, will give us all her hungry laborers and artisans, amounting to many millions. Oh that they could vote! as advocates for the admission of our flour into her ports, upon reasonable terms. We think her attention, and the attention of several of the continental nations of Europe should be called to this interesting subject, in a new tone, to be backed up by sensible legislation in Congress. But the interests of the people are rarely attended to without the interference of the people. The people must meet and discuss this concern in all its various bearings. They must gather facts and publish them; they must investigate principles and comprehend them; they must petition the national government for its interposition, and show how that interposition may be effectual.

In this most necessary movement we ought to feel no restraint, and Congress should feel none, from the tariff compromise entered into a few years ago. The Tobacco planters and the Cotton Planters suffer no restraints on this ground, to deter them from pursuing such measures as their peculiar interest may seem to demand. Why should we? we would not resist the law, but we would modify it.

Nothing is needed, as we fully believe, to place the vast wheat growing interest of our country on its just foundation, but true light and concerted action among the men of the wheat growing States. We ask our intelligent farmers, our well informed and sagacious millers, our observing flour merchants, our enterprising and exact owners of ware-houses, and lines of transportation, and all others interested in the prosperity of the country, and instructed on this subject, to collect the facts within their means of knowledge, and lay them before the public, with such suggestions of policy as they think wise and prudent, for the people and the government to adopt. We shall be happy always to publish, and give, as far we can in our paper, currency to their statements and reasonable views. And we would earnestly advise, that a meeting should be speedily called, in this city, to consider and discuss this subject; and to recommend a convention of delegates from each of the wheat growing States, to be

held at an early day next Spring, somewhere in the State of Ohio; at which the proper policy to be pursued in promotion of the wheat interest, should be matured, and further measures to render that policy effectual, should be originated.

Our Trade with France.

It appears from a recent table, published in the N. Y. Herald—a paper which strongly advocates free trade—that there was imported into the United States from France alone, in the year 1839, \$32,124,405 worth of articles free of duty—nearly one half of this amount was in silk goods. The articles imported from the same country, on which a duty was paid, the same year, amounted to little more than ten millions of dollars.

Grand total of imports from France, in American and foreign vessels, for the year 1839,	\$32,124,405
Grand total of exports to France from the U. S., in American and foreign vessels, the same year,	18,338,854
	\$11,192,467

Thus leaving a balance of imports over our exports against us, with France alone of more than *fourteen millions of dollars* in one year, or about one million more than the whole export of cotton to France the same year.

Yet, strange as it may seem, the advocates of free trade argue that this same unshackled commerce with France must be continued, lest France should take it into her head to go to India or Egypt for the supply of cotton. The same paper which gives the above statistics, urges, as an argument in favor of this free trade, the fact that we import more of the precious metals from France, than we export to France. So much the worse for us, because our debt is thereby only increased. If this debt is not secured by the Venetian bond of old—the pound of flesh—*State stocks*—the life's blood of children yet unborn—are sold in France and England, to pay all this excess of importations, no less than for the trifling sums in coin imported to bolster up the United States Bank, or to help ruin a new State, who, mocking all the precious lessons of experience, prefers a fevered and sickly adolescence to the simplicity of a healthy childhood—the sad precursor of both moral blight, and physical imbecility and decay. S. W.

New Agricultural Papers.

Within a few months past, we have received about half a dozen new agricultural papers, most of them published in the Western States. We rejoice to see this evidence of the increased taste for such reading, and expect the time will soon come when no respectable farmer will be willing to live without an agricultural paper. We hope these new papers will all be well sustained; but we apprehend that some of them will seriously interfere with each others success.

"*The Western Farmer*," is the title of a small semi-monthly paper published at Detroit, Michigan, by Josiah Snow—\$1 per year. The first number was issued January 1, and contains a large amount of statistical and other useful information relating to agriculture and horticulture, mostly original, (but some borrowed from our columns, and the credit accidentally omitted.) We think friend Snow should have chosen some other title, as there was already one or more papers with the same or a similar name.

"*The Union Agriculturist*," is an excellent new paper, published at Chicago, Ill., as the organ of the Union Agricultural Society. It is neatly executed and appears to be ably conducted.—Terms, \$1 per year—semi-monthly.

"*The Western Farmer & Gardener*," is a continuation of the *Western Farmer*, at Cincinnati, Ohio.—The 2d vol. commenced last October, and appeared in a new and improved form, with an able writer on horticulture as co-editor. It is published monthly, in pamphlet form, 24 pages, successively—\$1 per year.

"*The Agriculturist*," is the title of a large monthly paper commenced January 1, at Nashville, Tennessee. It is the organ of the State Agricultural Society; is edited by three gentlemen, and gives evidence of a good degree of talent.—Terms, \$2 per year, 24 pages, monthly.

"*The Indiana Farmer*," is a small but useful paper, published at Indianapolis, by our friend, J. S. Willets, formerly of this State—monthly, 50 cents per year.

"*The Practical Farmer & Silk Cultivator*," published at Harrisburgh, Pa., might be a pretty good paper, if the editor was a little more careful or courteous. In one number of his, we observed three articles in succession, borrowed from the *New Genesee Farmer* without one word of credit.

"*The Farmers' Gazette*," is a good little weekly sheet—commenced last September at New Haven, Ct.—\$1 per year.

"*The Yankee Farmer*," published at Boston, Mass. by C. P. Bosson—S. W. Cele, editor, is one of the most interesting weekly agricultural papers extant.—The new vol. commenced January 1, much improved in appearance and substance. Arrangements have been made for obtaining monthly agricultural reports from different sections of the country, respecting the crops and the markets, &c.—Terms, \$2 per year.

"*The New England Farmer*," is one of the oldest and most respectable agricultural papers in the Union. It is published weekly, at Boston, Mass.—\$2 per year. (We have seen it stated that some change has lately taken place in the editorial management; but as the paper has failed to reach us for some weeks past, and we cannot tell what the effect has been.)

Sore Throat in Hogs.

MESSRS. EDITORS—Can any of your correspondents furnish a cure for sore throat in hogs? A number were lost by myself and others last summer; and all remedies used were ineffectual. The throat and head were swollen, food was refused, and in about forty-eight hours from the commencement, grunter would grant his last. SAMUEL DOUGLASS.

Whitchell, Ohio.

Causes of the decay of Turnips.

MESSRS. THOMAS & BATEHAM—The following is submitted to the opinion of all that are interested in the inquiry made in the first number of the present volume of the *New Genesee Farmer*, which is for the cause of the decay of Ruta Baga Turnips.

I have come to the conclusion that early sowing in warm seasons, will lead to the true cause. When turnips are forward in the season, they fail for want of sufficient moisture during the extreme warm and dry weather, which effects the heart or centre of the turnip and commences the decay, which first appears by the top turning yellow when the outside appears sound and healthy. This effect is produced on large turnips when small ones will escape. Another cause may sometimes be observed. After the turnip is nearly matured, wet weather will produce a new life and cause them to crack open, and during warm weather, water standing in the crevice will cause the decay.

It may be well to state that the turnip and cabbage tribes, flourish best in a climate somewhat cooler than

the summer in this section, and that warm, dry weather is equally injurious to both. Therefore the time sowing should be delayed as long as possible, and hasten maturity before the winter too nearly approaches unless some is wanted for early use. W. R.

Fredonia, January 11, 1841.

"The Burlington Silk Worm Frame."

We have received three numbers of the "*Burlington Silk Record*," a small paper, "issued monthly without charge, to all persons interested in the silk business, for the purpose of opening a cheap channel of communication, to extend among them a knowledge of the Burlington Silk Worm Frame, of the Burlington Culture, and of the Editor's having made it his business to raise and keep for sale the choicest kind of Silk Worm Eggs, as well as to stimulate and foster the extension of the Silk Culture in the United States. It will be sent by mail to such as write for free of postage. Address, EDMUND MORRIS Burlington, N. J."

We copy the following article from the *Record*, setting forth the advantages of these Frames. We will give some description of them next month.

The No-Cleaning System.

We believe that all silk culturists have found the business of producing silk perfectly certain and manageable, up to the fourth moulting of the worms. After the fourth moulting, they increase so enormously in size, and discharge so great an amount of excrement, that in a large establishment it seems impossible to preserve the proper degree of cleanliness, even when many hands are employed at cleaning, as this operation must be performed every three or four days. This great discharge of excrement, added to the dust plus foliage which will accumulate more or less, mixed in with the bodies of the dead worms, speedily generates putrefaction, which causes the death of the silks more, from the fatal impurity of the air which constantly rising up from below. The books of European writers are filled with cures for diseases thus generated, while not one has thought of suggesting a better preventive than that of cleaning. They have none of them thought of going back and making fresh start from the beginning, by using such fixtures as will remove the cause of these diseases. Here we believe the grand mistake has been made, and remains for American ingenuity and perseverance demonstrate that the whole system of feeding must change, in order to accomplish any good results with the least approach to absolute certainty.

On the Burlington Frame, the worms are placed the difficult period between the third moulting & spinning, in such a manner that all these three elements of putrefaction, the excrement, the chipping of the foliage, and the sick and dead worms, are completely got rid of by being riddled out at the bottom of the frame. Whatever proportion of these three do not fall through, is exposed to a continual current air passing upward, which evaporates so large a portion of the moisture remaining in them, that the liquid which is left is too small to be injurious. The efficacy of this has been proved by repeated trial, and different gentlemen who have used the frame. And the construction of the frame demonstrates it. We tried and proved it ourselves, on a crop which produced five bushels of beautiful cocoons, without loss of three per cent. of the worms; and a friend in New York, who fed on the same principle, did not lose even three per cent., and from two ounces of eggs reared twenty six bushels of cocoons. He did not clean his worms once after being placed on the frame between the third and fourth moulting, nor did we. The saving of labor and expense was very great, the lives of all our worms were insured, and that the great point—that we shall succeed in making every worm spin a cocoon.

To ascertain the exact quantity discharged by a worm after the fourth moulting, we collected and weighed the droppings, and found that 1000 worms 24 hours discharged two ounces of clear excrement which fell through the frame to the roof below. A considerable quantity was intercepted by the straw spread too thick on the frame. This makes a weight from 8000 to be one pound; from 20,000 pounds; and from 800,000 one hundred pounds, for ten days, half a ton!) No person whose opinion is of any value, will be weak enough to argue

ent that there is no object in getting rid of the enormous amount of filth; and few can be found willing to acknowledge it a most important advantage. Our frame throws off the whole of this dangerous discharge of dirt, instead of confining in contact with the worm, where it becomes the fruit of disease and death. We have tried the rug upon solid surfaces in a large way, and give our decided conviction that worm feeding can be carried on profitably in that mode, on a scale enough to be worthy of a capitalist. It may do small way, where the greatest success will never get to much, while even then there is continual risk of a total failure. The next year will prove in favor of the new system of feeding, as many establishments will adopt it. Silk can thus be at a low price, and the crop will moreover be a one—and no one will assert that it has ever any thing like a certain one so far. The shelves and riddles must be laid aside, the new system must be tried, and reeled silk can be made for a dollar and per pound. E. M.

For the New Genesee Farmer.

Cellars—Protection for Cattle, &c.

RS. EDITORS—Many writers for agricultural have given descriptions of farm buildings, of protection for cattle, sheep, &c.; but they for the most part, been on so large a scale as to be a benefit to the common farmer. Those of your who have taken the Genesee Farmer from its cement, can call to mind with what interest I read the glowing account of Ulmus describing his Island farm; his oxen, the manner they were reared and fed; his plan of a barn and stables, in the Cultivator. Also, the numerous articles of A. M., of Tompkins Co., on protection for his land. A. B. Allen's description of his hog pen. There are all interesting articles; but not one of them, I think, has ten yoke of oxen to need a hog pen to accommodate fifty hogs, or as to protect eighteen hundred sheep. Most of your readers are small farmers, like me, who have only from one hundred to one hundred acres of land. These are the men who are urged to afford protection for their cattle although few in number. When you can recommend an ordinary farmer to cultivate his lands in the best order, to own no cattle, hogs, or sheep, but to raise the finest order, and afford suitable protection to these, the great object of agricultural practice have been accomplished.

I have built a cellar under my barn, and a stable in front of it, which I think answers a good purpose. In this plan, I propose giving a description of it, in hopes that so far as the plan is a good one, it may meet with the approval of my brother farmers, who perhaps contain some seasonable suggestions about building. I came into possession of my farm, and a sufficient number of buildings were upon it; but the barn, thirty years ago, in the usual style of barns of that day, had but little accommodation for cattle. It was divided into three parts, the stable, the mangel, and the mangle. The ground was slightly descending at the end of the barn, in which was a well near four feet from the ground. Having no other corners for props, I dug out the earth to a depth under the barn and barn floor, and built a wall, enclosing a space of thirty feet. I then built an addition of sixteen feet to the barn, for stables. The floor of this addition was four feet lower than the barn sill. Across the end of the barn, is an alley of four feet from this alley is a passage to the cellar. At the end of the alley is the manger, as seen in the plan. My stable will accommodate nine horses, arranged according to their strength and necessities. I have tried different methods of feeding cattle, and I prefer a chair around

the neck, fastened by a ring and key. This chain passes through a small wooden bow, which slides up and down a stanchion.

My feed for cattle depends somewhat upon my success in root culture. I am now feeding apples and potatoes, and find them answer a good purpose, although I prefer mangel wurzel and carrots, to any other food for cattle.

It may be useless, in this day of improvement, to enumerate the benefits of stabling cattle; but I consider, as not the least of these, having them at command, where they are handled and made docile. In short, the benefits are manifest, open and confessed by all; but who feels an interest sufficient to go and do likewise? Yours, &c., MYRON ADAMS.

Ontario county, January 18, 1841.

The following plan will give the reader a more definite idea of the arrangement:

- A, A, Cellar with a partition B.
- C, C, Bins for potatoes, apples &c., under the barn floor, filled by driving on to the floor and opening trap doors.
- D, Alley between the cellar and stables.
- E, Manger. F, F, Stables.

Scraps,

CONDENSED FROM EXCHANGE PAPERS.

GEORGIA SILK. The Macon Telegraph says, "At a late term of the Inferior Court in this county, one of the Judges appeared on the bench in silk stockings, silk handkerchief, &c., made by his own family or some of his friends, the production of their own coconeries. The next day another of the judges, A. E. Ernest, Esq., appeared in a full suit of silk, (including coat, vest, pantaloons, stockings, pocket handkerchief, and stock,) produced and manufactured wholly and entirely in his family."

FINE-PROOF PAINT. The Buffalo Commercial Advertiser gives the following method of making paint, which when applied to wood, will secure it from both fire and rain. It is recommended as useful on floors under stoves, and it is stated that wood thus treated may be converted by fire to charcoal, but will never burn.

Dissolve potash in water till saturated, then add, first a quantity [how much?] of flour paste of the consistency of common painter's size, and secondly, a quantity of pure clay to render it of the consistency of cream. When well mixed, apply it with a brush.

BUCK LIVING TO HOESERS. A correspondent of the Cultivator filled in the walls of his house with un-

burnt brick, set edgewise. One layer of hard brick, laid flat at bottom, prevent mice from ascending.— The cost of the brick was \$2, 25 per 1000.

EXPERIMENTS ON POTATOES. Thomas G. Lofton, in the same paper, gives the following experiment and results:—

- "I planted five rows side by side, and the hills I experimented on side by side; and
- 1st. row, cut the common size, that is, one large potato into 4 or 6 pieces, 4 pieces in a hill.
- 2d. " 4 pieces in a hill, cut as small again.
- 3d. " 2 " " smallest round ones.
- 4th. " 1 " " largest, without cutting.
- 5th. " 2 " " of same size potato."

The following are the results in weight and number:—

1st. row, counted 53 potatoes, weighing 103 lbs.
2d. " " 62 " " 103 " "
3d. " " 36 " " 82 " "
4th. " " 37 " " 123 " "
5th. " " 31 " " 82 " "

LIME AS MANURE. B. G. Avery, of Onondaga Valley, near Syracuse, applied manure in the summer of 1839 to mown land, inverted the sod and sowed wheat. To other land, more worn, and previously in wheat, he applied refuse lime from the kiln, about 180 bushels to the acre, and sowed it. On the manured land, the straw was large, and the grain somewhat shrunken; on the limed portion, the straw was not so large, but was bright, the grain good, and the yield the greatest per acre.

CLOVER AMONG CORN. Allen Putnam, the now Editor of the New England Farmer, recommends the practice of sowing clover seed among corn, from personal experience, as being more certain of vegetation, the crop more free from weeds the first year, free from grain stalks, easier to mow, equally abundant, and better in quality; and the young plants are not overshadowed by grain early in summer, nor too much exposed to the sun after harvest. The mode is, to make no hill, sow at mid-summer, and cover with a one-horse harrow, and make all smooth with a hoe. Cut the corn closely to the ground. If necessary, the surface may be cleared with great expedition while the ground is frozen in winter, by means of a common hand hoe.

GREAT CROP OF CORN. The Kentucky Farmer gives the experiment of G. W. Williams, with a certificate of measurement, on a corn crop from an acre and an eighth, which yielded one hundred and seventy-eight bushels, or more than one hundred and fifty-eight bushels to the acre. The land was evenly covered with unfermented manure, the corn, an early yellow variety, planted in rows two feet apart and one foot in the row, the surface kept level, the land rolled after planting, and the weeds subsequently cut by scraping the surface with a sharp hoe.

THE SCRATCHING SYSTEM. A correspondent of the Western Farmer, in commenting on large farms and miserable cultivation, and recommending a concentration of labors, speaks of a farmer who cultivated one acre of land adjoining a field of thirty acres, both planted with rye; at harvest a bet was made that the yield of the one acre was equal to that of the thirty acres, but was lost, the thirty acres, by accurate measurement, yielding three quarters of a bushel the most. Both fields he had seen, and also another where the owner offered to dispose of his crop of rye at a dollar an acre, but could find no purchaser at that price!

ENORMOUS HOG. J. S. Skinner, of the American Farmer, recently saw a hog, of the Bedford and Byfield breed, that weighed last summer 900 lbs. His increase has been such since, that he is now estimated to weigh 1300 pounds! The owner has refused, at one time \$150, and at another \$175 for him.

For the New Genesee Farmer.

REVIEW.

Journal of the American Silk Society—Edited by GIDEON B. SMITH, Baltimore. Nos. II and 12, for Nov. and Dec., 1840.

This is the only publication now remaining in the United States, exclusively devoted to the culture of Silk. It was originally issued under the auspices of the American Silk Society; but the society itself is long since defunct, having existed only during the continuance of the mulicandis manna. The Journal, however, has been continued, with distinguished ability, by Dr. Smith, the earliest, most steadfast, and most persevering advocate of the industry to which it is devoted. It contains, throughout, a mass of facts and information indispensable to the cultivator of silkworms in the present infancy of the art in this country. It is with deep regret that it is perceived that it also must soon follow the fate which has overtaken other periodicals of the kind, unless the friends of the cause promptly step forward and hand in their subscriptions for another year. This crisis in its existence, together with an anxious solicitude for the prosperity of the cause, has induced to the present communication.

The second volume of the Journal has just been brought to a conclusion—the November and December numbers having been issued under one cover.—The value of these numbers perhaps exceeds any that have preceded them, with the exception of those which contain the account of the new and very important theory of the editor, in regard to the principle of saving and preserving silkworms' eggs with safety, for the purpose of successive crops. The promulgation of this theory will, it is believed, constitute an epoch in the progress of silk culture in the United States. The principle is philosophical and rational; and while it explains, satisfactorily, most of the difficulties and disasters of the past year, a knowledge and appreciation of it will serve to guard against similar consequences in future. That its discovery should have been reserved for this day and country, is by no means surprising. In the old silk growing countries, the rearing of successive crops has been attempted; and, owing to the character of their climate, it is no doubt impracticable. American cultivators, however, have looked to a more extended field of operation, and with the advantage of the mulicandis, have conceived the practicability of producing silk throughout the warm season. That they have been subjected to much discouragement and disaster in the outset, ought not to be a matter of any special wonder. It is not to be expected that an art, confessedly in its infancy in this country, and conducted on entirely new principles, can be prosecuted at once with entire success. It may possibly require several years of experiment and observation, to establish what may be termed the *American System of Silk Culture*, on a sure basis; but the ultimate advantage, both national and individual, by which its triumph would be attended, offer strong inducements to persevere, even had its failure been much more general than it has been. As to the old system of single crops, reared in the spring, it has succeeded in no country better than in this.

The two last numbers of the Journal contain gratifying intelligence from various parts of the country. In Tennessee the business appears to have flourished better than in any other State. There is a well organized State Society to promote its advancement, and the exhibition of silk goods has been highly creditable.—At Economy, in Pennsylvania, the quantity of silk produced, during the last year was very considerable; and at Frederickton, in Maryland, the culture was attended with decided success. These instances, together with numerous others that might be adduced,

go to show that the cultivators of the silkworm have still much encouragement to prosecute their labors.

The use of lime has obtained extensively, during the past season, as a preventive of disease amongst silkworms. In the 11th number of the Journal, there is an article on this subject which is worth more than the annual subscription.

The Address to the friends of silk culture, in the closing number, is a highly interesting paper. It contains a general view of the present state of the business in this country, with notice of what is doing and may be done to promote its permanent advancement.

The following extract from the "EAST APPEAL" of the editor to the friends of the cause, deserves special attention:—"After considerable effort, the subscriber has been enabled to complete the publication of the second volume of the Silk Journal. This has been done at great personal sacrifice, the subscriptions to the work not having been sufficient to pay the expense by several hundred dollars. It now remains for the friends of the silk culture to say whether the Journal shall be continued another year. The subscriber believes that the information which he will be able to publish during the ensuing season, will be invaluable to the cause. The great and important improvements made in the art, in the United States and in Europe, and those that will be made next year, ought to be disseminated freely amongst the people. Particularly the New Theory may be referred to as one item of immense importance, that requires the freest discussion and examination. If that theory shall be proved to be the true one, the widest circulation ought to be given to its principles and details: because it will effectually establish the business in the United States, and place it beyond the reach of casualty. All this cannot be done without the aid of a publication devoted to the cause exclusively."

The terms of the Journal are Two DOLLARS a year, payable in advance; and we earnestly desire that the friends of the culture may freely sustain it. P.

Virginia, 1 mo. 12, 1841.

Lightning Rods.

Last summer during a thunder-storm, the lightning rod attached to our house, received a very heavy stroke of lightning—the shock was tremendous; but we only mention it at this time on account of the practical inferences to be drawn from the circumstances.

The rod is five-eighths of an inch in diameter near the top, but six-eighths of an inch below,—in two pieces secured together, with a single point on the top capped with silver. It is upheld by large oak pins eighteen inches long, driven into the frame, and the rod passes through them near the outer end. It is pointed to prevent its rusting. Near the surface of the ground it begins to slant from the house, descends into the earth, and terminates in a bed of charcoal six feet deep, which extends still further from the building.

This fixture has been found sufficient with a slight exception, to let off a discharge that shook the whole neighborhood. The exception follows:—A stove pipe twenty feet in length, entering the chimney just under the roof, ten feet below the point of the rod and three feet from it,—received a small portion of the fluid, which passed through two chambers in succession on its way to the cellar. Two joists under the stove were very slightly shattered, and a few panes of glass broken by bursting outward. It appears that the nails conducted it through the pine floor into the joists.

The point of the silver cap was melted. This we suppose was occasioned by the crowding of the fluid to get down the rod; but if there had been more points, probably no fusion would have happened, and the stove pipe have been protected.

No traces of the lightning whatever, could be discovered on the oak pine, although the wood was in

contact with the rod; and neither glass nor any other substance employed to prevent the scattering of fluid. We infer therefore that all such appendages are useless; and that it is quite as safe to fasten the rod to the building by cleats as to have it stand off at a distance. It must even be safer unless the upper cleats lean against the building.

The prejudice against pointing such rods, appears to be unfounded. We presume indeed that pointing is not more objectionable than rust.

The Roads.

The winter is a favorable time to lay up instruction. After a light snow has fallen with a brisk wind, him that feels an interest in the state of the roads, into a cutter and drive a few miles to make observations. For this purpose, he will commonly succeed best when he goes alone. Where the highway has been turpiked and raised considerably above the general surface, he will find in most places more hubs than snow, and he may heartily wish for a good side-track.

As this is a term not often to be found in the vocabulary of path-masters however, we shall stop to explain; and as in many districts, owing to the impudence of the people, nothing of the kind can be covered, we shall proceed to tell what and where it ought to be.

The law allows our highways to be sixty-six feet wide; but if they are only sixty feet in the clear, thirty feet be appropriated for the turnpike, the shall have fifteen feet on each side for side track. Make the ditch six feet wide with easy slopes, on the bottom, and clear out all large and loose stones, and there will be a most convenient track for snow to settle in, when it is driven by the wind to the turnpike. No better sleighing can be desired what we occasionally find in a ditch of this description, while much of the track which is ordinarily in summer, is unfit for any loaded sleigh to along.

But another side-track ought to be provided on comparatively level. Between the ditch and the fence there are nine feet remaining, where a sod ought to be found; and on this not more than two inches of snow will be required to make comfortable sleighing. To see the traveler who has tured from a more snowy region, at one time going over the bare ground with his horses on the one side, and then starting on a trot as he reaches the other, which perchance was left by the way side,—ought to make us, who have it in our power to do better, ashamed of our negligence.

Why not go to work in the summer, level the inequalities, and remove all obstructions, especially large stones whether fast or loose? In such cases, the necessary labor would not be a trifle, what is annually spent in hauling mud, or stuff, by hand, into the beaten track. Have path-masters no memory? Can they never recollect in summer what we shall need in winter? If so, now is the time to make memorandums, as well as observations.

Snow Drifts and Meadow Mice.

Young trees surrounded by snow drifts, are in a dangerous condition. Such as are quite small and covered by snow, in consequence of its weight and heaviness are almost sure to be crushed; while as they reach above the drift, with most of their limbs enveloped, will have them stripped off and their trunks lacerated.

A worse disaster however, often happens to those that stand in snow drifts. The meadow mouse, aware of its numerous enemies, seldom, if ever, attacks a tree that stands clear in the open ground where it can work in safety under cover, it is destructive. We had one tree, three inches in

that stood in a snow-bank, and it was barked entirely to the height of four feet.

Though drifts are much the most dangerous, yet deep snows that lie long, mice frequently injure trees. As a preventive, we had a small mound round each tree to the height of a foot, with success, for we have not had a tree damaged as properly guarded in this manner. When ice, rooting along under the snow, come to such a point, it appears that they generally turn away; there is another advantage: In snows of moderate depth the wind sweeps it off; and even should a man persevere in ascending the mound, he would find his nose in the open air.

To prevent both crushing and gnawing however, endeavor to tread the snow round all our trees if it is deep, whether by drifting or otherwise; this is done to the most advantage when it gives or is near to the melting point. †

Italian Spring Wheat.

EDWARD EDWARDS, of Virgil, Cortland county, made us a successful experiment in the culture of wheat. He went seventy miles, and succeeded in raising twenty bushels, which, when thoroughly threshed, amounted to only sixteen. These he sowed, as practicable, in the spring of 1857,—a part of a half acres, which produced 210 bushels, or 38 bushels to the acre; the rest was not productive. The whole crop was 468 bushels. The land was ploughed only once, but was afterwards harrowed and cultivated, and covered with leached ashes applied to the acre. The wheat was sold for seed at two dollars per bushel.

On 115 acres of cleared land, from the tilled part of which, (about one half,) he has raised in four years, more than six thousand bushels of wheat. His wife has manufactured about two hundred of butter to the cow the past season, and raised 600 lbs.

Successful Culture of Silk.

JOHN SINCLAIR, of the Clairmont Nursery, near West, writes to us as follows:—"A poor man in need, on a very poor sandy farm, with the hope of improving his condition, planted the morus multicaulis but not being able to sell them, he turned his attention to the culture of silk. He fitted up his barn, and all the unoccupied rooms in dwelling, for an inner suitable for feeding, and by constant attendance made good cocoons. These, by the assistance of a wife and family, he succeeded in reeling, doubling, twisting, and converting into good sewing thread which he says produced one thousand dollars." Any person in this country who has had no experience in raising cotton or flax, able to produce such successful results!

Clover in Orchards.

EDWARDS EDITORS—A writer over the signature of "a West," inquires if clover is injurious to orchards. Most certainly it is—though the degree of injury depends very much upon the nature of the soil, being greatest where the soil is thin, and the trees heavy and cold, and least where the reverse is the case. I have noticed its deleterious effects in a great number of instances. The first case of the kind that came under my observation, was that of a fine thrifty orchard belonging to Judge Brewster, then of Riga, in the Co. These trees took well when transplanted, and flourished for several years with uncommon vigor under the judicious treatment of that accomplished agriculturist. About that time clover was first introduced into that part of the country. The advancing its culture were at once perceived by the farmer, who sowed many of his fields with it, and in some of them the orchard above mentioned. A few years were sufficient to show the ill effects of the clover

upon the trees, in their stunted growth, rough, scaly, moss covered bark, and small yellow leaves; in a word, all those peculiar appearances which mark an orchard dying of starvation. Since that time I have watched the effects of clover on fruit and other trees, and have invariably observed the same effects, in a greater or less degree, follow its introduction.

The reason for this, I believe will be found in the formation of its roots, which run deep and interfere with those of the trees; while the grasses, Timothy, red-top, and the like, gather their nutriment at or near the surface, leaving the soil below for the exclusive pasturage of the trees. The long tap roots of the clover penetrate to the same depth with those of the trees, or at least that portion of them from which the trees derive their nourishment, robbing them of all, or nearly all, of that sustenance which goes to make up the growth of the clover.

Another reason will be found in the fact—for such I believe it to be—that the peculiar property of the soil which is sought for and taken up by the roots of the trees for their growth, is the very same which is selected and appropriated by the roots of the clover for its use; or, at least, much more allied to the same, than that which is taken up by the grasses above named. So that the trees and the clover suffer, not only by their proximity, but also from their sameness of taste—they are both seeking the same peculiar food in the same locality. It is like setting two guests at one table who will eat only of the same dish. The result is obvious—unless there is a plentiful supply, one or both must make a scanty meal.

H. M. WARD.

Rochester, January, 1851.

For the New Genesee Farmer.

Roots and Root Culture.

MESSRS. EDITORS—I propose to give you some account of our farming operations during the past season. If you think it will add any thing to the general stock of knowledge, you are at liberty to publish.

CARROTS AND TURNIPS.

We ploughed up a piece of muck land upon which ruta bagas were raised last year. May 23d, ground in fine condition, drilled in the seed, at the rate of 3 lb. to the acre. Soaked the seed until it had considerably swollen, turned off water and sifted in plaster. Rubbed the seeds in plaster till they became distinct and separate, and passed through the drill without trouble. Owing to the dry weather and the seed being planted too deep, they did not vegetate very rapidly. The prospect however, was favorable for a very good crop, when one day went to examine them, and some two hundred sheep had taken it into their heads to get over a poor fence, and eat every thing down to the ground. This was about the 25th July. Had a good fence put round the lot and yarded the sheep several nights, occasionally dragging the field. On the 30th drilled in the Norfolk turnip, and have gathered a very tolerable crop. I am satisfied carrots will prove the best root, next the potato to cultivate, as they will do well on almost any soil, more hardy and less exposed to insects than turnips or beets, and less affected by the season than the potato.

RUTA-BAGA AND POTATOES.

Sowed almost two acres, and did not vegetate well, and what did grow was badly injured by the fly.—Ploughed up the ground and planted potatoes. Had a fair crop, but not so good as we should have had if we had not cultivated so many weeds among them. I am no believer in the Rohan. The Merino is better adapted to the country and with no good care will yield as bountifully. I think it is the best field potato that can be raised. It has no seed to sell however. Where the soil is favorable, I believe the potato, beyond all comparison, the most profitable root

crop the farmer can cultivate. If he have good potato land, the farmer had better eschew all these modern improvements in the root line, and go for his oldest and best friend. It is only in those situations where potatoes cannot be raised to advantage, as when the crop with good cultivation, and average years, falls below 300 bushels per acre, that other roots should be tried. From my observation this season, I am satisfied the Carrot, under all circumstances will prove the next best root for extensive field culture.

SUGAR BEET AND ROOTS GENERALLY.

The beet crop was a total failure, owing to the seed being planted too late (24th May.) I am not much in favor of them for field culture. However, I believe all of us have much to learn on the subject of root culture. All are agreed as to the importance of cultivating more roots than we do, and I am glad to see much attention exhibited on the subject. In conversing with an intelligent farmer yesterday, he told me he had been feeding his horses for some months upon carrots, and he was satisfied a bushel of carrots was worth as much for that purpose as a bushel of oats. Should further experience justify that assumption we shall wonderfully increase our profits, by the increase of the root culture. With ordinary care 500 bushels per acre might be counted upon with as much certainty as 40 bushels of oats. Then, allowing them to be on a par as to feeding properties, you have in productiveness at least 12 to 1. It will cost more time to cultivate an acre of carrots than an acre of oats. But the difference will not exceed three to one; still a large balance in favor of the root. The root however, has another decided advantage, and that is in leaving the ground in fine condition for a spring crop, and making a great deal more manure.

I hope we shall hear more on this subject from the numerous list of your really able contributors.

Sincerely yours,

Darien, Dec. 21, 1850.

T. C. PETERS.

For the New Genesee Farmer.

Salting Butter.

Take 2 pounds of the best common salt; 1 lb. of good brown sugar, and 1 lb. of salt petre. Mix and beat all up together, and take one ounce of the composition for each pound of butter; work it well into the mass and close it up for use.

Butter cured in this way, appears of a rich, marrowy consistence, and fine color, and never acquires a brittle hardness or tastes too salt. It should be kept two or three weeks before it is used. If well made, it can be kept good for two or three years. This recipe is used and highly approved in many parts of England and France. W. N. H.

Fattening Poultry.

An experiment has lately been tried of feeding geese with turnips, cut up very fine and put into a trough with water. The effect was, that 6 geese, weighing only 9 lbs. each when shut up, actually weighed 20 lbs. each, after about three weeks feeding with this food alone.

Malt is an excellent food for geese and turkeys. Grains are preferred for the sake of economy, but will not fatten so fast. Oats ground into meal and mixed with a little molasses and water; barley meal mixed with sweet milk; and boiled oats mixed with malt, are all excellent for fattening poultry, reference being had to time, expense, and quality of flesh.

Corn, before being fed to fowls, should always be crushed and soaked in water, or boiled. It will thus go much further and digest easier. Hens will often lay in winter, when fed in this manner, especially if well sheltered.

W. N. H.

Fates County, N. Y.

NEW GENEESE FARMER.

BERKSHIRES.

Farmers differ with regard to the valuable qualities of this breed of hogs. Without asserting, as some have done, that they are positively the best breed in existence, one thing is quite certain, that they far excel most of the native varieties raised in this country. Their rapid increase and dissemination for a few years past has been such, that they may readily be obtained with comparatively trifling expense. We hope that all who regard them with suspicion, will examine thoroughly their merits before rejecting them.

One of the strongest objections is their *smallness of size*. It is true they are not equal in this respect to some others. But the following instances will show that they may attain a respectable magnitude at least, and if farmers would cease buying inferior animals and cullings of litters, because they are cheapest, this objection would not, we believe, have much ground for validity. A recent importation by A. B. Allen, of Buffalo, contains a boar and sow, the former weighing 559 lbs. and the latter a few pounds less. They were fed on nothing but grass for months before weighing. One 18 months old, was sold in the Albany market in 1839, which weighed when dressed 633 pounds, and sold for about \$56. J. Lossing, of Albany, states that he has one imported male, that at fifteen months old, measured six feet five inches from the end of the snout to the root of the tail and five feet six inches in girth; that of fifteen slaughtered by the Shakers of Watervliet in 1839, consisting wholly of what are called runts and the cullings of litters, from fifteen to seventeen months old, the average weight was 356 lbs; that one killed at Shaker village at Lebanon, at two and a half years old, weighed 800 lbs.; and that he himself killed one at sixteen months weighing over 400 lbs. The chairman of the committee on swine for Tompkins county, in his report, says he recently saw pigs in Rhode Island, a cross between the Berkshire and Byfield breed, (the latter a smaller breed than the Berkshire,) that weighed 300 lbs. each, at a little less than nine months old. J. R. Caldwell, of New Windsor, fattened a pair of Berkshire barrows, and killed them at a little more than a year and a half old, when they weighed 1,020 lbs. They were fed on grass alone during the two summers, and given other feed only a few months before they were butchered. Such instances might be greatly multiplied. They show that, by proper management at least, a large size may be attained.

But size is by no means the most important consideration. If a Berkshire at 200 cuts up as well, and affords valuable parts in as great a proportionate quantity as another hog at 500, who would hesitate between them? Many, in their great largeness for size, are sacrificing quality. The large bony breed will indeed fill the barrel the soonest,—with heads and shanks,—but, as somebody has justly observed, it is of far more importance to fill the consumer. Accurate experiments are greatly needed to exhibit the relative qualities in this particular, of the Berkshire and other breeds; the best we have seen, are the following, taken from the report of the committee before mentioned. The first is a sow of "common breed," two and a half years old, and weighed when dressed 235 lbs. The second is a half blood Berkshire sow, 18 months old, and weighed 204 lbs. The first had raised one litter of pigs, the Berkshire two litters. The third example is a half blood Berkshire barrow, eighteen months old, fattened in the ordinary way.

	1st Sow.	2d Sow.	Barrow.
Lard.....	26 lbs.	16 lbs.	31 lbs.
Hams.....	32½	31	52
Tender loin...	5½	3½	5
Int.....	8½	6½	9
Mess Pork.....	96	103	176
Prime "	20	16	26
Spare ribs.....	20	12	16
Head.....	18	16	21
	235	204	336

Farmers are usually extremely particular to obtain the full market price for their grain—the loss of ten cents on a dollar by bad marketing would be insufferable. But why is it, that they are not as careful in relation to the market at home, the market of their own making, which is to tell whether they get the same return for twenty bushels of corn, as another man with an improved Berkshire market gets for ten? A near neighbor lately butchered a few pigs, several months old, a part of half blood Berkshire, and the rest full blood; the latter were two months younger, and received similar feeding in every respect, but averaged, on killing, full weight with the half bloods. The half bloods were a cross with a large and excellent native variety. It is the quantity of flesh and fat made, (and little odd,) for the small quantity of food given, which pre-eminently distinguishes the Berkshire breed, which eve-

ry one acquainted with them have observed. A striking instance of this quality, is given by Wm. P. Caro, of Kentucky, of a full bred boar, which at eleven months was castrated in consequence of an injury rendering him useless—he weighed at that time 122 lbs. "After being fed 64 days, he was weighed, and lifted the beam at 410 lbs., showing the astonishing gain of four and a half pounds a day. He is now fed solely on grass, and weighs 550 lbs. at the age of two years."

In consequence of the well attested excellence of this breed of hogs, many attempts will doubtless be made to impose on the farming community; caution will therefore be necessary in procuring animals, as well as in deciding on qualities which may belong only to the genuine breed, and not to spurious ones.

Farmers who are in possession of Berkshires, would do the community a great favor, as well as themselves, by instituting experiments, by accurately weighing and measuring, showing the quantity of food they consume, their increase in weight, and the relative proportion of the different parts yielded in cutting up; and if these were accompanied with experiments of a similar character on the common and other breeds, they would be of still more value.—The labor of such experiments would be very trifling.

COL. SAWYER'S BERKSHIRES.

According to promise, we give the portraits of two more Berkshire swine, property of Col. Amos Sawyer, of this city.

The above is a beautiful sow, 2 years old, weighing 300 lbs. She is not fat, but broader and heavier than represented in the cut. She is now with pig by young Prince Regent. (figure in our last,) and will litter next month. (Col. S. expects to have a few pigs to spare in the Spring, but most of them are already engaged.)

This pig is one year old, and weighs about 275 lbs: is from the above sow, by a full blood imported boar sold to Baltimore for \$200.

Bushes, not Bushels.

An error occurred in our last paper, on page 2, col 3, which materially alters the sense, and makes our venerable assistant appear somewhat ludicrous, which we very much regret. He did not say that he planted some dozen or fifteen bushels of currants in a row (but that he planted that number of bushes in a row. The error was noticed and marked by our printer and proof reader, but overlooked by the compositor. He promises to keep his speech on hereafter.

Bees and Honey.

SAMUEL MARRIOT, of Hudson, N. Y., informs us that he has very good success with his bees, managed as follows:—The hives are placed under a shed; stand from one to three feet from the ground, and have the bottom entirely open, so that if any worms are produced, they fall to the ground, and cannot return. A hole, 2 inches square, is made in the top of each hive, over which a box, 2 inches square, is placed in the spring. In the fall these boxes are removed, and found to contain about 20 pounds each of the finest honey.

The British Corn Laws.

The N. Y. Emancipator of Dec. 24, contains some latter comments on the remarks of our correspondent, S. W., in the Dec. No. of the Farmer. The Editor dissents from the opinion of S. W., however, but we have no right to expect that England will so modify her corn laws as to admit the bread stuffs of his country on payment of a duty of 20 per cent. On the contrary, he thinks that if proper measures be taken, this modification can be effected; and to this end he makes the following suggestion:—

"We propose that there should be Anti-Corn Law Societies formed in New York, Troy, Rochester, Buffalo, Cleveland, &c. The declared object of these societies shall be, to obtain, by lawful and pacific means, the repeal or modification of all laws, usages and regulations of foreign nations, which hinder the admission of any American products upon as favorable terms as the products of such countries are admitted into the United States. The principal means to be relied on, are the collection and diffusion of statistical and other information among the people by means of correspondence, agents, public meetings, liberative conventions, the publication of a monthly journal, &c. They should also endeavor to engage the cooperation of our government, by such measures of negotiation and legislation as may from time to time be deemed wise and prudent."

As our object and aim is to promote the great agricultural interests of the country, we most sincerely wish that such a modification of the British Corn Laws could be effected; but we cannot bring ourselves to view the subject in the same light as our New York friend; nor can we think that, in the present state of affairs, any material good would result from carrying out his suggestions.

We like the remarks of the American Citizen on this subject, which may be found on page 19, headed our Wheat Growing interests."

FARM TRANSACTIONS.

Piggery and Pork Making.

Messrs. Editors—Under the above title, I proceed, from time to time, to give you some of our experience in farming. If others will do the same, it will be but a few months before your journal will become one of the most valuable in the Union. Let us state facts. Let farmers state their operations for a year—pointing out what their own experience formed defective,—and we shall have a mass of facts before us to serve as beacons in our onward career; and save us, if we read your paper, many dollars which would otherwise be lost in unsuccessful experiments.

THE PIGGERY.

In constructing a piggery, I went upon the principle that a judicious outlay of capital upon a farm necessary buildings or other improvements, increased in a much greater ratio than the interest—the luctiveness of the capital already invested. And that to farm profitably there must go a regular system in the management of every branch of your business. Thus there should be a place for your horses and carriages, harness, grain and hay, all under roof if possible; and in like manner for all other kinds of stock, and in particular, a place where you can keep your swine, from the pig to the boar, and all their feed convenient to your hand. Finding a place for every thing, it is easy to keep everything in its place; and thereby gain greatly in saving of time in carrying on business.

The piggery is designed for fattening from 50 to 60 hogs annually, and the fixtures have been made to that reference. By the annexed plan, you will perceive that it has a front 60 by 20 feet. The first section having 13 feet posts, the others only 7. The floor is 50 by 20 feet; 10 feet of one end being reserved for a boiling room, or rather for a furnace

and boiler, as all the cooking is done on the floor, which is on a level with the pens. The rear, as far as was built last year, is 30 feet square, 6 feet posts, with an alley through the centre, 4 feet wide. There are three pens on a side, 10 by 13, and each pen will accommodate 7 large hogs, or 8 middling sized ones while fattening. (We shall continue the pens by building another, 30 feet square, so that there will be 6 pens on each side of the alley; or the building for the hogs will be 30 by 60.)

Under the main building is a cellar, 20 by 60, and 8 feet deep; 10 feet from the east end is walled out by itself and no floor laid over it. Here is a boiler, made of sheet iron, not so thick as boiler iron, but a medium between that and stove pipe iron, six feet long and 24 inches in diameter, with a safety valve, &c., and capable of working about 15 pounds pressure to the inch, though it is never worked over 18—set in an arch or furnace. The steam is carried from the boiler to a series of vats on the floor adjoining, constructed as follows:—The outside is of 2 inch pine plank, 12 feet long in the clear, matched and keyed together into one bin or vat, 3 feet deep and 4 feet wide. It is divided into four equal parts by tight partitions of the same material; so that we have 4 vats, each 3 feet deep, 3 feet wide, and 4 feet long, holding about 7 barrels of liquid, or 22 bushels of vegetables. All the feed for our hogs is cooked in these vats, by steam, and fed from thence directly to them without handling after being once put into the vat. The saving of labor is very great, as well as the expense of cooking; for 100 bushels of potatoes or apples can be cooked in 6 hours, by a boy 10 years old. I have repeatedly cooked 50 bushels in 3 hours, and taken every thing cold. The vats can be made full of pudding in much less time.

The building is doubly boarded, and the floor over the cellar is lined, and has scuttles, to enable us to ventilate the cellar at pleasure. The hog pen is also doubly boarded—the front fitted with swing doors so that the hog can go in and out at pleasure, and still keep the building sufficiently warm. A floor is laid over head, and thus gives us a good room for storing soft corn in the fall. Ten feet of the further end of the cellar is partitioned off for an apple cellar, and is 10 feet deep. The apples are put in shallow bins, of which there are 30, which hold 8 bushels each.—Thus, it will be perceived, the object has been obtained. We have a place to keep our hogs and their feed, whether green or dry, and prepare it, all under the same roof.

FEEDING HOGS, ETC.

We took up our hogs from the stubble and orchard, the 21st September, and commenced feeding with cooked apples and bran—2 bushels of bran and 3 quarts of salt to 20 bushels of apples. After the apples were gone, we fed with pumpkins and potatoes boiled with meal (corn and cob ground together.) Then with pudding fermented, 10 bushels of meal to 6 barrels of water, and closed with four weeks feeding boiled corn. Salt was used uniformly, at the rate of two quarts to a vat, whether meal, corn, or potatoes. The potatoes were boiled and mashed in the same water, while hot, and meal mixed with them. Our hogs thrive well, which satisfies me that it is an error to suppose the water in which the potatoes are cooked, is injurious. The corn was cooked by making the water boiling hot, then put in 15 bushels of corn and let it soak for at least 12 hours, then put on the steam. It requires about 12 hours to cook the corn after it has soaked, and when you commence, the corn should only be covered with water. The hogs eat the boiled corn with great avidity, and digest it as well as the pudding. The saving in cooking the corn is, the toll and waste

at the mill, and the trouble of mashing, which, together, is something of an item. The corn should be steamed till it turns rather brown, and loses its white, parboiled appearance. We have never fed hogs any thing that has made them lay on fat equal to the boiled corn. We feed no water, as after repeated trials the hogs would not drink it, though none is fed with the corn except what the kernel has imbibed in cooking. At least one-quarter is saved by cooking, and then there is considerable gain in not feeding until after fermentation.

We shut up our store hogs, feed them with boiled potatoes and provender, and keep them in thrifty condition till they are turned out to grass in the spring. We keep all our hogs, whether store or fat, well littered with clean dry straw.

Perhaps I have been tedious. If so, my desire to contribute my mite is the only excuse.

Sincerely yours, T. C. PETERS.

Darien, January 8, 1811.

P. S.—Will some of your chemical friends give you a bill of such articles as a farmer would require for a cheap Laboratory?

T. C. Peters's Piggery.

Darien, N. Y. T. C. PETERS.

Pump logs, for conducting water, made of perishable wood, may be preserved a long time under ground by surrounding them with ashes or lime, and the joints should be cemented with tar. Those always filled with water will last longer than if occasionally empty.

Compost Heaps.

The following most excellent remarks on the manufacture of compost, are richly worth the perusal of every farmer, old or young, rich or poor. Most of them have the merit of being as applicable to this country as to England. Every sentence is full of meaning, and we are tempted almost to print one half of the article at least, in italics. Most of our farmers have yet to take the first step in the proper management of manures—a thing, which if well understood and attended to, would, in a few years, triple the products of the country, and, to speak very moderately indeed, be worth yearly to the country HUNDREDS OF MILLIONS OF DOLLARS. We think there will be no difficulty in proving this. If the writer of the following remarks had mentioned lime as a component part of his compost heap, we think it would have been better, as we consider this ingredient as indispensable.

From the Journal of the English Agricultural Society.

AN ESSAY

On making Compost heaps from liquids and other substances; written on the evidence of many years experience—To which the prize of ten sovereigns was awarded—By JAMES DIXON, Esq., Secretary to the Manchester Agricultural Society.

The force and power of an agriculturist to produce good crops, mainly depends on the manures he can command; and how to derive the greatest possible benefits from his immediate resources, is one of the most useful subjects that can engage his attention. The English Agricultural Society having offered a premium for the best mode of making compost heaps, I venture to forward the committee my ideas on this most important branch of rural management; and in doing this I shall state the course I have pursued in this particular for many years, and which every additional experience inclines me not to make any systematic alteration.

My farm is a strong, retentive soil, on a substratum of ferruginous clay; and being many times disappointed in what I considered reasonable anticipations of good crops, I determined on a new system of manuring. Though quite satisfied of the expense which would necessarily be incurred by my plan, I still determined on its adoption. At the onset I effectually drained a considerable part of my farm. My next object was how to improve its texture at the least cost—(perhaps I may be allowed to state that my holding has always been at rack-rent;) for this purpose we carted great quantities of fine sawdust and peat earth or bog; we had so far to go for the latter, that two horses would fetch little more than three tons in one day—one horse would fetch three cart-loads of sawdust in the same time. Having brought great quantities of peat and sawdust into my farm yard, I laid out for the bottom of a compost heap, a space of considerable dimensions, and about three feet in depth; three-fourths of this bottom was peat, the rest sawdust; on this we conveyed daily the dung from the cattle sheds, the urine is also conducted through channels to wells for its reception, (one on each side of the compost heap;) common water is entirely prevented from mixing with it. Every second day the urine so collected is thrown over the whole mass with a scowp, and at the same time we regulate the accumulated dung. It is being continued for a week, another layer, nine inches or a foot thick, of peat and sawdust (and frequently peat without sawdust) is wheeled on the accumulated heap. These matters are continually added to each other during winter, and in addition once in every week never less than 25 cwt., more frequently 50 cwt., of night soil and urine; the latter are always laid next above the peat or bog earth, as we think it accelerates their decomposition. It is perhaps proper here to state that the peat is dug and exposed to the alternations of the weather for several months before it is brought to the heap for admixture; by this it loses much of its moisture.—In some cases, peat contains acid or astringent matters, which are injurious to useful vegetation. On this I have not tried any decided experiments, but am led to the supposition by frequently seeing stones, *supra* in a partial state of decomposition, others wholly decomposed in bogs, and at the depth of several feet from the surface. Some years' experience

has convinced me of the impropriety of using recent dug peat; proceeding in the manner I recommend, it is superior, and more convenient on every account—much lighter to cart to the farm yard or any other situation where it is wanted; and so convenient an I of its utility in composts of every description of soil, except that of its own character, that wherever it can be laid down on a farm at less than 1s. per ton, I should recommend to every agriculturist and horticulturist that can command it, even at the cost here stated, to give it a fair trial. So retentive and attractive of moisture is peat, that if liberally applied to any arid, sandy soil, that soil does not burn in a dry season, and it so much improves the texture and increases the produce of an obdurate clay soil, if in other respects rightly cultivated, that actual experience alone can fairly determine its value.

For the conveyance of night soil and urine, we have the largest and strongest casks, such as oils are imported in; the top of which is provided with a funnel to put the matters through, and the casks are fixed on wheels like those of a common dung cart. For the convenience of emptying this carriage, the compost heaps are always lower at one end; the highest is where we discharge the contents, in order that they in some degree spread over the whole accumulation: the situation on which the wheels of these carriages stand while being discharged is raised considerably; this we find convenient, as the compost heap may be sloped six or seven feet high: low compost heaps, in my opinion, should be avoided. The plan here recommended, I have carried on for some time. I find no difficulty in manuring my farm over once in two years; by this repetition I keep up the fertility of my land, and it never requires more than a moderate application of manure.

I am fully aware that there are many localities where neither peat nor night-soil can be readily obtained; but it is worth a farmer's while to go even more than twenty miles for the latter substance, provided he can have it without deterioration: the original cost is often trifling. On a farm where turnips or mangold are cultivated to some extent, the system here recommended will be almost incalculably advantageous; a single horse is sufficient for one carriage—mine hold upwards of a ton each; six tons of this manure in compost with peat, or, if that is not convenient, any other matters, such as ditch scourings, or high headlands which have been properly prepared and laid in a dry heap for some time, would be amply sufficient for an acre of mangold or turnips. This manure is by far the most invigorating of any I have ever yet tried; bones in any state will bear no comparison with it for any crop; but it must be remembered that I write on the supposition that it has not been reduced in strength before it is fetched.

Convenience frequently suggests that compost heaps should be raised on different parts of a farm; but, unless in particular instances, it is well to have them in the yard; in it all the urine from the cattle stalls may be employed with the greatest economy; and be it remembered that the urine from animals, in given weights, is more powerful than their solid excrements.* How important then must it be to the farmer to make the most careful use of this liquid. It is sometimes carted on the land, but that practice will not bear a comparison with making it into composts in the manner here recommended. Great waste is often made in putrescent manures after they are carted on the land; instead of being immediately covered or incorporated with the soil, we not infrequently see them exposed for days together in the hot rays of a scorching sun, or to the injurious influences of a dry wind. I have before stated that compost heaps should on many considerations be raised in the farm yard; still, circumstances are frequently such that it is more proper to make them at some distance in the fields. If a headland becomes too high by frequent ploughings or working of the land, in that case it should be ploughed at the time when clover or mixed grass seeds are sown with a white crop, for instance, barley or oats, and clover for the year following: a headland might then be ploughed, and a number of cart loads of some manure heaped from one end to the other. Immediately after this it should be trenched with the spade (or what is sometimes called digging) and

* This must be taken with some limitations, for urine contains 80 to 95 per cent. of water; and unmixed dung contains all the salts of urine, besides much mucus and other substances.—W. L. BRAM.

ridged high, in order that an action should take place between the soil and manure; by this means the mass would soon be in a condition for turning over, and any ditch scourings, or other matters which had not in the first instance been used, might now be added to the mixture. The heap should then be allowed to remain closed for a few weeks, then turned over again; at this turning, in all probability, the mass would be much reduced; if sufficiently reduced, raise the ridge of compost well on both sides, but, instead of its top being pointed, make a trench or cavity on the top from one end of the heap to the other. This cavity should be made tolerably retentive of moisture, which may be effected by treading with the feet; carriages of night soil or urine from the cattle stalls may then be emptied into the trench, and the bulk of the heap would determine how many were required; this being done, a little earth should be thrown into the trench, and the heap allowed to remain in that state until the middle or latter end of autumn; it will then be ready for another turning; but at this time care must be taken to have the heap well made up at the sides and pointed at the top; in this situation rain will be thrown off, and the compost preserved dry until winter presents some favorable opportunity for laying it on the young clover, wheat, or for making any other use of it which may be required.

The beneficial effects of top dressing young clovers or mixed grass seeds is scarcely ever regarded with due attention. By this help, crops are not only much increased, even 30 or 50 per cent., but they are also ready for cutting much sooner, which in a backward spring gives the stock farmer inestimable advantages for sorting his cattle, and thereby raising manure at his pleasure. The full effects of this practice I first experienced in the dry season of 1826: I had some clovers which had been manured the previous winter; my land was soon covered with crop, and that so vigorous a one, that the hot weather did not overpower it. My cows that summer were tied up during the day-time, and in the night they were turned out into the pastures; most of the stock in my district were much distressed from overheating as well as from being short of food for some weeks; milk yielded little butter, scarcely any for a time was offered in our large market town—no doubt that year will be remembered by many gentlemen on the Agricultural Society's committee. I, however, was under no difficulties on account of the season: my clovers produced plenty of food for my cattle, and in return they yielded as much milk and butter as I ever recollect from the same number. I am persuaded that the same satisfactory results would have followed if the same system had been adopted for feeding; it was that year my attention was first directed to raising compost heaps from urine. This I now do frequently without the help of any dung from the cattle stalls; the same occasion called my mind to another matter well worthy every farmer's attention.—I allude to the great superiority of the manure raised in summer soiling to that produced in the stalls during winter. I very believe the difference is fifty per cent., unless stock are fed in a great measure during winter with artificial food.

In an arrangement for making compost heaps from urine, I would recommend a receptacle to be made at the back of the cattle stalls just outside the building; this should hold about twenty cartloads of mould, or any other matters to be employed; if its situation were a little lower than the cattle sheds, all the urine would pass into it, and there remain until the mass is completely saturated, which will be sufficient; when the earthy matters are covered over with it, the compost may then be thrown out and the preceding again renewed. In order to show part of the benefits of this practice, I beg here to observe that the most foul or weedy mould may be used; the action of the urine, if not reduced by water, is so powerful, that wire worms, black slug, many other destroying insects, and all vegetables, weeds, &c., when in contact with the urine for a time, are deprived of their living functions. The situation for raising this compost should be protected from the weather by a covering similar to a cart shed; indeed the deteriorating influences of rain, sun, and arid winds, on all putrescent matters or compost, are so serious, that, in my humble judgment, it would be worth while to have places under cover where these are usually laid down.

I beg to conclude this essay with some observations made on a former occasion: No amelioration

connected with the rural art is of the more lasting importance than correcting the constitutional defects of a soil. The best horticulturists and market gardeners are many of them perhaps unacquainted with the theory, yet perfectly understand the great results from that practice; and in this particular information, they are all of them superior to many practical farmers. How often do we see a stiff soil sterile in a great degree from that cause only; yet in the vicinity of a sandpit and adjoining most bogs there is a considerable breadth of coherent land, which might be made double its present value, by judicious and liberal top dressings of peat, which is also unproductive from causes of a contrary nature. The present poverty of many extensive tracts of land is a manifest exhibition of the want of skill or enterprise of their owners and cultivators.

Public Lands--Emigrants.

Prior to the year 1835, the sales of public lands had not averaged more than three millions per annum. In the year 1836, however, in consequence of the speculation mania of that period, the sales of a single year amounted to about fifteen millions, and formed one of the principal items in the vast increase of the public revenue. In 1837, they were suddenly reduced to about the usual amount.

So vast, however, is the public domain, so great the emigration, both foreign and domestic, and so very fertile and tempting the broad plains of Illinois, Indiana, Iowa, and Missouri, that the permanent average amount of public land sales is now very much increased.

It appears that in the year 1838, the number of acres sold was 3,414,907. The purchase money \$4,305,554. During the three first quarters of the year 1839, the returns showed the following results:—

Acres sold, 3,771,994
Purchase money, \$4,766,852

Averaging the 4th quarter, we have receipts for 1839, \$5,958,365.

The year 1839 was not deemed a prosperous year, and yet in that year we have the large amount of about six millions of dollars, received into the treasury on account of public lands. This may be deemed something like the future average receipts from this source of revenue.

If we suppose 160 acres to be the average quantity bought by each person, (and we suppose it is very near it,) there must be 24,000 persons buy public lands each year. This number, as heads of families, represent 129,000 persons. Of this aggregate, about 70,000 are foreign emigrants, and the residue domestic population, changing residence.

This result corresponds very nearly, we believe, with the actual fact. Such a fact as this shows how rapidly our population is changing, and with what gigantic strides the vast waves of the people move over the face of our country. In ten years, more than a million of people have moved from the shores of the Hudson, the Connecticut, and the Delaware, or the more distant lands of England, Ireland, and Germany, to settle on the plains of the West. And in ten years more, this million will add from three to four hundred thousand to their number, by natural increase; and thus is the Great Western Empire extending its limits and multiplying its numbers in a constantly increasing proportion.—*Cincinnati Chronicle*.

The Riches of the West.

We have before us the agricultural returns of nine townships of Monroe county, N. Y., containing 22,000 people. The result is astonishing. It is proof conclusive of the immense and almost illimitable resources of these heaven-blessed United States. These towns produce in gross as follows:—

1. Wheat, 558,000 bushels.
2. Oats, 245,000 "
3. Corn, 184,000 "
4. Potatoes, 329,000 "
5. Sugar, 110,000 lbs.
6. Spirituous liquors, 2,200 bbls.

The above is only a *part!* Such trifling affairs as horses, hay, dairies, manufactures, &c. &c., we have not added up. But look at the result. Every living soul, man, woman, and child, has in the allotment, as its share in the productions, 25 bushels of wheat, 12 bushels of oats, 9 bushels of corn, 14 bushels of potatoes, 5 lbs. of sugar, &c. Or any head of a family has 150 bushels of wheat, 72 of oats, 54 of corn, 84 of potatoes, and 30 lbs of sugar.

Taken as a whole, these townships raise at least four times as much bread stuffs as are necessary for their consumption, and other things in proportion!

But if the reader be a little surprised at this, he will be more so, when he learns that these same towns made \$105,000 worth of butter and cheese; raised \$32,000 worth of fruit; made \$40,000 worth of home cloth; and produced \$450,000 worth of manufactured articles; or \$39,00 a piece for each living soul. This affords matter for comment, not only on the *physical* but the *moral* condition of the county—None but a country in the highest moral condition, can produce such a result. These people are not only well off, independent, but they are the richest in the world. Nor is this an isolated example. Our own Western Reserve will show the same result; so will many other districts.

Beside these wheat fields rise the village church and the village school. There are happy faces, young and old, around them. Long may they enjoy the peaceful fruits of happy, independent labor!—*Cincinnati Chronicle*.

Riches of Ohio.

We have taken occasion to illustrate the great resources of our country, and especially the Western portion of it, by the statistics of a part of Monroe county, N. Y. The result of that inquiry was, that the people of that section actually raised near five times as much bread-stuff as they could consume, and therefore four fifths of it was positive profit.

We shall now continue the illustration of this fact, by the agricultural statistics of WAYNE county, Ohio, as published in the *Wooster Democrat*.

Wayne county is a large county, containing some 700, or 800 square miles, on the great central table land of the State; partaking of the same general character as that vast plateau which extends from the foot of the Alleghenies to the Mississippi. It is not intersected by any of the great internal improvements (canal or railroad) in the State. It is therefore a fair specimen of the agricultural condition of Ohio.

The county of Wayne contains about 8,000 male adults, which may therefore stand as representatives of the families. Of these, 7,000 or 7-8ths of the whole are farmers.

We will now see what proportion of bread-stuffs, or what may be deemed the *stuff of life* to man, is raised in this county.

Wheat, 753,000 bushels.
Rye, 59,000 "
Buckwheat, 20,000 "
Corn, 345,000 "
Potatoes, 132,000 "

Of these articles we may exclude from men corn, which, though bread-stuff, is in Ohio chiefly fed to animals, and include potatoes, of which man is almost the only consumer. We have then, 945,000 bushels of grain, or its equivalent, used as the food of man.

Allowing the usual average for the consumption of these articles by the population of Wayne, and the result is that the people there raise *four and a half* times as much bread-stuff as they consume. In other words, of 4½ bushels of grain raised in that county, 3½ may be set down for exportation. In this great fact we see how it is that such enormous amounts of flour arrive at the ports of Buffalo and New Orleans. At Buffalo, 27,000 barrels of Ohio flour arrived in a single day! But this is only one side of the statistics of this county. There are raised in it,

Oats, 543,000 bushels.
Hay, 38,000 tons.
Wool, 120,000 lbs.
Sugar, 177,000 "
Horses and Mules, 82,000
Hogs, 35,000
Sheep, 75,000

And, we may add, there are less than 1500 barrels of Whiskey made in the county.

We give these facts as specimens of the domestic industry, and the substantial wealth of this prosperous nation. We doubt whether any thing like it can be found in the history of nations. It is every man (with few rare exceptions) sitting under his own (not vine and fig tree) fruit trees, looking over his own waving fields, enjoying the rewards of his own labor, secured by wise and equal laws, under a free government and a merciful Providence. It brings us back, in idea, to the days of Abraham, with the addition of blessings which Abraham knew not of. This is Democracy in America, which neither needs the comments of Philosophy nor the songs of Poetry to be seen, felt, and understood.—*Cincinnati Chronicle*.

Apple Molasses.

The Ohio Farmer gives the following mode of making apple molasses, and we have no doubt that it is more sweet, and for some purposes superior to that

made by boiling down the juice or cider; for this will be likely to change in some measure by the vinous fermentation, before it can be boiled down.—*American Farmer*.

"APPLE MOLASSES.—There is many a good housewife who has more faith in her own experience than in the science of chemistry, that knows not the value of apple molasses; but still believes it to be the same kind of tart, smoky, worthless stuff that has from time immemorial been made by boiling down cider. It is not within my province, at this time, to attempt to convince such that there is a chemical difference, though it might easily be shown that they are almost as different as sugar and vinegar. I would, however, invite them to lay aside their cider this year, and try the plan of boiling down the juice of the apple that has not been exposed to the air by grinding and pressing.

Last autumn I placed a number of bushels of Wetherill's sweetening apples in two large brass kettles, with water just sufficient to steam them; when they boiled soft, I turned them into a new splinter basket, containing some straw, and placed on them a barrel head and a heavy weight. The juice was caught in a tub. This was repeated until I had juice enough to fill the kettle, when I commenced boiling down, and attended to it strictly, till it became of the consistency of cane molasses. The native acids of the fruit, imparted a peculiar flavor, otherwise it could hardly be distinguished from the syrup of the cane. It was used in my family for making sweetmeats, pies, for dressing on puddings and griddle cakes, and a variety of other purposes. The cost of making is very trifling, and the means are within the reach of every farmer."

Horticulture.

BY MRS. LUDIA H. SIGOURNEY.

If the admiration of the beautiful things of nature, has a tendency to soften and refine the character, the culture of them has a still more powerful and abiding influence. It takes the form of an affection. The seed which we have nursed, the tree of our planting, under whose shade we sit with delight, are to us, as living, loving friends. In proportion to the care we have bestowed on them, is the warmth of our regard. They are also gentle and persuasive teachers of His goodness, who causeth the sun to shine and the dew to distil; who forgets not the tender burned vine amid the snows and ice of winter, but bringeth forth the root long hidden from the eye of man, into vernal splendor, or autumnal fruitage.

The lessons learned among the works of nature are of peculiar value in the present age. The restlessness and din of the rail road principles, which pervades its operations, and the spirit of accumulation which threatens to corrode every generous sensibility, are modified by the sweet friendship of the quiet plants. The toil, the hurry, the speculation, the sudden reverse which mark our own times, beyond any that have preceded them, render it peculiarly salutary for us to heed the admonition of our Saviour, and take instruction from the lilies of the field, those peaceful denizens of the bounty of heaven.

Horticulture has been pronounced by medical men, as salutary to health, and to cheerfulness of spirits; and it would seem that this theory might be sustained, by the placid and happy countenances of those who use it as a relaxation from the excitement of business, or the exhaustion of study. And if he, who devotes his leisure to the culture of the works of nature, benefits himself—he who beautifies a garden for the eye of the community, is surely a public benefactor. He instils into the bosom of the man of the world, panting with the gold fever, gentle thoughts, which do good like a medicine. He cheers the desponding invalid, and makes the eye of the child brighten with a more intense happiness. He furnishes pure aliment for that taste which refines character and multiplies simple pleasures. To those who earn their substance by laboring on his grounds, he stands in the light of a benefactor. The kind of industry which he promotes, is favorable to simplicity and virtue. With one of the sweetest poets of our mother land, we may say,

"—Praise to the sturdy spade,
And patent plough, and shepherd's simple crook,
And let the light mechanic's tool be hailed
With honor, which encasing by the power
Of long companionship, the laborer's hand,
Cut off that hand, with all its world of nerves,
From a too busy commerce with the heart."

Lady's Book.

BEAUTY.—After all, the most natural beauty in the world is honesty and truth. For all beauty is truth. True features make the beauty of a face; and true proportions the beauty of architecture; as true measures that of harmony and music. In poetry, which is all fable, truth still is the perfection.

CENSUS AND STATISTICS OF MONROE COUNTY.

TOWNS.	Population.	Horses & Mules.	Neat Cattle.	Sheep.	Swine.	Wheat raised '39	Oats, 1839.	Corn, 1839.	Potatoes, 1839.	Tons of Hay '39	Founds of Sugar made. For the New Genesee Farmer.

Agricultural Societies--Legislative Aid.

Messrs. Editors—The increased circulation, and great improvement, of our agricultural journals, and the formation of the numerous agricultural societies, with their splendid exhibitions, the past season, afford cheering evidence that the cultivators of the soil, are beginning to realize the importance of useful instruction and practical improvements.

I am also glad to perceive that farmers begin to think it is time for the Legislature to assist them in the laudable work of improvement. I am not strenuously respecting my individual views, but it is my present opinion that an agricultural survey of the State, would meet with less opposition, and perhaps be more generally useful at present than appropriations to county societies, provided the societies can be sustained without such aid, but if they cannot be otherwise sustained, then, I say, the sooner such aid is obtained the better; for I consider their support very essential to agricultural improvement.

I am aware that many objections are brought against our societies, and some of them not without reason. I do not suppose it is possible to conduct them in such a manner as to please all; but it appears to me that some plan can be devised by which many of the most serious objections might be removed, and the usefulness of the societies be made more general and extensive. It is my opinion that premiums ought never to be given for single acres of produce, unless for the purpose of introducing some new production; as it too frequently withdraws the attention of the farmer from his other crops, and the large amount of the premium crop when compared with average productions, often causes doubts as to the correctness of the statements; and the love of preeminence often causes the unsuccessful competitor to feel dissatisfied.

If we can obtain Legislative aid, our societies should be remodelled; and I will now suggest a plan for the purpose. In hopes that some abler pen will improve it, or propose a better.

Respecting the amount which the Legislature ought to appropriate, I am of the opinion that \$200 for each member of Assembly would not be too great a sum for the Empire State to bestow for the encouragement of productive industry; and it ought not to be for less than ten years. Each county society ought

to raise a sum equal to that which is received from the State.

I would suggest that each county society consist of the usual officers, together with a publishing committee; to hold annual Fairs for the exhibition of stock, productions, implements, and domestic manufactures; but no premiums to be awarded to individuals at the county Fair—the towns only to compete. The money received from the State by the county, to be divided among the towns, according to their ratio of population, provided they raise an equal amount by voluntary contributions, and conform to the requisitions of the law. Each town to form a society auxiliary to the county society, to consist of the usual officers, together with a viewing committee of three, whose duty shall be to examine the farms and crops in the town, at least twice in each season, and make an annual report of their inspections, to the county society. These reports should contain, as far as practicable, an agricultural survey of each town; and the committee men should receive a compensation for their time. Each town society to hold an annual Fair, at least one week previous to the county Fair, and to award premiums to those who raise the greatest average crops, and to the persons exhibiting the best stock, &c., as usual. Each person receiving a premium at the town Fairs, to be required to attend the county Fair; where the towns, and not individuals, are to be competitors. Each competitor to give all necessary information as to raising, breeding, &c., as usual, and all the statements and reports to be handed to the county committee for publication.

Any towns neglecting to raise the necessary amount, their quota of the public funds to be distributed among the other towns, but any town raising part of the sum required, shall be entitled to an equal amount from the public fund. Any county neglecting to comply with the requisitions of the law, of course the money would remain in the State treasury.

I think the foregoing plan would remove many of the objections which are made against our present societies, and would bring the improvements more generally home to each cultivator. If the towns would mostly co-operate in the plan, there would be splendid county exhibitions.

I hope others will communicate their views on this

subject, in order that the best plan may be devised and adopted.

Respectfully yours,

W. GARBUTT.

Wheatland, January 22, 1841.

Remarks.—The plan proposed by our esteemed correspondent, embraces many suggestions deserving of consideration; but we apprehend that a difficulty, to which he alludes in his closing paragraph, will, for some years at least, prevent the possibility of its successful application. There are not a sufficient number of spirited farmers in the majority of towns to secure their co-operations. The plan is new to us, however, and we hope to hear from others on the subject.—Eds.

Hoof Ail.

We wish to call the attention of our correspondent N., whose communication on this subject appears in another column, to an experiment reported in the eighth volume of the old Genesee Farmer, page 156, by Heman Chapin, of East Bloomfield. A calf, which had been slightly affected with hoof ail, but had nearly recovered, was fed (mixed with bran) one quart a day of the ergot of spear grass, which had been carefully obtained and cleaned for that purpose, until he had eaten a bushel of it. It did not produce the slightest apparent effect on his health, although often and closely examined. On the 18th page he will find an account of several cattle affected with the hoof ail which were fed wholly on corn stalks. These, and the fact we have often observed, of cattle eating hay, the winter through, which contained vast quantities of ergot, without being at all affected, serve at least to throw doubt on the opinion our correspondent expresses. The remedy he proposes of sawing the hoof, we have found the most effectual of any tried. The remedy of H. E. Hubbard, following his communication, given from the Cultivator, we presume applies to the "foul in the foot," a disease quite distinct from the hoof ail, and which is also cured by the application of hot tar, which is done by rubbing a hot iron rod, dipped in tar, between the claws at the upper part of the foot.

Market for Cocoons.

We are asked if there is any market for cocoons in this vicinity. If any person is desirous of purchasing them, we should be glad to be informed of it.—Eds

THE MAGAZINE OF HORTICULTURE, Botany, and all useful discoveries in Rural Affairs.— Edited by C. M. Hovey, Boston—40 pages, monthly—\$3 per year. M. B. BATHAM, Agent, Hartford.

We have received the first number of the 7th volume of this excellent Magazine, and observe the editor very justly calls upon the friends of horticulture for an increase of patronage. We apprehend that nothing but a want of a proper knowledge of this work can prevent its receiving a liberal support. It is the only periodical of the kind in the United States, and will not suffer by a comparison with the most popular magazines in England (which it very much resembles.)— To the nurseryman and professional florist, it will be found indispensable to a knowledge of the various improvements and discoveries which are constantly making. And the amateur gardener or florist will find it give new zest to these delightful pursuits.

We extract the following article from the January number.

Horticulture in Western New York.

It is now two years since any report was given in the Magazine, respecting horticulture in Western New York; and, although we cannot boast of any great advancement, we are unwilling that old Genesee should be quite forgotten in your annual retrospect of gardening. A few years ago, it was thought that this section of country would make rapid progress in scientific and ornamental horticulture; but a cloud of adversity came over our prospects, and we were compelled to confine our attention to the necessaries, and neglect the luxuries of life. It is believed, however, that a brighter day begins to dawn, and prosperity will again smile upon us; so that we still hope to see this fertile region become as celebrated for its attainments in horticulture as it now is for its natural advantages.

My time and space, at this time, will only allow me to glance at a few of the principal gardens, and I shall confine my remarks to those which have green-houses.

At Rochester, the green-house and nursery establishment, commenced in 1831, by Reynolds & Buelam, is now owned by Messrs. Ellwanger & Barry, who have removed it a little out of the city, near Mount Hope Cemetery, where they have purchased a fine piece of ground, and erected a good green-house and hot-house, which are already well stocked with plants. Mr. Ellwanger has imported some fine plants, mostly Cactæ and cinnellias, from his native country, Germany. They are making arrangements for planting an extensive nursery, and if industry and skill will insure success, these young men will surely succeed.

The nursery of Mr. Asa Rowe, six miles from Rochester, is the oldest and most extensive in this vicinity. Mr. Rowe has a large green house, and a good collection of common plants, but, owing to the small demand for rare plants, he has not added many to his assortment of late. His attention is mainly bestowed to the growing of fruit trees, of which his sales have been extensive.

Mr. William King has erected a small green-house in the city, the past summer, and made a good beginning, all things considered.

Rochester cannot yet boast of one private green-house, although many families cultivate plants in their parlors. Mr. S. O. Smith, a gentleman of wealth and taste, is now erecting a fine dwelling-house, and intends building a conservatory next year; when that is done, others will doubtless follow his example.

Mount Hope Cemetery deserves, at least, a passing notice. Many improvements have been made there the past year, and in summer it is a place of great beauty; but now, it is desolate and gloomy, and so it will it ever be, during more than half of the year, unless our citizens take example from your own Mount Auburn, and intersperse it liberally with evergreens, a kind of ornament of which we are sadly deficient.

At Buffalo, there is no perceptible improvement.— H. Pratt, Esq., the great patron of horticulture, died last spring, and the improvements which he had projected and commenced, have been discontinued and neglected. His stately mansion is unfinished and unoccupied—and the garden, and fine range of horticultural buildings, give evidence of the loss of that master spirit, of whose taste and liberality they are now the sad monuments.

The nursery establishments of Messrs. B. Hojge, Jr., and A. Bryant, appear in a thriving condition.

They both have green-houses attached, but complain that the sale of plants is quite limited.

The good people of Buffalo are fond of display, and take great pride in building large and costly houses, and, consequently, to regard horticultural embellishment, producing the desired effect. If they studied the matter aright, they might save thousands of dollars, and, at the same time, display far more real taste and beauty about their dwellings.

At Watavia, the garden and green-house of D. E. Evans, Esq., are, as usual, kept in good order, by Mr. Logan, the gardener. This is one of the oldest gardens in this region. The collection of fruit, &c., is of the very best description, but the assortment of plants is rather ordinary, not having enough of new and rare kinds to make it interesting.

At Genesee, a green-house and graperies were erected the past year, at the beautiful residence of the venerable James Wadsworth, Esq. The green-house was erected for the gratification of Miss Wadsworth, who has a fine taste for botany and horticulture, and has already obtained a good assortment of plants, including some rare kinds. With her good taste and ample means, it may reasonably be expected that her collection of plants will, in a few years, be superior to any in this section of country.

At Canandaigua, the green-house of John Greig, Esq., is in excellent condition. The plants are mostly of common kinds, but many of them are very large and beautiful. A striped agave (Agave americana var. variegata) is the largest of the kind that I have ever seen, and Mr. Greig says he intends to take measures to bring it into flower, if possible.

Capt. S. Menteth, residing near Canandaigua, sent some very beautiful oranges and lemons of his own raising, to the fair at Rochester, in October, but I have not had time to visit his house, or obtain information respecting his plants.

There have been no horticultural exhibitions in Western New York, this fall, except in connection with the agricultural fairs. We hope to give a better account of Rochester next year.

M. B. B.

Rochester Dec. 21, 1840.

"Books never make Farmers."

A number of our readers have very justly objected to some positions taken in the article in our last number from the National Aegis. The article contains many excellent remarks, but the assertions are not strictly true, that "books and learning will never make farmers"—"that to be a farmer, a person must [necessarily] begin when a boy."

Experience, it is true, is essential; but we have known instances where farmers, not educated as such, have acquired from one year's practice, more knowledge of the operations of farming, than others have through twenty years of apprenticeship. Indeed, some of the very best farmers we know of, spent the early period of their lives in far different pursuits. A long life, without industry, attention, knowledge, and judgment, is insufficient to make a good farmer; but with these requisites, a few years will accomplish wonders. Every kind of knowledge which tends to expand the mind, tends also to improve the judgment, and enables us better to perform any kind of business whatever.

We wish to be distinctly understood,—a mere load of the memory is not knowledge. The objection

* One instance, out of many which might be given, is that of Judge Burd, which is doubtless familiar to many of our readers. A few weeks before his death, he made the following remarks, which we wish every one who has an object in "book farming" would read. "Bred to a mechanical business, I took up Agriculture, more than twenty years ago, as the future business of my life. We left the precious moments of youth which we are apt to acquire in the long practice of business. I began farming with a consciousness that I had every thing to learn, and that the eyes of my neighbors would be quick to detect faults in my practice. At once, therefore, sought to acquire a knowledge of the principles of my business, and of the practice of the most enlightened and successful farmers. These I found in books and agricultural periodicals; and by the use I have been greatly benefited. Although it does not become me to herald my success, I will venture to say, to encourage others, and particularly the young, in the work of self-instruction and improvement, that my lands, which are light and sandy, and which, only an un cultivated state, thirty dollars an acre, are now worth two hundred dollars by acre, for farming purposes. The other words, that the net profit of their interest of two hundred

made so often,—of the uselessness of school learning in the common affairs of life,—is valid only in relation to the learning which young people acquire, but do not understand—which they commit to memory but do not know how to apply in practice. It is valid rather in case of superficial, than of thorough knowledge. If our public schools were more occupied in teaching the application of learning, than the mere theory; and directed the attention more to the art of doing, than the mere art of remembering, most of the objections made to them in this respect would fall to the ground.

Rohans vs. Meshannocks.

MESSRS. EDITORS—Having noticed the statement of Mr. P. Briggs, in the last number of the Farmer, and wishing to induce him to "try again," I will inform, him that I raised 37 bushels of Rohans the past summer, on 9 rods of ground, which is at the rate of 657 bushels to the acre, and an increase of 98 fold on the quantity planted. On comparison, it will be seen that my Rohans yielded 124 bushels per acre more than Mr. Briggs' meshannocks.

Now, if friend Briggs will make another trial with me, and publish the result through the columns of the New Genesee Farmer, I will acknowledge it if better.

A FRIEND TO AGRICULTURE.

Danby, Tompkins co., Jan'y. 13, 1841.

Another Small Crop.

MESSRS. EDITORS—Your last paper contains an account of a large crop of Potatoes. With your permission, I will give you an account of a small crop. About the middle of last May, my father had a small Rohan potato given him, weighing 2 ounces. This he cut into 18 pieces, of one eye each, and planted them in 9 hills. On the first of October he dug from the 9 hills, 1 bushel and 10 quarts, which weighed 78 3/4 pounds; being an increase of 630 to one.

In order that my father may be able to raise a larger crop next season, please send him the New Genesee Farmer for one year, addressed, Horace Fowler, Hancock, Jackson co., Michigan. Yours, &c.

T. F. F.

Stabling Milk Cows.

We have been much surprised, at the increased quantity of milk cows afford from being stabled in winter, which some recent experiments have proved. A near neighbor suffered his cows, from necessity, to run in the open air, during the early part of winter, and, as usual, their milk greatly diminished in quantity, although they were well fed on hay, and mange wurtzel. He then stabled them, without changing their food, and taking care of course to give them plenty of clean litter. He lately informed us, as the result, that his cows now gave just double the milk they did when exposed. A similar experiment by the writer, has proved nearly equally successful.

How to keep a Village Cow.

Transplant sugar beets 15 inches apart, like cabbages, but with more care, in every spot or space you can spare in your lot or garden. If the land is worked well and early, they will tend themselves after two or three light hoeings, and grow large enough to make a mess each, with the addition of a quart of shorts seasoned with ground oil cake. Here is sugar, gluten, starch and oleagineous matter to boot. With such slops, a cow needs nothing but a little straw.

S. W.

RATS. A writer in the N. E. Farmer has effectually prevented rats from gnawing holes in the wood work of a house, by pouring upon places where they were apt to appear, a strong decoction of Tobacco. They were at work, a strong decoction of Tobacco. Many of the wood saturated with Tobacco. Many

Sketches of Travel.

Newport, R. I., July 1.

Here we are at A. C. M's. delightful cottage. For me to attempt to describe the measure of my comforts and pleasurable sensations here, would be labor lost. I have been within higher and more massive walls, where the decorations of man's invention spoke more worldly splendor; but here, in the midst of Nature's magnificence, there is in union with it, in this house, a chastened simplicity and neatness of arrangement truly admirable. Our unpretending hostess is one of those intellectual females who regulates her mansion with noiseless efficiency. If her rules partake of the self-denying discipline of that society, in which she is a "bright and shining light," even the more worldly of her inmates are too well bred to wish to infringe them.

But who can, in this delightful spot, desire the sound of factitious merriment, the gross amusement of mere sense? Sufficient for me was the all-subduing influence of Nature's charms. Every morning at day dawn, I opened my chamber windows and set ajar the blind to look out upon the old shingled wind mill, Brindley's little pond and old rope walk, the narrow-walled lanes and neat little fields, where I had so often played in my boyish days. The deep continuous roar of the breakers on Easton's beach, was now more audible than at any other hour. I felt that this same reverberating roar was the music of my boyhood—forty years had neither impaired its freshness nor its power.

"States fall—arts fade;
But Nature doth not die."

At the close of this day, while sitting in the front piazza of this delightful cottage, looking down upon the quiet town below, and the resplendant bay and islands beyond, I saw some half a dozen chaises, accompanied by two or three modern buggies, returning from a ride of pleasure on the island and over its beautiful beaches. Each vehicle held a lover and his mate, as if mystified by the tender passion, or perhaps only with feelings imbued with the power of Nature's more magnificent attractions, the whip cracked not, and the horses trotted lazily along. How different is all this in Western New York. There our young people bundle into one or more large carriages or carryalls, drawn by two or four of the fastest trotters. Jehu like they drive—all is life and noise and nonsense—putting the horses to the top of their speed, as if to annihilate time and space to the manifest jeopardy of life and limb.—This, said I to my wife, speaks the difference between the Yankee and the New York character. The one is economical, even in his pleasures; the other loves stronger excitement, he even carries his enterprising spirit into his amusements.

Sunday morning, went to Friend's meeting. This venerable house, with all its accompaniments, reminded me of other days, save the absence of those hoary heads which now "were not." Here was no longer a D. B. or C. R. on the high seat; no T. R. with his full bottomed whig below; no G. W. with his huge ivory headed cane, on the high seat in the wing. This huge wing was also razed, and gave a concession to the republican feelings of these after times; but the same ponderous oaken beams supported the quaint looking roof, the attic and the galleries. This unity of strength and plainness, a work of the 17th century, carried a sentiment of reverence with it.

I have sometimes heard apparently thinking men complain of the irksomeness of the hour spent in the silence of a Quaker meeting. I can only say, let such an individual take up his cross for this single hour. If he is poor, let him take to himself the

rich promises of that Gospel, which was in the beginning preached, first of all to the poor. If he is rich, let him employ this brief hour in examining his own heart, to the end that he may not incur the penalty pronounced against the rich man, hardened in sin and selfishness.

In the afternoon, we went to old Trinity. The congregation large, fashionable, attentive. The evening service was read by the venerable Dr. W., with a pathos and unction suited to the holy purposes of its office. What contrite heart will say that these forms of glowing piety, framed by the saints of old, are a "killing letter?" If such an one there be, may he be compelled to listen a full hour to the dull sermon of a man who has no reverence, no spiritual nature in him.

The subsoil of R. Island is dark clay, but unlike the clayey regions of the West, it is here intermixed with stone and gravel, and so compact as to be very difficult to excavate. On the surface small boulders of slate, flint, and granite, abound. The upper stratum is also relieved by sand or gravel. At the North end of the Island, below the schistous formations, anthracite coal is found; but it is more friable, and of course less valuable, than the anthracites of Pennsylvania. The predominant rock is coarse gray wacke slate: it bounds the head lands at the South part of the Island, forming with its thick annual coat of rock weed, an impenetrable barrier to the ocean's increasing surge. Also at the South part of the Island, there are valuable quarries of building stone, and some few ledges of irregular granite, too full of seams for such uses. I know of but one ledge of lime rock, and this is principally under water at high tide. It is coarse in texture, and nearly white; bearing little resemblance to our own deep blue fine grained carboniferous variety. But if Nature has furnished us of the West with her more fertilizing fossils, limestone and plaster, here she dispenses her blessings in another shape, with no niggard hand. Here the everlasting ocean not only yields its vast shoals of the oily munnaden fish to the net of the fisher, but every eastern gale drives to land an endless variety of marine vegetables and shells, in such abundance as to furnish both lime and vegetable matter to the grateful soil.

Indian corn, rye, oats, and barley, are the principal grains grown on the Island. It is said that in an early day wheat grew well on the opposite Island, Conanicut. Hence its present failure may not altogether be attributed to the influence of the sea fogs. Grass seemed to me, at this time, July 1, to be the most promising crop. Such Timothy (*Panicum pratense*), now in full bloom, I rarely ever saw in the dry, hot, champagne West. The Locust (*Robinia pseud-acacia*), together with many other ornamental trees, do not thrive well on the Island. The Buttonwood (*Platanus occidentalis*) is the only ornamental tree which seems to thrive gracefully here. Perhaps the pure damp sea air is quite as congenial to it, as the mephitic vapours of the Western creek and river bottoms. S. W.

Gardening for Ladies.

The accompanying amusing and instructive observations are taken from an excellent article in the Gardener's Magazine, entitled "Instructions in Gardening for Ladies," by Mrs. Loudon:—

To derive the fullest enjoyments from a love of flowers, it is absolutely necessary to do something towards their culture with their own hands. Labor is at the root of all enjoyment. The fine lady who has a nosegay put upon her table every morning by her gardener, has not a tenth of the enjoyment from it that the lady has who has sown the seeds, or stuck the cuttings, and watered and shifted, or transplanted, pruned and tied up, or pegged down or thinned out the plants, and at last gathered the flowers herself. But

we would have ladies of leisure do a great deal more than this. Let them hoe, and rake, and dig, and wheel a barrow, and prune and nail wall trees, handle a syringe, and work one of Read's garden engines.—By these, and similar operations, they will ensure health, without which there can neither be good temper, nor any kind of enjoyment whatever, mental or corporeal. The grand and all pervading evil among ladies of independent fortune, is *ennui*, which, every body knows, is brought on from a want of rational and active operation. Now the pursuits of botany and gardening supply an occupation which is at once rational and active; and they supply it not only to the lady who has merely a love of flowers without a scientific knowledge of botany or a taste for the arts of design, and who may, therefore cultivate her flowers, and perform her garden operations, without a greater exertion of mind than is required from a gardener's labor; but to the scientific lady, whose botanical knowledge, like that of the scientific gardener, may enable her to raise many kinds of flowers, fruits, and culinary vegetables, by the different processes required for that purpose; and to the lady of artistical taste in drawing, painting and sculpture, who may direct her attention to landscape gardening, and more especially, to the designing of flower gardens, and the introduction in them of the various kinds of ornaments of which they are susceptible; a subject at present as much in its infancy as botany was before the time of Linnæus. But, says some of our readers, "What, the Duchess of ——— wheeling a barrow, and nailing wall trees?" Yes, certainly, if she have nothing else to do, that will be an occupation equally active and rational. Why not a Duchess as well as a plain mistress? Suppose this Duchess at work in her garden, and that you are not aware that she has any title. Suppose her dress in the simplest manner, (as were the Vicomte D'Ermenonville's wife and daughters in the gardens of Ermenonville,) what wonder would there be then? Ladies of rank are as much subject to *ennui* as ladies without rank; and every lady, as well as every gentleman, has a portion of the day that she can call her own, when she may indulge in what she likes. If she has not, her life is not worth keeping. Did not the Earl of Chatham, notwithstanding his being prime minister at a period the most important that ever occurred in the annals of this country, find time not only to lay out his own grounds, but to assist Lord Lytleton in laying out Hogley?—We insist upon it, therefore, that what we propose is just and suitable and necessary for ladies of the highest rank as it is for those without rank, provided they are equally without active and rational occupation of some other kind.

The following excellent communication deserves an attentive perusal from every mother and daughter in our land; and in behalf of our fair readers, we tender FANNY many thanks. At the same time we think she has mistaken the meaning of ANNETTE, and applies the *hickory* without real cause. We do not believe that Annette meant to "attribute all the discontent and unhappiness of farmers' daughters to a mis-education, and put the blame upon teachers and seminaries." In the communication referred to, she was only speaking of a *certain class* of daughters, not of the majority; and we think an attentive perusal of her several communications, will show that she does not reason altogether in "logical circles."—Eps.

Farmers' Homes, Wives, and Daughters.

Messrs. EDITORS—I noticed, in your December number, another chapter of grievances from Annette; but having had Thanksgiving, Christmas, and New Year days to attend to, (which are the climax of all enjoyments in the country,) no time was allowed to reply last month; and although I feel no disposition to criticise, or drive my amiable *combatant* from the field, still I think a little sprig of *hickory* from *Walnut Grove*, may serve to drive her from some of her logical circles.

In your July number of last year, she attributes all the discontent and unhappiness of farmers' daughters to a mis-education, and puts all the blame upon teachers and seminaries. Now she says that teachers and

seminaries are made to bear the blame of "inconsiderate fathers;" but I think, if she keeps on, she will come round to the right point yet, and find that in the family circle the *mother* is the law and testimony, and that "like mother like child" will still be the motto.

I would not pretend to say that there are not avaricious, penurious men, whose *wealth* consists in the accumulation of their possessions, and not in the enjoyment of them, and who would deprive their families of the comforts of life, that they may compound their interest or odd farm to farm, to be considered rich in the eyes of the world,—or that there are not indolent and inefficient men, who, if they can be fed and clothed from day to day, care not how or whither. There are procrastinating men, too, who are never ready to do any thing in its proper time; but these I consider the exceptions to the general rule, and not "that a majority of the farmers of our country, enjoying a competency," are of either class. But admit they are,—the mother, seeing these traits in the father, has the sole power of correcting it in her children; and if she is a judicious mother, and understands the philosophy of human nature, she can do it without ever destroying the confidence of her children in their father.

It is from the *mother* children receive their first impressions of right and wrong. It is her voice that checks their wayward steps during the day, and hushes them to sleep at night. If sickness comes, mother always has a remedy—the natural qualities of every mother ensure to her an unbounded influence over her children. Their character must also be formed in childhood. If they are to be virtuous, the seed must be sown in the spring-time of life. It is then the occupation is selected, taste is formed, habits contracted and principles planted—"as the twig is bent the tree's inclined;"—but it needs not the strength or power of a syllogism to prove the assertion—the fact is self evident—that these must be imbibed in early life, planted and nurtured by the hand of a mother. Her example is written indelibly upon the table of their memory, and her peculiarities must serve as an infallible standard. Now, think ye, if the daughter has been educated to be industrious, and to bear her part in the duties of the family, and to be contented with such things as she may have, "working diligently" to improve her condition, whatever it may be,—that there is nothing "within or around" that home to make it "lovely or attractive," and she, nevertheless, unhappy?

We will take a most extreme case. Take an uneducated man, devoid of a refined taste, an avaricious, penurious man, and, if you please, let him be a peevish and a fretful man, who wants nothing but what will bring dollars and cents. He has a wife and daughters of refined taste, who like to blend the ornamental with the useful. Let the daughter go out early in the morning when she sees her father planting beans or cucumbers, and say, Father, I will drop your beans for you, if, when you get through, you will help me put out a beautiful rose bush I got yesterday. Why, child, what is the use of all these roses and posies around the house? they want pay our debts or buy bread. I know they want, father, but it won't take you but a minute to do it, and then it helps make the old house look so much better, and makes mother and the children so much happier when they see every thing around looks cheerful and pleasant; and this little Burgundy rose is mother's favorite, you know. I do not believe the most clownish, peevish, fretful man, could resist such an appeal from an affectionate daughter; for "soft words will turn away wrath," and love will beget love; and the unconscious father will not only set out the rose bush, but enjoy its fragrance too.

We will take a still more important case. Say they want a new fence around the house, and the house pointed. The mother and daughters now say,—If father will let us have the butter and cheese we make this summer, we will paint the house and have a new fence, &c. But says the indolent, inefficient, procrastinating man,—Oh! we can't afford it; besides I want all the butter and cheese you can make, to pay for the new wagon and harness we have been getting. But says the daughter,—Father can have all the avails of the farm for that, only let us have the butter and cheese, and we will do without a hired girl, and do the work ourselves. He must be something less than a man, and a man with a competency too, who would not only yield to such wishes, but rouse from his indolence and procrastination, and do all he could to aid them; and I am confident that in nine cases out of ten, Annette will find, if there is nothing "within or around a country home calculated to please the mind, or delight the eye of an intelligent daughter," it is the mother's own fault. She has not brought up that daughter to industrious, frugal, and economical habits. She has sat her down in the parlor, a dressed up automaton, living and dressing upon the hard earning of somebody; and whatever may have been her school education, her home education has been all wrong; and not possessing energy of character sufficient to rise from her indolent habits, she sits down to enjoy her ennui, dissatisfied with herself and every body else, and consequently unhappy. And if she were thirsting for knowledge, and the father unwilling to furnish her the means of allaying that thirst, there is not a literary gentleman in all the region, that would not delight to open his store-house of literature to feed a starving intellect; for in these reading days, nothing is more rare than an exclusive library.

Happiness has no locality. It is not the city or the country, the brick or the wood house, the mahogany or the pine furniture, the Brussels or the rag carpet, that can make a discontented mind happy, or a contented unhappy. Home, to a contented mind, will be home, and have its charms be it ever so humble.—If Annette will go with me, I will show her a happy country home—not a thousand miles from a city—where dwelt a father, mother, brother and sister. That home was truly attractive, and that daughter was a happy one. "She had much to gratify her taste, and call into exercise those faculties which afforded her the highest kind of enjoyment." She had "the fragrant rose, the climbing honey-suckle, the shady bower and the vine-clad arbor;" but her own hand watered and trained them. And when she would "luxuriate on nature's charms," she would ramble o'er her native hills, by the winding brook, the shady grove, where she could

"Converse with nature, and commune
With nature's God."

and never was she less alone than when alone.

There was much around that country home "calculated to please the mind and delight the eye." The birds from the forest came at her call; an old wren for years built her nest in a gourd shell that she hung in the well-curb, and her favorite robin when molested always knew that in her she found a friend to drive away her foes. She could feed the chickens or milk the cow; she could wash, or bake, or iron; all of which did not prevent her thumping the piano, or "tripping the light fantastic toe," nor exclude her from the most refined circle in the city; and none enjoyed her rural home more than did her city friends. And there was much "within" to make that home delightful—there were happy hearts and cheerful voices, and the hospitable board that ever made welcome both the stranger and the friend—that home was truly attractive; but not more from the wearied and

care-worn father, than from the mother and their only daughter; and that daughter was none other than

Your humble servant, FANNY.

Walnut Grove, Jan. 11, 1841.

The Education of Females.—The proper training of Farmers' Daughters.

I like your correspondent Annette, much better than I do her antagonist "Home-spun Farmer;" because, like a true woman, her errors are not of the feudal age. She says, "public sentiment, and the spirit of the age, now require that females of the rising generation, should receive a higher degree of education than was formerly deemed necessary."—In the depth of her sympathy with her sex, she might perhaps relieve them a little too much from the wholesome drudgery and petty details of domestic life, and suffer them to go a little too far into the more expensive refinements of the age; while, on the other hand, her antagonist, and his exponent, of the *Egis*, "Franklin," seem to forget that "man lives not by bread alone." They appear very much to dread that a female should be educated above her condition in life; but it does not seem to have entered their philosophy, that education, and a pious one too, can alone fit a woman to bear a right those ills which "flesh is heir to." Is it reserved alone to the wealthy to indulge in intellectual pleasures? Does not the honey suckle clamber as gracefully, and bloom as fragrantly, on the rough exterior of the log cabin, as on the piazza of the gayest cottage of art? Must every poor widow too, stifle the yearnings of a mother's heart, and compel her fatherless daughters to live in somebody's kitchen; to be hourly reminded, by unqualified command from the mushroom daughters of her mistress, of her hopeless servile condition? Did Franklin ever read the story of Cinderella? If he has, does he blame any fair, delicate young female, for shrinking from Cinderella's wrongs, even if she were certain of Cinderella's final reward? Franklin is so much a man of the past lousy woolly age, that he seems to forget that the revolution which those modern improvements, the STEAM ENGINE, SPINNING JENNY, and POWER LOOM, have made in mechanics, calls for a correspondent social and moral improvement, and modification of labor and employment. He even limits woman's reading to five books, including the Bible. Annette might possibly err on the other hand; but we want to hear from her again on the subject of the proper training of farmers' daughters. Woman alone can do this understandingly—she is less an animal than man. It has been beautifully said of woman, "that in her rich heart, God more generously sows the divine germs of his holy religion;" though "she will sometimes sell her birthright for TISSEL and the ADMIRATION OF DECEITFUL LIPS." Yet in the main, her purity of heart is "her strength, her loveliness, her primal excellence." Is she not therefore the only safe and legitimate teacher of her own sex?

LUBIN.

SONNET.

WINTER.

The scene, how changed! The winds of winter, wago
Eternal warfare with the leafless trees;
And mora and even, the elemental rage
Pulls the cold heart, as springs their channels freeze!
Where are the children of the woods? the Lees—
The songs of birds that wake the woodland train?
All, all are gone, and like the locks of age
The pendant icicle the woodman sees,
And feels the blood run chill in every vein.
Season of cold! when round the ingle cheek
Young children gather, and the hoary sire
Looks o'er the assembled group, and feels the bleak
Cold hand of death upon him, which the fire
Of youth no more will come, its icy spell to break!
London, U. C., Dec. 21, 1840.

J. N.

The following communication is from the pen of one whose experience and learning entitles him to more than ordinary regard. We hope to receive further remarks from him on this all-important subject; and feel assured that our readers, who are parents, will find his suggestions deserving their consideration.—Ebs.

For the New Genesee Farmer.

Education of Farmers' Children--No. 1.

Messrs. Editors—I have not been wholly pleased with the articles on the education of farmers' families, which appeared in your paper in the last year. I approved many things; but some things appeared rather distorted, and others to be neglected or omitted. I thought, too, that mothers were censured beyond their proportion.

There are two prominent mistakes on this subject, which need correction. The one is the notion that a farmer's condition is rather inferior; the other respects the kind and quantity of education.

1. The first mistake is made and continued by farmers themselves. While the condition of the farmer is one of the most independent, and his profession as honorable as any, and far less annoying and irksome, and is far more free from temptation and passion, there is a constant effort to leave it and to engage in some other pursuit. The sons are often prepared for some other business; the daughters are educated for another sphere. All this tends to depress the notions of the usefulness and respectability of an agricultural life. True indeed, some of their sons must have a collegiate education, and engage in some of the more learned professions, and some of their daughter must be the wives of such men. But the great body of the sons must continue in the occupation of their fathers. While the men of the learned professions fill the more important stations, as a great fact, and the sphere of their influence is greatly enlarged, and while their pursuits may in one respect be allowed to be superior, in the general rank the farmer's place is important beyond estimation. If the other is considered as the eyes and hands of the system, the latter is the very backbone of the country. Without the latter, the former would be powerless and unnecessary. For this place their sons should be educated, and their daughters too, as this place they will chiefly fill. The worth, the dignity, the respectability, the usefulness, the security and independence of this place, should be known, acknowledged and felt. Then will the action suit the thought.

2. The second mistake comes more within the scope of education. The kind and quantity of education, is material. In the lower class of farmers, both sons and daughters have only very ordinary advantages. In the highest class, which is not large, both enjoy nearly equal means. In the middle and great class, the daughters have far the greatest advantages. The reason is, that the sons are need'd on the farm in the summer, and cannot so well be spared in winter. The daughters therefore attend the select schools and academies for a much longer period than the sons, and having a fully active minds, they study to better advantage and make greater acquisitions. They become more delicate and refined in their manners; they see and hear more of the world; they are able to converse and to show off to greater advantage. They have, in fact, far more of cultivation to show off, and far more of that which will be interesting to society. Hence it is that they are raised above their brothers, and will naturally seek the society of those who have more congenial acquisitions. The sons of farmers are thus thrown into back ground, mortified, repelled. They would at a state of things, over which they have no control, and the daughters are often blamed and reproached for not finding the pleasure in the society

of those who have not been educated so as to be on an equality with them. Hence it is that many a young farmer is obliged to find a wife among those daughters who are not quite on his own level, and who are not so well fitted for their place as he is. How often a farmer's son is sent to a higher school for one quarter, and then he must be upon the farm. He has hardly been able to get well employed in study, when he must leave, till another season will give him another quarter. The daughter less rarely has only one quarter at a time for her improvement. She has not indeed enough of time for improvement; let her not have less; but let the son have more, much more.— However much the sister may have, let the brother have far more means of education. Farmers' sons need to be raised in the scale of their qualifications for usefulness, and enjoyment on their farms, as well as for influence in society. Then will their wives be raised to a higher character also, and a nobler generation will appear. When a highly educated female has allied herself with a young farmer of good talents and disposition, of activity and enterprise, though he may have less of education and refinement, because he has not been able to acquire them, who has not seen with delight the plastic power of the wife in moulding and elevating and refining her husband. She becomes in a two-fold sense, a help meet for him. "She looketh well to the ways of her household, and catcheth not the bread of idleness. Her children rise up and call her blessed; her husband also, and he praiseth her." D. C.

ENGLISH MARKETS.

LONDON, January 1, 1841.—A great improvement has taken place in the manufacturing districts. Cotton goods especially have been in very active demand, and at advanced prices. The money market is also assuming a more healthy tone. So that with moderate stocks of produce generally prospects are favorable.

CORN MARKET.—Average price for Wheat for the last six weeks; for the week ending Nov. 29, 6s. 8d.; 27th, 60s.; Dec. 1st, 59s. 7d.; 11th, 58s. 10d.; 15th, 59s. 1d.; 18th, 60s.—Aggregate for the six weeks, 59s. 10d.—duty 27s. 6d. The average is pretty large. English wheat is saleable at the currency of a fortnight ago, for 62s. 6d.; white, 67s. 6d. 70s.

LIVERPOOL, CORN MARKET, Jan. 2.—American Flour, free, has sustained late rates, but has been rather slow of sale, the best markets of United States at 36s., Canadian at 35s. to 36s. per bbl. A little United States has been sold, in bond, for export, at 26s per bbl.

January 4.—American Flour, in bond, 25s. 6d. a 26s., but these prices could not be relied upon in the face of large importations. American Wheat, in bond, 5s. 3d. a 5s. 6d. per bushel.

NEW YORK MARKET—JAN. 27.

CORN EXCHANGE.—Flour was held firmly through most of the week, but the news from England was unfavorable, and on Saturday holders were ready to sell, but there were very few buyers; 350 bbls. Genesee were however taken on that day for England, at \$4.41, 1000 bbls. Georgetown sold at \$5.12; small parcels of Howard street and Baltimore City at \$3.25, and some New York at \$5; 800 Brandywine at \$5.50. Corn Meal sold in bunches at \$1.43, and bbls. at \$2.25. Rye Flour at \$3.37. In wheat the only parcel sold was 2500 inferior Long Island at about 50 cts. bu. There is considerable Genesee wheat, say 100,000 bu. in store, held at 75 a 60 cts. There were no sales of Rye. A cargo of very handsome Delaware Corn was sold on Friday at 57 cts. weight, but a very fair article was offered afterwards at 50 cts. The distillers buy Long Island Corn at 60 cts. Northern Oats may be quoted at 12 cts.; Pennsylvania and Jersey, 30 a 30 cts.; Southern, 32 a 31 cts.; Barley is held in store at 40 cts.

PROVISIONS.—Beef and Pork are abundant and very heavy. Prime Pork especially drops; they were sales at \$ 0.25, and of Mess at \$12.50, and more is offered at the same rates. 2000 kegs Ohio Lard were sold at 7c. lb., another lot of about the same quantity is held at 7 1/2. Smoked Meats, Butter and Cheese are without change.

FEEDS.—Flat Seed is dull; 5000 acres of Clover have been sold at 3 cts. lb.

MONEY AND EXCHANGES.—Money has been rather more plenty since the resumption in Philadelphia and the considerable sums received thence. The Banks discount at the ordinary business paper which is offered them, coming within 90 days. There is a very little paper in the street. Bills on France, and England were heavy through most of the week, owing in part to the large sums drawn for by the U. S. Bank. The usual arrangements now making for the shipment of specie, though the Havre packet of the 1st February will take \$1200,000, chiefly arrange for some days ago. The rates of Domestic Exchange improved on the whole, and so did Money Generally.

BUSINESS GENERALLY.—It will be seen that a good degree of activity has existed in several of the articles mentioned in this Review, and there is a healthy feeling pervading the market generally. The importations of manufactured Goods are quite large, and the sales by auction, are commencing on a large scale. The merchants generally are successful in their affairs, and so confidence is increasing from month to month. J. W. C. W.

Errata.

Besides several unimportant typographical errors in the January No., the following have been noticed as affecting the sense.

On page 2, col. 1, 9th line from bottom, for pippins read "Pippin." Same page, col. 2, 25th line from top, insert the "Kentish," &c. Same col., 10th line from bottom, for Crestan read "Chrestian." Page 12, col. 2, line 7 from the bottom, for yields read "yielded." Same page, col. 3, line 6 from bottom, for particular, trees read "particular trees." Page 13, col. 2, line from top, for forest, chers read "forest. Where," &c.

ROCHESTER SEED STORE--1841.

THE subscribers have made complete arrangements for furnishing all kinds of SEEDS from this establishment as usual. Large importations have been made, in addition to the supplies raised in this country. No pains will be spared to have the seeds of perfect quality, and give satisfaction to their customers. Agents will be supplied, as usual, in the principal places of Western New York—Particulars next month. BATHAM & CROSMAN. Rochester, February 1, 1841.

MOUNT HOPE GARDEN & NURSERIES,

ST. PAUL STREET,

ROCHESTER, NEW YORK.

THE Proprietors of this establishment offer for sale an extensive assortment of Fruit and Ornamental Trees, Flowering Shrubs, Green House Plants, Bulbous Flower Roots, Double Dahlias, &c. &c.

Gardens laid out, and Gardeners furnished on reasonable notice.—Persons requiring information on any subject connected with the business, will receive a prompt reply.

All orders, letters of inquiry, &c. must be addressed (post paid) directly to us.

Trees, Plants, &c., will be carefully packed, so that they may be carried to any part of the country in safety; and packages will be marked and shipped as may be designated in the order.

Persons with whom the proprietors are unacquainted, are requested to give a satisfactory reference, or name some person in the city of Rochester, who will guarantee the payment. BELLWANGER & BARRY. Rochester, Dec. 1, 1840.

TIMOTHY SEED WANTED. At the Rochester Seed Store. BATHAM & CROSMAN.

ROCHESTER PRICES CURRENT.

CORRECTED FOR

THE NEW GENESEE FARMER, FEB. 1, 1841.

Table with 3 columns: Commodity, Unit, Price. Includes items like WHEAT, CORN, OATS, BARLEY, RYE, BEANS, POTATOES, CIDER, FLOUR, SALT, PORK, BEEF, POULTRY, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, PEARL SHEEPS, WOOL, HAY, GRASS SEED, CLOVER, FLAX, PLASTER.

Remarks.—Our sleighing was nearly discontinued, and but little is doing in market. Wheat is purchased only in limited quantities for the retail flour trade. More is doing in Corn, Oats, &c., but at low prices. The Pork trade is nearly over; prices somewhat low. The Money market is much improved. A very large sale of Dry Goods, at auction, took place last week. The goods were well attended, and the prices obtained

Triumphant Success.

We congratulate the friends of this paper, on the success which has thus far attended the 2d Volume. We commenced the year with an edition of 20,000 copies, and some of our friends thought it was too great a number, but present appearances indicate that we were not mistaken; for if the friends of the cause continue to exert themselves, as they have done the last two months, this large edition will soon all be reculated; and then who can estimate the amount of good that our monthly messenger may accomplish?
Have patience with us. Owing to the flood of letters, which daily pour in upon us, we are sometimes compelled to defer attention to them for a day or two; and sometimes (though not often) names are not entered correctly. We regret these evils and endeavor to avoid them, and hope, therefore, our friends will not be soled too severely, or tax us postage on their complaints. Postmasters, when requested, will generally inform us of inaccuracies.
Some of our subscribers complain that their papers do not reach them till some days after the 1st of the month. We cannot help it. We wish to obtain the

reports of the Markets, &c., up to the 1st, and therefore cannot go to press earlier. Then, notwithstanding we use a Power Press, it takes quite a number of days to work off so large an edition. The whole are mailed as fast as possible, and should all reach the subscribers before the middle of the month.

Post Masters and agents in Canada, who wish to send us instructions respecting the direction of the papers, are requested to direct their letters to the Post Master at this place; otherwise we are subjected to postage.

Post Masters and Agents are particularly requested to write the name of the Post Office, County, and State. It is sometimes almost impossible to decide what State the place mentioned is located in.

Uncurrent Money.

Bills on solvent Banks in this, and the Eastern States, are at par with us—Canada, Pennsylvania, and New Jersey, are 5 to 10 per cent discount—Ohio, Indiana, Kentucky, and Illinois money, is 6 to 8 per cent.; and Michigan is 12 1/2 per cent. discount.
We hope our friends at a distance will take pains to send us the best money they can obtain. We do not refuse any of the above, when sent us free of postage, and nothing deducted for commission; but the amount paid by us for discount during the year, is a serious item.

Monroe County Agricultural Society.

By a notice in another column it will be seen that the Genesee Agricultural Society, organized in this city last year, and intended to embrace several counties, is now to be confined to this county, and called "The Monroe County Agricultural Society." The reasons for this change are numerous. When this was organized, there was no society in Genesee, Ontario, or Wayne counties, but now each of these have societies of their own, and other counties are expected to organize. Besides, it is expected that some aid will be granted by the Legislature, and if so the law will confine the societies to single counties.

The Petitions are daily presented to the Legislature, and if any persons have petitions with signatures in their hands, they should send them in without delay. No report has yet been made on the subject, but doubtless soon will be.

Hatch's Broadcast Sowing Machine.

This machine has been exhibited at several Fairs, and used on several farms in Western New York the past fall, and has been spoken of in high terms of praise. It is calculated for sowing all kinds of grain, broadcast, and is particularly valuable for sowing lime or plaster.
Mr. Hatch, the inventor, is now in Rochester, making arrangements for building machines. We intend to give a more particular account of it next month.

"Rochester Seed Store Catalogue"—1811.

The annual Catalogue of the Rochester Seed Store is sent as an extra with this number of the Farmer, and should be preserved by our readers. The agents named for the sale of seeds in other places, will receive their supplies in a very few days.—Catalogues are sent gratis to all applicants.

Hints for the Month.

Every farmer should be able, if not already so, to answer the following questions in the affirmative:—

Is your stove and other wood, for use next summer, all cut and piled up for seasoning? And have you plenty of wood seasoning for next winter's use? Are your chips all collected and secured for fuel?

Are your tools, for the approaching campaign in farming, all in first rate order?—your ploughs with good points, beams sound, handles firm?—your rakes and harrows with teeth, your hoes and forks with handles?—your harness in good repair, and well oiled?

Are your tools all the best of their kind, so that the additional work they will perform, will pay for themselves ten times over before next fall?

Are you provided as far as practicable against borrowing tools?

Is there a place for every thing, and every thing in its place, so that you need not waste the richest portions of your time next summer in fruitless searches?

Are your farming implements all well painted where needed, to preserve them from decay?

Are your fences all in good repair—loose rails laid up—low fences made higher—board fences well nailed—stone walls not tumbling?

Are your cellars kept clean and pure?—your roots in them in good sound condition?—your apples kept assorted, the decayed from the sound?

Are the water furrows in your wheat-fields kept open and deep, so that you may not loose bushel of wheat by the want of as many minutes work?

Are your grafts cut—the best kinds chosen—your grating plasters made?

Is the additional attention given to cattle and sheep, especially to the latter, which this critical period of the year requires?—the feed increased, the quality improved?

Have you procured the plaster you intend to sow, so as to have it on the grass early, that it may receive the full benefit?

Are your farm and garden seeds all procured? Do you understand the best way to make and save manure—that steam engine of farming operations—and if not, have you endeavored by reading and observation to find out?

Most farmers will perhaps be busy this month in preparing to answer the above affirmatively, after which we should be glad to make further suggestions.

Those of our readers who wish directions on gardening for this month, are referred to the copious instructions on the subject given in this paper the last year.

Board Fence.

There are three methods of making board fence, all of which without doubt are familiar to our readers; but our motive for describing them here, is for the purpose of comment.

The simplest kind is made by setting the posts, and nailing on the boards—nothing more. It is deficient in strength, and ought never to be adopted nor recommended.

The second kind is made by adding a strip on the top of the posts, which adds materially to the strength of the fence; but it affords no protection from the rain either to the nails or to that part of the boards that are in contact with the posts. In consequence of being thus exposed to the wet, the wood decays, the nails rust, and in a few years dilapidation commences. *

The best kind of board fence resembles the latter method, by having a strip on the top of the posts; but it reaches far enough in front to cover upright strips which are fastened by nails passing through the boards into the posts. These protect the joints and most of the nails from the wet. This kind of fence is not only very strong, but very durable; and not liable to get out of order if a nail or two should chance to be defective, as the upright strip must give way before the boards can fall down, or get out of place. The additional expense may be considered as *insurance*.

There is another kind of insurance however, that should not be forgotten: This is plugging the posts with salt. In 1824 William Phillips, of Philadelphia county, wrote to the secretary of the Pennsylvania Agricultural Society as follows:—

"In 1803 I planted four gate posts of Delaware oak, of very inferior quality; a two inch auger hole was bored through them, filled with salt, and plugged at both ends. As they were to support highly finished gates, they were cased with boards, and some salt put inside of the case near the ground. The posts are now as sound as when put down, and bid fair to last for some generations to come."

We should presume however, that posts already set, or to be set, would not require to be bored through, if the direction of the auger be properly gauged; and then one plug would answer. †

Preservation of Woodlands.

In looking round the country, we find the most common management of wood-lots to be as follows: Cattle and sheep are allowed to range through them; and all young trees within their reach which they are fond of browsing, such as the maple, the basswood, or the elm, are effectually destroyed. Oak and hickory also suffer; and between being overshadowed by large trees and nipped by live stock, they soon become worthless and stunted even if they survive.

In the mean time the axe and the tempest are gradually thinning the primeval array of the forest. A sound tree is wanted for a sill or a beam; or the necessary supply of rails for the farm; and declining ones are prostrated by the storm, or cut for fire wood. As the residue stand more distant from each other, the leaves which formerly supplied an annual covering for the roots, are now swept away by the winds; the grass gets possession; and though young trees will often flourish in the open pasture, old trees which have always stood in the crowded forest, cramped and confined in their roots, are not prepared for the change; and the lot from a wood gradually becomes a shady pasture.

Yet it is necessary for landed proprietors to look forward to the next generation; and our advice would

* Some persons paint their fences, and then a part of this objection is removed. For farm fences, however, this process is too expensive; though sometimes those parts of the boards and posts that come in contact are painted—a very judicious precaution. If throwing hot nails into oil, prevents their rusting, a board fence is the very place to try them.

be: Inclose your woodlands, allowing no live stock to run through it that can damage the smallest tree; for though there may be a *convenience* sometimes in violating this rule, yet it will be paid for at a dear rate; and it will be cheaper to hire pasture of a neighbor even at a high price. Let this inclosure be sacred from all intrusion of the kind.

But large trees and small ones will not flourish together; and when large trees are felled there is frequently a destructive smashing among the juniors of the wood. When the farmer therefore wants rails and fire-wood, let him cut down a portion annually, say a quarter or a half an acre, sparing nothing that he finds on the ground, but let the axe and the brush-hook perform their respective parts. Even saplings will make durable rails, if cut at the right season—not of the moon but of the sun,—in summer, autumn, or the early part of winter; and then the young growth will have nothing to overshadow it. On the reverse, it will soon overshadow the whole ground, retain the leaves as they fall, and have their roots protected from the cold of winter, and the heat and drought of summer.

We believe it is not an uncommon opinion that oak, chestnut, or hickory lands, are the only kinds worth preserving for an undergrowth; but we have never seen a more thrifty wood than one that was principally maple, elm, ash, butternut, and basswood. The latter kinds indeed are more injured by cattle than the former; but when they have not been destroyed, and have a clear field, their growth is very rapid. †

Working Butter.

It has been a custom in our family, time out of mind, not to use any water in working butter, under the impression that the latter would be injured by such contact, and disposed to become rancid. Instead therefore of washing out the buttermilk, it is carefully worked out with a wooden ladle. The following extract from the account of the Holstein dairy system lately copied into the New Genesee Farmer,* will explain the whole affair. We copy it again lest some of our readers might pass it without notice.

"The churning being completed, the butter is taken off by means of a large wooden ladle, and carried in a tub directly to the butter cellar, where, in a large trough, very smoothly polished off inside, and provided with a plug hole at the lower extremity, the butter is slightly worked, and salted with the purest salt; then moulded with a wooden ladle into a mass at the upper end of the trough, and left for some hours to drain. In the evening it is thoroughly beat or rather elapped.—

"The butter in Holstein is seldom if ever washed, as water is believed not only to rob it of its richness and flavor, but as being itself susceptible of putrefaction," and inimical to the preservation of the butter. †

* Volume 2, page 3.

Florist.

From Eaton's Botanical Dictionary modernized for 1840 we copy the following:—

"**FLORIST.** One whose employment is that of creating monsters; that is double and various colored; as carnations, double roses, &c."

Folks who are fond of queer things will be pleased with this definition; but those who look more gravely at such matters, may wonder how it ever found its way into a Dictionary of Scientific terms! They may even be inclined to think it not only vituperative but unjust; and unfortunately the learned professor has furnished his old friends with no evidence to the contrary.

As early as the year 1832, * we ventured to call his attention to this impropriety—for so we must consider it; and indulged the hope for a time that he had profited

* Genesee Farmer, volume 2, page 77.

by our admonition. Were we mistaken? We will state the facts: Its tail has been snipped off, but the nucleus is left to shine with its original splendor.

Some sort of an apology might possibly have been invented, if the Dictionary had contained a notice of other professions, such as *botanist*, *horticulturist*, &c., but nothing of the kind has been found; and we apprehend that some will not resist the impression that he has run off the track to have a cut at vegetable "monsters."

A more serious view of the matter however may be taken. Was the learned professor in the line of his duty, as an *instructor of the young*, when he wrote that definition? It is a caricature, uncalled for, and unworthy of such a place. The true definition, which we copy from Webster, is as follows:—

"**FLORIST.** A cultivator of flowers; one skilled in flowers." †

Field Beets.

A respected correspondent at page 23, ascribes the loss of his beet crop to their having been planted so late as "May 24th;" but we did not plant our Mangel Wurtzel (Vol. 1, p. 130) until about the 7th of the month following; and we think that if he had seen them a short time before they were gathered, he would have spoken more favorably of the beet culture.

There is a great difference between the labor necessary to secure a crop of potatoes and a crop of beets. In topping the latter we used no knife; but wrenched off the leaves with our hands—a much more expeditious way; and the beets scarcely required any digging. A great proportion of them came up very easily; and we filled our corn baskets long before a potato digger would have unearthed half the quantity.

That experiment of ours which ran counter to the opinions of some good farmers in several particulars, and succeeded in all of them,—has given us much satisfaction. The time of planting however, was later than we would recommend, except in a case of necessity like our own; but the exemption from hard frosts until late in autumn, was most favorable,—for they were not gathered till in the 11th month. In some years undoubtedly they would have been damaged by such exposure.

We think one cause of our success was in the scalding, which hastened the germination of the seeds. They were put into a vessel containing about two quarts which was then filled with boiling water, and left to stand for several days. Those who are afraid of hot water however, may use that which is only tepid; but we would earnestly recommend that the seed in no case, be planted dry or without soaking.

Another cause of our success was in using fresh manure from the stable in all its rankness; and we hope that the practice of our friend "SENECA" * on this point, as well as our own experiment, will remove all fears in regard to this important auxiliary. †

Trimming Orchards.

This is a very necessary and important operation. Large apples of the same sort are better than small ones, not only on account of the size, but the flavor is more perfectly developed,—especially when they grow well exposed to the sun and air. Our rule is, the higher the color, the higher the flavor, of that particular kind. Now when the branches become crowded and proportionately stunted, we have no right to expect fine fruit; and the only remedy is judicious pruning.

Writers have differed in regard to the best time of performing this operation, some preferring the winter

* New Genesee Farmer, volume 1, page 147. He would render our journal more interesting by using his own proper signature; and we earnestly request that all our correspondents do the same.

season, and some the summer. Both seasons are favorable, but the sooner it is done the better. If any farmer from indulging in theory should prefer the latter period, let him first consider how it will agree with his other business; and if it should appear clear that he will have nothing to interrupt him when summer comes, well and good—let him defer it till that time. If on the contrary, should his corn-field, potatoes, mending roads, or any other service, be likely to interfere,—let him make up his mind at once, do it now before the sap begins to flow, if possible; and remember that a coat of paint over the stumps of the larger limbs when amputated, is worth more than the theory that has been invented.

Now a few words in regard to the manner. Cut the under side of large limbs first, to prevent them from splitting down; and in cutting of all limbs, whether large or small, be careful to have as little naked wood as possible,—leaving it very smooth, neither jagged, split, nor haggled. For this purpose, the saw is the proper instrument on most of the large limbs; though a broad chisel on the end of a pole, and even an axe in dextrous hands may be used in some situations; but then let none but dextrous hands touch it. That of the trimming in our orchards, is miserably defective.

For the New Genesee Farmer.
Experiments in Feeding Beets.

LESSAS. EDITORS.—Every writer who intends his articles for publication, particularly in giving experiments which may induce others to make a similar trial, should be very careful in giving the detail; also, that he has not been deceived himself, lest he deceive others. It frequently happens, that different individuals arrive at different conclusions in making the experiments, (I mean experiments like the one the head of this article.) For instance, my friend, stated to me, some one or two years since, that he considered mangel wurtzel a valuable crop for wintering swine. He said, "he had fed them to his as the principal food. They were very fond of them, and kept in good condition through the winter." The past fall and present winter, I have endeavored to test the value of various kinds of beets as food for hogs, and am fully convinced that they are the best, and, at the same time, as good keep as can be had for wintering swine. I fed them to my fat hogs, for their first feed in the fall. I washed and boiled them, mashed them fine in the liquor they boiled in; then, after standing a few days, fed them to my hogs. They ate them with great avidity, and gained flesh as fast as they afterwards did, fed on corn in the ear. I did not, however, feed them enough (some 8 or 10 days) fairly to test their value as food for fattening porkers.

Samuel Guthrie, in an article headed, "Experiments in feeding Sugar Beets," (Cult. & Far., Vol. 1, p. 13,) says, "I washed and boiled the beets, and fed them profusely for two weeks. The hogs devoured them most ravenously; but, on making a careful calculation at the end of this time, to ascertain the progress I had made in fattening them, I learned, to my surprise, that they evidently had gained nothing. The large sow put on an appearance so wo-begone, she induced a charitable friend to take her off my hands gratis." The experiment was carried still further by adding a peck of potatoes to a bushel of beets, and tried two weeks longer, but the improvement was barely perceptible. Then potatoes and beets, in equal quantities, were fed one month more, and they had gained about as much as the potatoes would have improved them. "I had now," he says, "17 hogs left, including two beautiful Berkshires of full blood, &c. As I had provided little food for their sustenance, and as I had de-

termined to give the root a fair trial, I continued to feed them, adding corn and bran, as seemed indispensable, through the winter. This spring I have 14 left, having lost three during the winter; all of which, except the two Berkshires, are miserably poor. These Berkshires, without, to my knowledge, having fared better than the rest, have not apparently suffered at all, but are in fine condition. I attribute this, in some measure, to their domineering spirit, and to their greater industry; for they are intolerable monopolists, and in perpetual action." Something then depends on the breed; for had they all been Berkshires, we may infer they would all have been "in fine condition" in the spring. Three died during the winter! Did they starve to death? Or may we infer that they were diseased, or had not a comfortable shelter to keep off the pelting storms and drifting snow of winter?

"Much depends on the breed, as every farmer knows; much on the health of the animal; something on the season of the year. I failed in attempting to fatten several swine in one case, though they were carefully attended, and various kinds of feed tried; and the failure was totally inexplicable until they were slaughtered, when the intestines were found corroded with worms, resembling those found in the human stomach; and this, I have no doubt, prevented their thrive. The same fact has occurred in another instance, and with the same result. I failed in attempting to fatten some other swine, which had been driven a considerable distance and exposed (probably not half fed on the road) to severe cold and storms."*

My store hogs were fed for some weeks on beets alone. Not having a full supply, I have fed them, of late, alternately with beets, potatoes, and corn, all in the raw state. The beets and corn they eat with the same greediness, but the potatoes are a drug. They squeal over them for some time, and then reluctantly eat about half their ration. Another fall I intend to lay in largely for mangel wurtzel and sugar beet, and shall, the coming season, cultivate them accordingly.

I had supposed it to be an established fact, that cattle would fatten if fed sufficiently on beets. But Samuel Guthrie's experience (in the article above referred to) is in the negative. He says, "To one cow, designed for slaughter, I fed some forty bushels in thirty days, and this without making any perceptible improvement in the condition of the animal." I shall have to refer to my friend D. T. again. He tells me he has fattened a beef, this winter, principally on beets. "For the fattening of a bullock, forty or fifty pounds of beets per day, mixed with five or six pounds of dry fodder, will accomplish the object in four months. Care must be taken to give it in three separations, since by feeding often and in small quantities at a time, the same amount of nutriment goes farther." †

Since writing the above, the 1st No. of the 2d. vol. of your valuable paper has come to hand. I was much gratified to find an article [page 11, copied from a "Western paper"] on "Beets for Cattle." The comparative value of beets and potatoes, as food for cattle, I am of the opinion, is rightly estimated. The writer says, "In feeding the same animal with beets, it was easily told that one third less than of turnips or potatoes, would make them give the same quantity of milk of better quality, and they showed better keep." The same writer also says, "Young animals [cattle] are peculiarly fond of the raw beets, and thrive astonishingly on them." Exactly the same with swine. Farmers, store well your cellars with beets, and make a fair trial. Feed your store hogs and cattle on them one winter, and you will be convinced of their value, and cultivate them accordingly.

To the Editors of the New Genesee Farmer:—

GENTLEMEN.—On reading an article in the January number of your paper, headed *Effects of the Stock on grafted Fruit Trees*, in which you comment on remarks contained in a late number of the Yankee Farmer, by the editor of that Journal, on the above subject, in which he lays down the following propositions, viz:—

1. Stocks have an effect as to bearing years.
2. Stocks affect the scion in hastening or retarding the ripening of the fruit.
3. Stocks produce defects on grafted fruit.
4. Stocks affect the color of fruit.
5. Stocks affect the quality of fruit.
6. Stocks have an influence in increasing or decreasing the size of fruit."

And, as you observe, the subject is not new to horticulturists—Dr. Mease, of Philadelphia, affirming such influence some years ago, and reviewed by you at the time, in the 3d vol. of the old Genesee Farmer; and not thinking the evidence conclusive, and having seen nothing since to change your opinion, you express your willingness to examine the subject anew with candor and fairness; and you commence in the right way, by stating the results of your own practice and observation.

In addressing you on this subject, I beg to inform you it is one I have been closely connected with upwards of sixteen years in England and this country, the greater part in the former, and the result of my conclusions are the reverse of yours.

In quoting Professor Lindley in support of your opinion, I think the statement quoted does not go far enough in support of the subject under consideration.

Though the food communicated from the albumen of the Quince to the Pear, is in nearly the same state as when it entered the roots of the former, it does not follow that the quantity received would be equal to that communicated through the albumen of a Pear stock, and hence the austerity of the former, and the luxuriance of the latter. Before I quit this part of the subject, it will be well to state, though it is a fact known to most horticulturists, that in all English nurseries, a certain number (sufficient to meet the demands of the establishment) of Pears are worked on the Quince annually, and Apples on the Paradise stocks (a sort of dwarf apple or crab, used as stocks, especially for the premature fruiting of the apple, and the influence it has on the scion to form a dwarf tree or bush) for Eepaliers and dwarf Standards, to plant in the borders of the principal walks in the kitchen garden, where they form a counterpart to the trees trained on the garden walls and add much to the general effect of the garden, and are to be seen in most of the gardens of England; and I never knew an instance of their failing to exercise the desired influence, namely, dwarf habits, premature fruiting, and premature ripening their fruit. Consequently, (though the fruit is mostly fine, if attention is paid to pruning the trees and thinning the fruit when too thick,) the specimens are never so fine as those obtained from trees worked on the thrifty Pear stock, and common Apple or crab stock—which trees are generally reserved for the orchard, with occasionally something choice for an open space in the garden. Instances are not rare in England, (where the climate is not so favorable to the maturing of the finer varieties of the Flemish Pear as the United States, &c. &c.) when trees are not fertile, (I mean Pears,) although in a flourishing state of growth, scions have been taken off and worked on the Quince Stock, and they have assumed fertile habits and bore plentifully. I believe the above includes proposition 2, 5, 6.

By the first proposition is meant (as I understand it) bearing in alternate years, a subject which I think the stock has no influence whatever. On this head I believe we agree. And as you observe, it is not the stock

confined to apples, and always to the late fall and winter apples; summer and early harvest varieties almost invariably being regular bearers, for this reason: they mature their fruit and get rid of their burden in time to recruit strength, make shoots and form buds for the next year's crop; whereas the over-burdened winter apple tree holds on to its fruit as long as its foliage, and consequently requires the next year to rest, to recruit its exhausted strength, and form buds, &c., to produce fruit. In my opinion, this is a part of the subject worthy of paying more attention to than is generally paid; and if people who have young orchards, or only a few trees around their door yards, were to take the trouble to thin out the young apples to one or two to a bunch, on observing their young trees assuming these habits, the result would be, the fruit left on would be so much larger and finer, that the quantity would be increased in bulk, though not in number, to as much as if they were all left on, and the buds, divested of the young fruit, would have time to form fruit buds for the next year; and by pursuing this system for a few years, when trees first come into bearing, much may be done to alter the system of bearing in alternate years.

In reference to proposition No. 3, in my opinion, if a stock is diseased, it will communicate it to the scion, and consequently affect the future tree: for instance, I think suckers, or layers, or even seedlings, raised from fruit of diseased trees, will communicate the disease of the parent stock to any scion that may be worked on to it. This I have observed always to be the general rule, though occasionally an exception.

Respecting proposition No. 4, I am not ready to enter into at present. And finally, respecting your currant bushes. We frequently see currant bushes and other trees, partly in a state of decay, whilst the other part flourishes luxuriantly; and in the case of the parent stock of your bushes, though apparently in good health when slips or cuttings were taken off, may, if left on, show the disease in some of those identical shoots taken off the following year; but being taken off, it appears in the individual plants, and consequently the superiority of some of your currant bushes over the others.

ONE OF YOUR SUBSCRIBERS.

Orange Co., 1841.

For the New Genesee Farmer.

PEARS.

Who is not fond of good pears? To my taste there is no fruit, not even that of tropical climes, equal to a luscious, melting pear. Few of our farmers know any thing about good pears. Most of this fruit cultivated by them, is of very inferior quality, and yet considered good by those who know of no better. But very little is cultivated. Many are discouraged from undertaking to raise pears, from the idea that it takes a man his life time almost, to obtain fruit by setting out young trees. This idea is very erroneous in reference to grafted trees. Though it takes a pear tree from twelve to fifteen years to bear from the seed, yet the graft, taken from a bearing tree, will bear as soon as any other kind of fruit—in two or three years.

In the spring of 1837 the writer received scions of several choice varieties of pears from Messrs. Kenrick, D. Thomas, J. A. Lazelle, and others, which were then engrafted, mostly on small trees set out that spring. In 1839 several of them bore a few, and last year some of them bore plentifully. Among these were the Julienne or Bloodgood, Madeline, Bartlett, Henry Fourth, Passe Colmar, Beurre Die, Lemon Pear of Scotland, Bezi de La Motte, Capiamont, (so called, but not the true Capiamont,) Heathcot, Winter Nelis, and Prince's Virgalieu. Most of these prove to be excellent. The Julienne, ripening the

latter part of July, is good, but hardly equal to the Madeline, which is larger and ripens about the same time. The Bartlett, which Kenrick thinks is the same as the Williams' Bon chretien, is a most capital pear, ripe in Sept., large, buttery, and of a high musky flavor, sound at the core. Henry Fourth, one of the new Belgian pears raised by Dr. Van Mons is truly excellent; ripening in October, of moderate size, buttery, resembling very much in flavor the Seckel, though not so sweet, and like this, growing in clusters. It must be eaten as soon as it becomes mellow. It is, in eating, a little before the Virgalieu. Passe Colmar is described as one of the very best pears originated by Van Mons. It sustains its character, though to some tastes it would be considered too sweet. It resembles, in flavor, a rich citron or pine apple melon. It is a winter pear, of medium size, growing in clusters, and a great bearer. Beurre Die is another of the New Belgian pears, and a noble one it is; large buttery, and fine flavored. Though described as a winter pear, it can hardly be called such, as it was in eating in November. Lemon pear of Scotland is a good sized, handsome fruit, ripening in October and November; yellow at maturity; buttery, with an agreeable acid; not high flavored, but a good pear. Bezi de La Motte is an old but good variety; ripe in November, it is of good size; buttery, and of a peculiar flavor. It is worthy of cultivation. Capiamont. The pear I received by this name, is a late fall pear, of moderate size, of a russet color, tapering to the stock, moderately acid, of pretty good flavor; but it answers not all the description of the true kind, which ripens in September, and is said to be a "large and a most delicious and beautiful fruit." A scion of the true kind was recently obtained from Mr. J. A. Lazelle of Columbus, Ohio, who says of it, "I have had the true Capiamont fruit this season—first rate. The Capiamont that was in the country previous to the receipt of scions direct from Dr. Van Mons, by Messrs. Kenrick and Manning, is said to have been erroneous." Heathcot. The scions of this were obtained from Mr. Kenrick, who describes it as "a native pear, a capital variety, which deserves to be ranked with the Seckel and Bartlett." There must have been some error about it, as Mr. Kenrick says it ripens "in September;" whereas, the fruit from the scions he sent, did not ripen till January. It could not have been the true kind—probably a mistake. It was however, a good winter fruit, of moderate size, green, juicy, and of a pleasant flavor. Winter Nelis is a small russet-colored fruit, buttery, but of very little flavor; hardly worth cultivating when there are so many others that are better. Prince's Virgalieu is another I would reject from my list of good pears. It is a winter pear, of fair size and appearance; green, coarse, and of little flavor. It may be good for baking, but is hardly eatable as a table fruit. I have cut the grafts off to give place to kinds more worthy. Of the above kinds, the Madeline, the Bartlett, the Henry Fourth, the Beurre Die, and Passe Colmar, particularly, I would strongly recommend for cultivation to the lovers of this fruit, in addition to other kinds of known and proved excellence, as the Virgalieu, Seckel, &c. I would mention as highly worthy of cultivation also, the Flemish Beauty, Foster, Dix and Dearborn Seedling. Of the first two, Mr. J. A. Lazelle says, "The Flemish Beauty, I had fruit this season. It is large and delicious; ripened in September. It needs to be taken off a little before it is ripe, and ripened in the house. The Foster is a delicious fruit, to my taste superior to the far famed Seckel." The Foster, Dix, and Dearborn's Seedling, are American fruits, of great excellence. Others might be added to this list, but my paper admonishes me I must close this communication. B.

Urbana, Feb., 1841.

Sowing Locust Seed.

A correspondent in Yates Co. complains that he has found great difficulty in causing locust seed to vegetate, and inquires what preparation is necessary to ensure success.

The difficulty is a very common one, but the remedy is well known to most readers of agricultural papers. If the seed is perfect, all that is necessary is to scald and soak it thoroughly before sowing. By this we do not mean soaking in hot water merely; but pour on two or three quarts of boiling water, and let it soak twenty-four hours, when the whole or a part of the seeds will be swollen to three or four times their former size. If only a part are swollen, they should be separated, and the remainder scalded again. When thus prepared and swollen, they will vegetate almost as freely as corn; but without this process, disappointment will almost invariably be the result.

It is still a good time to gather locust seed from the trees; and if any of our young readers will collect a quantity and take it to the Rochester Seed Store, they will obtain a good price for it.

Raising Fruit Trees from Cuttings.

We have received several communications making inquiries respecting the manner of raising fruit trees from cuttings; and we answer them all in one short sentence. We do not believe it can be done successfully. This popular error was pretty fully exploded in our vol. 1, p. 210, and therefore we deem it unnecessary to occupy more space with it at present.

New subscribers are reminded that they can obtain vol. 1, at the subscription price.

"A Subscriber" is also referred to vol. 1, for information respecting the worm in fruit trees.

Raising Chestnut Trees for Timber.

Messrs. Emmons—I have 5 acres of new land—soil clayey, but good, surface rolling, beach timber predominating, which I intend to clear and plant with chestnuts. I propose to prepare the ground for corn, and plant chestnuts in each alternate hill of every second row, with the corn. I would repeat the planting of corn for two or three years, and dress the young trees with the corn till they had attained sufficient size; then sow the land with grass-seed, and let the trees grow for fence timber.

Now, if you or your correspondents, will communicate through the medium of "our own paper" some better plan, or throw some light on this subject, I will esteem it a favor, and will promise to inform you of the results of my experiment.

W. DARGITY.

Iberia, Ohio, Feb., 1841.

Remarks—The plan proposed would probably succeed very well, if the soil is suitable for the chestnut but of this we have some doubts. This tree delight in a deep sandy or gravelly soil, and is seldom found on clayey soil, or where beech timber predominates. It is worse than useless to attempt to raise forest tree on soil that is uncongenial to their growth; and, if we are not mistaken, Mr. D. had better abandon his project, or select some other kind of tree. The subject is an important one however, and we will endeavor to give more particular information respecting it next month.—Eus.

Ornamental Plants.

It is our intention in this article to depart from our usual course, and speak only of plants which we have not seen, on the authority of others.

In Baist's Flower Garden Directory, printed in 1839, Clematis carulea is noticed as an "entire new climber," introduced from Japan to Europe by Dr. Van Siebold. It is arranged among hardy plant

and Professor Lindley is quoted for the following opinion:—"It is a charming addition to the climbers cultivated in England. It has a most graceful mode of growth; and the large violet flowers with deep purple stamens, are more ornamental than those of any species of *Clematis* in this country."

Clematis siboldii is another species from the same country and by the same florist. "Large blue and white, superb—petals suffused with violet spots—anthers of a violet color. An attractive inhabitant of the flower garden, from its graceful habit, and the size and beauty of its blossoms."

In Buist's Catalogue for 1840, he mentions *Deutzia scabra* as "one of the finest of white flowering shrubs"—said to be hardy.

Its being hardy at Philadelphia however, is no proof that it would be hardy in the Genesee country. A balance against us of three degrees of latitude, is not all that is to be taken into account. Our elevation above the level of the sea is another item; and our soil in many instances, is a third one of no small importance. Many shrubs, like the Laurels on the mountains* to the South, which could abide severer winters than ours, are sickened by the *lime* diffused through our soil, and gradually perish. Possibly the shrubs above-mentioned may be of this number, and refuse to embellish our gardens, a point however, which experiment alone can determine.

Herbaceous plants which are hardy at Philadelphia, may be safely introduced here, if they have only to contend with a difference of temperature. Our heavy soil is not so deeply penetrated by the frost, and under a more durable covering of snow, and such thick curtains as the condensed exhalations of our lakes, they will generally lie snugly and safely in their winter abode.

We notice the following perennials in Buist's Catalogue, and copy them for the purpose of making further inquiry:—

- Aconitum grandiflorum—large blue.
- versicolor—blue and white.
- Campanula striata—striped flowered.
- Delphinium maximum—superb blue.
- Barlowii—dark purple.
- bicolor—white and purple.
- Dianthus splendissima—superb double crimson.
- Dracopcephalum argunense—Fischer's fine blue.
- Lobelia propinqua—large crimson.
- ignea—brightest scarlet.
- Lychms bungeana—large star flowering crimson.
- Onosma tauricum—golden flower.
- Pæonia edulis (albiflora) v. odoratissima—sweet scented.
- Pentstemon cobæa—large blush.
- coccinea—scarlet.
- Phlox corymbosa v. alba—white, superb.
- speciosa—very showy.
- alcordia—perpetual blooming crimson.
- læta—very splendid.

For the New Genesee Farmer.

Gold Vine Peas—their History and Character.

MESSRS. EDITORS—Having in your January number given an account of my success in raising the Gold Vine Peas, I have in consequence been addressed by several individuals in relation to their origin, the period of their ripening, and their other peculiar characteristics; and considering your paper the best medium of communicating this information to those desiring it, you will confer a favor on some of your readers, by giving a place in your columns to this communication.

*On a former occasion we referred to a remarkable circumstance: The deluges of this district, including much *lime*, has been swept over our high hills to the South into Pennsylvania; and wherever this deluvium is found, no *Kalmia* flourishes. We have not observed this deposit however, more than twenty miles South of our boundaries.

The Gold Vine Peas were obtained from Canada two years ago by Mr. Bateham, of the Rochester Seed Store. The following is his account of their origin:

"A farmer, in Canada, observing in his field of peas a few vines peculiarly and unusually bright, while the rest were more or less affected by mildew, took the precaution carefully to preserve the peas from these vines, and planted them year after year; fully testing and proving their perfect freedom from mildew, which so frequently destroys whole fields of common peas."

For two years I have tried these peas and find them well deserving the character and high commendation bestowed upon them. A gentleman from Rochester informed me that last season he lost a field of peas of several acres, almost entirely, by mildew; and purchased twelve bushels of my Gold Vine Peas for seeding the coming summer. Several other instances have come to my notice of similar failures. But the Gold Vines, being perfectly free from this blight, secures the farmer from all hazard and loss from that cause.

In ripening, the Gold Vine Peas are from six to fourteen days earlier than the common Marrowfats or field Peas.

The vines of these peas are at least one-third shorter than those of the Marrowfats; hence a larger quantity of seed may be sown to advantage on the acre—at least half a bushel more.

So far as my experience has enabled me to determine, and I have given them a fair trial, the Gold Vines are greater yielders, by one-quarter, than the common varieties.

Respectfully yours,

Pittsford, Feb., 1841.

E. WILBUR.

For the New Genesee Farmer.

Tariff for Revenue—Low Prices of Agricultural Productions more favorable to the nation's wealth than high prices.

MESSRS. EDITORS—The advocates of countervailing duties and protective tariffs in Congress, animated by the true spirit of moderation, have no disposition to meddle with the compromise act, as necessary to such a consummation.

The Secretary of the Treasury in his recommendation of a tariff for revenue of 20 per cent. on silks, wines, and such other articles as are now imported free of duty, while it answers the purpose of revenue, and saves the government from the disgraceful treasury note system, will also give protection to our own productions.

There is little doubt that the next Congress will increase the tariff on such articles, so far at least as it can be done without infringing the compromise act, as the expenses of the Federal Government, aside from borrowing, cannot be defrayed without it.

At this time, in the midst of low prices, our agricultural interests have no cause of alarm. These low prices have alone induced an unprecedented export trade the past year; a great diminution of both foreign and domestic indebtedness; a balance of trade in favor of the country to the amount of \$27,000,000; less speculation and extravagance, and greater industry and economy among the agricultural no less than among all other classes.

From the report of the Secretary of the Treasury, Mr. Woodbury, we learn that all our exports the past year amounted to \$131,591,950, exceeding by more than ten and a half millions of dollars the exports of 1839, notwithstanding the extreme reduced prices of some of our great staples, while the imports of the past year were more than one half less than in 1839. For several years back our imports have exceeded our exports nearly twenty millions of dollars. In 1836 the excess of imports over exports amounted to \$61,316,694; but now, in 1840, in spite of the unusual low prices for all our great staples, cotton, flour, &c.,

our exports exceed our imports nearly twenty-seven millions of dollars. A balance of trade in our favor more than three fold greater than ever accrued before in a single year since the Constitution was adopted.

It is an axiom among business men that when agricultural productions are high, not only the farmer, but the whole body politic, increases its indebtedness, and *vice versa*. The high price of our staples in New York brings exchange in our favor, our banks discount liberally to speculators and millers, money soon circulates, prices are inflated, and speculation, folly, and extravagance are on foot. When prices fall, the banks curtail their issues, and money is *not*. The farmer finds, to his utter astonishment, that his last year's debt, which might then have been paid by half a crop, cannot now be liquidated by two crops. A healthy retrenchment and reform now commences, and better habits of industry and economy are acquired.

Let farmers then, instead of croaking about the low prices of their productions, reflect that these low prices alone have enabled Western New York, Ohio, and Michigan, to reduce our foreign indebtedness the past year, by an export of flour to England and France, to the amount of several millions of dollars, and that this same export continues to England even against a duty in the English port of three dollars a barrel. Let him also reflect that as low as are the staples of the north and west, they are no lower than the great southern staple, cotton; the article without which our country could never have arrived at its present state of luxurious civilization.

When, in 1837, flour was wanted for export to England at \$8 per barrel, instead of selling at that price, and thus reducing our foreign debt, the New York commission houses held on for \$10 a barrel. The result was, that instead of exporting flour, we imported several million bushels of wheat and rye from the north of Europe. This both increased our indebtedness and reduced the price of flour from \$10 to \$6 per barrel. During this monopoly and consequent inflation of the prices of bread stuff in New York, farmers bought more land, built fine houses, and rode in steel spring carriages—the whole country went into debt with rail-road speed; and, as if we could not increase our indebtedness abroad fast enough, our government took off the duty on rail-road iron. High prices of produce, and the consequent high prices of labor, paralyzed our manufacturing industry and prevented the exportation of manufactured articles. Every thing was imported, until, as might be expected, a general revulsion and prostration ensued. But in 1839 and '40 the low prices of the necessaries of life, caused by increased production and better notions of economy, has enabled the country to export the past year, aside from agricultural productions, three times the amount of manufactured articles ever before exported in a single year.

S. W.

Produce of One Acre of Ground.

Mr. J. Fry, of Concord, Erie Co., N. Y., raised 100 bushels of sound (shelled) corn, twenty-five bushels of potatoes, and two cart loads of pumpkins on one acre of ground, the past season, and sold his corn stalks for 15 bushels of oats.

The above is the postscript to a business letter received by us a few days since from Erie county. We wish our friends would more frequently annex such items of information to their letters of business.—Eds.

Domestic Industry in the Far West.

A correspondent in Iowa informs us that the women of his household want to manufacture domestic cloth, such as Insey woolsey, filled cloth, blankets, &c.; but find much difficulty in the *warping*. We hope this art is not yet to be lost; and therefore request that some of our readers will give our western friends plain and full instructions on this subject.

For the New Genesee Farmer.

Rust on Wheat.

MESSENGERS. EDITORS—If there is one subject more than another in which the farmer is deeply interested, and which needs thoroughly investigating, it is the one at the head of this article. It is not an evil consequent upon poor farming, for it attacks, indiscriminately, the grain of the best, as well as the poorer class of farmers. The ground is thoroughly prepared, the seed committed to the bosom of the earth; its progress is watched with anxiety, and it promises a plentiful harvest. The farmer's expectations are about to be realized, when he discovers the ravages of a disease, which is either to deprive him of a part of his earnings, or entirely to destroy the "golden prospect" and rob him of the whole.

The writer of this article is well aware that he has entered upon a difficult subject. Difficult, because there are difficulties constantly arising, or, in other words, discordant suggestions are continually presenting themselves to one's mind while investigating it. He does not flatter himself with the expectation of arriving at the right conclusion. His only aim is to add his little, and to solicit others more competent than himself, to come forward and investigate the subject. We want all the facts connected with the subject, that any one, and every one, may be in the possession of, for in this way we may arrive at the truth.

Well, what is to be done? In the first place, let us ascertain, if possible, what this evil, rust, is; and in the second place, the cause of its attacking and the manner of its affecting, the plant.

It is believed by most who have written upon the subject, that rust is a parasitical plant of the fungus kind. Some, however, contend that it is "nothing more than the thickening juices of the plant, escaping through the ruptured envelope, and dried and blackened in the sun." That the rust is a plant of the fungus kind, is a fact established perhaps beyond a doubt. There are two distinct kinds, commonly called the *yellow* and *black* rust, both of which attack wheat, though the latter is much more injurious. They are described by Professor Eaton, in his *North American Botany*, as follows:—"Uredo linearis, (yellow grain rust,) linear, very long, stained yellow, at length but obscurely colored. On the culms and leaves of barley, oats, rye, wheat, &c." and "*Puccinia graminis*, tufts dense, oblong, often confluent, forming long parallel lines in the direction of grassy fibres; color, yellowish brown, becoming black; seeds elongated with the upper shell shortest, containing dust: stripes filiform. On wheat and other grasses. Called rust or blight."

The cause of either of these fungi affecting grain in the manner it does, or rather the preparatory cause for its reception and germination on the stem and leaf of the plant, is what is yet to be learned. The following passage is found in an article on the rust or mildew of wheat, in the *Edinburg Quarterly Journal of Agriculture*:—

"The dust-like substances of the rust originate beneath the outer bark or epidermis of the plant, which it raises and renders thin, and at length cracks and bursts through. When examined by the microscope, it presents a congeries of egg-oblong bodies, some of which have projections almost like tad poles, or pow heads, though they are not animated."

The question then arises, supposing the dust-like substance of the rust to originate beneath the epidermis, where do the sporules or seeds of the fungi lodge, or become deposited, and what is the state of the leaf and stem most favorable for this reception? Some suppose the sporules fall upon the ground, and are absorbed by the roots of the plants and carried by the sap through the pores of the stem, where they germinate and produce the disease, called rust. Others contend that the sporules are blown by the winds

and lodge upon the leaf and outer bark of the plant. The time most favorable for their propagation, is damp warm weather. The epidermis of the plant is then damp, consequently the seeds of the fungi are easily attached to it. Again it is contended, that wheat, the most likely to be affected, is that which has been kept back in the spring, from some cause, either by being raised out by the frost, or late sowing, when, particularly if the soil is rich, it grows too rapidly, and the consequence is, the juices or sap of the plant accumulates sufficiently to check or split the stem. The exudation of the juices through these openings makes suitable lodgements for the sporules, and the the damp sultry weather, hastens the germination and perfection of the fungus. Its growth is very rapid, arriving to maturity in the short space of twenty-four hours; and producing probably many millions of seeds. Hence the cause of its spreading with such rapidity.

J. B. BOWEN.

(To be continued.)

For the New Genesee Farmer.

Lime and its Application.

MESSENGERS. EDITORS—Having read some paragraphs in both the old and New Genesee Farmer on the subject of applying lime to the soil, but having seen none which agrees with the manner in which I was, in early life, used to seeing it applied,—I will give you a brief statement, should any of your numerous readers think it worth a trial.

For wheat, we used to consider it best to have it drawn and prepared some two or three months before its application. The manner of preparing, thus:—Plough round your inclosure intended for wheat, say six or eight furrows, (it will be better drawn out in the field than left for brush and briars to grow in.) Along the centre of these furrows put your lime, and cover it with earth six or eight inches thick. If the weather is moist, two or three days will dissolve it to powder, when it should be thoroughly mixed with the soil, that is around it, by means of a hoe, and drawn up in a conical shape, when, if it is thoroughly dissolved, (which it should be before mixing,) it will receive no injury from the weather. It is not likely that there would be enough to go over the whole. Then the centre of the field might be ploughed, say two furrows each way, and heaps thrown up at suitable distances for spreading, prepared in the same way. The writer has seen swamp muck, road soil, &c., prepared in this way, and attended with very beneficial results.

For spring crops, the lime was drawn in the early part of the spring, and the heaps made at suitable distances for spreading, by throwing two or more furrows against each other and the lime allowed to dissolve in the same manner; but in no case spreading it before it was well mixed with the soil with which it was covered. This was the manner of applying lime to the soil in the west of England twenty years since.

Yours respectfully,

A SUBSCRIBER.

Eric County, Jan'y. 1841:

For the New Genesee Farmer.

Sprouting Garden Seeds--Raising Onions.

MESSENGERS. EDITORS—The approaching season will soon resume the interest in the field and garden; and it may not be unprofitable at this time to consider what will be the best course to pursue. The following statements are advanced as proof of the very great advantage derived from the simple process of sprouting garden seeds before planting. The positive knowledge of its benefits, is derived from six years' practice. There is no difficulty to be apprehended if the same judgment be exercised that is required in the common operations of the garden.

First, soak the seeds in water from six to twenty-four hours—some seeds being slower to admit mois-

ture than others, is the difference in the time required. After soaking, drain off the water, and mix the seeds with a sufficient quantity of earth to absorb the moisture remaining on the seeds; stir them often that they may vegetate evenly, and keep them in a moderate degree of warmth and moisture until they are sprouted, when they are ready to be put into the ground. If the weather should be unfavorable, put the seeds in a cool place, which will check their growth.

The advantages of this practice cannot be better shown, than by relating the management and improvement of the onion crop in our own garden. The culture of the crop in 1840 was as follows:—Just before the approach of the preceding winter, there was a light dressing of fine manure put on a piece of land designed for onions, containing $2\frac{1}{2}$ acres, and the same ploughed. It remained until a thaw in the winter; it was then ploughed again—the frost was not all out of the ground; it was consequently left very rough, and more of the soil was exposed to the frost, which was beneficial. It was left in that situation until the time of sowing. In April, as soon as the soil was sufficiently dry, the ploughing was commenced, and the second day, at night, the sowing was finished, with seed prepared as before stated. In one week the onions were up, rows were soon visible nearly twenty rods, and no weeds yet appeared. The operation of stirring the soil with rakes and hoes was then commenced, and the weeds were not suffered to grow during the summer. (It is a mistaken notion that it is not time to hoe a garden until it is green with weeds.) The first of September the onions were harvested, and the produce was over two thousand bushels of fine onions from two and a half acres.

The management of the crop six years before, (in 1834,) was as follows:—Early in the spring there was a light dressing of fine manure put on the piece of land intended for onions, containing $2\frac{1}{2}$ acres (the same piece before mentioned.) The necessary travel across the ground for the purpose of manuring, and the natural state of the soil, as it had remained from the time the crop was taken off the preceding fall, produced a great quantity of lumps after ploughing, and although the work with teams, bushing and harrowing, was four times as great as in 1840, it was not in good condition; the seed was sown dry; a season of dry weather followed, consequently the onions did not come up until the weeds were started, which made it a great task to till the crop. By referring to the memorandum kept for that year, (as the practice has invariably been to register daily proceedings or occurrences connected with the garden,) the onions were sown the 15th of April, and the weeding commenced the 21st of May, which was as soon as the onions were fairly up, making 26 days more for the weeds to grow than in 1840. The onions did not all bottom, on account of the late start in the spring, which is generally the cause for what it is termed *skullions*, (a difficulty which more or less prevails; but by the improved practice it is not in the least to be feared.) The produce was eleven hundred and forty bushels from $2\frac{1}{2}$ acres, and the quantity of labor very nearly double the amount required in 1840.

The practice of 1834, had been followed successfully on the same piece of land for twenty-five years. The former proprietor had been engaged the most of his life in raising onions, and it was supposed had gained the point of perfection in that business, especially as, previous to his settlement in this country, he came from that well known town in the land of Yankee nativity, where originated the large stories about raising onions, that amused and astonished the children in other parts of the country fifty years ago.

W. RISLEY,

Horticultural Garden, Fredonia, N. Y. 1841.

For the New Genesee Farmer.

Bots and Horse Bees.

MESSRS. EDITORS—I wrote a few observations upon the horse Bee and Bot for the Genesee Farmer, which were published in vol 5, page 85. Some suggestions I there made, which I thought true at the time; but some further light upon the subject, has somewhat changed my views—which to acknowledge, is only to admit that we are wiser to day than we were yesterday.

Any thing that directly or indirectly concerns the worth or welfare of that noble animal, the Horse, should not be disregarded. The bot or horse bee, of themselves, we care not a pin about; but as far as they concern the horse, we have the best of reasons to be deeply concerned.

About the 4th of August I found several bots in one of my stables, where I kept two of my horses. I selected three of them and put them into the box of my carriage for safe keeping, until I should go to my house. I had supposed a bot unable to crawl, having never seen them do it, and never seeing any legs or apparatus for progression. I therefore concluded they were unable to advance or retreat of their own volition; but I soon saw they had the power of crawling with tolerable speed in a manner that I had not suspected. The body of the bot seems encased in several circles, and incapable of but a little motion more than a slight elongation and contraction; but their heads and necks are very ductile, and capable of much motion, being about five-eighths of an inch long when contracted, and seven-eighths of an inch when elongated. Their motion, like the maggot tribe in general, seemed to be by a distending of the head and neck, then seizing hold with the mouth, and instantly contracting the neck so as to draw the body forward. Any little unevenness would joggle and upset them. They crawled about my carriage box for some hours, searching every depression, or knot, or nail hole, eagerly, as if intent to escape from the air, or light, or both. I observed, when they were searching a crack, knot, or nail hole, they would root up and throw out dirt like little pigs. When I went to my house I took them along, and put them into a wide mouthed vial, tied a cloth over the mouth, and laid them by in a drawer to see what would be their end. After occasionally crawling about a little for ten or twelve hours, they contracted, changed from an opaque or horn color, to a reddish chestnut color, and then lay dry and immovable until the 8th of September, being 35 days. When they came forth, three Horse Bees, two females, full of eggs or nits, the other having none, I think it was a male. Whether the eggs are fecundated, or impregnated, I have made no experiment yet to ascertain. Their close confinement might have made them unhealthy, and deprived them of the inclination to fecundity. They seemed inclosed in nine circles, and armed with short, stiff hair, between the segments of the circles.

In consequence of all three of the bots passing into their chrysalis state in one day, and all coming forth horse bees (*Estrus equus*.) in another day, I am led to infer that the times of their changes are quite regular, especially the time they remain in the chrysalis state; also the time they remain a horse bee or bot fly; but the time they generally remain a bot maggot, or larvæ, in the stomach of the horse, I am now unable to say; but we may safely conclude if they are cast out any season but a warm season, they must perish. As the temperature of the stomach of the horse is about the same, summer or winter, I think it most probable they come to maturity at some certain time from the period they reach the stomach of the horse, probably ten or eleven months.

Whether a bot is armed with teeth or other apparatus sufficient to perforate the coats of the stomach of a horse, I cannot now decide; but that they possess ample means to trouble and greatly annoy the horse, I have no doubt. It is a well known fact that all the insect tribe while they are in the maggot or larva state, are very active and voracious.

Whenever the bot is in any way disturbed, it contracts itself into its coat of mail, *capapie*, which renders it invulnerable to the most of substances that a horse can endure, which probably is the reason of the difficulty generally of ridding the horse of them. I have much faith in the use of spirits of turpentine, in doses of from a gill to half a pint, in molasses or sugar, every one or two hours, until it gives relief, whether it be bots or colic, as we cannot often know which is the trouble, knowing that all the insect and vermin tribe are so much annoyed or destroyed by the contact with spirits of turpentine: beside, the horse or human subject may safely use large doses of it, if they use sugar freely with and after it, to abate its acrimony. Another remedy I think is entitled to a trial at least, viz: one quart of new milk, saturated with honey, molasses, or sugar, in the order named, (fasting if possible,) two hours after, drench with a pint of brine, as strong as boiling water can make it; two hours after give half a pint of flax seed oil.

It is asserted that the bot will fill itself so full of the first mixture, that the action of the other destroys it.

Baron Cuvier says, the different classes of the fly (*cæstri*) in their larvæ state, inhabit the ox, horse, ass, rein deer, stag, antelope, camel, sheep, and hare.

SPECTATOR.

Brighton, N. Y. Jany. 1841.

Use of Swamp Muck.

MESSRS. EDITORS—A Young Farmer asks if marshy black earth can be made a good dressing for upland. I think it can. First, cart it from the bed on the land you wish to manure, or any other place convenient, in heaps, or, which is better, in rows, like winrows of hay, and about the same size, and after it has lain a month or two, or six, all the better, take stone lime, lay it along on the top of the row, say one bushel of lime to 15 or 20 of black earth; put on water sufficiently to slack it, and cover it with the earth slightly; as soon as it is perfectly slacked, and while hot, begin at one end of the pile and mix well together, and apply it to the land when wanted, and it will be found an excellent manure. Another good way is, when you have cleaned out the barn yard in the spring, cart in the black earth to the depth of 10 or 12 inches; throw on occasionally straw, leaves, green weeds, &c.; let the cattle run on it through the season; it will get saturated with urine, (the strongest of manure,) and in the spring following when carted out, will be fine manure. Shell, or calcareous marl, is also an excellent mixture, (and possibly a Young Farmer may find some by digging two or three feet deep in his black, swampy earth.) Farmers often cart swampy earth on the land and immediately plough it in, but I think with little profit. It is too sour—it wants to be laid up to the air, and mixed with lime, marl, or something to sweeten it.

As to the best and cheapest kind of fence across the marsh, I cannot say from experience; but think that a live fence of willow, swamp elm, or American thorn, would be the best. Throw up the bank, a foot or two high, or sufficient to be tolerably dry, and plant cuttings of the basket willow, 10 or 12 inches apart; and in two or three years it can be cut yearly for making baskets, &c.; but probably the native thorn would make the best and most durable fence, and it would require more labor and expense. The ground must be thrown up dry, and well prepared with lime,

manure, &c.; the plants put in 6 or 8 inches apart; kept clean and clipped, and in a few years it will make a beautiful and durable fence.

A FRIEND TO IMPROVEMENTS.

Nearburgh, N. Y., Feby, 1841.

For the New Genesee Farmer.

RECIPTS.

TO KILL LICE ON CATTLE.

Feed them a quantity of sulphur in small doses at a time, mixed with cut roots, hay, salt, or any thing else. [This we believe very efficacious, the sulphur passing to the surface and repelling the lice.—Evs.]

TO MAKE CALVES EAT ROOTS.

Pound the roots fine, mix with them cut hay, bran, or any thing they will eat, and in two or three days they become fond of the roots.

The following were handed me by a lady of no small standing, so you may depend upon their accuracy.

TO MAKE WISCONSIN MINCE PIES.

Take the usual quantity of meat, and substitute *beets* for apples, but in only one-third the quantity of the latter,—boil the beets, pickle them in vinegar 12 hours, chop them very fine, and add the vinegar they were pickled in. Add one-eighth of grated bread, and spice to suit you.

TO MAKE INDIAN LOAF BREAD.

Stir Indian meal in ekim milk to the consistency of pan-cake batter, about two quarts. Add 2 teaspoonfuls of molasses, 1 of saleratus, 2 of shortening, and 2 teacups of wheat flour. Stir in the evening, bake in the morning, and eat while hot.

TO MAKE WISCONSIN SPONGE CAKE.

Take 2 eggs, (or omit them if wished,) 1 teacup of buttermilk, 1 tea-spoon of saleratus 2 table-spoons of cream, and salt to suit. Stir to the consistency of pan-cake batter. Bake 20 minutes on tin pans, and eat while hot with butter. F. H. SIPERLY.

Wisconsin.

Summer all the Year.

MESSRS. EDITORS—The "Hot Air Furnace," which was designed by W. R. Smith, of Macedon, and described by you in the October number of your valuable paper, has been tested by me for the last four months, and I am now prepared to give my testimony concerning it. It will take about twelve cords of wood to warm three or four rooms in my house, day and night, for one year, or about two cords for one month, during winter. This is about the same quantity that I have been accustomed to use in one fireplace, to burn me on one side and freeze me on the other, through the day only, while it saves much expense in preparing fuel for the fire, the furnace receiving wood forty inches in length and sixteen inches in diameter. We use no more bedding in winter than in summer. We keep milk and other things in the buttery at such a temperature as we please. In short we can keep any room in the house at any desired temperature, and all this from one fire in the cellar, while the rooms are free from smoke, soot, and ashes. I find in the furnace, all the benefits described by you, and can cheerfully recommend it to the public. I would advise all who design building new houses, whether private dwellings, meeting houses, or public schools, to examine the subject. Mr. Williams, of Palmyra, who furnishes the castings, designs to make some improvements in his patterns, by which the price will be somewhat reduced. Summer is the time to build, and the winter to enjoy it.

Yours truly,

V. YEOMANS.

Walworth, Wayne Co., N. Y., Feby. 1841.

Making Hot Beds--Gardening for March.

This is called the first month of Spring, but in this climate the weather savors too much of winter to allow of much being done in the Garden, except making preparations for next month, or forwarding such articles as are desired early, by means of hot-beds. Almost every farmer or mechanic, who cultivates a garden, would find a small hot-bed of sufficient advantage to amply compensate for the care and labor it requires. There are few greater luxuries than the early Radishes, Lettuce, Cucumbers, &c. which a good hot-bed affords, to say nothing of the advantage of starting Cabbage, Cauliflower, Broccoli, Celery, Tomato, Pepper and other plants a month or two earlier by this means than could otherwise be done.

Hot-beds can be made any time during this or next month. We give particular directions last year (Vol. 1. Nos. 2 and 3,) for preparing manure, constructing the frames, sashes, &c., and therefore deem it unnecessary to do so again in detail, but as it is particularly desired we will repeat the directions for constructing hot-beds.

Select a site for the bed, on dry ground, where it will be fully exposed to the sun, but sheltered from the north and west winds. Mark out the size of the bed, allowing six or eight inches on all sides larger than the size of the frame. Then drive down a good strong stake at each corner, as high as you intend to build the bed. Then take the manure (which should be fresh stable manure in a good state of fermentation) and commence building the bed by mixing the manure thoroughly, and putting on successive layers, beating it down with the fork. Observe to place it smoothly and firmly around the outside, so that it will not settle unevenly from the weight of the frame. The height of manure requisite, will depend on the time at which the bed is formed, and the purpose for which it is intended. If made early in March, and intended for growing cucumbers, &c., a good deal of heat will be required for two or three months, and at least four feet high of manure will be necessary. But a bed made early in April, for the purpose of forwarding early plants to be transplanted into the garden, will not require more than half that quantity.

When the bed is made, put on the frame, and then put in about six inches of good fine earth; put on the sash and let it remain two or three days for the heat to rise, when it will be ready for sowing.

Make the earth smooth and fine before sowing; if cucumbers or melons are to be planted, raise slight hills for them under the middle of each sash. The articles usually sown in hot beds are cucumber, radish, lettuce and cress, for early use; and cauliflower, broccoli, cabbage, egg plant, tomato, pepper, celery, &c., to transplant. The earliest varieties of each are of course the best for this purpose.

Mangel Wurtzel.

Our respected neighbor, Dr. D. A. Robinson, raised the past season, from one half an acre of land, a little less than five hundred bushels of mangel wurtzel. This was done at a cost, estimating labor at a dollar a day, of about two and a half cents per bushel. Land, previously in good condition, was manured broadcast at the rate of about forty loads to the acre. Ridges were subsequently formed, the seed planted in drills upon these half an inch deep and rolled, and the crop afterwards thinned and kept clean.

It may be proper to state, that the seed, obtained at the Rochester Seed Store, was sown at the rate of two pounds only to the acre, and afforded an abundance of plants, which required thinning to less than one third. We believe nearly all the failures of seed the past year were from planting too deep.

Correction.

We thank the Farmer's Gazette for correcting an error we committed, in stating that the report of the farms of J. B. Davis and W. K. Townsend were made to the Hartford County Agricultural Society. A our Connecticut readers very well know, Derby and East Haven are in New Haven county, and by a *lapsus penne*, and not from ignorance, we gave Hartford, and not New Haven the credit.

JESSAMINE.

THE PROPERTY OF WM. R. SMITH, MACEDON.

Jessamine is from T. Weddle's imported stock. Dam, Lady Bower; bred by the celebrated Major Bower, of Welham, Yorkshire; which, with her calf, 10 months old, was sold by T. Weddle to J. C. Hathaway for \$1,000;—is by Rover, (alias Charles,) bred by the Earl of Carlisle, and whose pedigree has been given in this paper, (page 8.) A calf, 10 months old, by the same bull and cow, sold to Kentucky for \$600.

The color of Jessamine is pure white. Great care has been taken to have the portrait correct, exhibiting the deformities as well as beauties; for unless portraits of animals are rigidly correct, they are worse than useless, tending only to mislead.

Scraps,

CONDENSED FROM EXCHANGE PAPERS, &c.

MARL.—In some parts of New Jersey, according to Henry Colman, the recent use of marl on land has been of great efficacy. "It has more than doubled the value of the lands in the neighborhood of the pits where it is found. The application of one hundred bushels to land, which, under common cultivation, would not produce more than 20 bushels of corn to the acre, causes it to yield 60 bushels, and wheat and clover in proportional abundance."

PEAT.—The island of Nantucket contains 985 acres of peat swamp, from one to fourteen feet in depth; and in the state of Massachusetts there are at least 50,000 acres, of an average depth of at least six feet.

GOOD FARMING.—A farmer near Philadelphia, on a farm of 130 acres, has an average yearly crop of 1,500 bushels of wheat, 450 bushels of rye, and 500 bushels of corn annually. He pursues a regular system of rotation.

G CASSES—loss of weight in drying.—The following experiments were made in 1822 and '23:

	1822.	1823.
100 lbs. of green White clover gave	17½	27
" " " Red clover	" 27½	25
" " " Herd's grass	" 40	39
" " " Fresh meadow	" 38	41
" " " Salt grass	" 39	40
" " " Corn stalks	" 25	25
" " " Red top	" 46	46
" " " Couch grass	" 48	48
" " " Fowl meadow (<i>Poa nemoralis</i> ?)	53	

The white clover of 1822 grew in shade, that of '23 in the sun. The salt grass of '22 a second growth.—*J. Wells, in Agric. Jour. Mass.*

CATTLE—new breed.—Col. Jacques, of Charles ton, Mass., has for several years been breeding from an imported short horn bull, and a native cow, his stock at present amounting to about sixty. The first heifer from this cross gave, the first year of milking, sixteen quarts a day. The milk from his cows is very rich, the cream very thick, and yields very little butter-milk. He says, 100 lbs. of cream will make 95 lbs. of butter. One of his cows makes one pound of

butter for every four quarts of milk. He does not feed high—says food will never make a fine breed, but that blood is every thing. His cows in milk have hay or grass, with one to two pecks of roots a day.

COTTON CROP.—The Governor of Alabama, says, "the cotton crop has fallen so far short of reasonable calculation, that without a forbearance on the part of creditors, not to be expected, the pecuniary distress of the people, the next year, will be unprecedented and ruinous."

BALKY HORSES, it is asserted, can be easily made to do their duty, by tying a cord round the ear close to the head, which will operate like a charm, where whipping, coaxing, and every thing else, have proved fruitless.

KEEPING STORE HOGS.—E. C. Frost, in the Cultivator, states, that he kept 24 shoats last winter, at an expense of 20 cents a day, (less than a cent per head,) by feeding them 10 lbs. of hay, half a bushel of potatoes, and 4 quarts of corn meal, daily, and never had hogs winter better. The hay, cut fine, was boiled with plenty of water, the potatoes were boiled in another kettle, pounded fine, mixed with the hay and meal, and let stand a day till fermented.

MANUFACTURES IN MASSACHUSETTS.—These exceed the largest crop of cotton ever raised in all the cotton growing states,—that of last year, which at 8 cents a pound, amounted to \$67,000,000, which is less than the returns in Massachusetts for 1837. The manufactures and fisheries of that state were \$92,000,600.

FUEL.—It is estimated that upwards of \$50,000,000 are consumed every year in the United States for fuel.

DEPTH OF LAKES.—A correspondent of the Geneva Courier, gives the result of an experiment made by Judge Norton and others, to ascertain the depth of Seneca lake, near Big Stream Point, which at one third of the distance across from the west shore was 461 feet, and at one half the distance, 553 feet. The depth of Cayuga lake at Aurora, according to the measurement of Dr. John Gridley, formerly of that village, in 1826, was found to be as follows:—1st sounding 51 feet; 2d, 72; 3d, 108; 4th, 120; 5th, 176; 6th, 192; 7th, 258; 8th, 282; 9th, 46. The

soundings was three quarters the distance across from the east shore, and the others at equal distances. This lake is doubtless much deeper some miles south, as it never freezes there, while it does sometimes at winters.

SALT FOR CATTLE.—The celebrated Curwen, says, "Before I commenced giving my cattle salt, my farmer's bill averaged 58 pounds per annum, (more than 250,) and since I have used salt, I have never paid any one year over five shillings." Did this difference result from the salt alone, or was not the care in giving salt regularly accompanied with a corresponding care in other particulars, also tending to prevent disease? Try the experiment, farmers.

IMPROVEMENT IN CATTLE.—A house in Boston, that has annually slaughtered 5 or 6000 head of cattle, have found, in the last twelve years, an increase in the average weight, from about 800 to 900 lbs. In the London market, cattle slaughtered have increased at least one third in the last 50 years, and mutton not less.

RIPENING WALL FRUIT.—An English gentleman reckoned with paint a part of the garden wall on which his grapes were trained, which caused an increase of three fold in the weight of the fruit on the reckoned part, the bunches being much finer, larger, and better ripened. The absorbing and radiating power of black surfaces is well known.

HESSIAN FLY.—Margaretta H. Morris, of Germantown, Pa. has made some recent observations on this insect, which if correct render former opinions relative to its habits erroneous; and her positions, if established, will be of great importance. According to her observations, the parent insect lays its egg in the seed of the wheat; the egg remains unaltered till the wheat germinates; the young worm remains below the surface of the earth during winter; in the spring it ascends through the stalk, passes to the sheath, changes to the pupa, or "flax-seed" state, and finally, when the heat is ripe, to the perfect insect or fly, which lives only ten days, during which time it deposits its eggs. To prevent its ravages, therefore, seed wheat must be procured from regions where the insect is unknown, and the farmer who sows seed from a district ravaged by it, actually commits the absurdity of planting Hessian flies for the next year's crop. We believe her theory not entirely original, and it needs more observations to establish its correctness.

Horticultural Meeting.

A meeting of the friends of Horticulture, in Monroe and the adjoining counties, will be held in the Court House in Rochester, on Monday the 15th of March next, at 11 o'clock, A. M.; for the purpose of forming a society, and devising such other means as may be deemed expedient to give a general impulse to horticultural pursuits.

As the objects of the meeting are of general importance, it is to be hoped that this call will meet with a hearty response from every friend of the cause throughout the country. It is the duty of every one to attend who cultivates or takes an interest in the productions of the garden, or who wishes to improve or beautify the rural aspect of our country.

Other countries, and other portions of our own country, have derived great advantages from Horticultural Societies, and their influence begins to be generally appreciated: for we find that on all sides of us, north and south, east and west, such associations are being organized. Why not here? It is evident to many minds, that in no portion of the Union are horticultural pursuits generally more neglected, or in a more backward state than in Western New York, considering the advanced state of society, the unrivalled natural advantages of soil, climate, &c., and the

enterprising character of the people. It is certainly high time that a combined and determined effort was made to promote the interests of this important branch of rural economy. Agriculture has received a powerful impetus all over the country through the influence of societies. They have disseminated a spirit of improvement throughout the farming community.

The same successful results will no doubt attend the efforts we are about to make to improve our system of gardening, if a proper spirit is evinced now; as we hope there will be, and Western New York in a few years will be able to vie with any portion of the Union, in respect to her horticultural productions.

Monroe County Agricultural Society.

The annual meeting of the "Genesee Agricultural Society," was held pursuant to notice at the Arcade House, Rochester, on Tuesday the 2d Februry. After considerable discussion, it was resolved to change the name and constitution of the Society—that it be called the "Monroe County Agricultural Society," for the advancement of agriculture, horticulture, and the domestic arts in Monroe county.

It was then Resolved, That a meeting of the Society be held on the 5th day of May next, to appoint committees and make arrangements for the coming season.

The following persons were elected officers of the Society for the ensuing year:—

- President—LYMAN B. LANGWORTHY, Esq. Greece.
- 1st Vice President—William Garbutt, Wheatland.
- 2d " " Henry E. Rochester, Gates.
- 3d " " Wm. C. Cornell, Henrietta.
- Recording Secretary—H. M. Ward, Rochester.
- Corresponding do. M. B. Bateham, do.
- Treasurer—Charles F. Crosman, do.

MANAGERS.

- Rawson Harmon, Jr., Wheatland,
- Oliver Culver, Brighton,
- Thomas Weddle, Greece,
- Isaac Moore, Brighton,
- H. E. Barnard, Mendon,
- Wm. Pixley, Chili,
- Enoch Strong, Perinton,
- John B. Smith, Ogden,
- John H. Robinson, Henrietta,
- George C. Latta, Greece,
- J. P. Stall, Rush,
- Geo. Sheffer, Wheatland,
- Dr. Abel Baldwin, Clarkson.

H. M. WARD, Sec'y.

Canada.

The two Canadas are now united in one Province, and Kingston is selected as the location for the seat of government. Lord Sydenham is Governor in Chief of the whole Province, and Sir George Arthur Lieutenant-Governor of the upper portion. This adjustment of the political affairs of the country appears to give general satisfaction, and it may confidently be expected that Canada will now make more rapid advancement in agricultural improvement. We are gratified to perceive increasing spirit in some of the

Agricultural Societies—and especially to find an increasing demand for the *New Genesee Farmer*.—Several of the Societies have ordered large numbers for the use of the members; and their letters speak in the most flattering terms of the good our humble efforts have accomplished during the past year.

We should be pleased to receive more frequent communications from the numerous able writers in Canada. Will they not favor us? The Secretaries, or other officers of the Societies, could send us much information that would be interesting, and some of them have promised to bear it in mind.

Double Hinge Harrow.

Editors New Genesee Farmer:—

GENTLEMEN—I send you a draft of a double-hinge harrow, of my own invention, which has been highly approved by many who have used it. It differs materially from any in use, it is believed, in two material points, viz: in the motion being better, and in clearing itself from stones, weeds, and other stuff, tending to clog it.

It sweeps 7 feet, and from end to end is 9 feet.

The angle is 80 degrees, or two inches to the foot from a square.

The timber is 6 feet long and 3 inches square.

The teeth are 7-8ths of an inch square, and 9 inches long.

The hinges are straps of iron, 7 inches long, with holes in each end, and bolts to pass through with keys.

The hook or eye, to hitch to, should rise 7 or 8 inches, to prevent the forward end from being lifted by the draught.

The cross pieces are let in on top, and fastened with bolts and screws. THOMAS HUNT.

Fall Creek, Dec. 18'0.

The Durham (U. C.) Agricultural Society.

The annual meeting of this spirited Society was held at Port Hope, Jan. 15. By the reports of the Secretary and Treasurer, it appeared there was a balance in the Treasury of one hundred and two pounds seventeen shillings and eleven pence.

The following officers were elected for the present year:—

President,
DAVID SMART, Esq., Port Hope.

Vice Presidents,
ALEXANDER BROADFOOT, Esq. of Hope,
R. W. ROBSON, Esq. of Clarke,
JOHN KNOWLSON, Esq. of CURRY,
JOHN SMART, Esq. of Darlington,
WILLIAM SISSON, Esq. Treasurer,
MORGAN JELLETT, Secretary.
And ONE HUNDRED DIRECTORS in different parts of the country.

H. COLMAN'S ADDRESS.

BEFORE THE AGRICULTURAL AND HORTICULTURAL SOCIETY OF NEW HAVEN CO., CONN.

We often feel a desire to lay before our readers more of the able addresses and other excellent articles which we find in our exchange papers; but were we to do so, we should be compelled to omit many of the favors of our esteemed correspondents; and we are aware that most of our readers generally prefer that which is written for their particular benefit. We should do them injustice, however, were we to confine our columns to original articles; for many valuable discoveries and improvements are made in different places, and published in other journals; and it always stimulates and pleases the mind to learn that other people, in various places, are actuated by the same spirit, and engaged in the same enterprise as ourselves.

No man at the present day, in the United States, occupies a higher rank, as an advocate of improvement, or a delineator of the pleasures and advantages of a rural life, than HENRY COLMAN; and no man is doing more to elevate the noble profession of Agriculture to its proper standard, than him. We are led to these remarks by reading the address above named. We cannot afford room for the whole of it; but we are sure our readers will derive both pleasure and profit from the following portions—Eds. NEW GEN. FAR.

THE FARMER NEED NOT BE JEALOUS OF HIS NEIGHBOR.

No occasion of the gathering of the people is less liable to objection, or more congenial to benevolent and pious sentiments, than that which has brought us together.

Here, a spirit of good will reigns over the whole. No discordant or hostile feeling can find place. No strife and no emulation can find place, but an emulation for excellence, which alike benefits all, and in improvements, which diffuse themselves over the community, and the sole aim of which is the common welfare. To well disposed minds, this is a religious occasion of the highest character. None is more suited to lift up the soul in adoring confidence and gratitude to the great Author of nature. He it is, who "causes grass to grow for cattle, and herbs for the service of man." He clothes the flowers of the field with a splendor, before which the gorgeousness of oriental luxury is dimmed. His benevolent agency operates every where in the teeming earth, the swelling bud, the golden and crimsoned fruit; in the vapor, the dew, the air, the heat, the light, in all their mysterious influences. He is the source of all felicity, health and beauty.

THE ART OF LIFE IS THE ABILITY TO OBTAIN FOOD.

Agriculture is the great art of life. In an economical view it constitutes the subsistence of man. Eating and drinking are deemed vulgar employment; yet who, even among the exquisite of the transcendent school, is not compelled to conform to the fashion.—The body is often spoken of with disdain, as though there were something degrading in its material elements. In such cases, a reflection is cast upon the divine skill and beneficence in one of their most wonderful exhibitions. But is there not an electric chain of sympathy between the body and mind? What is to become of our philosophy without bread and meat? How is genius to speed her flight, or the fires of the imagination to be kept bright, unless this same body, the dwelling place of the ethereal guest, be maintained in its health, elasticity, and vigor. It is calculated that if the harvest of a single year should fail, the whole of the human race must perish. In our latitude the earth yields nothing unasked and unwooded. All of food and of clothing, all that sustains and protects the body, is the product of agricultural labor in some of its various forms.

THE PRODUCT OF LABOR THE ONLY REAL WEALTH.

Agriculture is the foundation of wealth. The sea renders her tribute; but the earth presents to skill and industry richer and infinitely varied contributions.—Money is not wealth. It is only the representative of wealth. Money is coveted because it can command labor; but of what use would it be, if labor would not be commanded? What would it avail to possess all the riches of Potosí, if thereby we could not acquire the products of agriculture? What are the manufactures concerned in but these products? What freight-

the barks of commerce in their liquid flight, threading every channel and whitening every port, but the products of agriculture? What constitutes the wealth of the country but her cotton, hemp, sugar, rice, tobacco, wool, beef, and pork? Agriculture only can be considered as the creator of wealth. The merchant, the manufacturer, the sailor, the various artisans and tradesmen perform their part in making the products of agriculture more valuable; in transporting them so that the advantages of climate are equalized, and in putting them in a condition for use; but agriculture alone produces. Like the leader of Israel, she strikes the rock, the waters flow, and a famishing people are satisfied. She supplies, she feeds, she quickens all. Agriculture is the commanding interest of the country, with which no single interest, nor indeed all other interests of a secular nature combined, can be brought into competition.

AGRICULTURE ASCENDING DISCLOSES A MINE OF WONDERS.

Agriculture deserves the attention of liberal minds as a science. Like many other sciences, it is in its infancy. We have broken only the outer crust; but it comprehends the mysteries of philosophy. It involves the whole science of life in the vegetable and animal kingdoms; the miracles of actual production, and the power which man may exercise in modifying vegetable and animal existence. The rearing of a tree, the maturing of a vegetable, the production of a flower, the forming of a race of animals, with shapes, and dispositions, and qualities, modified to a great extent according to your wishes, are in themselves miracles of a power delegated to man, which an intelligent mind recognizes as divine.

Whoever, looking at a dried seed and kernel, considers what it may become, when the plant shall yield bread or the tree spread out its branches loaded with fruit, whoever considers the nature of the life which lies buried in this shell, and reflects upon the combined influences of earth, and air, and moisture, and heat, and cultivation, in their inscrutable operations, all requisite in precise times, quantities and modes of application, to bring it to perfection, will perceive subjects of inquiry suited to occupy the most gifted intellect. As he approaches this mine of wonders, his bosom will pant with an irrepressible curiosity to gain admission into the hiding place of the Divinity, and to quench his burning thirst at the original fountains of power, life, intelligence, and light. Geology, chemistry, botany, all the branches of natural philosophy, natural history, in its diversified departments, animal and vegetable physiology, comparative anatomy, mechanics, meteorology, all are involved in an improved agriculture. The nature of soils has been long a subject of philosophical investigation; and that, with the application and operation of manures, seems now to be biding in reserve for chemistry its most brilliant triumphs. Do I offend a fastidious ear by a reference to a topic so humble? In looking at the master-piece of human genius in sculpture, the Venus de Medicis, the vulgar mind brings away from the contemplation no higher sentiment than that it is naked. The pure and disciplined mind hardly conscious of this fact, and feeling the responsive movements of the divinity within itself, admires with adoring wonder the triumphs of genius in this sensible embodiment of the highest beauties of form in the works of the Creator. So it is with other objects in nature, so much depends upon the eye with which we look at them. The vulgar mind, in the heap of manure by the road side, thinks only of its offensiveness and corruption. The well disciplined mind regards it as an element in one of the most affecting miracles of the Divine power, and adores that beneficent agency, which, in its mysterious operations, converts this refuse into fruits and flowers.

To consider agriculture as mere servile drudgery, is no more doing it justice, than to consider chemistry as only the art of mingling acids and alkalies, and banding pots and retorts, and crucibles, and filters.—Let the man of cultivated and philosophical mind approach the subject of agriculture, and he finds "sermons in stones and books in the running streams."—Let him engage in its humblest labors, and the same furrow, which is to bear upon its inverted surface the golden grain to nourish his animal life, will produce bread to eat, which common minds know not of, to nourish his intellectual and moral being. There is not one of the natural, or what are called the practical sciences, which may not have a bearing upon agriculture. It is with agriculture as in other cases, that mere theory will make no man a farmer. The common processes and the successful execution of the common labors of husbandry can be learned only by practice. He who would handle a plough well, must have been accustomed to walk in the furrow; as the only safe pilot is the man who has been practised to

stand at the helm. But to think that because we have done these things, that therefore we understand a culture, is as wise as for the man, who should wade up to his ankle in some puddle left by the receding tide upon the sea shore, to pretend that the ocean is not very deep.

The nature and use of soils, the artificial combination of them in different cases so as to effect the large growth and productiveness, the nature of manure, their uses, application, operations, and infinite varieties, their mechanical influences, and their chemical effects, the varieties of grasses, grains, plants, fruits, which are or may be cultivated, the habits of vegetables and the propagation of new varieties, influences of light, and heat, and air, and dew, and rain, and electricity upon vegetation, and how they may be controlled by human ingenuity or skill—the history and habits of the domestic animals and modes of rearing them to the highest degree of perfection, the construction of farm implements so as to combine the greatest effects with the least expending power, the history of agriculture, its condition and improvements at home and abroad, rural labor, rural architecture, agricultural education, the intellectual and moral improvement of the agricultural classes, the connection of agriculture with national wealth, and with its great sisters, manufactures and commerce, and above all, its bearings upon domestic and public happiness, upon domestic morals—these topics, among others which might be named, show that agriculture is not destitute, to a philosophic mind, of matters of profound scientific inquiry.

"TRUE POLITENESS" IN THE COUNTRY AND THE CITY.

Agriculture, as a pursuit, commends itself to persons of refined taste and sentiment. I know how shall startle the ear of city fastidiousness by such an assertion; but I rely upon your candor that I shall offend by the expression of my honest convictions. There is much in the country that is vulgar, rude and offensive. There is no occasion for this. This is the fault of the country. But is there more of this in the country than is to be found in cities? Things depend much upon ourselves. The artificial forms of social intercourse do not prevail in the country as in the town—at least they are not so strict but it is often delightful to lay aside, at least a while, the buckram and the starch. I have been through life familiar with all classes of people. I have been for many years a citizen among cities, and a member among the farmers. I have been a frequent visitor in city palaces, and many a time an indweller in the humblest mansions in the secluded parts of the country; and I must say, without derogating from refinements of the most improved societies in the cities, that the comparison in respect to courtesy and civility would not turn out to the disadvantage of the country. True politeness is not matter of mere form or manner, but of sentiment and heart. There are rude and vulgar people every where, but will no sober judgment pronounce it as great a rudeness to sent knowingly away from the door of one who entertains a friend by a servant with a lie upon his mouth as to be received by the kind woman who welcomes us heartily at her wash-tub, or her spinning-wheel and sweeps a place for us without apology to sit down at her kitchen fire. You will pardon the homeliness of my illustrations. You may thread your beautiful valley from the ocean to the mountains; you may, I have done, follow the silver stream, whose honor name is borne by your Commonwealth, from the place where it deposits its contributions in the mighty treasury of the sea, to its gushing sources under the enclosed summits of the north, and traverse every State whose borders are laved by its gentle waters, and good manners on your part will generally be met with corresponding civility. Excepting among the vicious and depraved, you will find no rudeness unless you so unfortunate as to provoke it by your own arrogance.

It is folly to carry city manners and customs into the country. This destroys the simplicity which constitutes the charm of rural life. If you have no taste for rural pleasures, no interest in rural concerns, disposition for rural labors; if you are afraid of soil upon your hands or browning your cheeks; if you can make no friends with the flocks that whiten the field, nor the birds that make the hills and forests vocal with melody; if you are unwilling that the earliest rays of the dawn should disturb your repose, and your heart kindles with no enthusiasm in golden sunset, then flee the country as you would the Siberian desert. It would be to you only a land of discomfort and acute.

AGRICULTURE THE DELIGHT OF GIFTED INTELLECTS.

But it is otherwise with many minds. Agricultu-

and horticulture, far from being disdained, have been of all others, the chosen pursuits, the purest delights of some of the most gifted intellects; and their enthusiasm in these pursuits burnt with increasing intensity to the close of life. From the turmoils of war, the struggles of political ambition, the harassing pursuits of successful trade, the busiest scenes of life, from the forum, the senate, and the throne, they have retired gladly to the humble occupation and pleasures of rural life and labor, and have found the precious em, which they had so long sought, only in this calm philosophy of nature.

The country is the land of poetry, and the home of the winged imagination, as much as it is the home of the birds. The charms of the country are unconsciously acknowledged even in cities, when you see a boy, who lives in cities, love to get a grass-plot, though not larger than a handkerchief, before their doors; or train a woodbine or a honeysuckle to their casements; or crowd their windows with flowers, or adorn their persons with a floral wreath. The first offerings of the muses were dedicated to rural life. In the waving of the golden harvest, in the verdant lawn spreading its smooth carpet beneath your feet, in the prairie ocean of verdure radiant with the richest tints of floral beauty, in the deep and solemn forest, the mirrored lake reflecting in perfect distinctness the mingled beauties of forests and skies, in the flowing river an image of eternity, in the mountain lifting its crested top above the clouds, in the boundless horizon, in the reddening dawn, in the gorgeousness of a summer's sunset, in the mingled splendors of the tumbling forest, there is every thing to kindle the imagination and dilate the heart. When in the advancing spring the man of reflecting mind and cultivated taste, at break of day, witnesses the waking up of nature, beholds the desolation of winter rapidly retreating before the empire of spring, and sees day after day, almost hour after hour, new forms of vegetable and animal life starting into existence, it requires no violent effort of the imagination to behold a new Eden opening before him, and to hear the chorus of the morning stars, and "the sons of God shouting for joy."

THE SYMPATHY, MORE CHARITY, A HIGHER VALUE SET UPON HUMAN LIFE IN THE COUNTRY THAN IN THE CITY.

In speaking of the moral aspects of agriculture, I will make no invidious comparisons. The country presents as few temptations to vicious indulgence as a condition of life; perhaps it may be said fewer temptations. Agricultural labor, unless pursued to excess, so far from being exhaustive and destructive like much other labor, is friendly to health, and favorable to intellectual vigor and length of life. The domestic ties seem stronger in the country than in the city, because we are more dependent on each other, and have fewer objects to engross our attention. Human life seems more valued in the country than in the city. In the crowded city men crowd out of the stream, and the vacancy is instantly filled up by the rushing torrent, and scarcely produces in the spectators a conscious emotion. When a valuable man dies in the country, the whole village mourns and blows. There is more of real kindness and benevolent sympathy in the country than in cities. The cities are full of magnificent charities, the country is full of the charity of kind offices. In the country, the neighbor sick or afflicted, the whole neighborhood prompts to visit him, to aid him by personal service, and to watch night after night at his sick bed.—In cities it cannot be so. Cities present some of the bitterest cases of friendlessness to be found in human history. Persons suffer, and sicken, and die, without perhaps the cognizance of those living under the same roof and on the same floor. In the country personal character has a higher value than in cities.—In cities every thing is absorbed in the great whirl of business or pleasure; and in crowds, presenting every variety of character as of costume, men pass by without observation. In the country every man is known, observed, and watched. His character seems the common property of the village. This is sometimes complained of in the country as impertinence and intrusiveness. This may sometimes be the case, and it may become annoying; but it is not so frequent as the complaint of it. That it has a favorable influence upon good morals which, under the kindness of human nature, need every security, there can be no doubt.

In the healthful labors of the country, the early rising, the simple diet, in the open air, in the virtuous restraints, in the general good morals which prevail, the strong sympathy and mutual interest in each other's character and welfare, which bind such communities together, in the absence of multiplied temptations

and facilities of vice, which prevail in more populous communities, an agricultural life is highly favorable to virtue.

PHILOSOPHY, REFINEMENT, MORALS, THE CONCOMITANTS OF AGRICULTURE.

I hope I shall be excused for dwelling so long upon the advantages of agricultural and rural life. Agriculture has been too long denied the rank which belongs to it among the pursuits of mankind. I would speak of it as one of the highest pursuits of philosophy. I would gladly commend it to persons of refined sentiment, as abounding in scenes, objects and associations, full of gratification to the most cultivated mind; and for its moral securities and moral influences; it needs no recommendation in a community like yours, presenting in its beautiful villages, among its swelling hills, and its richly cultivated vales, in the character of its rural population, such emphatic demonstrations of improved education, of correct morals, and of the best influences of religion.

I have here glanced at these topics, because I would not encroach upon your indulgence. I have done this with the more earnestness, because the tendency of our young people, impelled by avarice or by false views of happiness, has been to forsake the wholesome pursuits of agriculture, where they found health, competence, and a manly independence, for occupations in the cities, oftentimes of the most servile character: degrading to their self-respect, corrupting to their passions, and proving often the grave of their virtue. Our cities likewise are crowded with young men of professional education, who, with hearts aching from hopes deferred, linger along from year to year until the health is exhausted, habits of indolence are induced and confirmed, and the best portion of life is wasted away without the accomplishment of any valuable object; or the enjoyment of those domestic ties, in which Heaven designed that man should find the strongest security of virtue and the purest fountains of happiness.

AGRICULTURAL IMPROVEMENTS BETTER THAN SPLENDID HOUSES.

I would likewise gladly commend this subject to another class of individuals, whose attention I fear, however, I shall bespeak in vain. Whoever visits our great cities is constantly struck with amazement at the enormous expense and splendor of many of the private residences; at the extravagant piles of brick and stone, seldom half tenanted, and adapted to real comfort and convenience in an inverse ratio to their inordinate size and their wasteful magnificence. I would seldom, indeed, advise a person, accustomed through the prime and middle of life to the excitements of business, politics, amusements, and general society in the cities, to go at once into the seclusion of the country, especially at that period of life when the vital current becomes sluggish and the physical powers lose their wonted energies; but is it not difficult for such men when their fortunes are made, to enjoy the advantages of the city and the country together. Let them pass, if they please, their winters in the city; but what immense benefactions might they confer upon society, and what sources of agreeable and useful occupation might they find for themselves, if, instead of spending their fitful or their hundreds of thousands on a brick or stone castle in the city, which they have seldom the means of enabling their children to occupy, and which must therefore, in the course of nature, soon change hands, they would expend some three-fourths of that sum in subduing, cultivating and improving some hundreds of acres in the country, rendering them productive, and planting upon them industrious families. They would breathe into the hearts of their benefactors, the purest of pleasures in welcoming them, whenever they came among them, as their best friends. This seems one of the most useful, as it is certainly one of the most innocent purposes to which wealth can be applied.

CAN AGRICULTURE BE MADE PROFITABLE?

But I must pass on to other topics. The next question then which arises in this case, is whether agriculture can be made profitable; and especially whether it can be made profitable in New England? This is a great question. I can only reply briefly, without going into the various illustrations which might be presented. I will here express my thorough disgust for that inordinate and grovelling avarice, which can find no good but in the accumulation of dollars and cents. Wealth is to be valued for its uses, not for its amount; and a philanthropist can look with sorrow and alarm upon that heartless and frenzied spirit of accumulation, which at one time, like a terrible epidemic, threatened to lay waste all principle and honor, and to render contentment, competence, and reasonable and

moderate desires, matters of pure romance, which we had somewhere read of in our childhood. By the righteous laws of Divine Providence, that inordinate thirst for gain without industry, temperance, or frugality, has been so signally rebuked that it will not again immediately show itself. There may still be the appearance of life in its quivering limbs, but few will have courage or power to attempt its resuscitation.

In the southern portions of our country, favored for the purpose by its peculiar climate and soil, we hear of agricultural returns in their great staples, which confounded the humble calculations to which we in New England are accustomed. Yet there are abatements in the case, in the perils to health, and in the nature of the labor by which these products are produced, which, save where the heart is cankered with avarice and inhumanity, at once relieve a New England man of all envy of such success. The fact likewise presents itself in the case, strange as the anomaly may seem, that the southern planters are not richer than the northern farmers; they have not so many of the real comforts of life. Many a New England farmer is more independent with his income of a few hundreds, than a southern master of his uncounted acres and his hundreds of slaves, with his income of many thousands. I do not say these things in the spirit of invidious comparisons; I would not mar the pleasures of the occasion by awakening a single unkind feeling. But we may learn, from the facts in the case, a lesson of gratitude, that we are permitted to breathe the bracing air of northern mountains and seas, and the still more invigorating atmosphere of equality of condition and universal freedom.

Agriculture in New England presents no brilliant prizes to the mind bent solely on the accumulation of wealth. Yet rough, barren, and inhospitable as New England seems to many persons, yet I can show you, in every town from Lake Champlain to the Arcostook, and from Saybrook to the Canada line, not a few examples of men, who by farming have maintained their families in health and comfort, educated their children well, and if so they pleased, found the means of sending one or more sons to college; exercised, as far as they had occasion, an unstinted hospitality; contributed their full share of the public dues, and are now enjoying the evening of life with an honest conscience and a competence for every reasonable want. The house, in such case, may appear moss-covered and brown with age. No burnished lamps light up its halls, and no carpet soft as down cover its floors; but infinitely preferable is such a dwelling to palaces, where once wealth, the product of defrauded labor, illuminated every room, and revelry and luxury held their frequent courts; and where now, though bankruptcy has long since entered, men are still living upon the fragments of former luxury or upon hoarded gains, in defiance of justice and honor.

ADVANTAGES OF HIGH CULTIVATION.

Further, my inquiries have satisfied me, that there is not a single crop well cultivated in New England, which in ordinary seasons will not pay a fair rent of the land at current prices, and liberally compensate the labor and cultivation. Our proximity to quick markets gives us great advantages over many parts of the country. In one of my visits to a town on the seashore of Massachusetts, in a region whose rock-bound surface seemed to have set cultivation at defiance, I found several acres of land subdued and improved at the rate of three hundred dollars per acre. Could this be afforded? Look at the case. The land was made to produce three tons of hay to the acre. The price of hay in the vicinity has averaged for years, at least fifteen dollars. The value of one ton of hay per year, is sufficient to gather the crop and keep the land in condition. Thirty dollars then are the net return for the investment. These are examples of extraordinary expenditure and ample profits. The crop of Indian corn is the greatest blessing of our country. The average crop in New England is thirty bushels. It is not difficult to produce fifty to an acre. I have known one hundred and eleven produced on an acre in Massachusetts, as measured after being shelled and dried. At fifty bushels per acre, rating the rough fodder as equal to a ton of English hay, and the grain at seventy cents per bushel, the return may be considered as equal to fifty dollars. Thirty dollars may be considered a high average price for cultivation, and this including the interest upon the value of the land at fifty dollars per acre.

(We here omit the sections entitled "Comparative Products, and Income of the East and West," "Great Improvements in Stock and Agricultural Imple-

ments," and his remarks on Silk Culture.—Eds. FALMER.)

COMFORTS OF A NEW ENGLAND WINTER.

The long winters of New England are often complained of. But let us look at this. The season of cultivation is long enough for the maturing and perfection of all the vegetable products which the climate and soil are capable of producing; and these embrace an abundance and profusion of the most valuable grains, grasses, vegetables, and fruits, for the whole year. The temperature is favorable to labor. The long winters bring with them opportunities of social intercourse of the most delightful character. While the bracing air of winter gives elasticity to the muscles and vigor to the mind, it affords, in its leisure from out-door labor, the most favorable opportunities for intellectual improvement. The farmer, in this respect, has advantages which fall to the lot of few other conditions in life. Happy is it for him, when an enlarged education and a taste for books and scientific inquiries enable him to improve them to the greatest advantage. Under these circumstances, no condition in life, to a man of reasonable desires, whose heart is not poisoned by avarice or ambition, seems more privileged or more enviable.

I have said that agriculture as an art, is as yet imperfectly understood. But it is encouraging to contemplate the improvements which have been made in it within the last half or even quarter of a century, and the rapidity which it is still advancing.

HORTICULTURE AND FLORICULTURE.

Among the interesting exhibitions of this occasion, Horticulture and Floriculture have presented their liberal contributions. In the variety and perfection of Indian corn, esculent vegetables, and the most valuable fruits, we see every reason to be satisfied with our local condition. If peculiar obstacles to their cultivation present themselves in the soil or climate of New England, we may with an honest pride congratulate ourselves upon that industry and skill, which in defiance of such obstacles successfully produces them in abundance and perfection.

Flora, likewise, on this charming occasion, holds her court among you, adorned with more than oriental splendor. In the two great floral kingdoms of nature, the botanical and the human, if we must yield the palm to that which is alike transcendent in the beauty of form and motion, and in the higher attributes of intelligence, innocence and moral perfection, yet it can be no derogation to admire, with a rapture bordering upon enthusiasm, the splendid products of the garden; and especially when their beauties are combined and arranged as on this occasion, with an exquisite and refined taste. What is the heart made of which can find no sentiment in flowers? In some of the most striking displays of this occasion, in the dahlias for example, we see what can be done by human skill and art in educating and training a simple and despised plant, scarcely thought worthy of cultivation, to the highest rank in gayety and glory and ever varying perfection in the aristocracy of flowers. We may learn from such success, a lesson of encouragement in the education and training of flowers of an infinitely higher value and perfection.

The vast creation of God, the centre and source of good, is every where radiant with beauty. From the shell that lies buried at the depths of the ocean to the twinkling star that floats in the still more profound depths of the firmament, through all the forms of material and animated existence, beauty, beauty, beauty prevails. In the floral kingdom it appears in an infinite variety, in an unsunned and even rich profusion than in other departments of nature. While these contributions are thrown out so lavishly at our feet, and a taste for flowers seems almost an instinct of nature, and is one of the most innocent and refined sentiments which we can cultivate, let us indulge and gratify it to the utmost extent, wherever leisure, opportunity, and fortune give us the means. There is no danger of an excess under these reasonable restrictions, which all our sentiments demand. "But," says some cynical objector, "flowers are only to please the eye." And why should not the eye be pleased? What sense may be more innocently gratified? They are among the most simple, and at the same time among the cheapest luxuries in which we can indulge.

The taste for flowers, every where increasing among us, is an omen for good. Let us adorn our parlors, doorways, yards, and roadsides, with trees, and shrubs, and flowers. What a delight do they give to the passer-by? What favorable impressions do they at once excite towards those who cultivate their own gratification, and find, after all, their chief pleasure in the gratification they afford to others. What

an affecting charm, associated as it is with some of the best sentiments of our nature, do they give to the sad dwelling places of the departed and beloved.

The moral influences of such embellishments demand our consideration. I do not mean merely the substitution of such refined tastes and pursuits in place of the gratification of the lower appetites. This is no small matter. But another influence should not be overlooked.

Every one familiar with human life must be sensible that mere personal neatness and order are themselves securities of virtue. As we cultivate these habits and in respect to our residences and the things and objects around us, make a study of rendering them orderly and beautiful, and of adding to them the highest embellishments of art, our own self respect is greatly increased. Next to religious principle nothing operates more than self-respect, as a safeguard to virtue and a stimulant to excellence.

"HOME, SWEET HOME."

The direct tendency of all such embellishments in our grounds and habitations is to multiply the attractions of home, and to strengthen the domestic ties. It is the glory of New England that these precious ties are no where stronger or more sacred. I would bind her children if possible, by chains a thousand times more enduring. In all my journeyings into other lands, favored as they may be by the highest advantages of climate and soil, I come back to New England with all the enthusiasm of a first love, and a filial affection which, if possible, has only gained new strength from absence. Indeed there is every thing in her to love and honor. Let us seek to render every spot of her rude territory beautiful. To the eminent picturesqueness of her natural scenery, adding the triumphs of an industrious, skilful, and tasteful cultivation, every substantial want of our nature will be supplied, every refined sentiment of the mind gratified; and the true New England heart will seek no other Eden this side of that better country where flowers bloom with a radiance which never fades, and "one unbounded and eternal spring encircles all."

A Correction—Feeding Berkshires.

MESSES. EDITORS—I wish to correct a small mistake that appeared in the published report of the committee on Swine, appointed by the Tompkins County Agricultural and Horticultural Society to report at its last annual fair. It is contained in the extract you have made from that report (on page 24, last month.) It reads "Fat, 83...63...9." It should be *Fect.* The error is a small one, but is somewhat important, as it shows the difference in the coarseness of the three animals. I made another experiment the past fall in cutting up two three-quarter blood Berkshire hogs, and found the result to correspond very nearly with the table you have published, although the hogs were heavier, weighing 360 each.

The reading of T. C. Peters' valuable letter on the subject of "Piggery and Pork Making," induces me to give you a short account of my method of wintering store swine, consisting of ten fall blood Berkshire breeding sows, three full blood Berkshire boars, and shots of different ages, to make in all twenty-two. These I have shut up in lots of from two to four each, and feed them twice a day, say morning and evening, with one cent's worth of boiled corn each—corn at 3s. 6d. per bushel—or 1 lb. 4oz. each, before it is boiled. I boil the corn about twelve hours by putting it over the stove in the morning in a copper boiler, and let it cook through the day—let it cool in the night, and feed it the next day. I find that twenty-eight pounds of corn, when boiled will weigh sixty-eight pounds, and it increases as much in bulk as in weight. I feed no water nor slop of any kind to my hogs; they have nothing but the boiled corn, and they come out in the spring in as good condition as they were in the fall. This is the second winter that I have pursued this practice. I have also tried the plan of boiling potatoes and rutabaga, and mixing brinn, shorts, &c. with them, to make swill; but it costs more that way than on boiled corn.

I wish to inquire of Col. Sawyer whether the portraits that you gave of his Berkshire swine are cor-

rect in their proportions. If they are not they have a tendency to mislead the public; but if they are correct they add value to your journal. It is a subject that I hope gentlemen giving portraits of animals will be careful about,—that the beauty of the portraits may depend on the excellence of the animal and not on the skill and fancy of the artist.

Yours respectfully,

E. CORNELL.

Rhaca, Tompkins Co., Feb., 1841.

Remark.—The Portraits are pronounced *very correct.*—Eds.

Maple Sugar.

The following communication contains excellent hints on the subject of making maple sugar. The two leading requisites for success, we believe to be, boiling the sap as fresh from the tree as possible, and the most punctilious cleanliness in all the different operations. As the season for this work will soon commence, we recommend the remarks of our correspondent to those interested, as well as those of A. S. Chew, from the Ohio Farmer, published last year on page 45 of this journal. We believe it to be as easy and economical, by proper management, to make beautiful, white, crystallized maple sugar, as the common, dirty looking, brown substance, which is not generally in fact, the very cleanest production of the material world.

MESSES. EDITORS—Having seen in your paper an inquiry for making a vat or box for boiling sap, and having long wondered that so little attention was given to making maple sugar, I give some of my own experience in relation to it. I have been surprised to see so little disposition to improve the usual mode of catching the sap in troughs, and boiling it in kettles hung on a pole, by which it is filled with all manner of filth, and the article of maple sugar, (the purest of all sweets,) rendered unwholesome and forbidding as it comes into market.

From twenty years' experience and observation, using kettles in various ways, I have adopted sheet-iron pans, which are here coming into common use, and have been used for ten or twelve years with good success. Pans with sheet-iron bottoms and wooded sides did not succeed well. The pans are simply a sheet of Russia iron turned up at the sides and ends about three inches, and will hold about three pails while boiling. A rim of band iron is rivetted round, about one inch wide, with rings as handles. The cost of a pan is about \$4. Two or three are set lengthwise on an arch, built of stone; from one and a half to two feet in depth, and about twenty inches in breadth, the pan being about twenty-two inches. The arch should be even on top, and a wide bar of wrought or cast iron across the arch between and under the pans to prevent the heat from the fire reaching the sides. The pans are slid off when emptied. One of these will boil about as much as a cauldron kettle.

I have for some years past used six, set three on an arch, side by side, and have about six hundred trees with buckets for the same, and average about twelve hundred pounds per year of sugar, which fetches eleven cents per pound, and the profits are from \$80 to \$100. This is done at a season of the year when little else can be done on a farm.

The sugar boiled in pans, I believe to be ten per cent better than in kettles, other things being equal. To make maple sugar as it should be, much care is needed to keep every thing used about it clean and sweet, and the sap should be boiled as soon as it can be to prevent fermentation. Maple sap of itself has no color, and if it could be crystallized without stain, would be white and transparent, and the sweet of the purest kind. Much is said about cleansing sugar, but

the better remedy is to keep it clean. Pearlash or saleratus put into the syrup while over the fire, will remove the acidity caused by fermentation.

GEO. HUMPHREY.

Guilford, Feb., 1841.

Low Prices favorable to National Exports and National Wealth.

MESSRS. EDITORS—Within the last two weeks 12,000 to 15,000 barrels of flour have been purchased at 4.75 in New York, for shipment to England. Before this can be consumed there, it must pay 50 cents per bbl. freight, \$3 duty in the English port, and about 25 cents commission, &c., which will make the price to the consumer in England about \$8.50 per barrel.

Thus, in spite of the duty of \$3 per bbl. on American flour in England for the protection of her agricultural interests, their profits are very much reduced by the competition of our bread stuffs in their own markets.

The friends of free trade in the United States, may well cite the above facts to show the bitter fruits of a high protective tariff. They say that it only inflates prices at home, thus enabling the British manufacturer to undersell us not only in the foreign market, but also in our own ports. The experience of the last two years most positively shows that the low prices of our agricultural productions have had the effect to treble our exports of manufactured articles, a consummation which could not have taken place under a protective tariff with high prices for the necessaries of life and consequent high prices of labor.

When the agricultural staples of a country are sold at low prices, the price of manufactured articles conform to them,—both become substantially the articles of exportation, and the country gets out of debt much faster than it would if prices were so high as to stop exportation. Another and paramount advantage to the country, from the low prices of its productions, is the great spur it gives to our maritime commercial interests. We now no longer hear of ships rotting at the wharves; they are busily employed carrying the products of our soil and our work shops to every part of the world.

Should England take off the duty on American corn, would not English corn have to fall in price as a necessary consequence, or be driven into the granaries, by imported bread stuffs? Certainly it must, and the result would be that all manufactured articles in England would be sold at correspondent low prices. English manufactures would then more successfully compete with our own, in our markets in spite of our duty, and they would effectually drive our manufacturers out of the great South American and other foreign markets.

But although we are opposed in the main to a tariff exclusively for protection, we feel that a tariff for revenue should be so amended and increased as to act as countervailing duty, while it also protects those branches of American industry which have already commenced in the absence of all protection.

It is said that every hoghead of tobacco shipped to France pays an impost there of \$300. As France cannot produce tobacco, this duty is ten fold as onerous to the American tobacco planters, as the operation of the corn laws of England can be to the wheat growers of the United States, as our foregoing remarks will explain. Hence we premise that the most ardent advocate of free trade will not oppose countervailing duties on French silks and wine. We have in a previous communication shown that the balance of trade against us with France is more than 14 millions annually. A balance which has heretofore been paid by drafts on England, State Stocks, United States Bank Stocks, &c. &c. But since the failure

of both States and Bank, ought not such excessive free importation to fail also? S. W.

Cause of the "Decay of Ruta Bagas."

MESSRS. THOMAS & BATEMAN—I see in your paper of January, an inquiry made by Silas Pratt, of Chili, as to the cause of his Ruta Bagas rotting.

I have, the last fourteen years, cultivated both the sugar beet and ruta baga, raising from 2000 to 3000 bushels for my cows. I have almost invariably found that when I sowed early my roots were more or less rotted. In 1839 I lost most of my crop from that cause, having sowed the seed as early as the first of June. The last season I sowed from the 15th to 20th. I had scarcely a defective one. I have always observed that those which are sowed early grow very rapidly at first, but are generally checked in their growth by the heat and drought of July, in which state they remained until the fall rains set in, when, from so great a change from drought to excessive moisture, the roots crack open, rot, and disappoint the expectations of the farmer. Should these suggestions prove of service to Mr. Pratt, or any others who have met with a similar disappointment, it will give pleasure to

A NEW SUBSCRIBER.

For the New Genesee Farmer.

Rats and Rat Catching.

MESSRS. EDITORS—The sagacity and cunning of this little animal are really extraordinary, and its daring courage is truly remarkable, considering its small size. Although almost every body can produce a budget of stories about rats; yet how few are there who have accurately observed their habits, or even sufficiently to rid themselves of such destructive vermin; and it here occurs to my mind that I have never seen the subject treated on in an agricultural paper. We may often see people carefully baiting traps in a place where rats are swarming, and marveling that none can be tempted to enter; when the simple reason is that from want of a little consideration, the sagacious instinct of the little animal is a match for the bad attempts made to capture it. The black rat (*mus rattus*) is characterized by the body being black above, while the brown or Norway rat, (*mus decumannus*) has the upper part of the body covered with light brown hair, and whitish underneath. The black rats are not very numerous, because the brown rats prey on them whenever they meet—the brown rats aid likewise in keeping their own species in check, a large rat being the terror of the small ones. If it were not for this fact, we should surely be overrun, for they are very prolific, breeding three times a year; producing from ten to twenty in a litter.

The enemies most dreaded by the rat are the common weasel and the ferret. These little creatures, in proportion to their size, are more blood thirsty and daring than the most tremendous and rapacious quadrupeds. A cat or a dog cannot follow a rat into its hole, consequently they are of little use, compared with the weasel or ferret. Only turn a single one down a rat hole, and the horror and alarm created is soon manifest. The rats fly with all possible speed, the ferret pursuing and darting at the neck. I have been acquainted with several men who followed this occupation, and they told me that their ferrets were frequently wounded severely, sometimes losing an eye in the conflict; but the moment it fixes itself on the neck, its victim is secured, for it cannot be shaken off until it has drained the life blood.

Farmers may sometimes drive away rats from their premises in the summer season, by blocking up their holes with broken glass, [or blacksmith's cinders.—Eds.] and plastering them with mortar, repeating the process wherever new holes appear.

Among other expedients, I have tried a box balanced on a stick, with a bait on the end. One morning I found my box down, and on raising it I found no rat, but a quantity of little chips, for the little rogue had gnawed his way out; but this I remedied with a narrow strip of tin round the lower edge. Another way is to smear a rat, (when caught,) all over with spirits of turpentine, set it on fire, and start him into one of the most frequented holes. A friend once told me that he took a full grown rat, and first cutting off his tail and ears, he singed off the hair, and fastened a fringe of stiff writing paper round his neck and let him go; but the whole body politic did not choose to be scented for one unlucky vagrant.

Now, my advice to any of your readers who may be troubled with rats is, to procure, if possible, a weasel or ferret, and turn him into the principle holes about once a month. But if neither can be procured, try the expedients above mentioned; but in case of these failing, the rats may be materially checked by persevering in the use of traps, baited with the following mixture:—Take of oatmeal one quart, one grain of musk, and six drops of the oil of rhodium. Put the musk and oil into sufficient sweet milk to moisten the meal; then mix all together in a stiff paste. The oil of rhodium can generally be procured at a druggist's store; and seldom fails, together with the musk, to draw rats into any place. Caution is requisite to guard against the common cause of traps failing, which is the smell of the hand. This can be avoided by using an old knife or spoon. W. N. H.

Yates Co., Feb., 1841.

Hundreds of thousands of dollars are yearly wasted in this State by the depredations of rats, and the subject is well worthy of attention. Dr. Godman, who says they "are the veriest scoundrels in the brute creation," (though more excusable than some other scoundrels,) recommends poisoning them with nux vomica, mixed with corn meal, and scented with oil of rhodium, which he says is very effectual. In using steel traps, a good way is to conceal them in light bins, using a spoon instead of the hands in covering them, although in this case, when the surface of the bran has been profusely baited, we have sometimes seen it marked thickly with their tracks, except directly over the trap.

For the New Genesee Farmer.

The Importance of Indian Corn as a Crop for Man and Beast.

MESSRS. EDITORS—Humboldt says that the *Musa Paradisica*, misnamed by his translator Banann, instead of Plantain, is to the inhabitants of the torrid zone, what the cereal grasses, wheat, rye, oats, and barley, are to the inhabitants of Europe.

A single bunch of this vegetable weighs from 65 to 82 lbs. It is probable, as Humboldt asserts, that there is no other plant capable of producing so much nutriment, on so small a space of ground,—still, the cultivation of Maize (Indian) corn is much more general in equinoctial America, but for the subsistence of man and beast, than any other vegetable production.—Ought not this single fact to encourage our farmers to give more of their attention to the crop of Indian corn. There is no doubt but that on a first rate soil, 100 bushels per acre may be easily produced. A heavy growth of stocks as fodder, particularly in a dry season, has never yet been duly appreciated; and the working of the soil planted with corn, is a certain means of eradicated those weeds which are so often introduced by manure in the cultivation of the cereal grasses. S. W.

ERRATUM.—Page 42, Col. 1st, line 23, of this number, for "h.m" read *hc*.

For the New Genesee Farmer.

Hills and Forest Trees.

MESSENGERS, EDITORS—During our peregrinations this winter, which have not been 'few nor far between,' though confined chiefly to this State, we have seen many, very many, beautiful farms; which we believe might be rendered still more beautiful by a little attention, and at a comparatively trifling expense on the part of the owners, to a portion of them now nearly or quite useless and unproductive.

We allude to the small gravel and sand hills (in some instances calcareous) so common throughout our State, more particularly in the Western part of it. Many of these are so steep that when the surface is disturbed by the plough, (which should never be,) much, and in some instances nearly all the productive portions of the soil is washed down by heavy rains, and finds its way to the plains below; and as these, by this unavoidable process, (if the surfaces of steep elevations are disturbed,) become enriched, the hills become impoverished, and very nearly in the same ratio.

One who has not closely observed these operations, can have no adequate conception of the vast quantity of earth that descends from mountains and hills, when these are disrobed of their natural covering by any of the operations of art, even when undisturbed by cultivation. In many instances these effects are ruinous to both, for years at least, and perhaps would require a century to regain their wonted fertility. Now all this may be prevented, and in our opinion ought to be; and will therefore venture to propose the following beautifying, cheap, and at the same time profitable, method of accomplishing so desirable an object.

Let the owners of these hitherto naked and comparatively unproductive and unseemly hills, provide themselves with a few bushels of chestnuts, black-walnuts, hickory-nuts, butternuts, acorns of the several kinds, as well as the seeds of the pine and locust—in short, all, or any of the seeds of our native forest trees, which fancy, taste, or utility may dictate.—There are also many shrubs that are eminently beautiful, and worthy the attention not only of the horticulturist but of the agriculturist; all or any of them might be selected at pleasure, to beautify, enrich, and adorn these now uninviting portions of their farms. The seeds should be gathered as soon as fully ripe, and sown, without depriving them of their natural covering, broadcast, in November or December. This method is to be preferred for the sake of avoiding that detestable regularity too frequently observable in door yards, lawns, and pleasure grounds, as well as in orchards of fruit trees. The sameness of such a view tires the eye, as does an extended plain without any undulation of surface.

If this has been neglected during the months of November and December, it can be done even now, with as great a certainty of success, as freezing is only required to facilitate the vegetating process. This done, the covering may be performed early in the spring, by means of a shovel plough or heavy harrow—the latter being preferable, as only a slight covering is required; for nature, who never errs, drops them on the surface to be covered only with a few leaves, and the work is completed; and if timely and properly performed, he will not only be astonished by the rapidity of their growth, but in a few years amply rewarded, ten a thousand fold, for all their toil and trouble: and thus these hitherto neglected portions of his farm, be the most ornamental, and probably the most valuable part of his whole domain.

Let none deem this work a useless ornament; for whatever beautifies and renders more dear to man his home, can never, by a reflecting and sensible mind, be deemed useless.

"Happy the man whose wish and care,
A few paternal acres bound;
Content to breathe his native air,
In his own ground."

Whose fields with bread, whose herds with milk,
Whose flocks supply him with attire,
Whose trees in summer yield him shade,
In winter fire."

In a future article, should this meet with a favorable reception, we may give you our thoughts on the injuries already done, when little more than half a century has elapsed since the sound of the woodman's axe was first heard in our noble forest, and in his mad career, cherishing malice prepense against every tree, bush, and shrub, has well nigh swept the whole from the earth, not only to the great detriment of the soil, but even to the climate and health of our beloved country; and with it the noblest ornament and greatest source of wealth to any country—its majestic forests.

NATURAL CROOK & CO.

Hemlock Hill, near Silver Pond, Jan. 1841.

Military Fines.

An esteemed correspondent, in allusion to that part of Governor Seward's message, which relates to military fines, and conscientious scruples against paying them, suggests, that such persons pay an equivalent of the cost of military service, to be expended in books published by the American Peace Society, for distribution in the common school libraries, and in tracts to be placed in families, for the spread of the principles of peace. He wishes to throw out this hint for public attention. As his communication is rather foreign to the objects of this paper, we hope he will excuse us for not publishing it at length.

Farming in Allegany County.

Joseph B. Skiff, of Hume, Allegany co., gives the following average products of a farm in that place for the three past years, as an indication of the state of agriculture there, and not as any thing unusual or extraordinary for that region.

	1838	'39	'40
Winter wheat,.....	16½	17	20
Spring wheat,.....	18¾	12	15
Barley,.....	14	25	37
Oats,.....	27	51	40
Corn,.....	50	25	40
Potatoes,.....	300	233	288
Hay,.....	1½	1½	1½

Importation of Silk.

The Journal of the American Society states that the importation of silk into the United States, during the year ending 30th of September, 1839, amounting to nearly twenty-three millions of dollars. Compared with other articles imported, that of silk is one-fourth more than the amount of any other. The amount of manufactures of cotton imported was \$14,692,397; of iron, \$12,051,668; of cloth and essimeres, \$7,078,806; worsted stuffs, \$7,025,898; other manufactures of wool, \$3,567,161; and half the value of silk and worsted stuffs, \$1,169,041; total woollen goods, \$18,831 90. The importation of sugar amounted to \$9,921,632; linen, \$6,731,278. So that the importation of silk nearly equals that of woollen and linen together, and is equal to half of the other fabrics combined.

From the Magazine of Horticulture.

On the Cultivation of the Dahlia.

Agreeably to your desire, I send you a few remarks on the cultivation of the dahlia; and, if you deem them of interest to your readers, you may insert them in your valuable Magazine.

This much esteemed flower, having been for many years a great favorite of mine, I have perhaps devoted more time to its cultivation, and had opportunities of seeing it planted in a greater variety of soils and situations than the majority of your readers; therefore, without hesitation, I give you the result of my experience.

I have invariably found the best general bloom upon those roots which were planted upon a moderately

rich, sandy loam, in a cool situation—if a clay bottom, so much the more favorable—as in hot and dry situations they do not suffer so much from drought, as those planted upon a gravelly or sandy bottom.

Planting the roots upon a proper soil, near the margin of a river; or other large body of water, seems to me the best adapted to ensure a perfect bloom of this exquisitely formed flower, as the continual evaporation from the surface in warm weather, produces a humidity in the atmosphere, much more congenial to the nature of the plant, than can be accomplished by any artificial means."

I admit that cultivators may obtain some very good flowers from plantations made upon a dry, sandy soil, but neither will the flowers be as abundant, or as large as those upon plants growing on the favorable location just noticed; and, if planted upon a strong, rich soil, the cultivator will have a much more vigorous growth of plants, but with a diminished quantity of good blooms.

These remarks will not apply to the striped and mottled varieties, so far as regards the soil. An experiment which I tried last summer, with that novel variety, *Striata formosissima*, leads me to the conclusion, that to bring out the colors, the plants will do better upon a poor gravelly soil, than elsewhere. The experiment was as follows:—

No. 1, I planted in poor, gravelly soil, in an open situation, and all the flowers but two were beautifully mottled.

No. 2, I planted upon a soil, as first recommended above, and not one half of the flowers were mottled.

No. 3. Three plants, very highly enriched, and every bloom but one was self-colored. [The same results have attended our own cultivation of the *Striata formosissima*.—Ed.]

Respectfully yours, T. DUNLAP.

Harlem, N. Y. Nov. 10, 1840.

From the Western Farmer and Gardener. To the Ladies.

"No more toil
Of their sweet gardening labor than sufficed
To recommend cool zephyr, and make ease
More easy, wholesome thirst and appetite
More grateful." MILTON.

Since the editors of this work are doing so much to enlighten the stronger half of creation, as to the ways and means of securing the solids and durables of life, it is but fair that something should be said to enlist the attention of the gentler sex, in regard to the ornamental.

Let me be understood, then, as giving you, one and all, an earnest request to take up the science of cultivation, in what pertains to ornamental gardening. "Poh!"—says some good house-wife, looking up from a portentous pile of stockings—"What's the use of fuddling and quidding over plants and flowers?" "Dear me!" says a young lady, between sixteen and eighteen, engaged in the momentous pursuits incident to that time of life—"How is any one to find time to attend to such things?" "Oh!" says another, "I admire plants and fine shrubbery, but then they are so expensive! one must pay so much for them, and have a man to tend them, &c., &c. And there are still others, we must confess, even among our own sex, who, should you show them the most peerless of flowers, in its fullest bloom, would tell you quite composedly, "La! that's only a rose, I've seen thousands of 'em!" To this last class, any argument on the subject of such very common affairs would be entirely out of place.

But as ladies in general, and American ladies in particular, never do any thing, even to undergoing the tightest lacing, and wearing the thinnest shoes in the coldest winter weather, without having good and sufficient reasons to sustain them, we must of course give a few solid ones, as to why the pursuit of ornamental gardening is so particularly to be recommended to them.

*Of this, we think, there can be no doubt. Mr. Thorburn, of New York, whose garden is situated at Astoria, L. I., nearly opposite Hurlgate, immediately upon the East River, running to within twenty feet of the water, has not failed, for several years, to produce an abundant bloom; while cultivators in the interior, at Jamaica, and at Brooklyn, and other places, have been unable to obtain a hundred flowers from the same number of plants. But, as it is impossible for most cultivators to avail themselves of such a situation, the best means must be adopted for procuring flowers in such soil and situations as those who are admirers of the dahlia, possess. This will undoubtedly be best effected by planting in the best soil and most favorable aspect that the garden affords. If the soil is sandy it should be well trenched, in order that it may retain moisture a greater length of time, and allow the roots to penetrate more readily to a greater depth, which will enable the plants to withstand drought. When the extent of a garden will allow of the choice of such a locality as Mr. Dunlop recommends, it should at once be selected.—Ed.

the first place it conduces to health. A gentleman of my acquaintance told me, that he would ride fifty miles to see one really healthy woman! and phenomenon we think would be rare enough to justify the effort. Now all our treatises on the preservation of health, in recommending exertion as its "sine qua non," insist also, that that exercise must be taken in the open air, and that the mind must be engaged excited equally with the body. Now what occupation fulfils these conditions like gardening? Let me practice it a while out of doors, on a beautiful morning, with all the delightful excitement of going out a border, sowing seeds, transplanting and digging shrubbery, and they will find by the quick of every pulse, and the glow of the cheek, how useful is the exercise. And as a sort of supplement to this part of my subject, I would add, that the art of gardening leads directly to early rising, some of its most important offices must be performed before the burning heats of the day come on. "dear me!" says some young lady, "I never get up early; if that is necessary in order to raise my ra, I never shall do it!" Never fear, my fair lady, once get your heart and soul engaged in the matter, and you will rise early, because you cannot be late. The images of your geraniums and roses await your morning pillow, and you will be down at the first dawn, to see if the blossoms they promise for the day before, have stolen forth, like beautiful flowers in the stillness of night.

When again, gardening is a graceful accomplishment for a lady, and has so been held from the time of Eve—if we may credit the saying of a very old gentleman, one Mr. John Milton, who has many handsome lines to that effect, and who is very much admired in times when every body will write such fine poetry as they can now-a-days. We seriously think that it is every woman's duty, as far as in her lies, to see that the outside of her dwelling is well arranged, trimmed, and ornamented, as to endeavor after bright brasses, pretty carved handsome china, in the inside.

"What is the use of flowers!" exclaims a thrifty housekeeper, meanwhile busily polishing her fire-iron. What is the use of bright fire-irons, say we truly? or of any fire-irons at all? could not you light a fire on two stones, that would keep you quite warm? What's the use of handsome table cloths that spread? one might eat on a board, and sleep on a buffalo skin, and not really starve either!

As much for the "utile." Perhaps many of our readers will remember how involuntary was the character they have formed, in riding by houses, as to the character of their inmates. When you see a house all alone, bare of shrub or flower, except perhaps a volunteer bunches of thistle and pig-weed; do you infer of its inmates? And when you are seated even a log cabin, where the sweet brier is carefully trained around the door, while veils of red glories and of scarlet beans, shade the window do you not immediately think of the dwellers in it, as neat, cheerful and agreeable? This is more especially the case in regard to the homes of the poor. The edit of the rich man's grounds may belong to the gardener, but they who can keep no gardener, whose simple flower garden springs out of momentary labor from necessary labor, possess a genuine maternal love of the beautiful, to render an humble place so fragrant and fair.

But then the time and expense of keeping an ornamental garden!—says some one.—Good, my dear, this is a consideration—but I have used up my sheet of paper. Next month, however, I may show you how to find both time and money.

H. E. B. S.

WET FEET.—How often do we see people tramping about in the mud, with leather soaked through, how often do such people when they return home, driven by the fireside and permit their feet to dry, changing either their stockings or shoes.—Do you then wonder at the coughing and barking, the rheumatism and inflammation, which enable them to ride in their carriages? Wet feet most commonly produce affection of the throat and lungs; even such diseases have once taken place, "the danger is not far off; therefore, let me read our readers, no matter how healthy, to be on their guard against wet feet.—*Med. Adv.*

Who has no bread to spare, should never keep a

Population Statistics.
We annex a comparative view of the Census of the United States at the several enumerations taken by order of the general government from 1800 to 1840.—The increase of population since 1830, is at least four millions. The present population of the United States is very little short of SEVENTEEN MILLIONS.

States.	1800.	1810.	1820.	1830.	1840.

§ Bradford county and parts of Union and Luzerne not included.
* Nine counties not received.
† Incomplete.
‡ Returns from the Western district not received.
§ A part of Monroe county not received.
|| Seven counties not returned according to law, and not included in this aggregate. It is supposed they have a population of about 30,000.

PROGRESS OF THE WHOLE POPULATION.

Year.	Number.	Increase.
1790.	3,929,827	
1800.	5,305,925	1,375,098 or 35.1 per cent.
1810.	7,239,841	1,933,889 " 36.3 "
1820.	9,638,131	2,398,317 " 33.1 "
1830.	12,866,920	3,227,789 " 33.5 "
1840. about	16,900,843	4,033,923 " 31.1 "

By an examination of the tables it will be seen that the white population has increased in a very uniform ratio from 1790 to the present time; the increase in no decade being less than 34 per cent., nor more than 36.1 per cent. The ratio of increase among the free colored people has been very fluctuating; but taking the colored population *en masse*, slaves and free, the fluctuation has been moderate down to 1830, and the average ratio of increase nearly as great as among the whites. But for some reason or other, (perhaps the Abolitionists can explain it,) the ratio of increase for the last ten years, has been greatly reduced, both among free negroes and slaves. A few have gone to Texas and Canada, perhaps 30,000 in all, but this affords a very imperfect explanation of the phenomenon.—*Jour. Com.*

For the New Genesee Farmer.

Education of Farmers' Children--No. 2.
Of the kind and quantity of education for the children of farmers, the following would be a just estimate:—1. It should be appropriate and pertinent; 2. practical, as far as may be; 3. extensive as their condition and means will permit; 4. moral and intellectual; and 5. elevating, and not depressing, them in their rank in life.

These particulars will comprehend more perhaps than some will be ready to admit; but, it is believed, not more than is required by all above the middling class of farmers. The acquisition of it by this portion will soon exert a salutary influence on those below them. It embraces what is necessary for all, that education in the common and elementary branches of which no youth in our country should grow up ignorant; next that which is specially pertinent to the farmer, that knowledge of agricultural subjects which is placed within his power; next, instruction in various kindred objects, and those general subjects which have a connection with our most important civil and social relations, including much of natural philosophy, some chemistry, moral philosophy, the elements of

the principles of government and our constitutions and laws, and the rights and duties and privilege of citizens, and something of political economy or the knowledge of the classes of men and of production and distribution of property as well as of commerce and money.

Besides these, there are various studies, which have an indirect but powerful influence in forming the mind, and strengthening it and fitting it for thinking correctly and closely and profitably, such as algebra, geometry, languages as the Latin, botany, mineralogy, surveying, rhetoric, a portion of geology, and other things of less consequence. Those may have no direct influence upon the son or daughter in fitting them for the immediate labors of a farm, or garden, or farm house; but they exert a great influence upon the mind, to bring out its powers, and to give to it energy and activity. Several of these are important to the sons especially, and will preserve them nearer the level of the daughters, as they will keep them longer at school, will carry more of them from home a few months, and show them more of men and manners, and will place them more on their own responsibility, and tend to elevate their whole character.

It is an undoubted fact, that the daughters too often receive those advantages to a greater degree than the sons, and that the latter are depressed by the comparison. Besides, many of these extra studies are important to both, and may be obtained by them. They will employ the sons longer, and when their minds are made more mature. But, how far they shall be pursued in any case, must be left to the good judgment of parents and the parties concerned. True it is, that the sons need more special attention. They would not be so likely to be dissatisfied with their condition in life, and another end would be gained too by such a course; the daughters, expecting a settlement in the same relative condition, would have a stronger inducement to qualify themselves for those household duties, for which they will find a strong and constant call. In this respect, there is need, too, of correction of mistakes, and the practical education of the daughters should go on hand in hand with that of the sons. The latter should not alone be required to labor and toil in the appropriate works of a farmer and of a farmer's house. For these domestic duties, there needs a wise preparation. He that by the plough would thrive, must either hold or drive, is a plain practical truth in all places, and conditions, and business. The mistress of a family has no less occasion for its application than the farmer himself.

Finally, such an enlarged education would make the sons and daughters more suitable companions for each other, and the amount of happiness would be greatly increased. The rank, the notions, the aims, and the efforts, would be more nearly alike. They would be far more contented with that truly honorable and happy condition in which their benevolent Father has placed them. Their children will be provided for in a wiser manner, so that their "sons may be as plants grown up in their youth, and our daughters may be as corner stones polished after the similitude of a palace."

D. C.

Rochester, Feb. 1-11.

A DEBABLE WHITEWASH.—Before putting your lime, which should be unslacked, into the water, saturate the water with muriate of soda, (common salt.) This will make a whitewash that will not rub off nor crack, and is very lasting.

CURE FOR TOOTH ACHES.—Mix alum and common salt in equal quantities, finely pulverized. Then wet some cotton, large enough to fill the cavity, which cover with salt and alum and apply it. We have the authority of those who have tested it, to say it will prove a perfect remedy.

To Correspondents.

We thank a fair incognita for her letter, but cannot guess out the enigma it contains. We shall wait with impatience the promised answer, and can assure her the favor will be highly appreciated. We hope she will not yet lay aside her useful pen. The errors mentioned were in the copy.

WHERE IS ANNETTE? There have been quite a number of inquiries respecting her of late. Her communications have had a good effect, and we hope she will not abandon us. We have received a beautiful song, composed in her praise, and set to music. If she will only inform us of her whereabouts, we will forward it to her, or call and present it in propria personae.—Ed. Jn.

Graham's Magazine, and Godey's Lady's Book.

We are now in the regular receipt of these two elegant periodicals, and as some of our readers are lovers of fashionable literature we would recommend them to their notice. The engravings alone are worth the price of subscription. Wm. A. HERRICK is agent at Rochester.

Genesee County Agricultural Society.

We are informed by T. C. PETERS, Esq., President of the Society, that, at a meeting held Feb. 10, a list of over 200 premiums was made out for the coming season, and it was decided to hold the annual Exhibition and Fair at Alexander on Wednesday and Thursday, the 13th and 14th of October next. The list of premiums will be circulated in handbill form. C. P. TRINIA, Esq., is Secretary, Batavia.

State Bounty on Silk.

The Committee of the Assembly, to whom the subject was referred, have reported a bill entitled "An act to encourage the growth and manufacture of Silk." It provides that a bounty be paid, of fifteen cents for each pound of cocoons, and fifty cents for each pound of reeled silk produced in the State. The report is an interesting one, and we will publish it next month, by which time we hope the bill will become a law.

Large Hogs.

Mr. Geo. W. Atwill, of Lima, Livingston Co., slaughtered a sow and nine pigs, the weight of which when dressed, was 4,411 lbs. The pigs were less than eighteen months old. The litter consisted of ten in all; one of them was sold. They were a mixed breed, mostly Leicester and Byfield. The weight of each was as follows:—Sow, 493; Pigs, 466, 454, 370, 511, 430, 445, 397, 406, 442. Total, 4,444. Average, 444 each. Quite a lusty family of porkers!

Another.

Mr. Hendrickson, near Miamisburg, Ohio, has a hog (common breed we suppose) which weighed, in October last, 535 lbs.—about three and a half year old. He has also a fine full blooded Berkshire boar—particulars not given. Mr. Rogers, of Miamisburg also, has some thrifty pigs—part Berkshires.

Large Pigs.

Mr. Sheldon Cook, of Bergen, Genesee Co., slaughtered 7 pigs, of a cross breed, (Leicester and Berkshire,) only 7 months old, all of one litter,—which weighed, when dressed, 1,500 lbs. The largest weighed 214 lbs. They were not fed corn, excepting about the last two months. Has any body had larger, of no greater age?

More Vet!

Mr. Samuel Lundy, of Waterloo, informs us that he slaughtered 12 spring pigs, Leicester breed; which weighed, when dressed, 3,014 lbs. The 6 oldest were 9 1/2 months old, and weighed 1760 lbs. One of the largest weighed 395 lbs. He challenges the Berkshires to beat this. If the expense of feeding was considered, perhaps the Berkshires would appear to the best advantage; also in the quality of the pork.

Frank.

Our thanks are due to Messrs. Kimber & Sharpless for three copies of "Frank, or Dialogues between a Father and Son, on the subject of Agriculture, Husbandry, and Rural Affairs," by James Pedder, Editor of the Farmers' Cabinet. We learn that they were forwarded last August, together with a box of the same for a bookseller of this city; but were by some oversight detained on the way. See advertisement.

ENGLISH MARKETS.

By the arrival of the Steam Ship Britannia at Boston, we have received the Mark Lane Express and other papers of the 1st of February, from our friends in London, for which they have our thanks. We observe no material change in the reports of the Markets. Business generally was said to be dull and unsteady. The best brands of United States flour continued to bring 36s per bbl. At Liverpool the demand for cotton had decreased.

NEW YORK MARKET—FEB. 22.

Provisions—There is no change in Beef. Pork is rather firmer; several hundred bls Ohio Mess have been sold at \$11.75, and some lots of Ohio prime at \$9.75. New York State Pork is \$10 and \$2 bbl. Small sales of Northern Lard at 7 1/2; City rendered is held a little higher. Butter, except that of prime quality, is very plenty; and for fair lots in rolls only 7 or 8c can be obtained. Cheese steady in price. Stocks—Clover is at 2 1/2c lb., and rough Flaxseed at \$10.25 for 100 lbs Timothy sold at \$25, and some afterwards at \$27.50, though this is more than can be certainly calculated on hereafter.

ASHEs—The stock of pots is about 1000 barrels, and of pearls 2650 hds—both sorts sell at \$6 per 100 lbs, though nothing of importance was done in pots.

CORN EXCHANGE—The sales of flour have been moderate in extent. Genesee at \$1.75, New Orleans at \$1.75, Ohio, north about, at \$1.75, Georgetown and Howard st. in a very small way at \$1. Some shipments were made of various kinds. A mixed parcel of Jersey Corn was sold at 46 cts, and a quantity of rye in the same boat at 36 cts, 50 lbs. These prices are considered rather too low for a quotation. Jersey oats sold at 30 cts, and Southern at 26 1/2 cts per bu.—Sales of cornmeal at \$2.75, barrel, and rye flour at \$3.25 a 37.

CATTLE MARKET—At market 510 head of Beef Cattle, including 100 left over last week, 130 was from the South, 120 from the East, and the balance from this State; 124 milch cows, and 1150 sheep.

There was a fair demand for beef, and 510 head were taken at \$7 to \$9, averaging \$8 1/4 the 100 lbs.

Milch Cows—Former prices were fully maintained, and 100 were taken at \$20, \$30, and \$10 each.

Sheep were in good demand, and all taken at \$3 to \$4 for common, and \$5 to \$6 for good.

Hay—The market was well supplied, and the sales were mostly made at 62 1/2 to 69 cts the 100 lbs.

PHILADELPHIA MARKET.

Flour for shipment to England, about 700 bls, were obtained at \$4 50; and part of it delivered at this price. Rye Flour—Fair sales at \$3 per bbl. Corn Meal—Sales of Pennsylvania Meal in bls, at \$12.25 for superior casks; for ordinary bls, the price is 11.50. There has been a steady demand for Clover seed, and upwards of 1200 bushels have been taken at 4 1/2 to 5 1/3 per bushel.

ROCHESTER MONEY MARKET.

Table with 4 columns: Specie, par, Eastern Funds, par. Treasury Notes, 1 pr ct prem, Indiana, 8 a dis. Eastern Drafts, 1 do, Illinois, 8 a do. Pennsylvania, 6 a 10 dis, United States, 15 a do. Ohio, 6 a 8 do, New Jersey, par a 5 do. Michigan, 12 a 13 do, Canada, 6 a do. Maryland, 6 a 10 do, Suspens'n Bridge, 3 a do.

Agents for the Rochester Seed Store.

A FULL assortment of seeds, put up at the Rochester Seed Store, may be found at each of the following places: subscribers will also be received here for the "New Genesee Farmer and Gardener's Journal."

Table listing agents for the Rochester Seed Store across various locations including Buffalo, Lockport, Albion, Brockport, Scottdale, Le Roy, Batavia, Attica, Warsaw, Perry, Mount Morris, Sunda, Genesee, Canandaigua, York, Waterloo, Palmyra, Syracuse, Tonawanda, Gettysburg, Hamilton, and Cooperstown.

GRASS SEED WANTED.

A VERY HIGH PRICE will be paid for good clean Timothy Seed, delivered soon at the Seed Store. BATEHAM & CROSMAN. Rochester Seed Store, March 1.

CLOVER SEED.

OF EXCELLENT QUALITY for sale at the Seed Store. BATEHAM & CROSMAN. March 1.

FRANK.

Our Dialogues between a Father and Son, on the subjects of Agriculture, Husbandry and Rural Affairs. This interesting and instructive volume is now for sale by D Hoyt, State St., Rochester. The extracts published in the New Genesee Farmer during the past year, cannot fail to convince the readers of that paper of the value of this book, especially as a present for farmers' children, or young people in the country. March 1.

AGENCY FOR PERIODICALS.

Wm. A. HERRICK, No. 61, Buffalo st., opposite Eagle Hotel, Rochester—Agent for Godey's Lady's Book, Graham's Gentleman's and Lady's Magazine, Littell's Select Reviews, The New Yorker, The New World.

GOLD VINE PEAS.

RAISED in Canada by the original producer of this variety, for sale at the Seed Store. BATEHAM & CROSMAN.

MOUNT HOPE GARDEN & NURSERIES, ST. PAUL STREET, ROCHESTER, NEW YORK.

THE Proprietors of this establishment offer for sale an extensive assortment of Fruit and Ornamental Trees, Flowering Shrubs, Green House Plants, Bulbous Trees, Rooted Dahlias, &c. &c.

Gardens laid out, and Gardeners furnished on reasonable notice.—Persons requiring information on any subject connected with the business, will receive a prompt reply.

All orders, letters of inquiry, &c. must be addressed (post paid) directly to us.

Trees, Plants, &c. will be carefully packed, so that they may be carried to any part of the country in safety; and packages will be marked and shipped as may be designated in the order.

Persons with whom the proprietors are unacquainted, are requested to give a satisfactory reference, or name some person in the city of Rochester, who will guarantee the payment. ELLWANGER & BARRY. Rochester, Dec. 1, 1840.

TIMOTHY SEED WANTED, At the Rochester Seed Store. BATEHAM & CROSMAN.

ROCHESTER PRICES CURRENT.

CORRECTED FOR

THE NEW GENESEE FARMER, MAR. 1, 1841.

Table of market prices for various commodities including Wheat, Corn, Oats, Barley, Rye, Beans, Potatoes, Apples, Cider, Flour, Salt, Pork, Beef, Poultry, Eggs, Butter, Lard, Tallow, Hides, Sheep Skins, Pearl Ashes, Pot, Wool, Hay, Grass Seed, Clover, Flax, and Plaster.

Remarks—We make but few alterations in our table of month. Business generally is dull—the roads are bad, a very little produce is brought into market. The price of wheat has advanced a trifle, but the quantity brought in is small. The Millers generally are not yet prepared to purchase for spring business. A little pork still comes in, it sells mostly at four dollars. Butter, eggs, poultry, &c., in good demand—supplies moderate.

Clover seed has been brought in liberally from Pennsylvania and Ohio, and the price has declined a trifle. It is probably advanced, as sowing time advances. Timothy is scarce, and price high at present.

THE NEW GENESEE FARMER

AND GARDENER'S JOURNAL

M. B. BATEHAM, } VOL. 2. ROCHESTER, APRIL, 1811. NO. 1. } JOHN J. THOMAS,
C. F. CROSMAN, Proprietors. } M. B. BATEHAM, Editors.

PUBLISHED MONTHLY. TERMS.

FIFTY CENTS, per year, payable always in advance.
Post Masters, Agents, and others, sending money free of postage, will receive *seen copies* for \$3.—*Uncollected copies* for \$5.—*Twenty-five copies* for \$10.
The postage of this paper is only one cent to any place within this state, and one and a half cents to any part of the United States.
All subscriptions must commence with the volume.
Volume 1 (stitched) can be furnished to new subscribers. Price 50 cents.
Address BATEHAM & CROSMAN, Rochester, N. Y.

CONTENTS OF THIS NUMBER.

Publishers' Notices, &c. Hints for the Month. To Gardeners—New Silk Reel—Cocoons.	49
Fire Wood. "Bats and Horse Bees." Rust on Wheat.	50
Making Hay. Agricultural Experiments, their dependence on Climate and Soil. Peck's Pleasura (Apple.) Sore Throat in Swine. Effects of Plaster on Land.	51
Important Discovery—How to render Wood Impenetrable and Incombustible. Joint Interests of the North and South in their Inter-State Trade, &c.	52
Transplanting Fruit Trees. Agriculture in Nova Scotia. 53 Fruitful Signatures. Importance of Wheat Culture. Best Time for Cutting Timber. Discovery in Sugar-Making. Blue Grass and Quack (or Corn) Grass.	51
Couch Grass. Educator of Farmers' Children, No. 3. Sugar Beets.	55
Gardening for April. Flowers in England. Wm. R. Smith's Farmery.	56
N. Y. Legislature—Bill to Promote Ag. Horticultural Meeting at Rochester. Burlington Silk Frame. Agricultural Implements Wanted. Chemical Apparatus.	57
Castor Oil Beans—Rhinus. Cheap Laboratory. Hints to Western Emigrants. N. Y. State Ag. Society.	58
Treatment of Peach Trees. Comparative Value of different kinds of Silk Worms.	59
Pleasures and Profits of Agriculture. On Cattle. Col. Sawyer's Berksires.	60

Publishers' Notices.

TO AGENTS AND SUBSCRIBERS—An Explanation.—The number of letters received daily at the Farmer office is very great, (sometimes from 50 to 100) and the health of the acting publisher will not at present allow him to give close attention to business; so that letters are not usually read by the publishers themselves unless they contain something of more than ordinary importance. This will explain many cases of apparent neglect—especially such as omitting to send extra copies to agents entitled to them, but who have not asked for them. It will also explain why letters of acknowledgment have not more generally been sent.

The clerks in the office are competent and careful, but they are not infallible, nor do they know every thing. Some mistakes are made, but many complaints arise from the negligence of the persons ordering the papers, in not mentioning what State the Post Office is in. There may be a dozen offices of the same name in the United States, and if the letter is not marked, it is no wonder if the papers are sent wrong.

A few cases have come to our knowledge where the letters have evidently miscarried or been purloined from the mails, and the money lost. In such cases we consent to bear the loss after being satisfied that the money was correctly mailed; and when informed of the particulars, we forward the papers.

Distressing Times!

It is too bad—we cannot endure it. What shall we do? We daily receive a greater or less amount of money, on which we have to sacrifice from 10 to 15 cents on a dollar, in discount, and some bills we have to return to those who send them. We presume our friends send us such money as they suppose to be good, and therefore we do not ensure them, but we wish to call their attention to the table below, and to inform them that if there is discount on the money, we can-

not afford to send the Farmer at the wholesale terms, (allowing a commission) and if the discount is more than ten per cent, we must return the money. (Several of the "Red back" banks in Western New York have stopped payment of late, and their bills are unsaleable at present.) The following are the present rates of the principal kinds of bills.

Specie, par.	New England, par.
Pennsylvania, 10 a 10 dis.	Maryland & Virginia, 10 a 10 dis.
U. S. Bank, 20 "	New Jersey, 3 a 6 "
Ohio, 10 a 15 "	Indiana, 10 "
Canada, 20 "	Illinois, 15 a 20 "
Suspension Bonds, 3 a 5 "	Michigan, 25 "

The bills of all the Safety Fund Banks are received in deposit by the Banks of this city; and all the Free Banks are also received at the Rochester City Bank, except the following:

All the 9 Banks at Buffalo—Bank of Western New York—City Trust—Chelsea—North Ward—State Island—Farmers', Seneca Co.—Millers', Clyde—Tonawanda—Leah—Lawville—Ocean—Dyer Creek—Allegheny—Brighton—Watertown—Cattaraugus—St. Lawrence—Exchange Bank of Genesee at Alexander—Farmers' & Merchants' at Babayan—James Bank—Dunsville—Farmers' Bank of Orleans at Gaines—Delaware—Mechanics' & Farmers' at Utica—Washington.

Several of the above Banks are no doubt perfectly solvent and will soon be again current.—*Rochester Daily Adc.*

To Readers and Correspondents.

We are gratified in being able to give the names in full of several new and valuable writers this month. Other communications are received, some of which will appear next month; but several, without proper signatures, we must decline publishing.

THE MONROE COUNTY AGRICULTURAL SOCIETY, it should be remembered, meet on the 5th day of May, to make arrangements for the season.

Hints for the Month.

Clover and grass seed, if not already sown, should now be, as soon as possible, that they may receive the full benefit of a moist soil, and a crumbling surface from freezing and thawing, to assist vegetation. When sown upon wheat, a light harrowing more effectually insures their growth, and benefits rather than injures the wheat. Be sure to put on plenty of seed—a few shillings more per acre in seed will often bring many dollars more per acre in crop. Sinclair gives the case of a farmer who always stocked heavy with grass seeds, and who always as a consequence secured a heavy coat of herbage the first year, which differed from old pasture only in being more luxuriant.

The farmer should also remember the advantage of a mixture of grass seeds,—different species subsisting upon different parts of the soil—and that a given surface of the soil will therefore support a much greater number of plants of different, than of one and the same species.

New meadows should be early and carefully picked of all loose or projecting stones, and the surface rolled smooth. By clearing off stones and filling covered ditches or building walls, the farmer kills at least three birds with one stone,—he enables the mower to cut more closely and thus save a larger crop of hay; he prevents the frequent loss of hours in the thicket of haying from the dulling of scythes; and useful drains and permanent fences are constructed.

Plaster should be sown early. —as soon as the grass and clover starts a little—a bushel and a half, or thereabouts, to the acre, is about as good as three times that quantity.

Spring wheat should be sown as early as practicable. If the soil be dry, it is best, like peas, to be covered by means of a light plough. Where wheat has been winter-killed, it may be advantageous to sow those vacant spots with spring wheat.

Let all the manure which has been collecting during winter be carted out on the land. To leave a large heap unapplied is throwing away money by handfuls—a single load will often produce several bushels increase of crop—an enormous waste results from neglect. But where manure is not now applied, let it be made into compost, by mixing soil, or what is far better, swan p muck and peat, with it. One load of stable manure, and three of peat, mixed together, with a small addition of lime, will make four loads of compost, fully equal in effect, and far superior to applying and mixing with the soil, to four loads of stable manure. "Manure is money"—let it not be wasted.

Let all spring crops be put in, in the best manner:—"a good beginning makes a good end,"—most commonly. Plough well—let furrow slices be narrow—(except sward—) furrows six inches wide, will show a much handsomer looking field after ploughing, than those a foot wide. Try it. Thorough work is cheap.

Sleds, now out of use, should be well taken care of, put under shelter, and raised from the ground. Sleds, cart wheels, &c. are often more injured by standing on damp earth, by which decay soon commences, than all the use, and (other) abuse, that they receive.

Transplanting trees must be done now, or very soon,—or else put off another year. Farmers! have you a fruit tree *enough*?—recollect they cost but little—and produce much.—Have you ornamental trees *enough* round your house?—they are easily planted—cost but a trifle—and make home delightful—rendering what is invaluable, still more invaluable—now is the time.

To Gardeners.

Our readers will perceive by a notice in another page, that a Horticultural Society is about being organized, and as an exhibition of Fruit, Flowers and Vegetables, will be held some time during the summer or fall, it would be well for gardeners and amateurs to make early preparations. Our June No. will contain the constitution of the Society and notice of whatever arrangements may be made with regard to exhibitions.

New Silk Reel—Cocoons.

Mr. Joseph Alley of this city, has invented a machine for reeling and spinning silk, which it is thought will prove superior to any now in use. It is not quite perfected, but the public will soon have an opportunity of judging of its merits. A more particular account of it may be expected next month.

Mr. Hiram Robbins, near Allen's Creek, in the town of Brighton, offers to take a few bushels of cocoons and manufacture them into sewing silk on equal shares, (halves.) We have seen sewing silk manufactured by him, and it was of excellent quality.

Fire-Wood.

Every individual in the land, shares the benefits of fuel for domestic purposes; and no subject can be proposed for our examination in which a greater number of our readers are interested.

Although fossil coal may now be obtained both from the east and from the west—upward from Albany or downward through the Chemung canal; and though peat, apparently of an excellent quality, has been found in some of the adjoining counties; yet farmers will probably for a long time to come, draw their supplies of fuel from their own woods. We shall therefore confine our remarks for the present to this branch of domestic economy.

The difference in value between some kinds of wood is very great. In this district, sugar maple and upland hickory, are considered the best; and willow, button wood, and Lombardy poplar, perhaps the worst.

But why is not a cord of Lombardy poplar equal to a cord of maple? Chiefly because it does not contain as much carbon. We do not say it would not make as many bushels of charcoal—it would probably yield more. The deficiency is not in the bulk but in the weight. Its texture is more porous—there is really less of it. A cord of maple has been estimated in the Genesee Farmer* to produce 25 bushels of charcoal, while a cord of basswood or white pine yields 32 bushels; but then the former will weigh 25 pounds a bushel, while the latter only weighs 15 pounds.

The relative values of fire-wood, have been stated by the same writer in a table, which we shall expand and render plain to the comprehension of all of our readers, as it may be useful in assisting purchasers.

Where a cord of hard maple is worth 100 cents, white beech and yellow birch are worth 80 cents—white ash and white oak, 75 cents—soft maple, white elm, and swamp ash, 65 cents—chestnut and butternut, 52 cents—basswood, whitewood, and white pine, 45 cents.

It should be understood however, that in comparing the different kinds of wood, it ought in all cases to be dry. Some sorts contain much more sap than others; and if we undertake to burn them green, a larger part of the heat will be occupied in carrying off the moisture in some than in others; for all the heat that is required to turn the sap into steam, is lost to us. As an illustration—we should prefer white ash to either sugar maple or white beech, if we must burn them without drying; and the simmering fires of white oak, white elm, and swamp ash, we should rather not approach.

But another view may be taken of the comparative values of fire-wood. It will not be far from the truth, if we estimate one cord that is well seasoned, equal to two cords of green. Here then by laying in a stock one year before hand, we gain about one hundred per cent.—a speculation certainly worth the attention of every house-keeper.

To leave wood corded up in the woods, however, is a poor plan. A few outside sticks when split fine to let out moisture, may dry enough to be much improved; but the interior of the pile, especially if it be in a shady place, will retain so much of the sap as to become sour—a most unfavorable state for fuel. We prefer green wood fresh from the stump.

But though wood which stands corded in the open ground, receiving the benefit of the sun and wind, may dry enough not to turn sour, it may still be in poor condition to burn at the commencement of winter. Every heavy rain has soaked it, often for days together; and its state will be very different from wood that stands free from the ground under a

dry shed. More than 25 per cent. of moisture will be retained, which is a heavy drawback from its value.

The difference in the quantities of heat received from the same kind of wood in different conditions, is so palpable where a stove is used, that a person of good observation might satisfy himself without a thermometer; and we believe the following scale, beginning with that in the worst condition, will be found nearly correct:—

1. Wet and partly decayed, or water-soaked.
2. Soured by a fermentation of the sap.
3. Remaining corded up in shady places.
4. Corded up in the open ground.
5. Partially decayed in seasoning.
6. Sheltered for 9 months or a year by a good roof.
7. Seasoned several years in a dry building.
8. Kiln-dried.

Whoever will carefully make experiments on fire-wood in all these conditions, must become satisfied that great improvements may be introduced into this branch of domestic economy. †

For the New Genesee Farmer.

"Bots and Horse Bees."

MESSRS. EDITORS—Some other facts on this subject may be added to those mentioned by "Spectator" in your last paper. It is not easy to decide in what manner the nits, deposited by the hot fly on the hair of the horse, pass into the stomach of that noble animal. The fact is certain. By the shaggy coat of the stomach the nits are detained by some unknown contrivance till they hatch into bots. By the same contrivance probably the bots are detained till they are full grown, deriving their nourishment from the coats of the stomach. In the course of the following winter and spring, many of them are voided by the horse, and may be seen in the manure of the horse stable, half an inch long, sharper at one end which is their mouth, showing minny rings, and giving signs of life on being touched, probably to be changed by the heat of summer into bottles. But many of the bots are often retained for a longer period in the horse's stomach, before they are voided by the animal. It is in this case that the bots are so dangerous, and often destroy the horse, as they pass their tapering mouth or proboscis through the shaggy and into the other coats of the stomach, and even through all the coats. I once saw in the stomach of a fine horse that had died from their action, multitudes of bots sticking into the coats, and many of them had pierced through that organ, so that on scraping them off with a knife the liquid matter of the stomach passed through its coats. Those bots were large and strong and of a deep flesh color. They might have been detached perhaps by the action of spirits of turpentine, for this substance has great power over all such animals, but the death of the horse must have ensued from the numerous lacerations of the stomach. The only way to prevent the fatal termination, is the application of remedies before the bots have got so deep a hold, and of course before there is any indication, or any alarming symptoms of the disease. In other words, the remedy must be applied while the horse is in good health. This will not commonly or very often be done; and if it should be done, it might not prove effectual. We can know the danger only by the symptoms of the disease, the indications of the danger.

The name given to the hot-fly by naturalists has been *Oestrus*, from the Greek to excite or to sting. Hence they called the gad-fly or goud-fly, which lays its eggs in the backs of cattle, *Oestrus bovis*, or ox-fly; the insect that lays its eggs in the nose of sheep, *Oestrus oris*, or sheep-stinger; the bot-fly, *Oestrus equi*, or horse stinger. The last, because it inhabits the stomach of the horse, is now called *Gasterophilus*

equi, the lover of the stomach of the horse. The economy discoverable in the works of nature, leads to the belief that the bot performs some important service in the stomach of the horse, while its own being is developed and it is preparing to become a flying insect. Probably it is only in a diseased state of the bots that they cease to be useful and become injurious to the stomach. It may be that some disease of the horse first brings on the diseased state of the bots. It is very certain that the larvæ of the sheep-stinger become diseased in the nose of the sheep, and work the way upwards towards the brain, and bring on blindness, and dullness, and loss of appetite, and the stupor, and finally the death of the sheep. The exarration of the head shows them to be large, strong, and active maggots.

It is well known that the transformations of insects are different and take place under different circumstances. The silk-worm winds up itself in a cocoon to become a chrysalis, and thence a fine moth. The common pletree-worm winds up itself by its web and a le and thus undergoes like changes; thus also many others. The worm on the milk-weed attaches itself its tail to the underside of a rail or limb of a tree drops off its head, and becomes a beautiful blue-spangled with spots of gold, from which in a few days a splendid butterfly comes forth. The large yellow worm on the common cabbage descends to the ground after its period of resting, drops off its head, and continued working forces its way into the earth for winter residence, and the next spring works up to surface, and comes forth in July or August one of those moths that trouble our candles in the evening to some extent. The earth too, becomes the habitations of bots, till the natural changes take place, and the flies spring into life to take their common round annoyance to horses and enjoyment to themselves. This annoyance is greatly increased by the fact the fertilization of the nits takes place after their deposition on the hair of the horse.

How wonderful are these contrivances and conditions for the diffusion of life. What a multitude of those wonders present, themselves to the eye of careful and patient observer. C. 1

March 1841.

For the New Genesee Farmer

Rust on Wheat.

(Concluded from page 38.)

There is a great diversity of opinion upon this subject, and it seems almost impossible to reconcile discordant views of those who have written upon it. In an article, on rust, over the signature of J. List, copied into the New Genesee Farmer, on page 100; from the Farmers' Cabinet, are the following passages:—"It is stated that the fungus is a sitical plant like the mistletoe, but this is not the fact the fungus has no power to attach itself, or penetrate the healthy stalks of the wheat." The foundation cause of the rust of the fungus, is the putrefying matter discharged from the ruptured sap vessels of plants."

Before settling upon any definite conclusion, the state of the stalks at the time the seeds of the fungus are deposited, it may be well to notice a few relative to this subject. The past season I had a few acres of Italian Spring wheat, containing two acres, and joined a piece of winter wheat a distance of several rods. The winter wheat was badly injured by rust the whole distance, and at the time of harvest it, the spring wheat adjacent, was found to be considerably rusted. Some 10 or 15 days after, the spring wheat was cut, and was affected as follows: swarth, badly rusted, perhaps 7-8ths shrunk, and a little less; and so on to the 8th, wd

rust disappeared and the grain was plump. The remainder of the piece was not rusted in the least. There was nothing in the soil or quality of the land where these *Swartha* grew, different from the rest of the piece. A few rods from the dividing line between the spring and winter wheat, and in the latter, surrounded by wheat badly rusted, was a bunch of wheat, (containing some 30 or 40 stalks,) *straw perfectly bright and grain plump*. It attracted my attention, when I discovered a pile of excrement that had been dropped by a horse, lying at the roots of the wheat. Two similar cases were noticed the year before.

A few years since my father hauled a number of loads of chip manure on his wheat field, in the fall after sowing, leaving it in piles of two or three bushels each. Through negligence it was left without spreading. This field of wheat, particularly in that part where the chip manure was hauled, was very much injured by rust *except* around these piles. *Here the straw was bright and the grain handsome.*

I will now notice the first passage quoted above, the import of which is, that the fungus is *not* a parasitical plant; and the reason assigned for this belief is, that it "has no power to attach itself to, or penetrate the *healthy stalks of the wheat.*" It is evident in the case of the spring wheat, that the sporules of the fungus were blown by the wind, (*remember it lay directly east of the winter wheat,*) and became attached to the stalks (whether *healthy* or not I cannot say) of the wheat, and thus produced the effect described. It is very probable that the wheat must be in a *certain state*, as regards its maturity, or rather its approach towards maturity; and it is also probable that much may depend on the state of the weather, to cause the propagation of the fungus. There could have been no inherent principle to cause the rust in the eight *swarths*, that was not common or co-existent with the rest of the piece. The conclusion is, that the rust or fungus spread from the winter wheat, and could its propagation have taken place sufficiently fast, it would have spread throughout the whole piece. But the wheat was advancing toward maturity, and by the time the rust had reached the distance it did, the stalks had become more hardened, and the weather being unfavorable, its ravages were checked. And here I can account, in a measure, for the escape of the wheat from the rust, in the case of the excrement by the horse, and around the chip manure. The roots of the wheat were protected from the action of the frost, and the nourishment received from the manure, advanced it sufficiently to escape the rust.

Before leaving this part of the subject, I will notice two more facts relative to it. *Wheat under shade trees almost invariably escapes the rust.* In this case the ground is more compact, and is not acted on by the frost so as to injure the wheat; and again, the wheat, if much shaded, is retarded in its growth, and may not be enough advanced to become inoculated with the disease. I had a field of wheat the past season, which on one side, was shaded by a row of trees, a distance of 40 rods. At the time of harvesting, this shaded wheat was in the milk, and although this side of the field was much injured by the rust, *this strip* was not at all affected by it. It was left standing, and sometime afterwards I examined it; *it had ripened free from rust.* The other fact mentioned, has undoubtedly been noticed by almost every farmer. The outside land of a field of wheat, which has been packed or trodden down by turning the team while ploughing and barrowing, generally escapes the rust. The reason is obvious: the wheat is not so much acted upon by the frost, consequently ripens sooner.

As it regards the second passage quoted above, to wit: "*The foundation or cause of the rust or fungus*

is the putrefying matter discharged from the ruptured sap vessels of the plant," I shall say but little. The peculiar manner in which the spring wheat was affected by the rust, (in the case given above,) conclusively settles the question. Else why was not the whole piece rusted? Or why should it have gradually decreased until it disappeared with the *Sth swarth*?

"Then, if the disease is contagious, there must be a beginning?" Certainly. But where do the sporules of all fungi originate? "The leaf and stalk of the wheat, then, must be in a *certain state or situation* to ensure the growth of the fungus?" *This is the grand question.* Wheat most likely to be affected by the rust, is that which has been injured by the frost, during the winter and spring and kept backed until the weather becomes warm, when it grows too rapidly, becomes rank and succulent; it advances in this state until it has eared out and in the blossom; rendered still more tender and moist by the damp, warm weather; the pores swelled to excess, occasioned by the luxuriant flow of sap. It is in this situation, when the seeds of the fungus come in contact with it. They find the right place for their propagation—the fungus soon comes to maturity, the sporules fly from stalk to stalk, perhaps carried by the wind some distance; it spreads like wild-fire. J. B. BOWEN.

Aurora, 1841.

Making Hay.

The old proverb says, "Make hay when the sun shines;" but there is something else besides sunshine necessary to make good hay. The grass must be cut when it is mature, or the animals that have to eat it will have a hard bargain.

Many people, including some good farmers, judge of the quality of common hay by its greenness and brightness. It is a fallacious test. We have been feeding out, for a week or two, (3 mo. 8,) hay that was as bright as any body could desire, well made without rain, and kept in the barn. It was a mixture of red-top and Timothy, cut about mid-summer on account of clearing the enclosure for the cattle; and which, had it been left to stand one month longer, would have made excellent hay. As it was, the cattle ate reluctantly, and evidently with some loss of flesh. It is now a pleasure to see with what eagerness they take hold of hay that was cut afterwards.

There is a great difference between the NATURAL and ARTIFICIAL GRASSES. The former, including red-top and Timothy, yield their nutriment principally from the *stem*; and like the Sugar Cane and other plants of the same NATURAL ORDER, should be suffered to stand till the *stems* are mature. On the contrary, the leaves of the ARTIFICIAL GRASSES, including the clovers and lucern, are the most valuable parts; and for this reason, these kinds should be cut when the *leaves* are in the most perfect state. †

For the New Genesee Farmer.

Agricultural Experiments—their Dependence on Climate and Soil.

MESSEES. EDITORS—It strikes me as very important that every correspondent who states the result of his rural experiments, should give the name of the State and county in which he lives, in order that the effect of soil and climate may be taken into the account.

A farmer in Pennsylvania, without giving his longitude, comes out deadly hostile to Timothy hay, giving clover the preference. Eastern Pennsylvania is too warm and dry to be a first rate hay country; hence the long tap root of clover penetrating into the moist subsoil, is thus enabled to yield well, when Timothy is dried up. Not so in the elevated mountain region of north western Pennsylvania. There clover grows rank, and its stalk is ligneous and almost worthless, while Timothy attains a perfect growth.

I once, at Germantown, Pa., saw Indian corn sown broadcast for fodder. The same is done in the Island of Cuba and other equinoctial countries, too warm and dry for grass.

Of late several clover machines have been ordered from this place to Alabama, where it is said clover thrives well, while Timothy can hardly be made to live.

There is very little doubt but that in Madison and the South part of Oneida counties, in this State, a much larger crop of potatoes can be raised for a succession of seasons, than in what is called the Genesee country, from the fact that this region is higher, cooler, and less subject to summer droughts. But on the other hand we are, with like attention, much more certain of a crop of corn, and our clover hay is better, from the very fact that our climate is warmer and drier.

SENECA.

Peck's Pleasant (Apple.)

Some years ago, we received grafts under this name from Rhode Island; and though one branch has borne several crops, we hardly became acquainted with it before this winter, except to observe that it was generally fair and free from that snut (a Lichen?) which damages so many sorts of apples in our hurried seasons.

Fruit above the middle size, heavier on one side setting the stem rather obliquely, somewhat flattened, broadest at the base, 3 inches in diameter, 2½ deep.—*Eye* closed in a shallow depression. *Stem* three quarters of an inch long, inserted in a wide and deep cavity. *Skin* greenish when first gathered, changing as it ripens to a delicate pale yellow, except on the side next the sun, where it is tinged with pale red.—*Flesh* yellowish white, firm though tender, sub-acid, delicate.

A dessert apple, keeping through the winter. 3 mo. 10. It is now in fine condition.

Its principal defect when it grows on crowded branches in the shade, is a deficiency of flavor; but where it is of good size—has been fully exposed to the sun, and acquired a fine blush,—it is a very superior fruit.

We have seen no notice of this apple except in Prince's Catalogue and in Kenrick's New American Orchardist, where a meagre description occurs. It is given on the authority of Stephen H. Smith of Rhode Island: "One of the most saleable apples in market—skin smooth—yellow in the shade—a blush next the sun—flavor pleasant and good—an excellent dessert fruit.—Nov. Feb." We abbreviate the language, not having the book at hand, but endeavor to preserve the substance.

☞ A few words in regard to describing fruit: In theory, the calyx (or blossom) is considered the upper end because it is more remote from the root, although it may hang below; and hence the *Eye* of an apple is described as being in a depression (a sinking in) while the *Stem* or *Stalk* is said to be in a cavity (a hollow below.) †

Sore Throat in Swine.

MESSEES. EDITORS.—Turn animals so affected, into a pasture where there is fresh feed and ground to root. It is a disease resulting generally from confinement. Pounded Charcoal mixed with food, where pasture cannot be had, or room for exercise, is one of the best preventives of diseases in swine. J. M.

Discovery of the Effect of Plaster on Land.

Professor Liebig, of Giessen, has discovered that snow and rain water always contain ammonia; hence its presence in the atmosphere. Plaster, (sulphate of lime,) forms this ammonia in the soil, and keeps it there to stimulate and feed vegetation, in the same manner as lime prevents the escape of the humic acid and other fertilizing gasses, from animal and vegetable manures. SENECA.

For the New Genesee Farmer.

Important Discovery—How to render Wood Imperishable and Incombustible.

Messrs. Editors:—A discovery of the highest importance appears to have been made in France, by which the long-sought preservation of wood from ordinary decay, combustion, &c., is finally achieved.—This has been done by introducing into the wood itself, through the agency of vegetable life, the substances which contribute to these important ends.

It has, indeed, been long known to amateur Botanists, that the flowers of house plants, &c., may be colored by the introduction of coloring matter into the organization of the plants; and that the flavors of fruits may sometimes be injured or destroyed by liquids poured upon the ground, at the root of the tree, at the season of their ripening, which are subsequently imbibed into the vegetable circulation. But these isolated facts have hitherto remained with their possessors, without any useful suggestions having been drawn from them, like a multitude of other scientific truths, which only require to be applied to the arts, to produce the most important results of usefulness to mankind.

The announcement of this discovery comes to us under circumstances which leave little doubt of its truth. The discoverer having submitted his results to the Academy of Sciences, of Paris, a commission was named from that highly scientific body, to investigate the subject, and make a report thereon. In the hope of usefulness, I have made a translation of this report, (omitting some portions, as irrelevant to my purpose,) for your paper, which I subjoin; deeming it highly important that experiments should be extensively made, the ensuing summer, in conformity with the discoverer's process, as shown in the report. It would be no trifling result to secure timber, in all situations, from decay, and our buildings from conflagration, at a cost so trifling as to be within the reach of all.

A physician of Bourdeaux, Mons. Boucherie, has arrived at the all-important result of rendering the tissue of wood almost entirely unattackable by those causes of destruction to which it is ordinarily subject; and at the same time his processes render it much more suitable to the various purposes to which it is applicable in the arts.

A commission of the Academy of Sciences, at Paris, having been named, to examine the subject, Mons. Dumas, in the name of the commission, made in December last, the following report, as the result of its investigations:

"The Academy has charged Messrs. Arago, de Mirbel, Poncelet, Gambley, Audouin, Bous-singault and myself, with the examination of the Memoir of Mons. Boucherie, relative to the preservation of wood, the following is the result of our labors:

"The Academy has already examined, with the most lively interest, the preparations of the author; and it has before it, at this moment, pieces of these so remarkable that the task of its commission is thereby greatly abridged. Mons. Boucherie proposes to render wood much more durable, to preserve its elasticity, to prevent the variations in volume which it experiences through the agencies of dry and humid atmospheres, to diminish its combustibility, to augment its tenacity and its hardness; and, finally, to communicate to it various and durable colors and odors.

"To assume that all these exigencies have been satisfied, and that this has been accomplished by methods, cheap, simple and new; and consummated through the agency of substances that are common, and which bear but a low price, is to fix the attention of the Academy, in a few words, upon the important features of the subject we are charged to examine.

"For the purpose of penetrating an entire tree with preservative, coloring, or other matter, the author has recourse to no mechanical, costly or complicated means; he finds all the force of which he has need, in that process, within the tree itself,—the same force by which its own sap is elevated and distributed through its various parts. This, alone, suffices to convey from the base of the trunk to the very leaves, all the liquids

which he wishes to introduce, provided that these are maintained within certain limits of chymical concentration. If a tree be felled, while in full sap and leaf, and the base of the trunk be at once plunged in a vat or reservoir containing the liquid which it is desired the timber shall imbibe, that liquid, in the space of a few days, will ascend to the very leaves, and penetrate every part of the vegetable tissue, except the heart of the tree, which, in some instances of great age and hardness, or imperfect vitality, resists the absorption, and is not penetrated.

"It is not entirely necessary that the tree shall retain all its branches and leaves during this process, although it is important that those of the extreme top should remain uninjured.

"It is not important that the tree shall remain standing during the operation, which would not always be convenient; it may be felled, and its butt submerged in the liquid it is destined to absorb, when this will find its way to every part.

"On the other hand, the tree may be treated standing, if this be preferred; for it is only necessary that cavities be cut near the bottom, or the trunk be partially severed by a saw, and that the parts thus prepared be put in contact with the liquid, to ensure the desired result.

"This species of penetration, or absorption, which is effected in a few days, without either difficulty or labor, is, as will be readily seen, wholly different from any means hitherto employed. Previous methods are well known to consist of forcing the ingredients into the pores of the wood, by powerful pressure, or of introducing them by the prolonged and imperfect action of liquids prepared at much cost, in huge vats, in which the timber is kept submerged.

"The new and ingenious process of Mons. Boucherie has placed at the command of industry an immense natural force which enables it, without cost, to conduct into the most delicate vegetable tissues all soluble substances which it may be desirable to deposit there.

"If the author has resolved, in a simple and ready manner, the great problem which he at first proposed, he has not manifested less sagacity in his choice of the substances which he has adopted for fulfilling all the indications announced above.

"To augment the duration and hardness of wood, and to oppose its decay, either dry or humid, the crude pyrolignite of iron is to be introduced into its tissue. This substance is wisely chosen, because crude pyroligneous acid is produced in all the forests, in the process of manufacturing charcoal; and it is easy to convert this into the pyrolignite of iron, by simply putting it, even when cold, in contact with scraps of old iron; and because, also, that the liquid, thus prepared, contains much creosote, which independently of the salt of iron, itself possesses the property of hardening, and of guarding against the attacks of decomposition, as well as the destruction caused by insects, wood and timber employed in constructions and for other purposes.

"Authentic experiments tried in the cellars of Bourdeaux, upon hoops, prepared by the author, have proved, in the most conclusive manner, the prolonged duration of wood, after subjection to his process.—The ordinary hoops fell to powder, upon the least application of force to them, while those of the same age, which had been subjected to his preparation, were as solid as upon the first day they were placed there.

"If he wishes to preserve the elasticity of wood, and to render it less combustible, the author has found in the employment of chlorine with an earthy base, the means of accomplishing these ends. Ever pre-occupied with the thought that his discoveries, to be most serviceable, must receive universal practical application, the author has not contented himself with the employment of the chloride of calcium, notwithstanding its great cheapness, but he has analyzed the sea water from the pits of the salt works, which is without value, and by so doing has obtained therefrom all the qualities necessary to his purpose. The different woods prepared by his saline solutions preserve their flexibility, even after several years exposure to the air; and thin sheets of this wood were twisted into spirals, first in one direction and then in the contrary one, without their suffering the slightest fracture or injury of any kind. Exposed to the air these thin pieces were neither split or otherwise injured however dry they became; and, finally, they were so far incombustible as to be capable of sustaining or propagating conflagration.

"To these highly useful properties, which the constructors of ships, bridges, dwellings, &c., will readily appreciate, and turn to profit, the author has joined

others, less important, certainly, but still new, and not without interest, in the arts. The colors woods in clouds so varied and casual as to promise much utility, by the employment of his method in ornamenting the most ordinary woods, so as to fit them for the fabrication of furniture, and for other purposes of ornamental use.

"The specimens of this kind, now before the Academy, relieve us from all details upon this head; and it therefore suffices for us to say:

"That the pyrolignite of iron, alone, gives a very beautiful brown tint;

"That by causing tannin to be absorbed by the tree, after the pyrolignite of iron, the mass of the tree is rendered black, while some portions exhibit tints of blue, black and gray;

"That by introducing, first, the pyrolignite of iron, and afterwards the prussiate of Potassa, a fine Prussian blue is produced;

"That by introducing, successively, the acetate of lead and the chromate of potassa, lemon, or chromate of lead color is produced;

"That by introducing into the same trunk, the pyrolignite of iron, prussiate, and acetate of lead, and chromate of potassa, the whole wood assumes a series of clouds of blue, green, yellow and brown, which collectively produce the most varied and pleasing effect.

"The colors and shades may be varied almost to infinity, according to taste or fancy; as chymistry is sufficiently rich, in agents of this nature, to satisfy the wants, and even the caprices, of the most fastidious.

"We have said nothing here, of the communication of odors to woods, by impregnations of this kind, because this is an application easily comprehended without explanation; and also because it is too strictly limited to the demands of luxury to be placed in the same scale of importance with the valuable result which we have above enumerated.

"It is evident, from the bare announcement of a these results, that they have not been, and never could be, the result of accidental discovery. The author has deduced them from simple ideas; and they are the fruit of long continued and laborious studies and experiments."

The commission closed their labors with a recommendation that a copy of their report be transmitted the ministers of agriculture and commerce, of the public works and the marine, of finances and of war, who recommendation was adopted by the Academy.

At a subsequent sitting of the Academy, that he received notice from the ministers of war and of finance, that they had recommended the method of Mons. Boucherie to the special attention of the commission of engineers, the artillery, and the woods and forests. This shows the importance that is attached to the discovery, by public functionaries, and by the first scientific men of this, or any age, residing upon the earth where its results have been witnessed and investigated.

R. W. HASKINS

Buffalo, March 22, 1841.

Joint Interest of the North and South in the Inter-State Trade.

All classes at the North taxed for Revenue—not so the South. Tobacco Planters beginning to stand their interests. The end of State Stocks remittance to pay foreign debts.

Messrs. Editors:—The Cotton Planters of South export more, and consume less, of their productions, than the farmers and manufacturers of the North. Hence our maritime commerce receives its greatest stimulus from the South. Northern ships carry both ways all that is raised of agricultural products, and all that is consumed of manufactures at South; and as Pennsylvania, New York, and England, are more legitimately the workshops for the South, than all the rest of the world, we can easily see how great importance the South is to the North, vice versa.

But the South very much overrates her import to the Union, when she asserts that because she is a large portion of our foreign debt with her cotton ought on that account to receive her wines and without impost.

It is ascertained that there is not a sufficient impost levied on foreign importations, to support the Federal Government. But if it was double the amount it now is, we would ask what proportion of this revenue would be paid by the cotton planter? Does his bare-foot black laborer, who receives his yearly suit of Yankee tag lock cloth, and eats his peck of corn a week, consume any article that pays a duty to government? I believe there is a single manufacturing town in New England, which, if silks were taxed, would pay more of the duty on that article, than half the cotton planters in South Carolina. At the South, the rich only consume those articles which pay an impost duty. At the North, and in all the free States, the whole mass of the people, the poor as well as the rich, contribute in this way to the support of government. But in the cotton growing States, the great working mass of the population, are of no more political or social account, save in the representation they give to their masters, than the horses and cattle of the North.

We have shown, in a former article, that all the cotton shipped from the United States to France in a single year, did not pay for the silks imported from thence the same year. Is it not therefore a wise policy to encourage the culture and manufacture of silks in our own country, by a moderate impost on the imported article. Would not the South be much more profitably employed, if, instead of all cotton, she turned her attention, in part, to silk culture? Her plantations would not then be so continually desolated by that exhausting crop; her banks would not then be ruined; her planters bankrupt by the low price of cotton, the result of over production and consequent glutted markets.

Our tobacco planters, heretofore so obtuse in relation to the laws of trade, now, quickened by a sudden insight into the full extent, at least of their own suffering interests, begin to ask for protection in the shape of countervailing duties. When our farmers complain of the British Corn Laws, they are answered by the fact, that there is generally as much corn and pulse raised in the United Kingdom as will suffice its consumption, and that if foreign corn was admitted free, it would only lower the price there, to the stimulating of the manufacturing interest into our more successful competitor.

But as tobacco is not indigenous either in England or France, the enormous duty levied on it there seriously lessens its consumption, while it reduces the profit to the American tobacco grower, without offering any boon to European Agriculture.

If ever there was a time when countervailing duties might be tolerated, and home productions encouraged as indispensable to this nation's social health, that time has now arrived. For years back we have paid for our surplus imports in United States Bank shares, State stocks, &c. &c. But in the utter failure of all these devices, all balances must now be paid in coin, every dollar of which we are told will give to the community three dollars of sound paper currency, which alone can keep up the prices of the real estate of the country in like ratio. S. W.

Transplanting Trees.

Although we gave some directions last season, in regard to transplanting trees,—yet we feel warranted in calling the subject up again on account of its great importance, and because it is so little understood by many persons who ought to cultivate trees.

When they are taken up in the nursery, care enough is not commonly taken to guard the roots against drying or freezing. Oftentimes they are carried many miles in an open wagon through warm sunshine, without as much as a blanket to protect them, and perhaps kept a day or two in this state. If the fi-

brous roots are not all destroyed by such treatment, at least the *spongioses* (tunnid ends of the fibres) must be all withered; but frost when it reaches them in this uncovered state, is not less injurious if they are allowed to thaw in the open air. Bury them therefore without delay, and keep them so till the frost is all extracted. Even peach trees, which are more tender than pears and apples, have survived when planted in a frozen state. In short, guard them at the time of transplanting from both cold and dryness; and reflect how much a fresh wound through our own skin would suffer from exposure.

It is not uncommon for a farmer to determine on planting an orchard, without stopping to consider whether his ground is in a suitable condition, or not. Perhaps it is covered with grass—a meadow or a pasture. Holes are then dug just large enough to admit the roots of the trees; and if a prong should project too far, and be too stiff to bend in, a side cut is made for its special accommodation. When the roots are covered, the job is finished for that season. A friend of ours, three years ago, procured pear trees from our nursery; planted them in the manner we have described; and the season proving favorable, all of them lived, which however, he had no right to expect; and they continued to live as he informed us to-day, but with no more growth perhaps than just to keep them alive. Now what has been the result of this course? All the time since they were planted has been lost in regard to them—the period for gathering their fruit has been deferred; and the money so invested has produced no interest.

Ground to be appropriated for an orchard or fruit garden, should be ploughed deep, and rendered perfectly mellow before the trees are planted out. No better crop can be selected for this purpose, than potatoes. To those who intend to have things done in the best manner, we would recommend holes of six feet in diameter, and eighteen inches deep; but those who feel as if they could not work in that style, may dig holes four feet in diameter; and then the following directions may be useful:—

Lay the rich soil at the side of the hole; but the yellow or sterile subsoil throw back, so as to have it out of the way, and not in danger of mixing with the better materials. Chip-dirt, or something similar, should be mixed with the earth in filling the hole—perhaps one-fourth, beginning from the bottom. All trees that we have tried, seem to luxuriate in such a soil. Set them nearly at the same depth as they stood originally in the nursery; but then the earth should be raised about six inches above the level of the ground round the hole, to allow for settling—otherwise the tree in a year or two may stand in a depression.

It is important to have fine earth to throw amongst the roots, leaving no hollow, but every fibre coming in contact with the soil; and it is a good practice when filling in, to shake the stem from time to time, an inch or so up and down, to let the earth settle in between them. When it is all filled in, press the earth down firmly with the foot.

There is another way of planting trees that may do however, when a man has no spade, or is unwilling to use one; and that is, to plough trenches where the rows are to stand. Broad hoes or shovels well worked would soon make the necessary excavation; and the rich mould may be removed into it by the scraper, at the same time taking care not to mix with it the sterile subsoil.

Well, what next? Why, have every tree fastened to a stake, so that the wind shall not shake it and loosen its roots; or by pressing the stem against the earth near the surface, make a hole down which the air can reach them and dry them. It is seldom, if ever, that a young tree does well when it is bent about in that

manner, either by the wind or by the pigs. If the stake is to be upright, it should be set close to the stem; and as it might injure the roots if driven in amongst them, we prefer driving it before the tree is set, which can then be placed near the stake without danger. Sometimes however, we drive the stakes slanting into one side of the hole, and thus avoid bruising the roots. Straw bands are the best for fastening, because if we wrap the band once round the stake before the tree is connected with it, it prevents them from chafing.

When the trees are planted, they are not to be forgotten. Neither horse, nor cows, nor sheep, must approach them. If hogs are permitted to range there, first and foremost, tie branches of the sweet brier round every tree as a sign for these animals to keep their distance. Hogs will take hints of this kind, and faithfully observe them.

Not done yet? No—we have some more advice to offer of great importance. Straw manure from the stable or barn yard, may be very usefully employed round the trees to stimulate their growth, to keep the ground cool by shading it from the sun, and to keep it moist by retaining the light showers that fall through the growing season. But this is not all. As often as once a month, the litter should be raked off, and the ground round each tree well hoed to the distance of two or three feet, and to the depth of three or four inches. See that the workmen do it faithfully, for some may think an inch is deep enough; and then replace the manure.

A tree planted and treated in the manner recommended is almost sure to grow, if the soil is not worked when it is too wet; and will grow many times faster than one that is neglected. Besides it will come much sooner into bearing, and always bear larger and better fruit. †

Agriculture in Nova Scotia.

Through the politeness of the Secretary, Dr. C. C. Hamilton, we have received a paper containing some transactions of the Cornwallis Agricultural Society. We extract the following remarks from the report of a committee on the condition of agriculture, and the best means for its improvement in Nova Scotia:—

“Your committee do not hesitate to say, that one grand cause, why our agriculture does not occupy that exalted position among us, to which it is entitled, is, the want of intelligence in the farming population.

This can only be remedied by the acquisition of agricultural knowledge, and its application to practical purposes; and your committee would earnestly recommend the members of our society, and others, to peruse the periodicals and standard works devoted to their calling, which can be so cheaply obtained, and which so much abound in interesting and instructive matter to the Farmer.

In proof of our deficiency in this respect, it may be mentioned, that although there are about 450 farms, only 12 agricultural newspapers are taken, throughout this Township. The great advantages of intellectual cultivation cannot be too highly prized, and can only be appreciated by those who enjoy them. Of all other arts and sciences, a thorough knowledge of their principles, is considered indispensable to success; surely the farmer will not remain inert, and indifferent, with ample means of information within his reach, and with prospects of a speedy, and adequate reward to amunite his exertions.

Your committee in directing their attention to these sources, from which our Agriculture may be revived and improved, cannot but deeply lament the withholding of Legislative assistance.

In England, Scotland, France, and the United States, &c., large sums are annually given for the encouragement of agriculture, and in proportion to the expenditure, has been its rapid advance, in all these countries. Any one conversant with the state of their agriculture, can readily draw the painful contrast.—Your committee having observed the spirit heretofore manifested by the House of Assembly, cannot forbear from urging on our members, the necessity of renewed diligence, in the hope that something may be accomplished, ere another session shall pass by.

Fictitious Signatures.

If it were the custom in any deliberative assembly—whether at Washington or at Albany—for the orators to conceal their persons and disguise their voices by speaking through trumpets,—would their speeches interest the audience as much as they do at present?

When a person walks in, or sits down in a legislative gallery, is he satisfied to close his eyes and listen to strange voices? Would not the same sentiments and the same arguments be more interesting if he knew from whose mouth they proceeded? Is it not a laudable curiosity that prompts him when a speaker takes the floor, to ask who he is, and to whom he belongs?

Now as we presume our readers will be willing to concede the right answers to these questions, we will take the liberty to ask another. Would not the anonymous articles which are found in our columns, be more interesting if we knew who wrote them? We are free to admit the title of some writers to concealment, such as our [Fair] correspondents "Annette" and "Fanny;" but to "C. D."—"S. W."—"P."—"B.," and many others, whose names if written out would shed a halo round our pages,—we feel unwilling to make this concession. We do not insist, indeed—being gratified to hear from them under any signature—but we hope they will consider how much our interests, and the interests of the community, would be promoted by such disclosures; and how much more eagerly the reader would take up our paper to learn something of his old friends and acquaintances.

For the New Genesee Farmer.

Importance of Wheat Culture.

MESSEURS. EDITORS—To improve the true interest of the farmer, of any section of country, you must most surely instruct him in the management of his lands for the production of the staple crop of the country, or to the growth of that crop for which his lands are best adapted, and which will yield him the greatest profit. It is well known that our principal profit is produced from our wheat crop. It is the adaptation of our soil to the production of this finest of grain, that will ever render our lands valuable above any others adapted only to the production of the coarser grains. And accordingly wisdom would dictate that our improvements in agriculture should tend mainly to the increased growth of this crop. It is true that exclusive wheat cropping may not be advisable; but in the management of our farms we ought to adopt a system of rotation not calculated to interfere with the growth of wheat; but rather to fit and prepare our lands for the reception of that crop. Since the settlement of this country perhaps too much attention has been turned to raising wheat, or we may have practised a bad system, and thereby drained and exhausted our lands in many cases; but having discovered this error, we must not henceforth quit our old crop and bestow our attention on other branches of farming to the neglect of this. And now, Messrs. Editors, what I would complain of in your paper, is the little attention paid by your agricultural writers to wheat growing, and the much to other things of minor importance. Perhaps it is taken for granted by all, that no information can be imparted to our farmers on this subject. The old motto that "practice makes perfect," I think will hardly apply in this case; for surely I believe that there are no greater errors committed among us, than in wheat culture; and there is no branch of cropping in which farmers more disagree than in this. For example, some think the best time for seeding is the last of August and the first of September; others think the middle or last of September preferable; some will plough in seed, others

barrow in; some think one bushel per acre sufficient, others two and others three. And also in regard to fallowing, there is much diversity of opinion. Now these and many other points which might be mentioned, are subjects worthy the attention of some of your intelligent, practical, agricultural writers, and subjects which might be profitably discussed. If some of your able correspondents will give us a chapter monthly on the subject of wheat culture, grounded on experience and observation, there will be more good resulting to the farming interest of Western New York, than all the articles on ruta baga and mangel wurtzel that have ever appeared in all the agricultural papers in the Union. Not but that the root culture has its share of interest and credit, but in this section it is of minor importance; and surely the New Genesee Farmer ought to be adapted to its location.

Yours respectfully, R.

We fully agree with the preceding remarks on the importance of the wheat culture, and we earnestly call upon our correspondents to furnish whatever may be valuable upon the subject. We think however, that the culture of root crops is quite underrated, as it is on these that the farmer must greatly depend for the successful and profitable feeding of cattle, and consequent manufacture of manure, that prime mover in good farming, not by any means excepting the culture of wheat itself.

A premium would have been offered last year, by the Genesee Agricultural Society, for the best wheat crop, had it not been too late when the list of premiums was published.

Best Time for cutting Timber.

We suppose another age must pass away before the notion of *lunar influence* on timber will be entirely exploded. When the yielding mind of childhood receives a wrong impression from a parent or preceptor, and it is allowed to *harden* for years before Philosophy attempts to efface it, argument too often glances off like water from a goose's back.

On what does this notion rest? Why the moon raises tides on the ocean. Admitted; but on what else is its influence felt? If it has not *room enough* to raise tides on our lakes, can it possibly raise tides of sap in the pores of a tree, where a microscope is necessary to discover them?

But if it did raise the sap, what advantage could we derive from that knowledge? It would raise tides every day; and no one particular time would be better than another.

It has been handed down to us as a rule worthy of remembrance, that "the old of the moon in February is the best time to cut timber." But why is the *old* of the moon better than the *new*? This question might puzzle a Philadelphia lawyer. The "old of the moon" may come on the first day of the month; or it may come on the last—it may differ a whole month. The sap may be frozen, and the moon not able to stir a particle. Or can it act on solids as well as fluids? If it can act on frozen timber, why not on seasoned timber, or solid rock? We cannot understand such occult principles.

We admit indeed that the time prescribed may serve well for cutting *some* kinds of timber; but certainly it is not the *best* time to cut *all* kinds of timber.

We believe it may be laid down as a maxim that *timber is most durable if cut when it contains the least sap*; and we have no knowledge that sap ever runs from a tree in full leaf. On a former occasion we stated a fact from an observant neighbor that basswood rails which he cut when the sap was in full flow, rotted before they seasoned, though immediately laid up in a fence. On the reverse, we have several instances of timber cut in summer that proved very durable, with not one case to the contrary. We therefore infer that

the gradation from the best time to the worst is in the following order: Summer—Autumn—Winter. No timber should be cut in the Spring before the tree is in full leaf.

Physiologists when treating of the functions of plants, have been too fond of drawing general rules, like other people, from a few observations. Because the sap of *some* trees, flows not in winter, they have erroneously concluded it was so with *all*. The sap of the sugar maple however, flows as soon as the leaves drop in autumn; therefore to have that timber durable, it should be cut when the tree is in leaf; and as every leaf is employed in pumping out the moisture, it might be well to let the tree lie untrimmed till they are withered.

A timber tree may be very valuable or otherwise, according to the time of cutting it; and in this country where they are growing scarcer every year, it is more especially important to have the best information on the subject.

Discovery in Sugar Making.

The following communication came too late for this month, but we now insert it, with the hope that possibly it may not be too late for trial this season. We know nothing of the value of the proposed improvement.

For the New Genesee Farmer.

MESSEURS. EDITORS:—As the time for making Maple Sugar is at hand, I take the liberty of sending for insertion, a very simple plan for clarifying it and making a much purer and whiter article than can be done by any other means. For some time the process was a secret, it having been accidentally discovered by a farmer whose sugar in consequence always commanded a higher price and more ready sale than that of his neighbors, and who for a long time would not let the method be used by known.

The story is this:—Having once borrowed a sugar kettle from a neighbor, on attempting to use it, he found it leaked from some cracks. Hoping to remedy the evil he threw in some Indian meal to fill up the cracks and enable him to use it. It did so; and to his astonishment on "sugaring off," he found a much better article than he was in the practice of making. As the corn meal was the only thing he could attribute it to, he continued the use of it, and soon ascertained that it was a very great improvement on the common method of sugar making.

The receipt is as follows:—To the sap required for 40 or 50 lbs. of sugar, add about a pint of corn meal, to be put in while cold and boiled together.

The above I received casually from a farmer who has used the process, and a neighbor of him who discovered it. It is so very simple, and I am induced to believe so very efficacious, that I send it for insertion in your valuable paper, with the hope that it may prove of use to some of your readers. Should any try it, I hope they will let it be known in some future number, how it succeeded.

VERNET.

Cazenovia, Feb. 25th, 1841.

For the New Genesee Farmer.

Blue Grass and Quick Grass, (or Couch Grass.)

MESSEURS. EDITORS—The prevalence, tenacity, and prolific dissemination of the grass well known among us by the name of Blue Grass, (*Poa compressa*;) the increased expenses of cultivation, and greatly diminished returns of product which result from its presence in our grain fields and cultivated meadows, at once demand, and will repay, the strictest inquiry as to the most successful means for its prevention or eradication.

This grass seems to be the natural or spontaneous growth of rich, moist land in this country, and its seeds appear to be thence disseminated by domestic animals, upon the upland pasture, where the opera-

tions of tillage divide and spread its roots and seeds, eventually filling up the soil to such a degree, that ordinarily, and otherwise sufficient cultivation, produces little or no return of grain; and land seeded for meadows, where it exists in the soil, produces one or two meagre and inferior crops of hay, and is then run out. But the most common mode of disseminating this grass, is by sowing clover seed chaff mixed with its seeds, having been mowed from land where it exists; and in this manner whole fields, previously exempt, have been at once filled up with Blue Grass. An obvious preventive in this case, will be to use the clover mill and sow the clean seed—although an opinion is very prevalent that the seed in the chaff is more likely to vegetate and survive than if sown clean.

A more pernicious, but somewhat similar variety of grass is found on some farms in this section, called *Quick Grass* or wild rye, (*Triticum repens*.) They appear much alike in their general character, modes of propagation, and injurious effects; and both require the most thorough and persevering care in cultivation to destroy them. The extreme severity of our winter frosts; and also the usually continued drouth and heat of our long summers, afford us facilities for its purpose which are not possessed by the agriculturist of Great Britain. Numerous experiments confirm the opinion that the vegetative powers of this grass are very much weakened by exposing the roots to the action of severe frosts. Accordingly shallow ploughing, (as the roots do not run deep,) applied later in the fall the better, by exposing the tender roots to the frost—the tillage to be continued by ploughing or harrowing as soon as the land is fit in the spring, has been found very effectual. After this process, it is advisable to plant the ground with corn, and cultivate it thoroughly, or to summer fallow for wheat.

In one instance a very heavy coat of Blue Grass growing on wheat stubble, (the wheat crop was a total failure,) was ploughed in the fall, and though sown in the spring, was wholly unfit for oats or corn. It was sowed with buckwheat at the usual time, which, producing a heavy growth, completely destroyed the Blue Grass. The next season however, there was much very minute Blue Grass in the ground, supposed to have sprung from the seed; which suggests the necessity that the cultivation, or the density of the succeeding foliage, should be such as to prevent this result. Instances of success are stated from the ploughing and rolling, performed just before planting with corn. Of this the writer cannot speak from successful experience. The usual process of summer fallow, by two or three ploughings, commencing in May or June, although it may produce pretty good crops of wheat, has little effect in permanently destroying this grass, or fitting the land containing it for profitable meadow. In managing a fallow much advantage is lost, by failing to apply the harrow, during sowing and harvest. The effects which a harrow applied, once over, every ten days, in dry, hot weather, as upon all noxious grass within its action, is truly surprising. In cases where small patches of the variety here termed *Quick Grass* exists, much caution is necessary to prevent its spread by the plough and harrow; and when the soil is properly loosened, a man with a many pronged fork and basket, will find profitable employment in gathering the roots and carrying them off the land.

Messrs Editors—I consider this, an important subject, and have given it considerable attention for some years past; and as I have not seen much in your paper respecting it, am led to hope that the foregoing suggestions may be useful to some of your readers.

I am cordially yours, &c.

JOHN McVEAN.

Couch Grass.

The following is from a correspondent of the Yankee Farmer.

SR—In the fall of 1839, it was recommended in your paper to kill *Couch Grass* by ploughing the ground late in the season, and expose the roots to the action of the frosts, by which their vitality would be destroyed. This advice was again repeated in your editorial remarks in the fall of 1840. But my experience shows me, that late ploughing will not kill *Couch*, or *Twitch Grass*, as it is sometimes called.—Soon after that notice was published I turned over by ploughing, just before winter set in, a piece of ground which was very much infested by this grass. It was green sward in the spring of that year, and was ploughed and planted with Indian corn; and at weeding time, this grass so completely took possession of the ground, that the rows of corn could hardly be seen, and my neighbors inquired what kind of grain was sown there. Intending this land for turnips the next season, I turned this over by the plough, as before stated: and what was the result? Not a root of the grass was killed, and it appeared in full vigor in 1840, and the field looked as green as if covered with a crop of rye. What was then to be done? This would be a troublesome tenant with my turnips, and having the advantage of prior possession, and firmer hold of the soil, would contend strongly, and perhaps successfully against the young turnip plants, and make the chance for a small crop, or a good crop, to say the least, rather doubtful? I then determined to extirpate it, root and branch, which was accomplished in the following manner:—The ground was ploughed and harrowed, and then my men followed with their rakes, and raked out the roots of the grass into heaps which were afterwards carted into the hog-yard; and this was done three times before sowing my turnips; and this so completely destroyed it, that scarcely a root appeared in the subsequent cultivation.

AN OLD COLONY FARMER.

Plymouth Co. January, 1840.

For the New Genesee Farmer.

Education of Farmers' Children—No. 3.

MESSRS. EDITORS—I have spoken of the useful part of education, as it either directly or indirectly influences the mind. I have taken a rather extended education for the general standard, because we are so liable to fall below than exceed the standard, whatever it may be. I wish now to consider the real object of education, the *developing, exercising, training* the powers of the mind. It is not so much the mere knowledge itself, valuable as that is in various respects, as it is the fitting of the mind for the business and duties of life. Of arithmetic, only a few rules find application in the business of the farmer and of most men; but who would desire his son to study only these rules while the others have a far greater *educating* power upon the mind. Indeed, if we contemplate only these subjects which will have a direct application and be directly practicable upon the farm, they will be found very few, and the influence of education exceedingly trifling, as the time taken to obtain it must be very short. Indeed, of what benefit will be much acquaintance with the art of *reading*, if only utility is to be studied in all our reading; if only there must be a direct employment of the knowledge on the farm. By such an education the mind must be left almost untouched. It will be rude and unpolished in its thoughts, low and common in its language; it will be left under the control of the animal nature chiefly; it will have only coarse views and notions of morality and religion, and of responsibility and obligation, it will be more subject to the power of temptation, and more easily seduced into the ways and works of folly and wickedness; or, it must be preserved from vice and crime by the fear of punishment and the strong arm of power, and not by those ennobling moral principles which are suited to our nature and circumstances.

The young farmer needs this cultivation of mind, this training of the intellect which education gives to prepare him for reading, and all the benefits of that knowledge which now fills the world. A taste for

reading is as much made and acquired as a taste for any thing. The untutored mind can have no relish for it, unless it is for the marvellous; the curiosity must be excited, or no motive will be presented to the mind little trained by culture.

The young farmer needs this cultivation too, that he may have an inducement to employ his mind daily, or often, upon books. The great improvement of mind is made by reading regularly for a short period every day. The instances of this, though far too rare, are abundant to show the great consequence. "*Great effects from little causes*," is the rule of Providence, and ought to be the motto for action. *The diligent hand maketh rich*, in whatsoever it undertakes.

The young farmer needs this cultivation also, that he may have some just estimate of himself and have more influence in the world. There must be superior wisdom in him that guides others. Trick and planning and wiles may succeed perhaps for a time; but all such arts must fail in the end because the ignorance will be disclosed, or the superior wisdom of others will be discerned. Even good common sense, that best of all human endowments of the intellect, must have knowledge and principles to exercise its power. Tact cannot operate without some materials to act upon and to work with.

The young farmer needs this cultivation also, that he may have some adequate notions of the necessity and advantage of education and moral principles in a free community, and may labor for the wider and more general extension of knowledge and virtue. Standing as the very bone and sinew of society, he must have the strength and power which will sustain the interests of society. For this end, education in its general meaning, the training of the mind and heart, is the grand means.

I have spoken of the wants of the young farmer in these several respects, for their bearing upon the main object of those papers, that the interests of the farmer suffer from the too limited education of his sons compared with that of his daughters. I have already said that I would not diminish the one, but increase the other. These views are not new indeed to many intelligent farmers, but they need to be diffused over the community. They cannot be fully appreciated without ensuring correspondent action.

I was about to enjoin some views upon the ornamental, as connected with the education of our children, but must defer them to another time. D. C.

March, 1841.

Sugar Beets.

MESSRS. EDITORS—Agricultural chemistry may indeed cavil at the supposed value of Sugar Beets as food for animals; but the results which nature gives, clearly prove that there are some wonderful secrets in vegetable physiology, which science has not yet discovered.

A neighbor of mine, who is a first rate gardener, told me that he had raised 60 bushels of Sugar Beets last year on an incredible small space of ground in his garden. I asked him which was the most profitable, corn or sugar beets. He replied, both. I then named potatoes, when he burst out into a horse laugh, and said that he could raise ten bushels of beets easier than one of potatoes, and that his cow gave more milk when fed on beets. Added to this, he said that potatoes wanted digging, and that, too, by daylight, in short and often wet days; but that any quantity of sugar beets could be plucked and housed in a single clear evening, and that the trouble of securing the two crops was also less to one in favor of beets.

SENECA.

Seneca co., March 14, 1841.

Gardening for April.

The weather during the past month has been so wintery that but little could be done in the garden except with hot-beds. No time should be lost this month, when the weather will allow, in commencing the operations of spring. Manure can best be carried on when the ground is frozen. Prune or trim fruit trees and bushes; repair espaliers, and procure new stakes for raspberry bushes, &c. Dress asparagus and rhubarb beds, and carry off, or burn all litter and rubbish. As soon as the ground is in good order, select and prepare the best apartments for early planting, and begin to plant or sow the more hardy vegetables.

Onion sets should be planted, and Peas, Lettuce, Spinnage, Turnip and Salsify seeds sown as soon as possible. Towards the latter part of the month, (earlier in Ohio and other States south of this) sow seeds of Carrot, Beet, Onion, and plant English Beans and early Potatoes; and, if not sown in a hot-bed, sow Cabbage Cauliflower, Broccoli Tomato Pepper, Celery, &c. on a warm border where they can be covered with mats in time of frosts.

In Ohio, and wherever danger from frost is not apprehended, most kinds of garden seeds are sown early this month; but in this state, severe frosts sometimes occur as late as the 1st week in May, and tender plants must not be exposed till after that time. It will then be time to sow Cucumber, Melon, Squash, Pumpkin, Beans, Corn, Radish, Turnip, &c.; also, most kinds of herb and flower seeds. For remarks on sowing flower seeds, see Vol. 1, P. 56.

*. * Ill health of Mr. Bateham must be an apology for the brevity of the remarks under this head.

Flowers in England.

From the Gardener's Chronicle of "Feb. 6, 1841," published in London, and edited (in part) by Professor Lindley, we make the following extracts:—

"*Pentlandia miniata*, a pretty bulbous plant from Cusco in Peru, called in *Panacatum* and *Narcissus*, produces its clear scarlet flowers readily, and grows very freely."

"*Geranium rhifolium*. The erect habit of this plant, and its large flowers distinguish it from *G. nepalense*. It is a neat hardy perennial, scarcely exceeding a foot in height. It should be planted in light soil, or on rock work, as it is destroyed by the wet in winter. It flowers in July and August; and may be increased by dividing the roots when in a dormant state, or by seeds, which are produced freely, but the seedling will not flower before the second season. It was raised in the garden of the Horticultural Society, from Himalayan seeds presented by Dr. Royle in May 1839."

"*Dahlia*s. A correspondent of the *Florticultural Magazine*, gives a long list of Prize Dahlias, from which we extract the following names of varieties, which according to this writer have gained more than fifty prizes at the shows for 1840.

- Anato (Muntyg's,) 79.
- Argo (Widnall's,) 51.
- Beauty of the plain (Sperry's,) 89.
- Climax (Jeffery's,) 89.
- Conductor (Widnall's,) 62.
- Defiance (Cox's,) 67.
- Duchess of Richmond, (Fowler's,) 63.
- Essex Rival (Sorrell's,) 109.
- Eva (Foster's,) 73.
- Grace Darling (Dod's,) 115.
- Hope (Neville's,) 105.
- Lewisham Rival (Mead's,) 92.
- Margaret of Lothian (Goodhall's,) 123.
- Mary (Dod's,) 92.
- Miss Johnstone (Willison's,) 87.
- Ne Plus Ultra (Widnall's,) 92.
- Rienzi (Widnall's,) 109.
- Rival Sussex (Stunford's,) 109.
- Springfield Rival (Inwood's,) 122.
- Suffolk Hero (Girling's,) 118.
- Topaz (Girling's,) 77.
- Unique (Ansell's,) 161.
- Virgin Queen (Protheroe's,) 87."

"*Rhododendron maximum* grows much better in shade than in sunny situations; the foliage is of a four times the usual size, and of a much finer green."

WM. R. SMITH'S FARMERY.

EXPLANATIONS.

a, Root cellar filled from the windows, 10 feet wide including walls. *b*, alley, boarded on the stable side, to the top of the mangers, four feet wide. *c*, stalls for the cows, &c., seven feet wide. *d*, ox stables, 8 feet wide. *e*, stalls for the horses, 5 feet wide. *f*, apartments for the *stall boys*. *g*, room for boiling, slicing roots, &c. *h*, sheep troughs, with racks communicating with the loft above. *i*, celf shed. *j*, wagon shed. *k*, barn yards. Note—The upper part of the above cut is a front view, and the lower part a ground plan.

For the *New Genesee Farmer*.

MES-SRS. EDITORS—It is very probable that the sketch of the barn above may strike many persons as being altogether too large and expensive for general use. This is doubtless true to a certain extent. Indeed my only hope is that *some* persons may profit by *some* things described, as I have no expectation but that glaring faults will be found in the plan. The inconvenience resulting from want of arrangement in our farm establishments is also great.

On many farms, having nearly or quite as many buildings as those described, the barns, &c. are so placed as to require much additional labor in passing from one to the other, and in the feeding of the animals.

Manures.—The man who at the present day neglects this important branch of labor, ought to be looked upon as laying the foundation for future poverty. Yet, I venture to say, that not one person in fifty who builds a barn, takes this subject into consideration, unless he may do so for the purpose of finding, as a friend of mine did, a *high knoll*, that the wash of his yards might give him no trouble.

Several methods have been proposed for saving and increasing manure, but on the whole, the plan adopted by Judge Bucl seems to me best adapted to our circumstances. This consisted, as the readers of the "Genesee Farmer" will remember, in shaping the yard like a dish, leaving a margin of ten or twelve feet quite round the outside. With this, if straw be freely scattered weekly over the whole, and the litter from the stables wheeled out and spread, subject to the treading of the cattle, ten times the usual quantity will accumulate.

Again, it is the decision of some of our best New England farmers that pork making is a losing business unless particular attention be paid to the compost heap. If this be true where great economy is used in feeding, what will be the fate of those, who, like myself, have no boiling apparatus nor economical hog yard?

In the sketch, I have placed this yard in the centre, where the excavation is the deepest.

Roots are justly coming into general use; but no systematic mode of feeding can be adopted unless they are accessible at all times. The long, narrow cellar exhibited in the plan, I think will be found very convenient. A sort of hopper with a gated bottom might be placed in the windows, into which the car would be emptied.

The extreme wing at the right in the elevation is the carriage and tool house; to the left of this is the grain barn, say 32 feet front by 45 feet deep, leaving long, narrow bays on each side the floor. The straw stack is directly back of this, and on the west side of the yards.

The centre building has the corn crib and general store room, occupying two-thirds of its length from the back end, which communicates by a trap door with the boiling vats below.

The front is used for a shop, stairway, &c.

To the right and left of this are the hay lofts, which communicate with the feeding alleys below.

The large building on the left, corresponding with the grain barn, covers the sheep house—the plan of which may be thought somewhat whimsical. I know the strongest of these useful animals can *live*, though exposed to the storms of snow and sleet incidental to stack feeding; but it is susceptible of the clearest proof that the expense of a comfortable shed is more than paid for by the increased quantity of wool and flesh. I propose that ranges of feeding troughs, four in number, should be placed in the basement, running from the alley to the back end. These are to consist of a rack, and manger at the bottom; the two outer ones single and placed against the wall; the inner double, that is, to supply food from each side. The racks will communicate with the floor above, from which they are to be supplied with hay.

A narrow floor communicating with the doors shown in the figure, runs the whole depth of the building. On each side are the hay mows, which are raised seven feet above the level of the floor, that the racks may be accessible. In this way a large number of sheep can be provided for in a small space, and without waste of time or food. The small wing on the left is the poultry house.

In the stables two cows or oxen occupy the same stall. The ground floor should be paved, as being better in every particular than plank.

Memor.

WM. R. SMITH.

N. Y. Legislature—"Bill to promote Agriculture."

We stated last month that no report had been made the Legislature on the petitions for the encouragement of agriculture; and such we still consider to be a fact, although some may think we are mistaken. It is true, Mr. Johnson, sometime in the early part of the session, before the petitions from the eastern part of the State were received, offered what is called "A Bill to Promote Agriculture;" but its provisions were so meagre, and so unlike what the members asked for, that we were in hopes the committee, on the receipt of the petitions, would become informed of their want, and report something more in accordance with the petitions, and more worthy of the Empire State. But a warm friend of the cause, who has spent some days at Albany, informs us that a bill is likely to become a law, without improvement, and without opposition.

'Half a loaf is better than no bread,' it is true; and the passage of this law will doubtless be a great benefit; but we shall certainly feel a degree of shame announcing to the world that the great and wealthy State of New York has passed a law for the improvement of agriculture, and appropriated only \$7000 per annum to the purpose.

The bill before the House provides that \$7000 be appropriated annually for five years, in the ratio of \$50 each member of Assembly, and \$600 to the State Society. When any County Society has raised by voluntary subscription any sum of money, the compiler is authorized to pay an equal sum, provided it is greater than the sum appropriated to that county. Mention is made of Commissioners.

It is proper to inform our readers that this bill was introduced in answer to the petition of a few individuals at Albany—self-styled the N. Y. State Agricultural Society—who it will be seen, were careful to provide their own interests. But, as yet, no notice has been taken of the numerous petitions which have been received by the yeomanry of Western New York.

We have seen no account of any further action on the bill for the encouragement of Silk Culture. We hope the members of the Legislature will not disregard the wishes of their constituents and the interests of the State so much, as to neglect these matters it is too late to secure their passage.

Horticultural Meeting.

In accordance to the call published in our last No., a meeting was held in the Lecture Room of the Young Men's Association in this city. Dr. Moses Long was called to the Chair, and H. M. Ward, Esq. appointed secretary.

After some discussion, it was agreed to form an association to promote the interests of Horticulture, to be called the Monroe Horticultural Society; giving to persons residing in other counties, the privilege of becoming members if they wish to do so.

On motion, a committee of five was appointed to prepare a constitution for the society, and report at the next meeting.

The following persons were nominated: Silas Corbin, S. O. Smith, H. M. Ward, P. Barry, Benj. Hill. The meeting then adjourned to meet in the same place on Thursday, March 25, at 2 o'clock, P. M.

A meeting was held agreeable to the above adjournment, but not being so numerously attended as was anticipated, and the committee being unavoidably absent, it was thought proper to postpone the adoption of a constitution until the first Thursday (being the 6th) of May next. The meeting adjourned to meet on that day at the same place, at 2 o'clock, P. M., for the purpose of organizing the society.

The friends of Horticulture in Monroe county, (and those who please from adjoining counties) are respectfully requested to attend.

According to our promise, and the request of several subscribers, we here give a description of the "Burlington Silk Frames," mentioned in our Feb. No.—The engraving and remarks below, render the subject quite plain. If any persons in this vicinity desire to obtain any of the frames, they can leave their orders with our publishers, at the Rochester Seed Store.

BURLINGTON SILK FRAME.

This simple yet complete apparatus for feeding Silk Worms, invented and patented by Edmund Morris of Burlington, N. J., has been found, after repeated trials to accomplish the following important objects.—

1. It secures the most thorough ventilation to all parts of the frame on which the worms are feeding, below as well as above, and obliges them of necessity, to clean themselves of their excrement and other rubbish.
2. That part of all former modes of feeding which requires waiting for the worms to mount upon fresh foliage in order to clean them, is entirely dispensed with; and though cleaning is never necessary, yet should the worms require changing, it is done almost instantly, a thousand at a time, and without the worm, being conscious of the change.
3. The whole apparatus is as portable as a quilting frame; and all the parts which require handling during the feeding season, are as portable as an umbrella, without being liable to breakage.
4. Ventilation and cleanliness are so perfectly accomplished, that disease seems out of the question, unless originating in the egg.
5. The age (from the spinning) of any number of cocoons, from one thousand up to a million, is identified in a day, and they are gathered with six times the facility of the hurdle system, at the same time coming out perfectly clean, and with but little waste of loss.
6. By using branches, cut down with a grass hook or scythe, it saves more than one half the usual expense of gathering foliage and feeding it out to the worms, and more of them are accommodated in the same space.
7. It is cheaper and more durable than the hurdles. All the purchaser is required to do after receiving his frames, is to put in a few nails to support his uprights, and to put straw into his spinning roofs, and the whole contrivance is complete and ready for use.

The vast superiority of this over all other fixtures for feeding silk worms, is such as to be apparent even to persons not acquainted with the rearing of them;

while intelligent gentlemen, practically conversant with the business, have pronounced, without a single exception, that it fully accomplishes all that has been said above. It has been tried repeatedly and found successful in practice, and may be seen at the Burlington Filature, where persons interested in the silk business are invited to examine into its merits. It rejects the hurdle system entirely, and is original in all its parts. A frame sufficient to feed 6,000 worms, may be seen at Jos. Leeds' U. S. Silk Agency, No. 2 Franklin Place, Philadelphia, the proprietor of which has been appointed agent for the sale of frames and rights, to whom, or to the patentee at Burlington, application may be made. An engraved view, with a full description, will be sent on application, post paid. Gentlemen about to erect cocoaneries will find it highly important to examine the capabilities of this Frame, previous to erecting any other fixtures.

The most unqualified approbation has been awarded to this Frame by the numerous visitors who have examined it, and none have made any objection, or expressed a doubt of its capabilities. Many large cocoaneries are now being fitted up with it, for the coming season, and others are building, in which no other fixtures will be used.

The Patentee proposes to manufacture and sell these Frames, or to dispose of the right to individuals to make them for their own use, in order to accommodate those who reside so far from this city as to make the cost of transportation too heavy a tax for them to purchase here. In either case, however, the purchaser should make his own uprights, as the freight would be costly. Each upright, 8 feet long and 6 inches wide, by 2 inches thick, contains 8 feet, costing about 10 cents for hemlock or pine—the expense for making grooves is about 6 cents for each upright. Ten of them will accommodate 54 frames, each 3 by 4 feet.

The price for a feeding frame and roof, calculated for the worms to spin in straw, will be 60 to 70 cents for the two—and this latter kind is greatly preferable to the lath roofs. The worms are remarkably fond of spinning in straw so arranged, the cocoons are gathered with equal facility, and come out perfectly clean, without waste of loss.

To those who prefer to make their own frames, the prices of rights are as follows:

For the right to make and use		
50 frames and 50 roofs		5 dollars.
100 " " "	" " "	10 "
300 " " "	" " "	20 "
500 " " "	" " "	30 "
1000 " " "	" " "	50 "

These frames can be manufactured by the Patentee at a cheaper rate than any individual can furnish them for himself, as machinery will be used for the purpose.

The proper size for the frames and roofs, is 3 by 4 feet, which will accommodate 1,500 or more worms. The dimensions can be varied to order. The straw roofs are covered with mush or thick pasteboard.

Application may be made to Edmund Morris, Burlington, N. J., or to Joseph Leeds, Agent for the Patentee, No. 2 Franklin Place, Philadelphia.

Agricultural Implements Wanted.

There is considerable demand for approved agricultural implements in this place; and if a good assortment were for sale here at moderate prices, the demand would soon be very great. But there are but a few kinds manufactured in this region, and the trouble and expense of obtaining them from the east, are so great that many will not be obtained from there. We would therefore invite some enterprising mechanic from the east—one who is familiar with the different approved implements of the day—and who has a little capital to invest, to come and establish a manufactory in this city. Here are the best of materials and facilities for the business, means of transportation in every direction, and the New Genesee Farmer to circulate intelligence all over the Western World. Now, who will come? Any communications on the subject, addressed to the publishers of this paper, postage paid, will receive attention.

Apparatus for Laboratories.

Professor Dewey informs us that the articles mentioned in another column for a "Cheap Laboratory," may perhaps be most easily obtained from Charles A. Spencer, Canastota, Madison Co., N. Y. Mr. S. will send a catalogue of prices to any person who will direct a letter, post paid, to him. From the catalogue such selection can be made as may be desired, and the order will be speedily attended to.

For the New Genesee Farmer.

Castor Oil Beans--Ricinus.

The cultivators of the soil, and indeed all classes of citizens, have reason to rejoice that this invaluable medicinal seed, is likely to be turned to a very useful account in the domestic economy of every housekeeper. If there is any truth in the following statement taken from the Peoria (Ill.) press, the composition described below may serve the whole country as a substitute for sperm.

"An important discovery was made about ten years ago, by Mr. Isaac Smith, of Eastville, Northampton county, Va. which enabled him to render castor oil equal if not superior to the best sperm for burning in lamps, and for which he intended to take out a patent. This he never did, and permission has since been given to make the improvement known for the benefit of the public. The method of preparing the oil is, merely to mix with it spirits of turpentine, with which it readily combines; in proportion of one of the latter to four of the former.

"Now, since sperm oil is becoming scarcer, and the demand for it increases, the citizens of the west especially will find it to their interest to take advantage of the knowledge of this composition.

"As to its excellence, there is but one opinion among those who have tried it. A lamp filled with this composition will burn four or five hours without the slightest appearance of crust upon the wick, and on extinguishing the flame, there is no fire remaining in the wick, as is generally the case with sperm oil, except of the very best quality—indeed, in the extinguishing and re-lighting a lamp of this oil, there is a strong similarity to that of a gas light. But it burns perfectly free from smoke or the least degree of offensive smell—emits a clear and powerful light, and never congeals in the coldest weather."

The main difficulty experienced by those who have undertaken to cultivate the castor bean in a small way in this latitude, has arisen from a want of knowledge how to purify the newly expressed oil, so as to prevent its becoming very rancid and unfit for use. Perhaps a plain and concise explanation of this process which has long been held as an important secret by the manufacturers of pure "*Oleum Ricini*" may be of service to some of your numerous readers.

This oil is extracted from the bean either by soaking it in boiling water and then subjecting it to a weighty pressure; or by bruising the seed and expressing the oil cold. The latter is called cold expressed, and the former hot expressed oil, in the market. Most of the castor oil consumed in the United States is imported from the West Indies. This, as well as a thousand other articles sent to us from abroad, ought to be produced at home and largely exported. Good oil is now worth by the quantity in New York one dollar and thirty-eight cents a gallon, which can be obtained from a bushel of beans. Land well adapted to their growth, and properly cultivated, will yield in this latitude from twenty-five to thirty-five bushels to the acre. The expense of growing and harvesting does not greatly exceed that of an acre of corn. The press and other machinery used for the manufacture of linseed oil will answer very well for making castor oil. The proneness of this oil, and indeed of all fixed vegetable oils, to become rancid, arises mainly from the mucilage which is intimately blended with it when expressed. Mucilage is quite insoluble in boiling water, hence if we put crude oil and water together in the proportion of five quarts of water to four gallons of oil and gradually heat them over a moderate fire, the mucilage will rise to the surface in a thick scum. All of this should be carefully removed with a skimmer into a vessel for further purification. The skimming should be continued during ebullition as long as any scum arises. The boiling should be kept up until all the water is evaporated, when the oil should be removed from over the fire, otherwise it will burn. It should then be put up in clean tight bottles or casks, and is ready for market. Other oils may be purified in the same way.

There are but few farmers who could not find room and time to cultivate an acre or two of the castor bean without interfering materially with their other farming operations. It should be planted on a warm, rich soil, and as early in the spring as can be done and escape frosts. The hills and rows ought to be about four feet apart. In warmer climates they are placed five feet asunder, because the plants grow much larger than they will in Western New York.

There is an establishment erected at Peoria, for the manufacture of castor oil, the proprietors of which offer to contract for all the beans they can obtain at one dollar a bushel. May the best success attend the enterprise. Yours truly, D. L.

Buffalo, March, 1841.

QUERY.—Will the Ricinus thrive and produce seed to advantage, in as cold a climate as this State?—Eds.

For the New Genesee Farmer.

Cheap Laboratory.

Messrs. Editors:—As you have not given a reply to the question on the articles and cost of apparatus for a cheap laboratory such as a farmer would need, I submit the following. It is difficult indeed to give any very definite statement, because the object designed to be accomplished by the apparatus is not stated. I suppose, however, that the mere examination of soils, as the analysis is rather difficult, long, and perplexing, is not the object. Should that alone be the object, a few crucibles, tumblers, wine glasses, plates and vials, with tongs for handling the crucibles, and scales for weighing accurately to half a grain, would be necessary, and cost two or three dollars. To these should be added several small bottles of chemical tests, such as acids, alkalis, nitrate of silver, oxalate of potash or ammonia, which cost three dollars more, and for the whole, \$6 00

For General Illustrations of Chemistry.

Pyrometer to show expansion of solids,	4 00
2 Bolt heads " " liquids, 5s	1 25
6 Florence Flasks for boiling liquids, 6d	37
Wires for showing conduction of caloric,	1 00
2 Air Thermometers, 20c, and 1 Fahrenheit, \$3,	3 20
Pair of Tin Mirrors for reflecting caloric,	4 50
Ball for do 4s, and Air Thermometer, 4s,	1 00
3 feet of Glass rods, 18d, and Iron stand and rings, \$2,	2 18
Argand's lamp \$2 50, and spirit lamp 50c,	3 00
Fire pump or air condensing Fire Engine,	1 00
2 pint Retorts 6s, and 2 half pints 4s,	1 25
1 Gas bottle \$1, and Tin pipe to conduct gas 4s,	1 50
Gun barrel for procuring oxygen,	1 00
Or an Iron bottle for the same,	2 00
And 6 feet lead pipe to conduct it,	50
1 pint receiver closed at top, or large tumbler,	37
1 quart receiver with ground stopple to burn Iron wire in oxygen,	1 25
Small gazometer to hold oxygen,	3 00
Or two small gazometers in a small cistern to hold oxygen and hydrogen,	4 00
And compound Blow-pipe for the brilliant experiments,	4 60
Tin pipe for burning stream of hydrogen,	50
And 2 glass tubes for musical tones,	75
Iron turnings for hydrogen,	25
Bottles of acids and alkalis,	2 00

The preceding articles would enable a man of some experience, to perform a great many experiments.—Most of the articles wear out with use, and some break easily. Some knowledge of chemistry will enable the enquirer to select from the preceding such articles as would be best suited to his object. The whole amounts to less than fifty dollars. A good selection might be made for thirty dollars. I have been willing on this account to give the articles more numerous than may be desired.

If it is wished to add experiments in Galvanism, I shall be happy to give any information in my power.

It is ardently to be desired that some of our independent farmers might succeed in establishing small laboratories, and in exhibiting the more common and general parts of chemical knowledge. C. D.

March, 1-11.

Hints to Western Emigrants.

Drink cold tea, or buttermilk diluted with water, but no whiskey. Go out of your ploughed and newly cleared fields before the sun is down, and the mirri begins to rise, and keep in doors in the morning until the sun has dispersed the same.

In hot weather make a fire in your house every evening, to dry and cleanse the air. For ordinary medicine, drink strong boneset tea; if very bilious, take Gregory's Pills, (not the spurious sort,) they contain antimony, but no calomel.

Few and simple as are the above directions, had they been strictly followed, many lives might have been saved, and hundreds of congestive fevers prevented.

The history of deaths by fever at the west, is but a combined detail of gross neglect and still grosser ignorance. Some men think that as long as they have a morbid appetite to eat, they have no need of medicine or a physician; and when a physician is called, he is looked upon as a magician whose office it is to raise the dead.

Once asked a physician how one of his patients got along. He is very sick said he, but he will not die, for his wife is a better physician than I am, and all of a nurse to boot. I asked in relation to another patient. He is not dangerously sick, said he, but I fear they will kill him—dont you think they were trying to feed him toasted cheese and fried cake.

GENESEE.

From the Albany Cultivator.

N. YORK STATE AG. SOCIETY.

Albany, Feb. 10, 1841.

Pursuant to public notice, the New York State Agricultural Society met at Knickerbocker Hall at Albany, this day at 11 o'clock A. M. The Present being absent, ALEXANDER WALSH, Esq., one of the Vice Presidents, took the chair, and JESSE BUEL was appointed Secretary pro tem. A quorum being present, the minutes of the last meeting were read. The Report of the Treasurer, C. N. BEMENT, Esq., was then received, read, and accepted.

The Constitution of the Society being called for, was read, when several amendments were proposed by Messrs. TUCKER, NOTT and FULLER, which, after discussion, were adopted, and the revised Constitution directed to be published as follows:—

Constitution of the N. Y. State Ag. Society.

As Amended Feb. 10, 1841.

The style of this society shall be "The New York State Agricultural Society;" its objects shall be to improve the condition of agriculture, horticulture, and the household arts.

Sec. 1. The society shall consist of such citizens of the State as shall signify, in writing, their wish to become members, and shall pay on subscribing not less than one dollar, and also of honorary and corresponding members.

The presidents of county agricultural societies, or a delegate from each, shall ex-officio be members of this society.

The payment of fifty dollars or more shall constitute a member for life, and shall exempt the donor from annual contributions.

Sec. 2. The officers of the society shall consist of a president, eight vice presidents, one to be located in each Senate District; a recording secretary, a corresponding secretary a treasurer, an executive committee, to consist of the officers above named and five additional members, of whom three shall form a quorum, and a general committee, the members of which shall be located in the several counties, and be equal to the representatives in the house of assembly.

Sec. 3. The recording secretary shall keep the minutes of the society.

a corresponding secretary shall carry on a correspondence with other societies, with individuals and the general committee, in furtherance of the object of the society.

3 treasurer shall keep the funds of the society, disburse them on the order of the president or a resident, countersigned by the recording secretary and shall make a report of the receipts and expenditures at the annual meeting in January.

4 executive committee shall take charge of and cultivate or preserve all seeds, plants, books, models, which may be transmitted to the society; and also have the charge of all communications, designed or calculated for publication, and so far as they deem expedient, shall collect, arrange and publish the same in such manner and form as they shall best calculated to promote the objects of the society.

5 general committee are charged with the interests of the society in the counties in which they shall respectively reside, and will constitute a medium of communication between the executive committee and the members of the society.

6. There shall be an annual meeting of the society on the third Wednesday in January, in the city of Albany, at which time all the officers shall be elected by a plurality of votes and by ballot, with exception of the executive committee for the counties which may be appointed by the executive committee, who shall have power to fill any vacancies which may occur in the officers of the society during the year. Extra meetings may be convoked by the executive committee. Fifteen members shall be a quorum for the transaction of business.

7. The society shall hold an annual cattle and horse fair at such time and place as shall be designated by the executive committee.

8. This constitution may be amended by a two-thirds of the members attending any annual meeting.

9. A committee of fifteen was appointed to nominate officers of the society for the ensuing year, to report at the meeting to be held at the Senate Chamber, at 3 P. M. to-morrow. Adjourned to 3 o'clock, Feb. 10, 3 o'clock, P. M.

Feb. 10, 3 o'clock, P. M.

10. Pursuant to adjournment, for the purpose of visiting Mount Hope Farm, near this city, to view the beautiful and extensive herd of improved sheep owned by Mr. P. The company, some twenty in number, after an examination of the Mount Hope and South Down sheep at Mount Hope, which they were highly pleased, were taken to Mr. Prentice to Mr. Corning's farm, where an opportunity of viewing a portion of the Cotswold and Cotswold sheep imported by Messrs. Corning and Southam the past season.

11. Senate Chamber, Feb. 11, 3 o'clock, P. M. Pursuant to adjournment, H. D. GROVE, Esq., was vice president, in the chair. The committee appointed to nominate officers, made their report which was read and accepted; and the following were unanimously elected officers of the society for the ensuing year:—

12. OEL. B. NOTT, of Albany, President.

Vice Presidents.

13. JEROMUS JOHNSON, of Kings.

14. ROBERT DENNISTON, of Orange.

15. CALEB N. BEMENT, of Albany.

16. EDWARD C. DELEVAN, of Saratoga.

17. BENJAMIN P. JOHNSON, of Oneida.

18. LEWIS A. MORRELL, of Tompkins.

19. WILLIS GAYLORD, of Onondaga.

20. T. C. PETERS, of Genesee.

21. Local Members of the Executive Committee.

ALEXANDER WALSH, of Rensselaer,

GEORGE VAIL, of "

HENRY D. GROVE, of "

A. L. LINN, of Schenectady.

JOHN D. MCINTYRE, of Albany.

JOHN S. RANDALL, of Cortland, Cor. Sec'y.

ESRA P. PRENTICE, of Albany, Treasurer.

THOMAS TUCKER, of Albany, Recording Sec'y.

22. The following resolution was introduced by J. J. TUCKER, Esq., of Rensselaer.

23. Resolved, That a committee of five be appointed to prepare and present, a memorial to the Legislature, praying for an appropriation of \$7,000 per annum, for the benefit of agriculture, to be distributed to the several County Agricultural Societies in the amount of \$50 to each member of Assembly, and the sum of \$600 to the State Agricultural Society; the

money to be paid to the several Societies when they shall have raised an equal sum.

After an animated and interesting discussion, in which Messrs. VIELE, JOHNSON, ROOT, FULLER, and others, took part, the resolution was unanimously adopted, and Messrs. VIELE, TUCKER, BEMENT, MCINTYRE and VAN BERGEN, were appointed a committee to memorialize the Legislature for the purpose expressed in the resolution.

Several Reports were received from Committees appointed at the last meeting, to report on various matters of practical agriculture, which will be published hereafter.

On motion of C. N. BEMENT, Esq., it was

Resolved, That the Executive Committee be requested to procure reports from different members of the Society, on the following subjects, to be presented at the semi-annual meeting.

1. On the most approved method of stall feeding oxen and other neat cattle.

2. On converting green crops and other vegetable matters into manure.

3. On the best method of increasing manure and forming a compost.

4. On the proper time to cut Timothy and other grasses, and the most approved method of curing the same.

5. On the comparative economy of employing oxen and horses in the usual business of the farm.

6. On the comparative economy of potatoes, ruta baga, carrots or beets, as food for cattle, sheep, and swine.

7. On the relative value of apples as food for swine, or other domestic animals, compared with making them into cider.

8. On the best means of eradicating Canada thistles.

A Resolution was adopted requesting the President elect to deliver an Address in the Assembly Chamber, in furtherance of the objects of the Society, on the evening of the 23d inst.

Assembly Chamber, Feb. 23, 1841.

The Society met pursuant to adjournment at 7 o'clock, P. M. The Hon. JEREMIAH JOHNSON, Vice President from the first District, took the chair and called the Society to order, when the President, J. B. NOTT, Esq., delivered an address, replete with eloquence and instruction, which was listened to by a large and attentive audience with great satisfaction. The thanks of the society were tendered to Mr. NOTT, and a copy of his address solicited for publication.

Meeting of the Executive Committee.

The Executive Committee of the New York State Agricultural Society, met at the office of the Cultivator, Albany, on the 23d of February—the President of the Society in the Chair. A letter was read from P. B. JOHNSON, Esq. Vice President, expressing his regret that he should not be able to attend the meeting. Mr. J. says—"It will afford me great pleasure to communicate with you at all times in relation to the interests of the Society, and to unite with the officers in such measures as shall be best calculated to promote the interests of Agriculture in our State. I hope something will be done in aid of our objects by the Legislature; and could County Societies be established and sustained, it appears to me that great good will result."

A letter was also read from Col. H. S. RANDALL, Cor. Sec'y., accepting the office, and assuring the committee that he will devote himself zealously and untiringly to the cause. He says—"I wish you would express to the committee the deep regret I feel in not being able to meet them. Say to them, that as one of their body, were I present, I would counsel action.—decided energetic action. A mere formal organization—a nominal Society merely, is useless—nay, the next thing to ridiculous; and unless I greatly mistake the signs of the times, effort on our part will be met with more of corresponding spirit, than it has been in preceding years."

After the appointment of a part of the County Committees, the business was postponed, and a committee appointed to make the necessary inquiries and report suitable names at the next meeting.

A committee, consisting of Messrs. Tucker, Prentice, and McIntyre, was appointed to report a code of By-Laws, and Regulations for the better management of the affairs of the Society.

The following resolutions were unanimously adopted:—

1. That the Executive Committee will hold regular monthly meetings on the Third WEDNESDAY of each month, at the room No 7, Exchange Building, Albany, at 3 o'clock, P. M.

2. That to enable this Society to carry into effect the great objects of its formation, it is necessary to raise the sum of \$1,500, in addition to the aid expected from the State.

3. That as one means of increasing the funds of the Society, the Corresponding Secretary address a circular letter to the members of the Executive and General Committees, urging upon them the necessity of immediate and persevering personal exertion to increase the number of both life and annual members of the Society.

4. That the Recording Secretary prepare and report at the next meeting, a correct roll of the members, specifying those who have paid their annual dues, and the sums due from those in arrears.

5. That the Executive Committee will decide upon the place of holding their First Exhibition and Fair, at their regular meeting in April; and that a committee of nine be appointed to report on the Premium List, so far as practicable at the March meeting. The committee consists of Messrs. McIntyre, Walsh, Bement, Randall, B. P. Johnston, Grove, Gaylord, Morrell, and Peters; and it is expected they will report individually, their views in relation to the objects which should be made subjects for premiums.

Treatment of Peach Trees.

A respected correspondent in the State of Ohio, says: "Two years ago last fall, I scalded a part of my peach trees. On removing some of the soil, the worms were exposed in various positions; and all the trees that I scalded at that time, were found to be free from worms in the spring.

"Some that were scalded in the spring however, were not benefited. The earth was left round the trees so that the boiling water stood above the part affected, and proved of no use.

"Soap suds and weak ley, have sensibly benefited the trees; and from a slight experience I have reason to hope that brine will be found useful.

"Among the useless remedies tried, I will name *borax* and *plugging with sulphur*.

"Soap suds acts like a charm on healthy peach trees; but on such as have the *yellowes*, it is like food in the stomach of a dyspeptic."

From the Journal of the American Silk Society.

Silk Culture.

COMPARATIVE VALUE OF DIFFERENT KINDS OF SILK WORMS.

GIDEON B. SMITH, Esq. Sir,—In June last I tried an experiment with several varieties of cocoons, which may be interesting to the numerous readers of the Silk Journal. The silk worms were carefully fed and were perfectly healthy. I intended them for obtaining eggs for the year 1841, and was anxious to ascertain, by my own experience, which are the best varieties. The cocoons were carefully reeled on the Piedmontese reel, and the silk weighed with a small copper scale.

8 oz. of mammoth white cocoons, floss on, chrysalids not killed, in number 141, yielded 360 grains of reeled silk.

8 oz. of pure white pea-nut cocoons, floss on, in number 134, gave 359 grains of reeled silk.

8 oz. of various colored pea-nut cocoons, floss on, in number 148, gave 329 grains of reeled silk.

8 oz. of mammoth sulphur cocoons, floss on, in number 134, gave 327 grains of reeled silk.

I have not succeeded in keeping silk worm eggs in an ice-house, to hatch successive crops through the summer. Last winter I sent a quantity of mammoth sulphur silk worms to an ice house in Newbern.—They were put up in a box, in the manner recommended by the Messrs. Carsona. In July, I had the box brought down, and spread the eggs on a feeding shelf—not one of them hatched out. I am informed the ice house was not filled until March; it is probable the hot weather in February started the hatching process, and then putting them on ice, in March, destroyed their vitality. Silk worm eggs intended for a succession of crops, in this latitude, should be put into the ice house in December and January.

I have raised about 30,000 multicaulis mulberry trees this year, for feeding silk worms, and intend to give the silk business a fair trial before I give it up.—My cocoonery is 120 feet by 20, a single story. I cannot perceive why the raising of silk should not be as profitable in the United States as it is in France and Italy.

I am, very respectfully, your obd't servt.

JAMES MANNEY.

Beaufort, N. C., Dec. 14, 1841.

For the New Genesee Farmer.

Pleasures and Profits of Agriculture.

Messrs. Editors—In the last number of the Genesee Farmer the enquiry is made, whether Agriculture can be made profitable? Mr. Colman answers this question in the affirmative, so far as New England is concerned; but the inquiry still remains, what are the profits of agriculture in western New York, or rather, what may be the profits under a correct system of cultivation? The wealth of the farmer consists in the productive power of his soil, rather than in the extent of his territory. The farmer who possesses 100 or 1000 acres of unproductive land may be poor. The farmer who possesses 10 acres of land with power and skill to manage and cultivate it so as to supply all his wants, is rich.

An increased fertility of the soil is a source of profit too generally overlooked by the farmer. The great defect in our agriculture, so far as my knowledge extends, is want of system. Any system which shall embrace the two great principles of agriculture, namely, a careful attention to the making and application of manure, and a judicious rotation of crops, will ensure success. A general attention to these great principles would raise Western New York, with a soil naturally productive, to the very summit of agricultural prosperity, if at the same time proper attention be paid to the rearing the best breeds of animals. Of the system or course of rotation the best adapted to his soil and his circumstances, the farmer must be his own judge. An acre of good corn land, well manured and properly cultivated, will produce 80 bushels of corn in a season. After the corn crop is taken off, this acre will produce 20 bushels of wheat. If this acre shall be thoroughly stocked with clover and well plastered, and for two years pastured with cows and hogs, with what manure may be made from the land, it will completely preserve the fertility of the soil, and even increase it. Here we have a four year's course, which will most assuredly preserve the fertility of the soil. But the great question remains to be answered. What will be the result of this system, as it respects profit and loss? An answer to this inquiry must determine the course of the farmer. Two acres of clover on rich land will pasture two cows and four hogs in the best manner, through the season. The acre of corn stalks and the acre of wheat straw, with 40 bushels of corn in the ear, ground and fed with the stalks and the straw, will winter the cows in the best possible manner. Fifteen bushels of corn ground with the cob, and making about 22 bushels of rich provender—this fed to each of the four hogs together with the slops from the cows, will make 300 lbs. of pork, or more—this would give 1200 lbs. pork at \$5 per cwt, would be \$60. The produce from the two cows in butter and cheese, or some of both, cannot be less than \$20 each, making \$40 for the two. The whole value of pork and dairy produce is \$100; the value of wheat from the acre, at one dollar per bushel is \$20—making the whole value of the produce of four acres \$120; \$50 will give one dollar for each day's labor, and pay all the necessary expenses, leaving \$70, or the interest of \$1000 for the use of four acres for one season, and the soil improving at least five per cent. per annum. Ten acres of good land cultivated after this manner, would afford a family of five persons all the necessaries of life. Forty acres cultivated on this plan will pay the interest of \$10,000 annually, without any diminution of capital.

However visionary the results of this system may appear to many, it is founded on facts and principles which every intelligent farmer knows to be correct, and can most assuredly be realized by careful and persevering attention. I do not pretend that this system is the best which can be devised; there is such a variety of soil, climate and circumstances, as renders it impossible to devise any system which shall suit them

all. If any of your numerous correspondents will point out the defects of this system, or devise and recommend any other which shall be more profitable, or which shall do more to simplify the subject of agriculture and bring it within the means of all our common farmers, he will deserve well of his country, and be entitled to the character of a public benefactor.

Thus far I have written upon the profits of agriculture. So far as respects the pleasures of agriculture I would just observe, that the man who has a mind to adopt a system of husbandry embracing all its great principles, will find an employment more conducive to the health of his body and the peace of his mind, than any other; and, while he stands upon his own soil, and sees a variety of vegetable productions springing up and coming to maturity around him, cultivated by his own hand, if his heart is susceptible of grateful emotions, he will "look through nature up to nature's God," and adore that power that scatters blessings around him in such pleasing variety and in such profuse abundance. JESSE IVES.

Homer, March 12th, 1841.

For the New Genesee Farmer.

On Cattle.

Messrs. Editors—Having spent some time this spring in Genesee county for the purpose of purchasing cattle for the Eastern Market, and seeing an ardent desire prevailing among a considerable portion of your intelligent and enterprising farmers of improving their present stocks of cattle, I propose giving some general hints upon that subject—more especially to those however, who breed for the Eastern Market. For steers and working oxen. I prefer the Devon's to any other breed; as their fine horns and beautiful red color united with their quick, graceful motions, give those of the same weight, over other breeds, a price varying from \$10 to \$40 per pair more.

For cows, the Durhams stand unrivalled for their superior milking qualities; yet when we consider their color and coarseness of flesh and the quantity of food consumed, they are not so much beyond the Holderness, or a cross of the Durham and Devon and Holderness, which suit purchasers generally full as well as the Durham. I have frequently sold a Cherry Red cow when driving, for full as much as I could a Durham, where the blood of the Devon was evidently to be seen, from the fine color and horns taking the fancy of the purchaser. But I would not by any means wish to be understood to rank the Devon or Holderness in the same class with the Durham, but would either advise the cross, or the pure Durhams for cows. I would also suggest the evil which results from the too frequent practice of many of your farmers in over-feeding their bulls of pure bloods, of either kind mentioned, with grain, &c. &c., in order to make a great show to their neighbors, in the size of the animal, and also in publishing the weight, at 6, 12 and 18 months old, which is proof sufficient that they are not proper animals for sires. More especially where this practice has been persevered in for some two or three generations. It is generally known that the offspring of healthy men, who live and wade in luxury, hand down to their posterity a curse which will follow them through life, and which cannot be easily shaken off; and most certainly where two or three generations follow the practice of their ancestors, their bodily powers sinking into numerous complaints incident to the human family. So with the brute creation. And, depend upon it, if you rear calves from bulls that have had their digestive organs distended, the same will be handed down, and if not fed with the same bountiful hand, such stock will sink into comparative insignificance.

It would be much better for those raising stock to see that their bulls should be fed well; that is, have

as much good hay as they wish to eat, and kept the old saying is, "heart whole." A few roots winter, say given as often as once a week, would advantageous perhaps, and advisable, as in winter animals like a change from dry hay, making the most "hearty."

I noticed a small stock of very fine Devons in Sheldon, in this county; also a fine Devon bull, near Roy; also a fine herd of Durhams, the property of Mr. Remsen, near Alexander, and the very fine Devon bull, *Red Jacket*, near Batavia, the property of Mr. Cone, lately from Connecticut.

All the above named cattle I would particularly recommend to the farmers of Genesee county, as they have not, I think, been over-looked, any of them sufficiently to injure their stock. Mr. Cone assured me he had let his bull run with his other stock, none which had had any food but hay and straw. This is the best way to produce fine stock. For what farm is there that can feed and nurse his whole stock? What farmer is there that wishes any stock of the kind mentioned, but that will improve his old stock, on same keeping? Rest assured that good blood will prove your stock, but great feed to particular animals should be condemned.

The Devons have proved themselves to the particular favorable attention of the farmers generally, excepting, however, those who keep dairies, for their constitution, standing the long winters, and keep as well as any other stock on the same feed.

Yours,

AN EASTERN DROVER

Col. Sawyer's Berkshires.

To the Editors of the New Genesee Farmer:

In the last No. of your paper, (page 44,) E. Colman asks, if the portraits given of Col. Sawyer's Berkshires are correct likenesses?

In my opinion they are not correct likenesses. The pictures of the two boars are much better likenesses than those of the sows, but are not exact. The traits of the sows, although intended, no doubt, faithful copies of the almost perfect animals they port to represent, I feel bound to say, are mere "ey's sketches." To show the defects of the picture would require more time and space than I can command; but the simplest observer will at once detect the want of symmetry, and of true anatomical well as (if I may so use the expression in this vicinity) architectural proportions belonging to this primitive, the "Improved Berkshire" pig.

I was in Rochester a few days since, and paid a visit to Col. Sawyer's piggery, where I saw some perfect specimens of thorough bred, and crosses of Berkshire. His imported sow, now about two years old, and his boar "Young Prince," from the pig of Mr. A. B. Allen, are probably as perfect specimens of the middle sized Berkshires as can be found in the country, and can only be exceeded in size, but happens not in symmetry, by a few individuals in the extensive piggery of Mr. Allen. Col. Sawyer breeds with great skill and judgment; and I hesitate not to say, that the originals of his Berkshire pigs far exceed in perfection of points and general excellence, the traits that I have seen of them in your excellent paper.

Very respectfully yours,

Buffalo.

L. F.

Note. I have no desire in these remarks to censure too severely, the portraits of animals that appear, and add so much of interest to your valuable publication. The correct drawing of animals, is as important as that of copying faithfully, the human face; this accomplishment is more rare than that of the artist. From the absence of patronage in this country few have chosen that branch of the profession, and is from this cause alone, that so few faithful copies of animals are found.

WHITING'S WISCONSIN PLOUGH.

The inventor of this plough, by a few year's experience in the use of the common ploughs, on the prairies in the west, became fully convinced that the reason why earth so generally adheres to the mould board, is none other than the mould boards being so short and crooked as to form a hollow that catches the dirt instead of a plain flat surface, that would receive equal pressure as it passes through the sward. His next step was to construct one so as to avoid the difficulties common to other ploughs, without in the least impairing its usefulness. And after taking one of the common ploughs, and using it in the prairie soil until such dirt as would naturally adhere to the board had become fully compressed, he examined it and found that a perfect straight line was formed the whole distance of the board, whether lengthwise or crosswise (as in the cut represented above) with a gradual wind to turn the sward. He consequently constructed one on this principle, and experience in its use has since taught him, as well as others, that it is the best and only principle that can be adopted, whether for prairie or other soils.

Many recommendations might be given, but the following are deemed sufficient.

The following certificate is from the Society of Shakers at Watervliet, accompanied by an order for four ploughs, and will show the estimation in which this plough is held by that intelligent society of people.

"We hereby certify that we have tried the Wisconsin plough, as exhibited to us for trial by Ebenezer G. Whiting, and we hesitate not in giving it the preference to any thing we have ever seen of the Plough kind, both for ease and utility.

CHAUNCEY COPLEY,
BENJAMIN TRAIN,

D. A. BUCKINGHAM,
WM. THRASHER.

The following is the report of the judges appointed by the Mechanics' Association of Western New York, held at Rochester, October, 1839, awarding a Diploma to the Wisconsin Plough:

A Green Sward Plough—from E. G. Whiting. This article is constructed upon strict philosophical and mechanical principles, combining many advantages of a rough, strong sward land, and those that are new and rooty, as well as those of ordinary kind, and cannot fail to be a favorite article.

C. DEWEY, L. B. LANGWORTHY, S. W. D. MOORE, Judges.

The following certificate is from Mr. Elias Cost, an extensive farmer at Oaks Corners, near Geneva, accompanied with an order for 6 ploughs:

OAKS CORNERS, December 15, 1840.

This is to certify that I bought a two horse plough last summer of E. G. Whiting, of Rochester, which plough I think is the best I ever used. In the first place it moves easier, and no plough can turn over the sod better. I therefore would recommend the plough to any one for a first rate article. ELIAS COST.

References for those who have never used the plough, and are unacquainted with the above recommendations:—HENRY VOSBURG, Gates; MANSFIELD PARSONS, Brighton; OLIVER CULVER, do.; RODNEY LYMAN, Rochester; GEO. WHITNEY, do.; PETER BURSE, Pittsford; ISAAC MOORE, Brighton; GEORGE BROOKS, do.; OLIVUS CHAPMAN, Riga.

To avoid difficulty for those who live at a distance, patterns for points will be furnished on application.

The above plough is manufactured and sold at A. J. LANGWORTHY'S Eagle Furnace ware house, Rochester; also at No. 1 Buffalo-st. west end of the bridge, by the Patentee, or SAMUEL RICHARDSON, Agent.

N. B. Patterns for the various sizes, furnished by the patentee. Also Castings by the ton to Plough-wooders.

E. G. WHITING.

WHITING'S PLOUGH.

MESSRS. EDITORS—In the December No. of your paper, I observe an article headed "Important Ploughing Match and Trial of Ploughs," purporting to have been held at Worcester by the Mass. Agricultural Society; and as that report is calculated to convey an erroneous impression, and unjustly prejudice the minds of the community against my plough, you will greatly oblige me, and subserve the cause of justice, by publishing the following remarks with the annexed challenge.

I am the inventor of the "Whiting's Wisconsin Plough," mentioned in that report, and was present at the exhibition; but as I had understood it was to be a State exhibition, and did not go with the intention of competition, but merely to witness the exhibition and test the draught of my plough; but being invited to put my plough in for trial with the others, I cheerfully did so, although without the least preparation—so necessary on such an occasion, and used to so good advantage by others. I will not now take up your time and space to detail what I deem the errors and unfairness of the report of that trial, but will do so hereafter. Suffice it for the present to say, that disinterested persons who were present at the exhibition, gave my plough a decided preference, and together with hundreds

who are using my plough in this State, agree in declaring that the report is both unfair and untrue; and if cattle had the gift of speech, there would be more than human testimony to the same point.

Those who are in the habit of using my plough, say it runs easier than any other plough now in use in Western New York, doing equal execution; and no one can persuade them that the above mentioned report is correct, or any where near correct. In order to bring the matter to a test however, I hereby offer a reward of

ONE HUNDRED DOLLARS,

for any plough, manufactured in Massachusetts, that will do as good work, and run (not 100 per cent., but even) one per cent easier than mine; and, in order that distance may not prevent a trial, I will meet any person half way, or thereabouts.

Address, E. G. WHITING.

Rochester, N. Y. March 29, 1841.

"The Northern Light."

This is the title of a large Monthly paper, just commenced at Albany, which bids fair to become very popular; and, judging from the reputation of the conductors, and the appearance of the 1st No. now before us, we can safely recommend it to such of our readers as desire a cheap, instructive, and useful paper, of un-

exceptionable moral character. It is published in double quarto form (16 pages) suitable for binding—Terms \$1 per year in advance. The following is an extract from the prospectus:—

"The principal object of the publication is to diffuse information on subjects of practical usefulness. For the more effectual accomplishment of this object, it is proposed to give it a popular shape and to afford it at so low a rate as to place it within the reach of all classes of readers. In this respect, it will bear a strong analogy to some of the periodical publications put forth in Europe, by Societies for the Diffusion of Useful Knowledge. In like manner, it will be conducted by an association of gentlemen, whose co-operation has been secured by the proprietors. The association consists of the following persons: JOHN A. DIX, T. ROMEYN BECK, GIBSON HAWLEY, AMOS DEAN, THOMAS W. OLCOTT, and EDWARD C. DELLIVAN; and the immediate superintendence and management of the publication will be assumed by the individual first named. The character of these gentlemen, and the fact that they may be considered as representing a variety of interests, political and professional, afford to the public the highest security that the objects of the publication will be kept steadily and faithfully in view.

The publication will embrace four distinct branches of inquiry and intelligence:

- 1st. POLITICAL ECONOMY;
- 2d. AGRICULTURE;
- 3d. LITERARY & SCIENTIFIC MISCELLANY;
- 4th. GENERAL INTELLIGENCE."

For the New Genesee Farmer.

The Past Winter.

MESSRS. EDITORS—The winter which has just closed, has been peculiar for the mildness of some part of it. The weather has been quite uniform, though some severe changes have taken place. The barometer has shown no great variations in the weight of the atmosphere.

The mean temp. of Dec. 1838	was	29°	76.
“ “ “ 1839	“	28	44.
“ “ “ 1840	“	25	14.
“ “ Jan. 1839	“	25	51.
“ “ “ 1840	“	19	32.
“ “ “ 1841	“	27	02.
“ “ Feb. 1839	“	27	78.
“ “ “ 1840	“	32	08.
“ “ “ 1841	“	23	38.
Mean of 3 winter months just ended,		25	20.
for 1840		26	61.
“ 1839		25	09.

The mean temperature of February, 1840, was uncommonly high, and made the mean of the winter somewhat above that of this year. The influence of that warm month was felt through the spring, in the preparation given for the early starting of vegetables.

In December, 1840, there fell in the last half of the month, about 21 inches of snow, and near a foot of it on the 26th and 27th, forming the first sleighing of any consequence.

On Jan 3, 1841, the temperature was 1° below zero.

“ 4, “ “ “ 4 “ “

The next half was warm; but on the 18th the temperature fell to zero, and the next day was only 3 above, while the rest of the month was warm. At the beginning of this month, snow fell 6 inches, and the sleighing was good till the 7th, when the whole was carried away by a sudden thaw, and on the 9th the ice broke up in the Genesee and passed over the Falls. Little snow fell the last half of the month, and the roads were smooth and fine for carriages.

February 12, 1840, the temperature was at zero, and from the 10th to the 18th was a very cold week, with constant and brisk N. W. winds; and the last half of the month was considerably colder than the same part of January. The whole month was 5° colder than that of January. Several inches of snow fell in the month, but the sleighing was at no time good. So much for the winter.

The first week of March has now passed, and has been only one-tenth of a degree warmer than the first week of February. On the 7th snow fell 14 inches deep, and the sleighing is now excellent. The present cold offers few indications of an early spring.

Rochester, March 9, 1841. C. DEWEY.

Vegetable Oyster Pudding.

“A lady of no small standing,” as our Wisconsin friend says, has furnished us the following, and were we at liberty to append her name, we are sure it would be a sufficient voucher for the excellency of her dish.

“Having a great deal of salsify or vegetable oyster, I tried many ways of cooking it; at last I thought of making a pudding of it—and it is very nice indeed—fit for Queen Victoria.

“Take 1 pint of sweet cream; 3 eggs; sugar enough to sweeten it, probably 3 large spoonfuls; a tea spoon of salt; a spoonful of bread crumbs; a tea-cup of grated salsify or vegetable oyster; and a quarter of a nutmeg. Make some pie-crust, line a dish, and bake it about half an hour.”

Regretting that we cannot give the name of the inventor of the above famous dish, we recommend it to special notice; and hope in future that none of our distinguished female friends will hide their names under a bushel, though it may be no (additional) honor to them, even if appended to so fine a dish as the above.

A Scene in Asia Minor.

Know ye the land where the cypress and myrtle
Are emblems of deeds that are done in their clime?
Where the rage of the vulture, the love of the turtle,
Now melt into sorrow, now madden to crime?
Know ye the land of the cedar and vine,
Where the flowers ever blossom, the beams ever shine?
Where the light wings of zephyr, oppressed with perfume,
Wax faint o'er the gardens of Gul in her bloom?
Where the citron and olive are fairest of fruit
And the voice of the nightingale never is mute?
Where the tints of the earth, and the hues of the sky,
In color though varied, in beauty may vie,
And the purple of ocean is deepest in dye?
Where the virgins are soft as the roses they twine
And all but the spirit of man, is divine?

We copy the following sketch of a scene in Asia Minor, for such of our readers as are fond of flowers, and who have not read the “Letters from the Old World,” by a Lady of New York. It occurred on the wild route between the Gulf of Macri and Smyrna, about latitude 37°, but if we make the usual allowance of 10 or 12 degrees on account of the difference in physical climate on this side of the Atlantic, we shall find no corresponding temperature in winter, nearer than the middle of Florida.

It is a sad reflection that lands fertile enough for such productions, and under so fine a sky, should be entirely deserted by the husbandman; and all this on account of the oppressor,—from the savage bandit up to “the most unlicensed and remorseless despotism that the world has ever seen.”

The party, of which this lady was one, carried their own tents and provisions, a cook, &c. &c., and encamped wherever it seemed to suit them best. Our extract begins with the morning of the third day after their departure from Macri.

“The next morning a most glorious scene presented itself to us, which we had not observed in the dusk of the evening before. We were in the midst of a paradise of flowers of such magnificent appearance, unusual size, and profusion of quantity, that were I to relate to you a tythe of what I saw of these splendid productions of nature, you might think I was drawing largely on my imagination. Were I to tell you that I had seen *Oleander-trees* twenty-five feet in height, you might accuse me of “drawing a bow” of equal dimensions; nevertheless such is the fact; for not willing to trust to our senses, nor having the means of making a trigonometrical measurement of their elevation while standing, we caused one to be cut down, and found it to be of the height before stated, and the body of it six inches in diameter; about ten feet of the latter we have brought away, with the intention of taking it home with us. This was only one of many, many thousands which we could see at one glance.

“Very few stood singly, but as far as the eye could reach, we could see them bordering each side of a stream of water, as in Palestine, only of far greater dimensions and in greater numbers.

“In the latter country, we only saw them near streams of water, but here we find them also in the midst of the plains. But the most extraordinary and almost incredible thing for you to realize from my description is this:—Here was a plain fifteen miles in circumference, which seemed more like a land of enchantment than any thing that one can realize from the limited observations one is in the habit of making in countries where Flora is less prodigal of her favors. It seemed to me as if I was in a land where giants had been amusing themselves in arranging and cultivating parterres by the square mile, instead of by the square foot, as we do.

“Distributed over this plain in all directions were groves of *Oleanders*, from ten to one thousand feet in diameter. At the outer extremes of these circles and ovals, the trees were not more than one foot in height, and in the centre they were of the loftiest dimensions.

“The smaller plots resembled beautiful cones, while the larger ones appeared like mounds of roses, so entirely were they covered with flowers. The leaves of the larger trees measured fourteen inches in length by two and a half in diameter.

“So delighted were we with this grand floral display, that we coursed our horses round and round them

• B wood.

in circles, plucking handfuls of flowers, and sitting them on the verdant carpet beneath our feet.

“The day began to waste away, and we had yet made a mile of progress on our road; and guide informed us that we should find subjects enough of this nature to engage our attention on every side during the whole day, if we proceeded on. We then took up our line of march, and the scenes of a far more pleasing and not less extraordinary nature presented themselves to our astonished gaze, during the remainder of our day’s journey.

“We rode through forests of flowering trees in blossom, of such rare beauty and splendid intertune of species and colors, and of such overpowering fragrance, that we were literally supposed ourselves in the midst of “the gardens of Gul in her bloom.”

“Here were the *Pomegranate*, with its incli blossom, its fully expanded bright scarlet flower, beautiful fruit; the *Myrtle* in full bloom; *Lime Orange trees* in blossom and fruit, with many other

“What are with us but mere shrubs, cultivated with the greatest care, and demanding constant attention, are here literally standing trees of large dimensions. Around the bodies of these are seen a variety of flowering creepers, *Honeysuckles*, *J. mines*, &c. &c., which reaching to the top branches, hang in festoons from tree to tree, so that sometimes it was with much difficulty we made our way through them.

“Our attention was attracted to another singular appearance in the vegetable kingdom; we rode and found it to be a vast field of *Heath* and *B* plants of so great a size that we could not at first believe our eyes, that what we beheld was the *Scotch Heather* fifteen feet in height with bodies surging six and nine inches in circumference of wood. But upon close observation we found we were not in error.

“The whole field which was of great extent covered with blossoms. We saw many other fields of the same kind afterward.

“There was too much enchantment about all these scenes for us to hasten from it, so we encamped in the day in order quietly to luxuriate on the beauties of this Eden.”

Cheap and Durable Fences.

MESSRS. EDITORS—As it will soon be time to pair fences, my plan is, where a fence is to stand out being removed, I stake out the ground, throw two furrows towards each other, within eight inches of meeting, then plough two more the same way and lay them on the top of the others, plough the loose earth where the last were taken and shovel it on the ridge and raise it about three high, between two ditches. Then lay a strait on said ridge, by placing the bottom rails on a or wood; cut your connecting blocks of wood two feet long and lay up the fence five or six rails. Then stick stakes without sharpening, in the edge of the ditches and lay on heavy rails for rid and no cattle will jump or throw it down. By method you can build a fence that will stop goats, pigs, will drain the water from the field, no bush will grow near it, the bottom rails will last much longer, and it is not liable to blow down.

Sliding Gates for Bars.

To obviate the inconveniences of common gates, take two 4 inch scantling, 5 or 6 feet long, and fix the end of the bars into them, take up your bar and throw them away, place two stakes or posts where your bar post stood, the thickness of the apart, and two at the other end four inches apart receive the frame and keep it perpendicular; move out at the bottom of each post so as to receive 4 rollers; bed two slabs down level with the surface of the ground, one at the end of the other, and the gate is done. No longer time is required to make such a frame than to make posts and bars, and

* In London’s Encyclopedia of Plants, no British *E. medeol* is marked more than two feet high; but *Erica medeol* is marked four feet; and *E. arborea*, also from the South of Europe is marked five feet high. Our travelers may have been very correct in their botanical examinations, but genus of many species (and *Erica* has 300) it is somewhat difficult to avoid mistakes.

very easy to open and shut. It is preferable to a swing gate in the winter, in a drifted snow. I have adopted the plan many years and find it answers well.

Protecting Fruit Trees.

Build a crib round them, (drawing in towards the top,) of any split firewood; three feet long will answer the purpose, and the wood will not be lost; place something at the top to keep the trees from chafing. Such a frame will keep sheep or cattle from injuring the trees. By keeping the land loose, the hot sun from injuring the bark, and the wind from racking the trees, they will grow twice as fast.

For the New Genesee Farmer.

Merino Sheep.

In answer to "A Subscriber," who asks information respecting the Merino Sheep imported from Spain by Col. Humphrey, I take the liberty of extracting the following from an Essay on Sheep, by Robert K. Livingston, L. L. D., President of the Society for the Promotion of Useful Arts, &c., published, N. Y. 1809.

"To Humphrey and Livingston, their country is indebted for that breed of sheep, which bears the material for the finest fabrics. The former by his poetry, has placed himself among the literary worthies of his time, and by this act has rendered himself more worthy of pastoral celebration than any swain of Arcadia. The latter had by his proficiency in the law, shown himself an upright and impartial Judge; and by this act has proved how deserving he was of the honor of the wool-sack.

The first animals of this race, were two pair bought in France by Dr. Livingston, and sent to New York under the care of one of his own servants, where they arrived in the spring of 1802. Afterwards he obtained permission to ship others, chosen from the highest bred flocks in that kingdom, by permission of the minister of the home department. All these derived their pedigree from the stock given by the Spanish monarch to Louis 16th, in 1786. This royal donation consisted of four hundred rams and ewes, assorted from the best collections beyond the Pyramus; and were conducted to their new residence under the care of Spanish shepherds. Afterwards, by the treaty of Basle, five thousand Spanish sheep were introduced by the government: and out of these national flocks was formed, by cullings and pickings, the famous flock of Rambouillet. Mr. Humphreys obtained his sheep direct from Spain. A numerous flock arrived in good health at New York—the particulars of which we insert from the report made by Eleazer Goodrich, Esq. to the General Assembly of Connecticut, in October, 1805. This gentleman and his colleague of the committee, state—that they have carefully investigated the facts and connected the various subjects referred to them: and take pleasure in observing, that Col. Humphreys, while discharging the high and important duties of his public station, availed himself of the facilities which his character and acquaintance in the capitals of Spain and Portugal afforded; and in the year one thousand eight hundred and two, extracted from Spain a chosen flock of one hundred sheep of the Merino race.

[Here follows a statement of the committee's of the results of their examination of these sheep, proving their distinguished excellence, and adaptation to the climate of this country, which general experience has since fully corroborated. We deem it therefore unnecessary to publish the statement.—Eus.]

Spanish wool was first introduced into England in the reign of Henry II, at this time the best English superfine broad cloths are chiefly made of Spanish wool.

There are two kinds of sheep in Spain distinguished as the *Migratory*, and the *Stationary* sheep:—the former are Merinos—they afford the most valuable fleece; and this superiority has been attributed to their being exposed to a more equal temperature, ranging upon the northern mountains during summer, and pasturing during winter, on the plains and valleys of the South. Mr. Townsend states, that the wool of the Merino sheep is worth about twelve pence a pound, while that of the Stationary flocks sells only for six pence; and that every sheep is reckoned to yield a clear

profit of ten pence to the proprietor, after all expences are discharged.

I am yours, &c.

E. HUMPHREYS.

Durham Cows, as Milkers.

The following remarks were made by Mr. Colman during a debate on the subject of Cattle, at an Agricultural Meeting in Boston, a few weeks since:—

"Mr. Colman had not intended to enter upon this discussion, but he felt it due to his official relation to the farmers of Massachusetts, to say that he had had the pleasure of seeing improved Durham stock of the Messrs. Lathrops, of South Hadley, and he thought them eminently beautiful, and evincing great skill and care in their management, on the part of those gentlemen. He had seen many of the imported animals throughout the country; and one of the herds imported for the Ohio Company, which he saw on their way, was truly splendid, and in beauty and perfection of form, far surpassed any thing which he had ever witnessed.

He must, however, in justice, add, that he yet wanted the proof of the Durham Short Horns being the best stock for our dairies. Seven of the race which he had owned, some full and others half-blood, had been inferior as milkers. The quantity of milk given by many of the animals which he had seen, was remarkable; the quality, in general, inferior; though he had found some exceptions, he believed, were accidental.

The Cheshire farmers, who were as distinguished as any in the country or in any country for the produce of their cheese dairies, preferred the native stock. From a dairy of eighteen cows, an average of 633 pounds new milk cheese to a cow, in a year, had been obtained. He had challenged in writing and conversation the owners of the Short Horns in the country to prove, by actual experiment, the dairy properties of this stock; and he would furnish of a hundred cows of our native stock, which had made from twelve to fourteen pounds of butter per week, through the season. He was far from having any prejudices against the Improved Durhams. He was an enthusiastic admirer of them; but he wanted their dairy properties tested by actual experiment. A very distinguished English farmer, Mr. Shirrer, who had made the tour of this country, expressed his regret at their introduction, and pronounced them in his book the poorest dairy stock in England. We could not be said to have formed any distinct race among ourselves, excepting the trials made by Mr. Jaques, and a long-continued improvement carried on in reference to milk cows, in another part of the State, upon which he had reported. Much, undoubtedly, yet remains to be done, but nothing in this respect can be effected but by skill, extreme accuracy of observation, and long perseverance.

He thought the Durhams not well adapted to the scanty pastures and negligent habits of many of our farmers. All high bred animals require particular care and the most liberal feed. Two of the finest oxen ever raised in the country were of this stock. One, it is believed, a full blood, from Greenland, N. H., weighing over 3400 pounds, live weight; and one a half blood, raised in Claremont, N. H., and sent year before last to England, for exhibition. His live weight was said to be 3700 pounds; and he was pronounced in England, by the best judges of stock, as unrivalled for weight and thrift, and eminently well formed.

The best breeds would soon run out if negligently or severely treated. This race were undoubtedly well suited to the rich pastures and abundant products of the West of Kentucky and Ohio. There they would flourish. What might be done for our own stock by more liberal keeping, was yet to be seen. He had known a calf from a native cow, at four months old, to weigh nearly 400 pounds; and another, at five months old, to weigh 600 pounds. If the improved Durham stock should prove the best for us, and he kept his mind on this subject open to conviction, we could at once avail ourselves of the distinguished improvements of half a century's skill and toil and expense, so liberally bestowed in England. At any rate, the improvements which they had accomplished in England, so obvious and impressive to the most careless observer, read a most important lesson to us, and showed what might be done by skill and care, by judicious selection, by steady perseverance in a regular system, and by liberal keeping; and presented, at the same time, the most powerful motives to exertion and enterprise in a branch of husbandry, acknowledged by all to be of the first importance."

Different Soils.

"Soils. Every farmer should have some general knowledge of soils, and be acquainted with the nature of plants, so as to adopt those he cultivates to the soil of his farm. This is an important branch of agricultural knowledge; every plant will flourish best in that which is congenial with its nature; and if farmers were acquainted with the art of adopting plants to soils, much manure might be saved; some soils require little or no manure to grow some kinds of plants, whereas, to grow other kinds of plants upon the same soil, requires much manure. The best index to the nature of soils, are the plants that grow upon it; true, the chemist has it in his power to determine the nature of soils without this *natural index*, yet every farmer who knows the timber, underbrush, and plants which a soil spontaneously produces, decides at once upon its value for cultivation.

The principal soils are *silicia*, sand, or earth of flints; *lime*, or calcareous earth; *alumina*, or clay; *magnesia*, a mineral substance; with these are blended vegetable and animal matters in a decomposing or decomposed state, and saline, acid, or alkaline combination.

The nature of *silicia*, or sand, is dry and hot—*alumina*, or clay, cold and wet—a proper mixture of the two, improve both—all experience shows that manuring sandy lands with clay, or clay lands with sand, is best for grain or pulse. But it is not the best natural soil that the farmer ought to consider, but the depth of it. The farmer should never lose sight of these facts. For if the richest soil is from four to six inches deep, and lies on a cold, wet clay, or stone, it will not be as fruitful as a poorer soil, that is deeper, or lies upon a better stratum. It is now generally agreed that gravel, if not too compact, is the best substratum to make land prolific.

We shall now attempt a plain description of the different kinds of soils, by noticing their quality. We shall begin with the best kinds of loams and natural earths; these are either of a light brown, or hazel color; hence, sometimes called "*hazel loams*." They cut smooth and tolerable easy, without adhering much either to the spade or to the plough-share; and are light, friable, (crumbling,) and all into small clods, without cracking in dry weather, or turning into tough mortar when very wet.

The next best are dark grey, or sometimes called "*russet mould*." But the worst of all natural soils are the light and dark colored. These clays may all be known by the sight. There is, however, another, and perhaps as equally sure a test of good clays, as that by sight—*smelling and feeling*. The best kinds of clay emit a pleasant scent on being dug or ploughed up, especially after rain; and being a just proportion of sand and clay intimately blended, or mixed, will not stick much to the fingers on handling. We would however, remark, that the best soils in the world may be impoverished, and completely worn out by an unjudicious succession of crops, and especially if the ploughings are not frequently repeated before the seed is sown.

As said before, plants are a good index to soils; for we find, if we examine tracts of lands not cultivated, we may also find that time has adapted different kinds of plants to most of the distinguishable varieties of soils; and though some belonging to one may, from some cause or other, be found on lands of a different quality, they seldom thrive or perfect their seeds so as to become general. The great care of the farmer, ought, therefore to be, by proper mixtures, to reduce his land to that state and temperance, in which the extremes of hot and cold, wet and dry, are best corrected by each other; to give them every possible advantage flowing from the benign influences of sun and air; and to adopt such kinds of plants as they afford in this state, the greatest nourishment to; and to renew their fertility by a judicious allowance of the most proper manures. When these things are done, there are few spots so unfriendly to cultivation, as not to repay his expenses and labor, with a plentiful increase. But without these, the best of land will, in time, become a barren waste, or produce little but weeds."—*Practical Farmer*.

Paying for Luxuries.—The Packet Ship Albany, from New York for Havre, took out \$150,000 in specie. So much for an article, that might as well be produced in this country, employing our own labor and capital, and furnishing a market at home for our agricultural productions.

The annual amount of cheese sold in Cincinnati, is estimated at 900 tons for the last six years.

Ontario Agricultural Society.

At a meeting of the Executive Committees of the several towns of Ontario county, convened at the Court House in Canandaigua, on the 9th instant, to fix upon premiums for 1844, it was agreed to award the following premiums, among others, upon the article of Maple Sugar, that is to say:

- For the best 100 lbs. of Maple Sugar, \$7.00
" second best do 5.00
" third best do 3.00

Competitors to exhibit their Sugar at the Court House in Canandaigua, on the third Tuesday of May next, at 10 o'clock, A. M.

OLIVER PHELPS, } Secretaries.
Wm. Gorham, }

ACKNOWLEDGMENT.—We are indebted to Hon. T. Kempshall, M. C., and to Hon. A. Kelsey, for sundry interesting documents received from them during the winter.

Hatch's Sowing Machine.

Owing to the engraving not being prepared, we are obliged to defer the description of this machine till next month.

RITTEHOUSE & BLACKWELL'S CLOVER MACHINE.

The description and certificates respecting this machine were received too late for this month: they will appear in our next. A. M. Hurd is agent, Waterloo

PEANUT SILK WORM EGGS WANTED.—Any person in this vicinity having these eggs to spare, may find sale for them at the Rochester Seed Store.

WILD RICE.—Another small quantity of this seed has been obtained from Canada, and will be distributed to such persons as desire it for experiment.

EARLY ASPARAGUS.—Three bunches of Asparagus were left at the Rochester Seed Store, March 23, from the garden of Dr. M. Brown—Stephen Quinn, Gardener.

THE LOST BOX FOUND.—The box of English Seed reported to have been lost, has come to light, but probably will not arrive before the 1st of May. Some choice articles will then be on hand at the Seed Store

ERRATA.—(This number) Page 57, col. 3d, line 9, for mianri read misri. Page 63, col. 1, for Robert K. Livingston, read Robert R. Livingston.

ENGLISH MARKETS.

We received English papers of 1st March, by steamer Caledonia. The flour and grain trade had been quite dull, but was thought to be reviving a little. American flour in bond (i. e. subject to duty) was 25s. 6d. per bbl. The duty on wheat remained as formerly, 25s. 8d per quarter. The Cotton trade at Liverpool was active.

NEW YORK MARKET.—March 23.

The Cotton market continues active. The sales this morning are 2000 bales at full prices. There are sales of Genesee Flour at \$1 1/2. There have been sales of Corn at 1 1/2 cents. Rice is 53 cts. Hops 30 cts. Ashes both sorts, nominal at \$6. Sales of country Mess Beef at \$7.50-\$8; Prime communs \$3.50-\$5.75. 1500 kegs Western Lard sold at 7 1/2.

BALTIMORE MARKET.—March 18.

FLOUR—Limited sales of Howard street Flour have been made at \$4.37 1/2, for good common brands. The receipt price has advanced to \$4.25. City Mills Flour, \$4.50.

GRAIN.—Sales of Maryland white Wheats at 90 a 95 cents, and red at 52 a 90 cents. Some parcels of white were sold this morning at 95 to 100c. Sales of Maryland Oats at 25 a 27 cents, and Virginia at 23 a 24 cents.

CINCINNATI MARKET.—March 16.

During the past week the markets on the whole have been somewhat brisker. In Pork there has been an increase of business; our quotations of the article are firmer, though without any advance, except in Mess, of which we can quote sales at \$11 per bbl. Flour is at decided advance; sales having been made at the Canal at \$3.25. The supply of the article is but light; the importers by Canal during the past week amounted to 676 bbls, being some 600 bbls less than during the previous week.

GOLD VINE PEAS.

RAISED in Canada by the original producer of this variety, for sale at the Seed Store.

BATEHAM & CROSMAN.

For Samples of Letters from George Washington—(The President of the United States, in St. John's N. H., on Agricultural and other interesting topics—Engraved from original letters, so as to be an exact fac-simile of the hand writing of General Washington. Price, \$4.

Rochester, March 30, 1844. D. BOYD.

PEAR AND CHERRY TREES.

DAVID THOMAS.

OFFERS for Sale the following select kinds which ripen in succession:—Pears: Maudslowi or Early Harvest, Jargonelle, Julienne, Skaneateles, Seckel, Virgibien. Most of these are of large size.

Cherries: Knight's Early Black—called Black Tartarian—White Tartarian, Black Crown, May Duke, Transparent Guigné, Carnation.

Ornamental Plants.

Trees, shrubs, and herbaceous perennials in great variety, which will be sold cheap.

Greatfield, near Aurora, Cayuga co. 3 mo. 23. 1844.

FRUIT TREES, MULBERRIES.

THE subscriber offers to the public the usual very large assortment, comprising the choicest Fruit Trees, of every class, embracing all the newest varieties. Also an immense collection of Ornamental Trees, Shrubs and Flowering Plants, Green House Plants, Bulbous Roots, and the most extensive assortment of splendid Dahlias in the country.

All these articles will be sold at a reduction to suit the times, and as cheap or cheaper than they can be elsewhere obtained. For the silk culture, are offered the finest varieties of Mulberries, which are the Cremonese, Elata, Alpine, Multicaulis, and Broussai; all of which are very hardy except the Multicaulis, and that withstands ordinary winters.

The State of New York having now granted a bounty of \$2 per lb on silk, and Massachusetts and Vermont having done the same, they will no doubt take the lead in this great national pursuit.

Flushing, March 7th, 1840. WM. R. PRINCE.

N. B.—Priced catalogues will be sent to every applicant. Any persons who wish to establish silk plantations will be supplied with trees, payable by a share of the proceeds.

The Imported English Horse, "Emigrant."

Will stand for Mares the ensuing season, at the barn of Mr. C. Ashton, in Shelby, one mile west and half a mile south from Medina, Orleans Co., where he has stood the two last seasons.

It is but just to say that he is not probably surpassed by any horse in Western New York. Good judges who were at the Fair in Rochester, last fall, think that if he had been there he would have taken the premium without any doubt. His stock is right—just the thing for farmers and the market. Gentlemen who wish to raise good horses will do well to call and see.—He is extensively known in Livingston county.

T. H. ASHTON, J. SHERWOOD, R. L. CHASE.

Medina, Orleans Co., March 9, 1841.

SAVE YOUR QUILLS.

A HIGH PRICE—say \$1.50 to \$2.00 per thousand—will be paid for any quantity of good goose quills, delivered at the Rochester Seed Store

April 1. BATEHAM & CROSMAN.

GRASS SEED WANTED.

A VERY HIGH PRICE will be paid for good clean Timothy Seed, delivered soon at the Seed Store.

March 1. BATEHAM & CROSMAN.

CLOVER SEED,

OF EXCELLENT QUALITY for sale at the Seed Store.

March 1. BATEHAM & CROSMAN.

"FRANK,"

OR Dialogues between a Father and Son, on the subjects of Agriculture, Husbandry and Rural Affairs. This interesting and instructive volume is now for sale by D. Hoyt, State st., Rochester. The extracts published in the New Genesee Farmer during the past year, cannot fail to convince the readers of that paper of the value of this book, especially as a present for farmers' children, or young people in the country.

March 1.

Seeds at Auburn.

In the list of Agents published last month, T. M. Hewitt, Auburn, was omitted by accident.

Agents for the Rochester Seed Store.

A FULL assortment of seeds, put up at the Rochester Seed Store, may be found at each of the following places. Subscriptions will also be received here for the "New Genesee Farmer and Gardener's Journal."

ROCHESTER SEED STORE--1844.

BATEHAM & CROSMAN, the proprietors of this well known establishment, respectfully inform the public they have now on hand a general assortment of superior English and American SEEDS of the growth of 1844, other articles in their line of business.

For the FARM—choice varieties of Corn, Grain, Green Clover, &c., and seeds for Root Crops, such as Mangel W. zel, Sugar Beet, Carrot, Ruta Baga, English Turnip, &c. For the GARDEN—all the most valuable and approved kinds of excellent Vegetable SEEDS. Those which grow greater perfection in Europe, are annually imported from England—such as the different varieties of Cabbage, Cauliflower, Broccoli, Radish, Turnip &c. Onion seed is obtained from Wethersfield, and other articles are raised for establishment with great care.

FLOWER SEEDS—about 200 varieties of the most beautiful and interesting kinds.—Price 50 cents per doz. paper.

ROOTS AND PLANTS—Choice kinds of Potatoes, parsnips and Pie-plant roots, Cabbage, Cauliflower and plants in their season.

TOOLS AND IMPLEMENTS, of various kinds, for Farm and Garden. And a large collection of valuable BOOKS on subjects connected with farming and garden silt culture, &c.

SILK WORM EGGS—of different kinds, on hand in season.

CATALOGUES gratis on application. Merch supplied with Seeds at wholesale, on liberal terms. Orders from a distance containing a remittance, or good city reference, will receive attention.

BATEHAM & CROSMAN. Arcade Hall, Rochester, April 1, 1844. Publishers of newspapers, in Western New York Upper Canada, who choose to insert the above 6 times, are entitled to three dollars worth of seeds, on demand a store, or any of our advertised agencies. B. & C.

MOUNT HOPE GARDEN & NURSERY

ST. PAUL STREET, ROCHESTER, NEW YORK.

THE Proprietors of this establishment offer for sale an extensive assortment of Fruit and Ornamental Flowering Shrubs, Green House Plants, Bulbous Root, Double Dahlias, &c. &c.

Gardens laid out, and Gardeners furnished on reasonable notice.—Persons requiring information on any subject connected with the business, will receive a prompt reply.

All orders, letters of inquiry, &c. must be addressed paid directly to us. Trees, Plants, &c. will be carefully packed, so that they may be carried to any part of the country in safety; and trees will be marked and shipped as may be designated orders.

Persons with whom the proprietors are unacquainted requested to give a satisfactory reference, or name some son in the city of Rochester, who will guarantee the merit.

ELLWANGER & BAR

Rochester, Dec. 1, 1840.

AGENCY FOR PERIODICALS.

Wm. A. HERRICK, No. 61, Buffalo st., opposite Hotel, Rochester.—Agent for Godley's Lady's Book, Graham's Gentlemen's and Lady's Magazine, Jewett's Select Reviews, The New Yorker, The New World.

Take Particular Notice.

No subscriptions for this paper are received for less than one year, and all must commence with the 1st No.
Volume 1, stiched in a cover with index, &c., can still be furnished—price, 50 cts.
No commission, or deduction of price can be allowed to Agents if the money sent is more than 5 per cent. discount, and if over 10 per cent. discount, the money will be returned. (Michigan is 25, and Indiana 15.)
Subscribers who wish to change the direction, or send any instructions concerning their papers, are requested to do so through their post-masters, or pay the postage. Those who send us unpaid letters, which are of little or no benefit to us, must not complain if they do not receive attention.
Our friends will please remember that this is a very busy time with us, and letters are sometimes so numerous, that a little delay on our part is unavoidable, especially as Mr. Bateham's health is not very good.

Hints for the Month.

This is the month for the farmer to be wide awake. There is "ocean" of work to do, as our friend down east would say, and the farmer must not relax his forces, if he would plough through this ocean by the end of the month—something more will be required than ploughing the soil, all important as this may be.
As good and efficient teams are of the first consequence, let all your horses and oxen, be very carefully taken care of:—well and regularly fed,—well and regularly watered,—and regularly, but moderately worked. A bushel of oats, well fed, will do for more good than two bushels, fed improperly.

Then, having got your teams, all in good condition, and your ploughs and other implements, all of the best kinds, and in fine order, you can begin with some satisfaction

Plough well—if the ground be already broken, plough very narrow slices—it will look much better, and be much better for it.

Let all crops be well put in.
Apply all your manure—suffer none to be idle—suffer none to waste.

Plant corn early. To keep off the crows, warm the seed before planting by hot water, then pour on a little tar, which will finely coat it while thus warm, then roll it in air-slacked lime. This is experience. The crows will "beg off."

Plant the rows perfectly straight. Then the cultivator will run well between.

Put in plenty of root crops—carrots—sugar beets, mangel wurtzel—turnips,—and so forth. They make fat cattle—and a fat dairy. How many there are in this region, who would have been glad a few days ago to have had an odd hundred or two of bushels, to have filled the mouths of their hungry and starving cattle, in the absence of the last morsel of hay. O, one word about carrots—get seed of the *new white kind*—they are much more productive—and much easier harvested—we have tried them.

Get your ground ready for ruta bagas by manuring, and then ploughing and harrowing repeatedly between this and the time they are planted. This puts the soil in first rate order—kills weeds—and lessens subsequent labor exceedingly.

Gardening for May.

The season is remarkably backward, and but little if any work has yet been done in gardens in this vicinity. The weather has been quite cold during the past month, but there is now some prospects of its being warmer, and danger from frosts is mostly over. Let no time be lost in sowing or planting the early hardy kinds of vegetables, as mentioned last month. This done, and all danger from frost being over, proceed to put in the more tender kinds, and such as are intended for fall and winter use. For the benefit of new subscribers, and to refresh the memory of old ones, we repeat some of the directions given for May last year.

Beans.—The early kinds may be planted early in the month, and the late kinds about the 10th or 15th. The *Lima Beans* require a warm, sandy soil, and should not be sown during wet or cold weather, as they are liable to rot.

Bets, Carrots, Parsnips, Onions, &c., may now be sown for the main crop. Those sown last month should be thinned out as soon as the plants will permit. Stir the ground frequently, and be careful to keep it clear from weeds—now is the time to kill them easily, and a few days' neglect may spoil the crop.

Broccoli, Cauliflower, and Cabbage plants, raised in hot beds, if of sufficient size, should be transplanted into the open ground early in the month. Take them up carefully, and immediately immerse the roots in mud, to prevent their drying: this renders it unnecessary to defer the operation till a rainy day. The early York and other small cabbages, need not be set

more than half the distance apart of the Drumhead and the Cauliflower. These might be three feet apart, and on very rich land. The *Purple Cape Broccoli* is an excellent vegetable, and easily raised. The seed may be sown in the open ground: early in May, and if the soil and cultivation are good, they will head finely in autumn. Winter cabbage may also be sown now.

Cauliflower seed may also be sown in the open ground early this month; and if a favorable season, it will do well.

Celery if sown early in a hot-bed, will now need to be transplanted in a nursery bed, where it can gain size and strength, and be fit for setting in trenches next month. Set the plants four inches apart and water frequently. Shade from hot sun till rooted.

Tomato, Egg Plant, and Pepper, should be removed from the hot-bed about the middle of the month. If the plants are getting large, they may be removed earlier, but must be protected during cold and frosty nights. Egg Plants and Peppers require rich land; a light, sandy soil is best for Tomatoes—if it is rich and moist they run too much to vine, and do not bear well.

Turnips.—Sow a little of the Early White Flat Dutch Turnip, as soon as may be, and if the soil is free from worms they may do well. Sow again the latter part of the month.

Radishes may be sown now, and repeatedly during spring and summer.

Lettuce should also be sown often. Transplant some of the earliest sown, in order to have fine large heads for summer.

Peas.—Sow Marrowfat, and other large kinds repeatedly, during this and next month.

Indian Corn.—Plant some of the early golden variety as soon as possible—if it escapes the frost all is well. Plant some Tuscarora and Sweet Corn as early as danger from frost will permit; and again about the last of the month.

Melons, Cucumbers, and Squashes.—Plant early in the month, for early use, and about the 15th for the main crop. If planted on highly manured ridges or mounds, they will bear much better than in the ordinary way, especially if the ground be cold and heavy. Flower Seeds may now be sown in the open ground. Those forwarded in hot beds should be transplanted about the middle of the month.

Watering.—Do not neglect watering in dry weather—it should be done in the evening, so that the water may sink in—not dry up.

"Wonders of Horticulture."

An exchange paper credits the *Gardener's Gazette* for the following extract, which we copy for the purpose of comment:—

"Few would suppose that the peach (from which branched the nectarine) had its origin in the wild (1) lime. That favorite edible, celery, springs from a rank and acrid root, denominated smallage, which grows in all sides of ditches, and in the neighborhood of the sea. The hazelnut was the ancestor of the filbert and the cob-nut, while the luscious plum (2) can claim no higher source than the sloe. From the same [sour?] crab (3) issues the golden pippin."

(1) What is the wild lime? In England, where we suppose this article was written, the linden (*Tilia*) is called the lime tree; and hence Cowper in enumerating their forest trees, mentions

—————the lime at dewy eve
Diffusing odors—————

but we can hardly think the *Gazetteer* could imagine there was much resemblance between a basswood and a peach tree. So we turn to the *Citrus limetta* (the lime of which punch is made,) but find ourselves no nearer to a solution of the difficulty. The lime is a berry of 9 cells—the peach a fleshy rind with a hard stone in the middle. Such a change would be transmutation indeed! and Botany would be no longer a science; but such a change never happened.

(2) The plum (*Prunus domestica*) is a distinct species from the sloe (*P. spinosa*;) and neither Ray, Linnæus, nor any other botanist of whom we have any knowledge, has ever imagined them to be nearer akin. It is absurd to talk of one species springing from another.

(3) On this point, the *Gazetteer* has authority on his side; but we believe nevertheless that he is in an error. Ray considered the English crab-tree or wilding, a distinct species from the cultivated apple; and we think no good reason can be given by modern botanists for confounding them together. The permanent characters of these two trees, (as given by Persoon and Gray,) show that they differ more than several other species of the same genus which are admitted to be distinct by all botanists. We subjoin those characters:—

CRAB-TREE. * *Leaves* ovate, acute, villous underneath; *styles* bald; *fruit* the size of a chestnut, acerb, astringent, austere.

APPLE-TREE. *Leaves* ovate-oblong, acuminate, glabrous; *styles* villous; *fruit* more or less sweet.

Now if we compare these differences with the differences between some other species, we shall find them very full and ample. For instance—*Pyrus Polleceia* differs from the common pear (*P. communis*) in having down on the under side of its leaves; while the True service tree (*P. domestica*) is specifically distinguished from the Mountain Ash (*P. aucuparia*) by its leaves being villous underneath, while those of the latter are smooth on both sides.

It may be proper to explain that all seedlings of the apple are called *seedlings* in some parts of England; but such is not the wilding whose character we have given, and which Sir Humphrey Davy says "always produces trees of the same kind—all bearing sour and diminutive fruit."

To distinguish varieties from species sometimes requires more expanded views than botanists have always taken. They may be minutely correct on many points, and yet fail to grasp the most important feature. Does a plant spread into many varieties like the apple—then there is a danger that some of these may be exalted into species; but if it differs essentially in its leaves, its blossoms, and its fruit; and pertinaciously adheres to its primitive character like the English

* Not the Crab apple of this country (*Pyrus coronaria*) which is entirely distinct from both.

Crab-tree, without any approach towards any other kind,—then we may be satisfied it is not a variety but an original species.

The triumphs of Horticulture are surely sufficient without straining after wonders, and traversing the regions of romance.

Cultivation of Dabbias--Bone Dust.

I have been a cultivator of Dabbias for several years; but it has only been within the two past seasons that I have succeeded to my entire satisfaction. My usual mode of preparing the ground, was to dig holes of sufficient size, and then to fill up with mould and rotted manure, properly mixed. Under this treatment a portion of the plants would flower early; and others, of a later habit, not until autumn. The early flowering ones were apt to become exhausted, and to produce a very scanty display in the fall; while the later varieties were seldom covered with a free bloom. On the whole, my success was indifferent.

For the two past seasons, however, my success has been complete. I had the ground prepared as formerly; and in addition to the manure, I made use of a small quantity of horn shavings or bone dust—about a pint or a quart to each hill—well incorporated with the soil and manure. The growth of the plants was most luxuriant from the time of sprouting. They attained a very great size without ever being watered, and were covered with a profusion of flowers from mid-summer until frost. There was also a corresponding development of the roots. Many of the branches, taken as they grew, would nearly fill a half bushel measure.

I have found the bone dust to be an excellent manure for all tuberos rooted plants. Nothing that I have ever tried has produced me such crops of Irish Potatoes. Tap-rooted vegetables are also much improved by it,—as the beet, parsnip, salefy, carrot, &c. It is no less valuable for all the cabbage family, including turnips.

T. S. P.

Virginia, 3mo. 20, 1811.

Portraits of Animals.

Few appear to be aware of the great importance of the most rigid exactness in delineating animals. The face of a human being, that the individual may be recognized, must be drawn with the nicest accuracy; a nose a little too short, or a mouth a little too twitching, spoils the whole. The man who cannot distinguish the portrait of George Washington from that of Deidrich Knickerbocker, or Louis Philippe from Jack Downing, pays but a poor compliment to the painter. But in some of our agricultural journals, individual animals are not only wretchedly represented, but it is sometimes even difficult to tell even to what race they belong. The portrait is the representative of the animal, in its absence; let it not therefore deceive. Skinner, of the *American Farmer*, very justly objects to a figure of a short horn cow in the *Cultivator*, with a body, he says, weighing about one thousand pounds, standing on four *spermaceti* candles! The owner of the cow has since published another picture, still worse than the former, intended for a cow, but the body certainly looks more like a tightly stuffed wool-sack. We must also come in for our share of criticism—a fine cow appeared on our pages, with the legs very much as if squeezed into gun-cases; and even the figure of the cow "Jesamine," in our March number, though the general outline is very correct, by some fault between the draughtsman and engraver, has one fore-leg represented like a board tacked on to her shoulder with ten-penny nails. It is better not to attempt figures of animals unless they can be executed in the very best style for life and accuracy. Turn to Youatt's treatise on cattle, and take his representation

of the Old Craven Bull, Lord Althrop's two short horn cows, and the head of "Firby," as models. There is one journal in this country, which deserves especial commendation for its figures of animals—the *Farmer's Cabinet*. Many of them, it is true, are copied from English books on cattle, but those drawn by Woodside, of Philadelphia, who is first among the first of animal painters, are worthy of all praise. Indeed we have not seen a badly drawn figure in the whole work, since in the hands of the present proprietor.

Cobble Stone Buildings.

The first cobble stone buildings that I remember to have seen were at Pittsford in Monroe county, nearly twenty years ago; and from the rude appearance of the work at that time, I have supposed the art was then in its infancy; but perhaps some gentleman of that neighborhood will furnish a sketch of its history.

About six years ago the first building of that description was erected in this quarter, one mile east of Aurora; and in my opinion the walls are more beautiful than brick. The beauty of such structures however, will mainly depend on the size and color of the stone, though the color of the sand will have an influence.

If the stone and sand are both dark colored, the building will have a lurid aspect; for the proportion of lime in the mortar (one-eighth or one-ninth) is too small to whiten it sufficiently; but if the sand be a light gray, the contrast of the colors with dark stone will be pleasing.

Cobble stones of any size not exceeding six inches in diameter may be used; but for the regular course on the outside those of two inches in diameter should be preferred. Small stones give the building a much nearer aspect. Two inch stones are very neat, though three inch stones will answer. The inside row of stones may be twice as large as those on the outside.

The mortar is composed of one bushel of fresh stone lime to eight or nine bushels of clean sharp sand. As the strength of the building depends on the goodness of the mortar, it is very important that sand of the first quality should be obtained. Yellow sand or any sand that contains clay should be rejected. Gray sand is sometimes found so pure as not to discolor the water into which it is thrown; and such should be procured if possible.

Mortar that has been made some weeks is generally preferred. Some masons are particular to reduce the lime to a thin paste, and then while it is hot to apply the sand.

The thickness of the wall is sixteen inches, though twelve inches will answer very well for the gable end above the garret floor.

When the foundation, or cellar wall, is leveled and prepared, a layer of two (or two and a half) inch sand mortar is spread over it; and the stones are pressed into the mortar in two rows which mark the outside and the inside of the wall, leaving about an inch between each adjoining stone in the same row. If the wall is to be grouted, the two rows are formed into two ridges by filling the vacancy between the stone with mortar, and the space between these two ridges (about a foot in width) is filled with such stones as are not wanted for the regular courses. The grout is then applied. If the wall is not to be grouted however, the mortar should be carefully pressed round every stone, making the wall solid without flaw or interstice. When one course is leveled begin another.

Between every two adjoining courses on the outside some have the mortar to project as far out as the stones, in a regular line round the building. It is wrought to an edge with the trowel, and adds to the neatness as well as to the strength of the wall; for during this process the mortar is pressed round each stone; and the smoother it is made the stronger it will be, and the better will it resist disintegration.

It has generally been the practice to have the corners formed of cut stone; but in a two story building erected last season within a few miles of us, this expense was avoided by rounding the corners and using cobble stone. The cut stone is not the only saving by this plan however, much of the mason's time is consumed in laying such corner stones.

On the first mentioned building, the workmen were employed by the day. Four walls, amounting to one hundred and forty-six feet in length, were commonly raised eighteen inches every day by three masons. This is a little short of ninety-nine cubic feet of wall, or six perches to each workman. Sometimes in damp weather they had to stop awhile for the mortar to set.

The building erected last season was contracted for the perch at thirty-seven and a half cents; and half this sum additional, was allowed for the tenderer's walls, however, were grouted—that is, all the joints between the stones were filled with liquid mortar; and this substance must have more time to set, or this reason not more than three courses a day can be laid in dry weather; and not any when it is showery.

It requires from ten to twelve bushels of sand to a reh besides the lime when made into mortar; and rubble stones lie in a heap when thrown from the wagon about as compactly as they do in the wall.

If cobble stone buildings are so cheap as wood, as one of those proprietors believes, they will be much cheaper in the long run; and this will be evident when we consider the frequent paintings which are necessary to keep a frame house in decent repair.

P. S. Since writing the above, I have received communications from persons who have had cobble stone houses erected. One says, "the thickness of the wall is measured from the outside of the stones. Pieces of timber, four by six inches and two feet long, are used for setting the lines. These are laid in the lines just finished, and the line is drawn through w-cuts just sixteen inches apart."

The other says, "The cost of cobble is about one-third less than brick; and probably one-quarter or one-third less than wood,—on the supposition that the stones may be had within a mile, and sand within two or three miles." It must be evident, however, that the expense of cobble, brick, wood and stone, must vary considerably in different places, according to the prices of those materials and the distances they have to be carried.—*Alb. Cultivator*. D. T. Greatfield, Cayuga co.

Scraps.

CONDENSED FROM EXCHANGE PAPERS.

LARGE OX. A late number of the *Farmers' Cabinet* contains a good portrait of the ox "Pennsylvania," a cross between the Devon and Durham, eight years old, lately slaughtered at Philadelphia, which weighed ten alive, 3,350 lbs., or more than a ton and a half. It was sold for the enormous sum of fifteen hundred dollars. He was only 400 lbs. less than the weight of one celebrated "Durham ox" in England, the owner of which refused two thousand guineas for him; and only about half a ton less than Dunhill's great Yorkshire ox, which perhaps stands at the head of the list of this kind of monsters.

QUALITY OF FUEL. According to the experiments of Marcus Bull, of Philadelphia, the following are the quantities of different kinds of wood required to row off an equal quantity of heat—all to be well seasoned.

Hickory,.....	4 cords,
White oak,.....	4 1/2 "
Hard maple,.....	6 3/4 "
Soft maple,.....	7 1-5 "
Pitch pine,.....	9 1-7 "
White pine,.....	9 1-5 "
Anthracite coal,.....	4 tons.

BOYS IN HORSES. A dose of molasses, is said, on the authority of experiment, to be effectual.

GRAIN WORM. S. W. Jewett, of Middlebury, Vt. thinks, from some experiments he has made, that the grain worm may be successfully repelled from wheat fields, by making use of the peculiar and intolerably ill-scented fluid emitted by the skunk, for that purpose.

SOUTH DOWN SHEEP. E. P. Prentice, near Albany, sells these for \$20 to \$50 each.

DRAINING. Judge McCall, of Allegany county, by means of underdraining, raised last year a good crop of spring wheat, at the rate of 25 bushels to the acre, where the year before the land produced little else than the coarse water grasses. He constructs underdrains in soft ground by placing two pieces of plank on edge at the bottom of the ditch, securing their position on edge by stakes driven inside, and covering with a slab. Small notches are cut in the upper edge

of the plank for the admission of water. A more substantial way, and adapted to quicksands, is to lay a slab in the bottom, scantling on each edge, and another slab at top.

THE PHILOSOPHER'S STONE FOUND. McDuffee, in his late agricultural address, speaking of John Randolph, of Roanoke, says, "In the midst of one of his splendid rhapsodies in the Senate of the United States, he paused, and fixing his eyes on the presiding officer, exclaimed, 'Mr. President, I have discovered the philosopher's stone. It consists in these four plain English monosyllables: *Pay as you go.*'"

SAW DUST, is converted into manure, by the Shakers of Canterbury, N. H., by using it as litter for stables. It has a very decided advantage over straw, in the case with which it mixes with the soil while the manure is yet unfermented.

ROHAN POTATO. H. D. Grove, in the *Cultivator*, gives the result of an experiment to test the relative productiveness of the Rohan and Merino potato. The soil was in fine condition, being similar in quality for each variety, but the Rohans received the most attention. The Merinos yielded at the rate of 550 bushels to the acre, and the Rohans only 263 bushels. We have observed in nearly all accounts of the productiveness of the Rohans, statements of the rate of increase from the seed merely, and not the rate per acre.

WHITE CARROT. A late number of the *New England Farmer*, contains several statements of the value of this new variety. It grows partly above ground, somewhat similar to the mangel wurtzel. In one experiment, the same number of men, that harvested in 1830, eighty-two bushels of the orange carrot, harvested in 1840, one hundred and eighty-four bushels of the white. Two prize crops, one of the yellow, and the other of the white, yielded 23 tons to the acre, of the former, and 38 tons to the acre, of the latter variety. Another crop of the white yielded 26 tons to the acre. Another, of 4 acres, yielded at the rate of 1300 bushels the acre.

CORN HUSKING MACHINE. The *American Farmer* contains a figure and description of Goldsborough's Corn Husker and Sheller, and according to the statement of Robert Sinclair jr. & Co., the manufacturers, 700 bushels are husked and shelled by it in a day, or 1200 bushels shelled, if previously husked. The husks, (stripped in fine order for mattress makers,) cobs, and corn, all pass out together. A boy will rake the husks and cobs from the corn as fast as discharged. The machine is on the principle of the common thrashing machine, with a spring concave bed set with fluted rollers. The cost, separate from the horse power, is \$35. The manufacturers expressly guarantee them to perform as represented.

DURHAM CATTLE IN ENGLAND. The following prices were obtained for fine animals of this breed at the Earl of Carlisle's sale last autumn. One at 110 guineas (about \$500); two at 150 guineas (about \$700); one at 320 guineas (about \$1500); and one at 415 guineas (over \$1900.) It was from the Earl of Carlisle's stock, the famous bull *Rorer*, formerly belonging to Thomas Weddle, was obtained, and from which most of the fine young animals of T. Weddle's stock in this country, originated.

Canada.

MESSENGERS EDITORS—Will not some of your Canadian subscribers give us a sketch of the rural productions of the country, its soil, climate, geology, &c. As we have no primitive rock except the erratic boulders, which have been swept over our country from the North, we incline to the belief that the geology of the North side of Lake Ontario must abound in primitive rock in-situ.

It is said that there are there vast swamps of red cedar, (*Juniperus Virginica*;) that under the earth in these places for many feet in depth, are found large trunks of those trees, apparently of antediluvian growth, and perhaps of a much warmer climate than in the present day. On this side of the lake our cedar swamps are filled with the white cedar only, an entirely different genus (*Thuja occidentalis*.) Our red cedar is confined to the East bank of the Cayuga and Seneca lakes. S. W.

Feed of Durham Cows.

We observe that Skinner, Colman, and other men of high authority, consider Durham cattle not adapted to the short pastures of the Atlantic states, but suited only to the rich lands and luxuriant feed of the west. If this is the case, we can mention one very decided exception. The full bred Durham cow, in the possession of W. R. Smith, figure in our March number, was kept through the last summer entirely on the shortest pasture that could be selected, yet during the whole time she continued so fat that fears of danger in calving were strongly entertained; the native breed, in the same pasture, continuing in greatly inferior condition. *

The Peach Worm, and the Borer.

While the *peach-worm* confines its operations to the pulpy part of the bark, the *borer* cuts through the solid wood. Both insects are occasionally destructive; the former by girdling, prevents the descent of the juices or liquid wood, and destroys the tree by strangulation; while the latter by perforating many parts of the alburnum through which the sap ascends, cuts off the channels of its nourishment, and destroys the tree by starvation.

The *peach-worm* in this district is found chiefly, if not entirely, near the root of the peach tree. The *borer*, on the other hand, lives in the quince tree, the mountain ash, and not unfrequently, the apple tree. We have never known it attack the pear tree, nor any tree from which gum exudes.

Both of these insects spring from eggs which are generally deposited in the bark near the ground; but the *peach-worm* works chiefly downward, so as to have its habitation protected from the cold of winter by the soil, only coming occasionally to the surface to dispose of its filth. The *borer*, on the contrary, penetrating into the interior of the wood, and keeping the entrance of its hole entirely closed, so as to exclude the cold air,—often works upward; and we have known it, when passing into the perfect state, to leave the tree at the height of more than two feet from the ground.

We should judge that the easiest way to destroy the *peach-worm*, is by scalding, as noticed in our last number by a correspondent from Ohio; but this remedy would be useless in most cases, against the *borer*, on account of his ascending progress, and his position in the interior of the tree. We have destroyed them in considerable numbers by means of a barbed wire, but the operation is often tedious from the crookedness of their holes. We have therefore for two years past, endeavored to exclude them from one of their favorite trees (a mountain ash) by coating the bark to the height of three feet with tar; and by rolling a newspaper round it, to protect it from the weather, tied in three or four places; and the plan has succeeded completely.

The *borer* is the chief cause of the scarcity of quinces in this district. We have had more than thirty trees destroyed by it; but we do not despair. The same process that protects the mountain ash, will protect the quince tree. Let the stems be single to the height of three or four feet; and only part of a day on the commencement of mild weather, would be required to guard a hundred in the manner that we have mentioned.

For the New Genesee Farmer.

Clover Machines--Raising and Cleaning Clover Seed.

MESSES. EDITORS—The attention of the public has been called at different times to the subject of Rittenhouse & Blackwell's Patent Clover Machine, for cleaning or hulling clover seed; and I will take the liberty of again calling their attention to this subject.

Living in a district where large quantities of clover seed are raised, and having been extensively engaged in purchasing and selling the seed, and also having been engaged in cleaning it with one of Rittenhouse & Blackwell's machines, propelled by water power, I have had many opportunities for acquiring information upon the subject.

I am satisfied that Rittenhouse & Blackwell's clover machine is the best one now in use, as it can hull the seed faster and cleaner, and can be propelled by less power than any other; which must give it a preference where horse power is to be applied.

I have seen the certificate of a number of gentlemen with whom I am well acquainted, some of which (as I understand) have been forwarded to you for publication; and I can say, I have no doubt of the truth of the statements made by them.

The power of two horses is necessary to propel a machine, and any horse power can be applied to this machine as well as to a thrashing machine or cotton gin, by regulating the size of the pulley block or band wheel, so as to give about 800 revolutions per minute to the cylinder. The cone is placed by means of nuts and screws, as near to the cylinder as it can be without cutting the seed, which of course must be regulated by the man who may use the machine.

The chaff should be thrashed out with the flail, as a thrashing machine cuts up the straw too much, which mingles with the chaff, and renders the process of hulling much slower. Some persons use a hand bolt about 12 feet long, the reel of which is covered with thin boards bored full of holes five-eighths of an inch in diameter, through which the chaff is passed before it is passed through the clover machine.

After the chaff has been hulled, it may be cleaned through any fanning mill, by arranging the mill as described in your September number for 1840, which perhaps it would be well to republish.

In the number above referred to, you make some inquiries about the plan adopted for raising the seed, the best soil, &c.

In this vicinity the farmers usually sow their seed in April, the same as if designed for meadow. The second year it is cut for hay, about from the 25th of June to 1st of July. Another crop springs up which is for seed. This is cut when sufficiently ripe, and if not perfectly ripe it should be cut before any frost comes upon it. The farmer must exercise his own judgment as to the fit state of the seed for being cut. It should, if possible, be scoured without getting wet, otherwise much seed will be lost in the hulling process. Where land is sown for the purpose of procuring a crop of seed, at least a bushel to five acres should be used. From two and a half to three bushels of seed is a fair average crop per acre. I have known seven bushels raised.

Almost any land is good for raising the seed, although some kinds of soil require a free use of plaster.

I would here observe, that farmers cut clover three years in succession for the seed. Yet it is better for the land that the clover should be ploughed under the third season.

Yours respectfully,

N. P. LEE.

Hartsville, Seneca co., N. Y.

P. S.—After the seed has been passed once through the fanning mill, it should be passed through a fine riddle, with the meshes sufficiently small for clover seed alone to pass through.

Low and High Prices.

MESSES. EDITORS—Much has been written of late upon the improved system of agriculture, upon Legislative aid, and upon agricultural societies,—all of which are subjects of high importance, calculated to increase and multiply the real and substantial wealth of a country. The only difficulty in the improving system and the rotation of crops, increased outlay on the farm, &c., is the low prices of produce. And yet, perhaps, for the last year, considering the crisis of our country, this has been for the nation's interest. But it is only a desperate state of affairs that can render such a depression of prices even tolerable. Until we have more to encourage us than we have at present, under the low prices of all produce, and a prospect of none better under a continued reduction of the tariff, but little improvement in agriculture can be expected, as there can be but little or no profit derived from it.

These ideas may be considered vague by some, but they are nevertheless true; that when a business offers a fair emolument it will receive the attention of enterprising men, and it will become a courted and popular occupation. Whereas, without this reward, it will be neglected. During the high prices of from 1836 to '40, more encouragement and more improvement was realized throughout our country, than in any number of years previous. Not but that prices were too high for our country's benefit during some part of that time; but the attention and progress in all parts, in farming during that period are sufficient to prove the truth of my remark. In regard to Legislative aid, it is needed not so much from our State Legislature, as from our national. Nothing short of an increased tariff, to promote and foster the manufacturing interests, can ever place our farming interest in a prosperous and healthy condition. At present, we can only look for fair prices in the result of a short crop in Europe or our own country, which, at most, can be but accidental; and then our country may grow rich only on the misery of another. We must correct this state of things which we are now practicing, of buying of other countries millions and tens of millions of those articles which we can as well produce and manufacture ourselves, if we would be an independent and prosperous people. And there is no way to effect this object, unless we become so poor we cannot buy, but to lay on a duty on British and French goods corresponding to their duties on our produce.

The objection now raised to the tariff, that it is at variance with the interests of the cotton planters of the South, will, in my opinion, cease to exist in a few years after we adopt that system. We may soon so increase our manufacturing business as to create a home market for a great share of the cotton grown in our country. The idea of making all producers, and relying on a foreign market, cannot be considered a wise policy, for a free trade with England can never be realized, whether it might prove beneficial to us or not. British agriculture will ever be protected—so ought American manufacturing to be. By driving all into the business of grain growing, we encourage so rapid a settlement of our rich wheat country to the West, not yet hardly begun, that in a few years we should be able to supply almost half of Europe with bread stuff, for which there can be no demand. By these remarks I intend to show in opposition to your able correspondent "S. W." that low prices of agricultural produce are not in general more beneficial to the nation's prosperity than high prices. A surplus will always cause a decline in price; but fair prices for produce and fair prices for labor, are blessings of prosperity; whereas, the reverse is a check to enterprise, and by no rule can be made beneficial to national wealth or prosperity. A SUBSCRIBER.

Sweden, N. Y., April 20, 1841.

The Flowers of Spring.

Though the season is backward and the balmy days of the last month have been few, yet some bright flowers have come forth, exhaled their odors, and passed away.

The *Snow drop*, white like the snow that often invests it, is always the earliest flower of the spring and seems regardless of inclement weather. No variety, except that with double flowers, has sprung from this plant; but another species from the Crimea has been described, though we believe not mentioned in any American Catalogue, and perhaps it has not yet crossed the Atlantic.

Next to this flower in earliness stands *Iranthis hymalis* from Italy, with its yellow bloom scarcely three inches above the frozen soil. Its generic name means earth-flower from its humble stature.

Then the *Crocus* follows, consisting of several species,—all nearly allied, though varying greatly in color—pure white, deep yellow, and rich purple, with many intermediate tints. Some florists advertise more than a hundred kinds, but none with red flowers. The *Crocus*, unlike the *Snow drop*, opens its cup as looking upward to the sky, but closes it on the approach of a dark cloud as if fearful that something would drop in. No garden should be without these ornaments.

The *Bulbocodium* may be considered a vernal *Colchicum*, to which genus it is nearly allied. Its pale flowers contrast finely with the *Crocus*.

Differing entirely in form and color, comes forth the *Persian Iris*, as delicate in tints as in fragrance which "scents the garden round." There is one circumstance however, respecting this flower, which may be peculiar: the olfactory of many persons at unable to detect its odors.

No shrub is so early in bloom as the *Mezereon*; but its fragrance and beauty are rejected by some florists because it bears acrid or poisonous berries. If we were to eat every thing that comes in our way however, our journey on earth would be short; and we have not been able to discover why other berries—those of the *Nightshade* for instance—are not entitled to a much consideration.

The *Siberian Squill*, resembling a hyacinth in miniature, seems to peep out as if half afraid of the season but as the spring advances and a milder air surround it, it raises itself to the height of three or four inches. It has no rival at this time in the delicate form and color of its flowers.

Primula veris spreads into numerous varieties under the names of *Primrose*, *Polyanthus*, and *Cowslip* (modern botanists to the contrary notwithstanding); and seems to pass into all colors except blue. Some of these kinds almost equal the *Auricula* in beauty.

For the New Genesee Farmer.

"Bots and House Bees."

MESSES. EDITORS—Since the appearance of your last number, the inquiry has been made, whether the nuts or eggs of the bot-bee must be hatched in the stomach of the horse or not at all. The reply is, that the bot has rarely, if ever, been found in any animal but the horse. This is its appropriate place for habitation and food, as the apple tree is for the canker-worm. In general, all such animals are endowed with the instinct which leads to the deposition of their eggs where they will obtain their appropriate nutriment. The wisdom of this general law is most obvious. The tick is found almost wholly on the sheep; and on the swine he would soon die, as was once remarked by a farmer of the *louse* in the same situation, of starvation. The louse of the gad, or godfly, finds its home and food on the back of cattle. They often abound, too, upon those which have inferior strength

fitness. Hence, in the spring of the year, they are greatly to aid by their activity in the skin, in making the poorest cattle still more unable to increase in flesh. The more special care of the farmer is to be bestowed upon such parts of his herd. The same is true also of the sheep; the poorer suffer much more from those insects which have been deposited in their nose. It is from the consequences of this fact, that some judicious farmers never intend to create an inferior animal.

While noticing such general and wonderful laws of the animal world, it may be well to explain a fact, similar till understood. In summer and the hottest part of the day, sheep congregate beside fences and hedges and the like, holding their heads down and between their fore legs, till suddenly they run in terror and fright to another part of the field, where the same insect is acted over. It is to avoid the insect that lays its eggs in their nostrils, that all this is done. In the cooler weather, or cooler part of the day, the insect is not active, and does not annoy them.

In respect to bots as a disease, it is to be remarked that other diseases are often mistaken for it. Hence we see one reason why the remedy applied often fails to produce the desired success. Sometimes other animals aggravate the bots, and would prove fatal without the other.

I have seen worms from four to six inches long, boring the liver and some other intestines of a horse that was sick with bots and died from one or both causes. It would be well if more frequent and careful examinations of the body were made in such cases. Improvements in anatomical knowledge have been of the highest consequence to the understanding and cure of the diseases of man. Similar results might be expected from like examinations, to ascertain the seat and cause of disease in the horse, the noblest and most useful of our domestic animals.

C. DEWEY.

The Curculio.

Now is the time to attend to the Curculio; and to trim your plums, nectarines, and apricots from desecration. We believe the winter-residence of this insect has not been satisfactorily ascertained, though it is probably in the earth; but for practical purposes, it may be sufficient to know that it is always ready for business as soon as there is any thing to do—always ready to puncture the young fruit as soon as it is large enough to receive a nit.

Several methods have been proposed or adopted, to prevent its depredations. Spreading sheets under the trees, and knocking down the Curculio on them, by striking the trunk or branches with a mallet or hammer, has been found very successful. The insect after it has fallen, generally lies still long enough to be caught and crushed; and its dark color contrasting with the whiteness of the sheet, favors its detection. This work should be done as early in the season as the predator can be found. In a few days it may do much mischief, and it is no easier killed after the trespass is committed.

Some have employed turpentine round the tree, and strings of shingles dangling in the wind to frighten the Curculio away; but we are not prepared to say anything in their favor. The most recent project that we have noticed is to dip strings in the drops that fall from India rubber as it burns, and then to tie them round the tree, which it is supposed will be sufficiently viscid to arrest the insect in its ascent. We should be gratified to hear of any successful experiments of this kind; but though we have gone so far as to environ one tree in the manner proposed, our hopes are not very sanguine.

The most successful fixture to prevent the ascent of this insect that has come to our knowledge, was

applied to some plum trees last season by our friend Thomas Lefevre of the town of Venier. It consists of a circular trough made of tin, which was kept constantly supplied with water; and the narrow space between the trough and the tree stuffed with tow or something similar. The trees so treated bore good crops, while not a plum on the other trees escaped. A few of the plums however, were found to be wormy, occasioned perhaps by some of the insects remaining on the tree when the troughs were applied; and it would therefore be prudent to jar the trees at that time. About harvest the apparatus should be removed.

The troughs of that description are worth about eighteen pence; but the person who applies them, must understand the art of soldering.

From the Albany Cultivator.

The Sugar Beet.

MESSES. GAYLORD & TUCKER—I have noticed in the late numbers of the Cultivator, Dr. Guthrie's and Mr. Bement's attacks on the sugar beet, insinuating that it is an almost worthless root for the feeding of stock; and as the opinions of these gentlemen, with partial experiments, are directly at variance to those of the most eminent agriculturists of France and Germany, after an experience of more than thirty years, and to those also of many of our own countrymen, after trying it with satisfactory effect about five years; and as I had the honor of appearing in the last May number of the Cultivator, strongly recommending its production and feeding, I feel bound to make some comments on these communications, and reiterate my own experience in the feeding qualities, of what I consider as one of the most valuable of roots.

I am perfectly satisfied by Dr. G's statement of the analysis that he made of the beet, vol. viii. p. 40, that he was either grossly imposed upon, in the purchase of seed, and had grown the mangel wurtzel instead of the white Silesian, or that he had planted it in so rich a vegetable soil, as to produce so rank a growth as to almost destroy the saccharine matter that is usually found in it, especially when he adds, that "the beet's brought upon our table are totally destitute of sweetness." Now I have not only my own taste for three years in succession, to prove that the sugar beets raised in and about Buffalo, are exceedingly sweet and nutritious, but can also bring a hundred witnesses at any time to corroborate the assertion, from their own daily eating. The famous blood beet cannot compare with the sweet, tender Silesian, and as for mangel wurtzel and other beets, they are almost tasteless after them; and they are never boiled in a pot by themselves, that there is not a sweet syrup at the bottom, almost of thickness and agreeable taste of sugar-molasses, which, in my opinion, only want to be clarified and graduated to make good sugar. So much for personal taste and experience; now for that of stock. I know that fed raw to cows, they considerably added to the quantity and especially the quality of the milk, making the butter as sweet, and almost as yellow as is produced on fresh summer's grass; they also keep them, with the addition of hay alone, in the best possible order; and the young stock fed on them, together with hay, were as fat and almost as fine and glossy in their coats, as when on the best of summer pasture. I never tried them with horses, but should hardly think them hearty food enough for those at work. Not keeping sheep, of course I could not experiment with them; but others speak very flatteringly on this point, as may be seen from some communications that went the rounds the year past in most of the agricultural papers, copied, I think, from the Philadelphia Cabinet. Beets were said to produce the best of mutton, and the finest of wool.

The most important use, however, that I have made of them, is with hogs. But as my breeds embrace only the China and Berkshire, it is in reference to these superior animals alone that I can speak; and here it seems that Dr. Guthrie's Berkshires did tolerably well, while his others almost starved. The first winter I kept my grown swine partly on beets and partly on potatoes, raw; the second winter almost exclusively on raw beets, thrown to them on the ground. I did not notice any difference whatever in their appearance during these two seasons, but each time they were kept in us good flesh as ever I wish to have breeders, and they were by no means allowed to eat their fill of them either. The third winter, (the last,) having erected a steaming apparatus, with a new piggery, I commenced cooking the feed for my hogs, and have frequently served them beets alone and fed them to all

ages, from the pig two months old, up to the grown animal of four years. To the last, I had to stint them to a common water pail half full twice a day, or say from eight to ten quarts, or they would get too fat for breeding; and as to the former, with the addition of a trifling quantity of corn, I never saw animals thrive better, or more contented in my life. They would fill their bellies and lie down on their straw, and doze away for hours together as contented as puppies and as whist as mice; and this stock thus treated, I am not afraid to show, either for general size or fineness of point, against any thing in the United States, saving my late importation, and that only for great weight, these last being somewhat of a larger class than is usual among Berkshires. During this same winter I steamed a mixture of carrots and potatoes with the beets occasionally; but in feeding I found that as a general rule, the pigs would pick out the beets first, the potatoes second, and only eat the carrots when hungry at last; but if any one were to ask which I thought the most nutritious, I should say the potato without doubt. My accommodations are too limited, however, to make the careful experiment as to the relative value of roots, bushel for bushel, and again in comparison with grain, as requested by Mr. Canton, of Illinois, but I trust that the above will be satisfactory to him and to others, so far as it goes, for it is experience and not theory. I must say that I do not like this jumping at conclusions from partial experiments. I recollect reading an address, some two years ago, by some one in Pennsylvania, before an agricultural society, in which the writer mentioned—and he seemed to be an intelligent, scientific man—that ruta baga, by analysis, was but little else than wood, and therefore as a food for man and beast, it was almost totally worthless. Indeed! And yet this same despised root, together with a little straw, makes most of the English beef and mutton, and in some instances at times one-fourth supports its laboring population.— Apropos to this: I recollect once telling an intelligent neighbor that I cultivated pumpkins a good deal, and liked them much as food for swine. "Well," he replied, "they never did any thing for my hogs but scour them." The fact was, he had an inferior breed of animals. Again, I shut up some Berkshire sows that were quite poor, about three weeks to put them in condition; they were allowed nothing but pumpkins during this time, and were then turned out, having got really, in that short time, almost too fat for good breeding. An intelligent gentleman who had seen them previous to their being shut up, and then again when they were let out, acknowledged that nothing but seeing the thing with his own eyes would have convinced him of the truth of it, and wound up by adding, (I do not give the words exactly, but the ideas,) "why, instead of fattening them, the urine that would have come from common hogs thus fed, would have made them skeleton poor by this time." I am no chemist, and therefore humbly ask what would be the analysis of clover? Not much, I fancy, but water. And yet Berkshires, and in fact, all good crosses of the China hog, will keep fat upon it in summer and grow well; and I will conclude this long letter on sugar beets by saying, that if their stock does not thrive upon them, why then gentlemen have been deceived in their seed, or they have not got the right sort of annual to consume their roots.

Yours,

A. B. ALLEN.

A Crop of Corn.

I give below an account of a crop of corn raised last year. The lot contained four acres, of a rich gravelly soil. It was well manured from the barn-yard, and then these rows were intersected with rows of manure from the hog-yard. It was ploughed of sufficient depth, well harrowed, and planted about the fifth of May. The corn was a bright eight rowed yellow variety; the rows three feet by three and a half, five grains to a hill. When sufficiently high, it was dressed with a mixture of one part by measure of plaster and three of ashes, a table spoonful to each hill. After weeding, it received another similar dressing.

The product was seven hundred and fifty bushels of good sound corn in the ear, twelve tons of pumpkins, sixteen of stalks, and the net profit of the field was ninety dollars.

A. G. S.

Springhill, Cayuga co., April 12, 1841.

Fride is the first thing that overcomes man, and the last thing that man overcomes.—St. Augustine.

"Washington's Letters on Agriculture."

Mr. D. Hoyt, Bookseller of this city, has placed on our table a very interesting and curious volume; being Fac-Similes of Letters from George Washington, President of the United States, to Sir John Sinclair, on Agriculture, and other topics. This is an American Edition, copied from the English, which was published in London some years ago, by Sir John Sinclair, from whose advertisement we extract the following remarks:—

"It could not but be highly gratifying to me, to be possessed of so many interesting communications from such a distinguished character as the President of the United States; and it was natural to suppose, that the public, but more especially those individuals who revered his memory, would wish to have in their possession a copy of a correspondence which displayed to such advantage the superior talents, the generous views, and the unbounded philanthropy of that celebrated statesman.

"The peculiar predilection which General Washington has so strongly and so frequently expressed, in the subsequent letter, for agricultural improvement, which he preferred to every other pursuit, is another circumstance which I was anxious should be recorded for the benefit both of the present and of future times, from a desire that it may make a due impression upon the minds of those who might otherwise be induced to dedicate themselves entirely, either to the phantoms of military fame, or the tortures of political ambition.

"As it is a singular circumstance that a person in such an exalted situation as General Washington, should have leisure to write, with his own hand, so many letters to an entire stranger, and some of them of considerable length, I have been induced to have them engraved in order to represent the handwriting of their celebrated author; they are exact copies of those received by me. It is proposed to deposit the originals in the British Museum, as the precious relics of a great man, fit to be preserved in that valuable repository."

Some Remarks on the Value of Live Stock, with relation to the Weight of Offal.

BY THE HON. ADAM FERGUSON, OF WOODHILL, CANADA.

Messrs. Editors—In the improvement of live stock in this country, the views of breeders have been long directed to the selection of animals of good shape and a "kindly handling;" and attention to the establishing of new breeds, or to the improving of old ones, has always been appreciated by the public, as reflecting credit upon the enterprise of the individuals, and as conducing to the prosperity of the country. A judicious improvement in live stock is not limited in its effects to that object alone. It never fails, at the same time, to improve the agriculture of the country around; the land being necessarily drained, enclosed, and cultivated, in a manner adequate to raise the superior kind and quality of the produce now required. Such being the beneficial consequences of an improvement of live stock, no suggestion ought to be disregarded which may lead to that important end.

It may be laid down as a maxim, that those breeds, or varieties, are best, which will pay most, all things considered, in the shortest period, or which will produce the greatest weight of marketable produce from any given extent of land, and within any given period. And, in like manner, it may be stated, that the animal of any given breed, which, in relation to its live weight, will bring to the butcher's stall the greatest quantity of good meat and tallow, is the animal of the greatest value. Now there is some reason to suspect, that a question having relation to this latter point has been of late too much overlooked, arising from carelessness on the part of the farmer, with some professional mystery, perhaps, on the part of the butcher. The question here referred to, is that of the live and dead weight; and the ratio which one bears to the other in properly fed animals. It is true, that various tables, founded on the determination of this question,

have been constructed with the view of assisting the farmer in the disposal of his stock; and such tables are no doubt to a certain extent convenient and useful. A difficulty, however, has generally presented itself in bringing their accuracy to such a direct and palpable test, as to be sufficient to silence a keen and depreciating purchaser, and compel him to admit that the seller does not overrate the weight of the animal. It would seem that attention, at once more extended and minute, must yet be bestowed before the relative live and dead weight of stock can be ascertained, in a manner equally satisfactory to the buyer and the seller.

The particular error into which it is conceived many have fallen, lies in estimating the dead at only one half the live weight. It is sufficiently apparent that should the former, in any material degree, exceed this proportion, a very serious loss may be incurred by the seller, who founds his calculation upon that datum; and from some authentic returns, to be just submitted to the reader, it will be seen that an inference to this effect may be reasonably drawn.

In the extensive farming concerns of the late Mr. Curwen, at the Schoose, County of Cumberland, England,—a mode of estimating dead weight was adopted, somewhat singular in its nature, and said to be remarkably correct in its results. Glover, the stock bailiff, a very intelligent man, made use of what he called his "magical number," "556," by which, upon receiving the live weight, he professed to give the dead weight, sinking offal, of any fat animal submitted to his test. The writer need scarcely observe, that there is nothing really "magical" in the number 556, or in the manner of obtaining it. If an ox were to weigh 50 stones when alive, and the dead weight were found to be 25 stones, the ratio of dead to live weight would be represented by the fraction 25 to 50 which, converted to decimals, would give 5, and this, multiplied by the live weight, would give the dead weight. But if Mr. Glover, by a series of more correct observations, found that upon an average of oxen the live weight was 50 stones, and the dead weight 27 stones 11 2-10 lbs., the proportion of dead to live weight would be represented by 27 stones 11 2-10 lbs. to 50, which converted to decimals, would give .556; which again multiplied by the live weight would give the dead weight. In one instance, (verified by the writer,) Glover's calculation certainly approached very nearly to the truth, and gave a greater return than competent judges were disposed to allow, from handling the animal alive. The subject of experiment was an Ayrshire heifer, 18 months old, which Mr. Curwen slaughtered at one of his great general meetings, as a sample of his favorite system of soiling. This animal had never been a day out of a calf pen or steaw yard, from her birth, had never tasted oil cake or grain, and was undoubtedly a very forward animal of her age. Her live weight was correctly ascertained to be 55 stone, of 11 lbs. to the stone, which being applied as a multiplier to the famous number, and cutting off the three figures to the right, gave the following product: 556 x 55 = 30,580, that is, holding the three right hand figures as decimals, about 30½ stones. The weight of this heifer, by measurement, in Ainales tables, was pretty nearly the same. The actual result gave 30 stones of meat, and 2 stones of loose fat, fine marbled beef; but by no means prime fat. In this animal, then, which had certainly not attained a state of perfection, we have a return considerably exceeding one half of the live weight.

Mr. Rennie of Phantassie, (probably the greatest practical agriculturist in Scotland, of his day,) and Mr. Curwen, with their respective adherents, differed in their estimation of the live and dead weight upon general principles. Mr. Rennie would not allow

more than one half of the live weight to be reckoned upon, except in cases of extraordinary fat, to which certainly the heifer in question had no pretensions and in whose case, notwithstanding the proportions of Mr. Rennie, were considerably below the mark.

The following details will still further illustrate the subject, and may tend to excite more than a doubt whether one-half be not too small a proportion to be assumed in estimating, the live and dead weight of stock.

Tables of Sheep and Cattle slaughtered in various years, with the amount of live and dead weight—stone of 14 lbs.

	Live Wt.		Dead Wt.		Tallow.	
	Srs.	lbs.	Srs.	lbs.	Srs.	lbs.
1. A Leicester sheep, 2 years old,	12	0.4	9	7.4	1	5.7
2. A Cheviot sheep, 3 years old,	10	7.6	7	7	1	10.1
3. A black faced sheep, 6 years old,	11	5.4	6	1.8	1	12.1
4. A Cheviot wether, 4 years old,	12	0	6	4	1	12.1
5. A Cheviot wether, 3 years old,	8	6	4	12		
6. A Leicester wether, 2 years old,	10	2	7	3	1	4
7. A black faced wether, 5 years old,	10	0	5	10	0	10
8. A Cheviot sheep, 18 months old,	7	12	4	0	0	13
9. A Cheviot ewe, 4 years old,	7	7	3	9	0	11
10. do do	7	7	3	11	0	12
11. do do	7	7	3	11	0	12
Total,	106	6.4	61	72	9	7.9
Average,	9	9.5	5	12.1	1	2.7

According to the average on the above table, Mr. Glover's rule would give 5 stone 5 lbs. as the dead weight; but the true multiplier would be 605 instead of 556, according to Mr. Glover's practice; or instead of 500 according to the common practice.

	Live Wt.		Dead Wt.		Tallow.		Hide.		Other c/s.	
	Srs.	lbs.	Srs.	lbs.	Srs.	lbs.	Srs.	lbs.	Srs.	lbs.
1. Aberdeenshire ox,	132	14.4	81	6.1	16	5.7	7	2.6	21	10.7
2. A short horn ox,	132	0.4	90	1.1	11	0.9	7	5.0	22	3.7
3. A short horned Guey,	120	4.4	77	9.2	15	8.5	7	5.0	22	0.4
4. A West Highland Steer,	83	8	46	3	6	3	5	4	30	7
5. An Aberdeenshire Steer,	96	7	52	4	8	0	5	0		
6. do do	47	4	27	2	8	0	6	0		
7. do do	47	4	27	2	8	0	6	0		
Total,	771	52	451	46	63	6.4	42	3.3	100	2.9
Average,	10	2.7	65	8.7	11	12.9	6	0.4	21	12.4

The above table gives the same result to a fraction as the last, and this curious coincidence is deserving of notice, as occurring in the case of animals so entirely

distinct in their form and character, as sheep and oxen.

The general conclusion to be drawn from these returns would seem to be, that the practice of estimating the dead weight at one half the live weight, is erroneous. It would by no means, however, be safe to draw a specific conclusion as to the actual proportion of live to dead weight from the tables now given, on account of the limited number of the returns made. It is only by means of a great number of such experiments as we can hope to obtain a just medium, and found on it a safe conclusion. Could farmers be induced to give more attention to this subject, by keeping accurate records of stock slaughtered by them and their yields, much might speedily be done to settle the question of the live and the dead weight, while there is good reason to believe that many respectable butchers would concur in preserving and communicating similar details. A further purpose might be promoted by constructing such tables. We should, by means of them, be able to discover the breeds or varieties of the different species of stock which yield the greatest amount in proportion to the offal, and thus perhaps be enabled to draw conclusions as to the relative value of the different breeds.

It has been before observed that the question of the ratio of live to dead weight seems to have been a good deal overlooked of recent years. At one period, the attention of individuals, admirably fitted for the investigation, appears to have been awakened to the importance of the inquiry. In the able report of the countess of Durham, some interesting details on the subject are given; but these can scarcely be said to do more than open up the subject; and certainly a great blank remains to be filled up before the farmer and the professional butcher shall be placed on equal terms as regards their information upon this point.

Should these cursory remarks tend to direct the attention of breeders and graziers to this interesting subject of inquiry, the object of the writer will have been fully accomplished.

Geology of Pennsylvania.

In the "Third Annual Report on the Geological Survey" of that State, (1839,) Professor Rogers in describing his "MIDDLE SECONDARY RED SANDSTONE FORMATION," makes the following remarks:—

"It seems to have originated in a long narrow trough or bay which had its source at least as far south as the central latitudes of Virginia, and which probably opened into the ocean somewhere near the present positions of the Raritan and New York bays. Their materials give evidence of having been swept into this estuary or great river from the south and south east; and hence the almost universal dip or inclination of the beds towards the northwest, a feature clearly not produced by any uplifting agency, but assumed originally at the time of their deposition in consequence of the direction or set of the currents, which laid them down layer after layer. With the exception of one or two fossil fishes found in this formation in New Jersey, I am not aware that any animal organic remains have been hitherto met with in any part of the stratum; and hence it becomes difficult to assign its precise place in the general series of geological formations. Relics of vegetation are however, occasionally found under the form, especially of highly compact and bituminous lignite."

It is possible the strata were formed in the manner he has mentioned; and that no "uplifting agency" has given them their present dip; but we think such a conclusion ought to be founded on something more than cursory observation. It seems to us very improbable. We have not learned however, whether this able geologist has relinquished, or still retains that singular opinion; for it has not been in our power to procure either of his later Reports; but if he should examine the locality which we shall proceed to designate, it is probable these fossils would indicate the age

of the formation, and their position shed some light on the manner in which they were deposited.

About half a mile northeast of Phoenixville in Chester county, on the opposite side of the river Schuylkill, on a high hill, we saw OYSTER SHELLS imbedded in the solid rock which had been laid bare by a torrent. It was shown to us in the fall of the year 1806; and as we had not found any fossil shells below the Blue Mountains before that time, we viewed it as a great curiosity.

For the New Genesee Farmer.

Letter from Wisconsin.

MISSES ERRORS—Perceiving that you have no correspondent from this territory, I take the liberty of filling that station, and will, whenever time shall permit, give an account of matters and things as they exist in this "Badger" territory of ours—premising, however, that I leave it to your readers whether my communications are interesting or not. Many of them have friends and relatives in this territory, and it may prove of interest to them to hear occasionally from this quarter.

Much has been written and said in respect to Wisconsin, its fertility, its universal wealth, and its natural advantages; but much remains to be told in relation to the system of farming that has been adopted in some parts of the territory; although there is much to be urged in extenuation, as the country is new, and most of the settlers are men of limited character; but still there are many among us, who, if they would take the trouble to look a little into the future, and loose their purse strings, could confer a benefit upon the territory, and upon themselves and their posterity. The introduction of improved farm implements and machinery, such as the thrashing machine, the straw cutter, the horse rake, the cultivator, and the hundred other useful implements to be found in the agricultural repositories of the east, would be of immense utility on our fine rolling prairies, where there are no stumps nor stones to obstruct their operation.

Many of the settlers are men who have not been bred farmers, but who have left the workshop to try their hands at the plough, and some of them are rather "green" at the business, among which I class myself. But I find one trait among them which is not found so generally among the old class of farmers. They are more of a reading people. Deprived of the advantage of experience, they are obliged to depend upon the knowledge of others, and are therefore more willing to lend their support to the agricultural journals of the day, than are those who have imbibed their knowledge and their prejudices from a daily experience in agricultural pursuits.

Although at this time the natural fertility of the soil of Wisconsin supersedes the use of manures, the time will come, if the eastern skinning system is followed, when it will require all the renovating powers of a proper rotation and application of the various fertilizing substances, to render an equivalent to the farmer for his labor.

Wheat is destined to be the great staple of this territory, and many are pursuing the same system that was adopted in the Genesee country, that of growing wheat to the exclusion of any other crop, on the same land.

Corn ripens well in this country, but it will never, probably, be grown to the extent that it is in Indiana and other states to the south of us; but enough, however, to supply the community, as the "badgers" are not such "corn crackers" as their neighbors in the hoosier state and in Kentucky, whose national dish is "corn dodgers and hoe cake." Every variety of soil may be found in this territory, and any thing may be grown here that will thrive in New York or New England.

With an extent of territory larger than any state in the Union, and possessing, as she does, immense treasures in her lead and copper and iron ores, Wisconsin presents at the present time an object worthy the attention of every well wisher of this country. Still reposing in her minority as a territory, she holds out to the patriot and the moralist the hope that her constitution and laws, will receive the benefits of the experience and legislation of the older states of the confederacy, and that by their misfortunes and miscalculations, she will steer clear of the rocks and quicksands on which many of them have been nearly wrecked. Taken as a whole, I do not believe there can be found a more moral class of people in the United States than in this territory. They are composed, to be sure, of almost every nation; for here you will find the Dutchman, the Norwegian, the Englishman, the Russian, the Prussian, the Frenchman, the Scotchman, and the sons of "Green Erin," all congregated in one community and amenable to the same laws, although they retain their national habits. It is amusing to see some of the Norwegians and Dutch open a farm in the thick forest. They make thorough work of it. In clearing, they commence at the root of a tree and dig round it so that it falls, either by its own might or by the wind. They then log it and burn it before they proceed further. By this means they get a clear field, unobstructed by stumps and logs, as you will find is not usually the case with the Yankee or English farmer.

Wisconsin at this time holds out great inducements to breeders of stock, especially as her beautiful prairies afford the best of pasture, and there are many thousand acres yet unentered, that would far surpass in worth many of the meadows of the eastern states, for the pasturage of cattle. Nearly all the neat stock now in the territory, is from Illinois and Indiana, and consist of all bloods, colors, shapes, and sizes; and you may see here also the famous breed of hogs which friend Robinson, of Lake C. H., took such a fancy to as to think he could fat them. They are the real land pike and alligator breed, snout and all. An improvement is beginning to be made in this race of quadrupeds and you may see the Chinese and Berkshire blood running in the veins of many of our grunting inhabitants. There are a few full bloods in this neighborhood, and their progeny are being distributed through the country, and will result much to the benefit of the farmer. There have been a few importations of blooded cattle into the territory. Jupiter, imported by Mr. Geo. Reed of Milwaukee, is a fine full blooded Short Horn Durham Bull, eight years old; and another, belonging to Judge Day of Green Bay, have been productive of great benefit to this section of country; and half bloods, and other grade animals may be often met with.

But I have written more than I intended at first, and shall conclude, and take another opportunity, when I am "in the vein" of giving you a second communication.

Yours, &c.

E. B. QUINER.

Milwaukee, W. T., March, 1841.

MICHIGAN COAL.—A load of coal passed through this village a few days since, on its way to Detroit, from the village of Couanna, in Shiawassee county. The gentleman who owned it, left a small specimen with us. It has the appearance of the coal found at Pittsburgh, Pa., and burns as freely, emitting the same smell. The gentleman informs us that, from present appearances, the supply is inexhaustible, and is found within three feet of the surface. It is represented by our informant, which we do not doubt, it will be a source of much wealth to the State at large, and add immensely to the business of the place at which it is found.—*Pontiac Jacksonian.*

Wilbeorce, who had a great taste for horticulture, considered flowers to be the smiles of the Divine goodness.

ROCHESTER, MAY, 1841.

Monroe Co. Agricultural Society Meeting.

A meeting of the Monroe County Agricultural Society will be held according to previous notice, on Wednesday the 5th instant, at 10 o'clock, A. M., in the long room, 3d story, Arcade Building.

It is particularly desired that all who feel an interest in the objects of the Society will be present, as very important business is to be transacted.

Legislative Aid.

The bill for the encouragement of Agricultural Societies, has passed the Assembly and to a third reading in the Senate. It will doubtless become a law before many of our readers receive this paper. (We stop the press to announce its final passage.)

Corrections.—The bill appropriates \$8,000 per annum—not \$7,000 as stated last month. We also stated that the report was made to the Assembly before the petitions from Western New York were received. We should have said before many of them were received.

We will, next month, publish an abstract of this bill, and also the one for the encouragement of Silk Culture, if passed.

Organize the Societies!

As the law for the encouragement of agriculture has passed, every County in the State should organize a Society, and adopt efficient measures to carry out the purposes of the appropriation. We hope at least to hear that all the Counties in the Western part of the State have done so, and it will give us pleasure to receive a list of the officers of each Society for publication.

Horticultural Meeting.

An adjourned meeting of the friends of Horticulture will be held on Thursday next, May 6th, at 2 o'clock, P. M., in the Lecture Room of the Young Men's Association, for the purpose of organizing a Horticultural Society.

The committee appointed to prepare a constitution will lay their report before the meeting. As most people at this season feel interested more or less in gardening, it is to be expected there will be a numerous attendance.

The Season and the Crops.

The severe frosts of last month have done considerable injury to the late sown wheat in this vicinity, especially on light soil, which here by frost. Some pieces we have seen, are entirely destroyed.

We observe accounts from nearly all parts of the country respecting the backwardness of the season, and the scarcity of feed for cattle. One would think a few such lessons would convince every farmer of the necessity and advantage of raising more root crops.

A paper from Oneida Co., states, that it seldom has so cold a spring been known, even in this part of the country, so near as we are to the region of perpetual snows. The winter has been so long and severe, that the farmers in the north part of this county have fed out all their hay, and most of the coarse grains and forage are exceedingly scarce. In some parts, cattle are dying for the want of food, and some farmers are driving their cattle at auction, having found it impossible

to furnish the necessary keeping, both on account of its scarcity, and for the want of means to purchase at the present high price of hay. The prospect still is far from affording any encouragement that vegetation will relieve their sufferings. On the hills north, the snow is yet very deep over the entire surface of the country."

The Troy Whig of the 24th April, says, "we learn by a gentleman from Pittsburgh, that loaded teams crossed Lake Champlain at that place on the ice, on Friday last.

"There are three feet of snow only ten miles west of the Lake. The farmers are nearly all out of hay, and their cattle in a starving condition."

INQUIRIES.

Larvæ or Grubs in Cattle.

MESSES. EDITORS.—Will some of your correspondents please give the public the benefit of their observations concerning grubs in the back and sides of cattle? They seem mostly to be found in these animals while low in flesh, in winter and spring, and to vary greatly, both in number and frequency, in different seasons. It is presumable that they are the larvæ of some insect; yet in the absence of proof this must be mere presumption. From our own small experience, we know them to create great annoyance and irritation, fever and emaciation, to cattle, if nothing more.

It is desirable that something be known in regard to their origin and character in a natural history, the means of prevention, and what is of still more importance, the means of best obviating the evils resulting from them to our stock.

JAMES H. C. MILLER.

Jackson co. O., Feb. 17, 1841.

Poultry.

MESSES. EDITORS.—I wish to ask through your valuable paper, the following questions, hoping that some of your correspondents will reply to them.

- 1st. Will hens lay as well when confined as otherwise?
- 2d. Will they lay as well without the male?
- 3d. What kind of fowl will lay best?
- 4th. Will hens pay better in eggs than in rearing chickens?
- 5th. What quantity of feed for a given number, and what kind is best to make them lay?
- 6th. Is there any work written on this subject, and what is it?—the best, I mean. S. H. CLARK.

Mattituck, N. Y. April, 1841.

Culture of Hemp.—A correspondent in Canada asks for information respecting the culture and preparation of hemp.

Culture of Tobacco.—Another asks the same respecting tobacco, in this climate.

Wild Rice.—Mr. P. Hunt of Milford, Mass., has obtained and sown some wild rice, and he requests some reader of the Farmer in Canada or elsewhere, to give information respecting the growth and use of this grain.

Beet Sugar.—If any of our readers made any experiments in the manufacture of sugar from beets the past season, they will oblige us by giving an account of the result.

Will the Managers of the White Pigeon Beet Sugar Co., inform us whether they made any further experiments, and with what results?—Do.

Cure for Bog Spavin.—A correspondent has a fine young horse affected with bog (or wind) spavin of 2 or 3 month's duration, and asks what is the most simple and effectual remedy.

The inquirers respecting Silk and Silk Worms, and Flowers and Shrubs, are referred to the numerous articles on these subjects in our last year's volume, which, if not already possessed, can be obtained for 50 cts.

Bounty on Silk.—W. B. B. is informed that the State of New York has not yet passed any law to give a bounty on silk. We only stated that a bill was reported to the Assembly for the purpose.

Extracts from Correspondence.

"A. G. S." of Cayuga co. made, in the spring of 1839, five hundred and thirty pounds of maple sugar from one hundred and twenty-five trees; and in 1840, from one tree, thirteen pounds of sugar, and seven pounds ten ounces of molasses. He decidedly prefers, instead of making sugar into cakes, to boil it until it will grain, so that the impurities will settle to the bottom of the vessel, and the molasses remaining gently poured off.

"A Mercer county Farmer," (Pa.) says, "My crops for five years have been as follows:—Wheat, 15 to 27 bushels per acre; corn from 40 to 60, oats from 40 to 50; potatoes generally 400 per acre. Our kinds are the Mississippi or Merinos, which will yield 500 bushels per acre, and the Neshanocks, not Meshanocks, as this is the county where these potatoes were first raised by James Golkey, on Neshanock creek."

Culture of Asparagus.

This wholesome and delicious vegetable ought to be cultivated by every family that possesses a few yards of ground. It is a dish that nearly all persons are fond of, and it supplies the table during the most destitute season of the year. A good bed will last fifteen or twenty years, and will bear cutting some twenty times in a season. It occupies but little space, and the trouble and expense of culture is much less than is generally supposed. A bed, five feet by twenty, will contain one hundred roots, and is large enough for a moderate sized family. If good two-years old roots are used, they will bear some cutting the next year after planting.

The following directions will enable any intelligent laborer to form and plant the bed:—

If there is any choice, select a warm location, where the soil is deep and rich, neither wet nor dry; mark out the boundaries of the bed, and dig out the earth to the depth of eighteen inches. (If the location is rather wet, and the bottom hard, dig six inches deeper, and put in six inches of oyster shells or loose stones.) If the top soil is good, lay it on one side, but wheel the poor earth away. Then take well rotted manure and mix it with an equal portion of good earth, and fill up the bed even with the surface; then rake it smooth and place the roots on the top of the ground, twelve inches apart; spread the fibres and fix them in their natural position with the hand; then cover the whole with three or four inches of the mixed compost, smooth it off neatly, and the work is finished.

Water the bed after planting, if dry weather succeeds, and keep it clear of weeds during summer. Before setting in of winter, cut off the stalks, and give an annual dressing of two or three inches of manure. The roughest of this should be raked off in the spring, and the surface of the bed loosened with a manure fork.

Fine two-years old roots are for sale at the Seed Store. Price \$1,50 per 100.

Rhubarb, or Pie-Plant.

This is another of the earliest luxuries of the season, and deserves more general cultivation. It is of the easiest possible culture. Plant the roots about three feet apart, in deep rich soil, well manured. A warm border on the south side of a fence, is the best place.

The Early Red variety grows the quickest, and in using requires the least sugar. One dozen roots is sufficient for a family. They are for sale at the Seed Store. Price, 50 cts. per doz.

THE ARABIAN HORSE.

From Low's grand work, "Illustrations of the breeds of Domestic Animals."

(COPIED FROM FARMERS' CABINET.)

The exquisitely beautiful animal, here most faithfully represented, exhibits correctly the form and character of the genuine ARAB. He was taken in an assault by an Arab tribe, on a party of the royal family of Persia, when journeying on a pilgrimage. The chief who headed the attacking party was killed, and his superb Charger, galloping into the Persian ranks, was taken: a ransom, enormous for so poor a tribe, was subsequently offered by the Arabs, but was refused, and he was brought to England by Sir John McNeil. He stands fourteen hands and a half high, is a mile in the highest degree, and so thoroughly trained in that kind of exercise which the Arabians are careful to teach their horses, that he may be galloped round the narrowest circle. When his portrait was in the course of being painted, he was languid from the effects of cold; it was shed to rouse him from his lethargy, and the idea occurred of trying the effects of a few tones of simple music—the sounds no sooner reached his ear than his whole frame instantly became agitated to a violent degree: his heart throbbed convulsively, and so great was his excitement that it was found necessary instantly to stop the music! some chord of feeling, it would seem, had been struck—perhaps he was reminded of his dearest home, and his friends and companions, from whom he had been so rudely severed. The generous animal here depicted as scenting the garments and weapons of his slaughtered master, and no one can examine the emblems of his expressive countenance, without experiencing a gush of feeling arising within his breast, in sympathy with the beautiful mourner.

The gentleness of the Arabian horse is proverbial; and although so elegantly formed, and so delicately and sleek his skin, even the English horse would perish under the scanty fare, the toils and privations he is doomed to suffer. They are patient of hunger and thirst, to a degree unknown in any other race, subsisting, sometimes, on the withered herbs of the desert, and roots dragged from under the sand, and even on the milk of the camel. They bear continued exposure to the fiercest heats, and day after day pursue marches of incredible toil through the burning sands of the wilderness, forming by their bodies a shade from the fiery heat of the sun, under which their masters repose during the halt for a period in the middle of the day, and a shelter at night. But an Arab never beats, or even speaks harshly to his horse—he treats him as a companion, and his children find in him a playmate, and his wife a nurse for her infant, and all making a pillow of his neck at night. Without the use of the bit, he will obey the slightest motion of his rider; stand at a word, or put himself at full speed in an instant! Such is the creature so happily formed for the scanty herbs, the thirst, and toil of the burning desert.

From the Mag. of Horticulture.

Cultivation of the Filbert.

The filbert is one of the finest nuts, and although great quantities of the fruit are imported, and sold in every fruit shop annually, there are scarcely any, as yet, cultivated in the United States. A sterile variety of the English filbert may be seen in many of our gardens, which rarely produces any fruit; but the finer sorts, which thrive luxuriantly, and bear most abundantly in this climate, are scarcely known in cultivation. Nothing can well be easier than the cultivation of this shrub or tree, and we are confident that were the merits of the better varieties generally known, no garden would be considered complete without them. A few years since, we imported small plants of the best celebrated English varieties, and have, without the least attention to pruning, realized quite an abundant crop of fine nuts, for two years past, which are quite an acceptable addition to the dessert.

Among the finest of these varieties are the *Frizzled*, the *red Kernel*, the *Northampton Prolific*, the *Cobnut*, and the *Cosford*. We have found the *Cosford*, *Frizzled*, and the *Northampton Prolific*, the most productive varieties in this climate. All the varieties grow very vigorously in any good soil, naturally dry rather than moist, but a dry gravelly loam, or sandy loam, is considered preferable. In pruning and training filberts, the first and most important requisite is to keep the main stem free from all suckers, and the second, to prevent to great a luxuriance of wood, which, if suffered to grow at random, will prevent the production of large crops. The nuts are produced, both upon the

sides of the young wood, and upon lateral spurs, annually produced on the older branches, after the previous year's branches lateral shoots have been trimmed away. Abroad, therefore, what is called the *spurring* system of pruning is adopted, and the extremities of the leading shoots are shortened every spring. This throws nearly all the vigor of the tree into the bearing branches, and produces a larger crop of fruit annually.

In some parts of England, large plantations of filberts are made, for profit. Kent is the most celebrated nut growing district, and the average crop there is about eight hundred weight per acre, although, in good soils and favorable seasons, thirty hundred weight have been raised on an acre of ground. The bushes are generally trained with single stems, and the heads pruned in the form of a hoop, kept about six feet high from the ground.

There does not appear to be the least obstacle to the profitable cultivation of the filbert on a large scale, in this country, and our dry fine summers would probably be found more favorable to the productions of large crops, than the moist ones of England. A return of fruit is speedily received after planting on good soils, and we would, with confidence, recommend a trial of a filbert orchard, to enterprising cultivators.

In gardens, a row of the finer sort of this fruit may be advantageously introduced, as a screen or barrier, in portions where such a feature is desirable, as the foliage is large and dense, and thus the double advantage of fruit, and privacy or protection will be realized.

A. J. DOWNING.

Norburgh, N. Y.

THE LATE PRESIDENT.

Our readers will pardon the liberty we take in devoting a small space to the commemoration of an event which has excited sorrow and mourning over this whole land. The death of WILLIAM HENRY HARRISON, whom the sovereign people, by their free will, had so lately chosen to preside over this great nation, has in all places, and from all parties, called forth manifestations of the deepest regret, and most abiding sorrow.

Devout minds cannot but regard this national bereavement as an afflicting dispensation of Divine Providence; and such will willingly comply with the following recommendation of President Tyler, as the most appropriate manner in which a Christian people can commemorate this solemn event.

TO THE PEOPLE OF THE UNITED STATES.

A RECOMMENDATION.

When a Christian people feel themselves to be overtaken by a great public calamity, it becomes them to humble themselves under the dispensation of Divine Providence, to recognize His righteous government over the children of men, to acknowledge His goodness in time past, as well as their own unworthiness, and to supplicate His merciful protection for the future.

The death of WILLIAM HENRY HARRISON, late President of the United States, so soon after his elevation to that high office, is a bereavement peculiarly calculated to be regarded as a heavy affliction, and to impress all minds with a sense of the uncertainty of human things, and of the dependence of nations, as well as of individuals, upon our Heavenly Parent.

I have thought, therefore, that I should be acting in conformity with the general expectation and feelings of community, in recommending, as I now do, to the People of the United States, of every religious denomination, that, according to their several modes and forms of worship, they observe a day of Fasting and Prayer, by such religious services as may be suitable on the occasion; and I recommend Friday, the Fourteenth Day of May next, for that purpose; to the end, that on that day, we may all, with one accord, join in humble and reverential approach to Him, in whose hands we are, invoking him to inspire us with a proper spirit and temper of heart and mind, under the crowns of His Providence, and still to bestow His gracious benedictions upon our government and our country.

JOHN TYLER.

Washington, April 13, 1841.

For the New Genesee Farmer.

New Drill Barrow.

Messrs. Editors—To the hundred inventions for planting ruta baga, beet, and other seeds, I must add one of my own, which I have had made, and shall give a trial this spring. If it succeeds, as I think it will, I shall send you a description of it, as I think it will be found the cheapest thing yet of this kind. It consists merely of a seed barrel and two hand wheels, one of which is placed on the axle of a common wheel barrow, by which motion is given to the barrel containing seed; a furrow is opened by a cultivator tooth, the seed is dropped, a chain covers it, and last of all a roller presses the earth upon the seed, and the planting is finished. The advantage of this contrivance is, it can be attached to a common wheel barrow, by taking off the bottom boards. When not wanted as a drill barrow, it can be converted to its legitimate use; and I have found it very handy about the place, in making garden, hot beds, &c.

Yours &c.,

E. B. QUINER.

M'rankee, N. T., April, 1841.

SILK WORM EGGS.

LARGE White Peanut, and large N. skin Peanut eggs; (the *Sina Morale*, and *Morale Jovis*, of the French;) and the common Sulphur varieties, are for sale at the S. C. Store, by BATHAM & CROSSMAN, Rochester, Apr. 21, 1841.

Excrescences on Plum Trees.

In a late journey through some parts of Seneca and Ontario counties, we could not but observe the increase of these unsightly *bunches* on the plum trees, within the past year; and the inquiry came before us, Have these people no eyes? or do they see not that their trees must soon perish unless they lend a helping hand? Branch after branch becomes loaded, the nutriment is turned into other channels, and a general decline must rapidly supervene.

Yet these worms which feed on the best juices of the tree and load it with deformity, are utterly helpless, and live entirely through our forbearance or neglect. No work is more easy than to destroy them, if we go about it in the right way. Let every man that owns a plum tree and wishes to preserve it, cut off every branch on which these excrescences are found, and burn them to prevent the possibility of the insects escaping. We do not expect however, that worms will be found in these old habitations at this season—the perfect insect escaped from them last season; but eggs were most probably deposited again in the same branches; and our object is to have the young worms destroyed. Soon after the receipt of this number of the *New Genesee Farmer*, begin to watch for new nests, as they will probably appear soon after the tree comes into full leaf. Let the search be thorough, cut them off and burn them without delay, and there will be but few to disturb the tree next year.

We have observed that this insect is generally not much inclined to travel when it can be accommodated near its native spot. Some limbs are more crowded with these bunches than others; and we have lately seen several trees standing near together that were ruined; while two or three others at no greater distance than a few rods, were almost exempt from those ravages. We mention this to show that the progress of these insects is moderate—not rushing on in overwhelming numbers like many other insects. Be encouraged then, and go to work. †

Our Woollen manufactures prejudiced by the Compromise Act, owing to the duty on fine foreign Wool. Cheap capital and cheap production makes England a creditor nation—not her restrictive measures.

Messrs. Editors—It was an oversight in the framers of our Compromise Act, to make the same reduction in the duties on imported woollens as on any other article; for the reason that England admits foreign wool into her ports at a merely nominal duty of one penny per lb., while the United States puts a prohibitory duty on fine foreign wools.

The low price of wool in Germany enables the English manufacturer to procure his fine stock from thence, much cheaper than it can be procured at home; and as it is imported almost without duty, he can the more successfully compete with our own manufacturers, who are cut off by a high duty from a supply of fine foreign wool. Hence the minimum duty of 20 per cent. on foreign cloths, which under the compromise act is to take effect in 1842, is by no means a sufficient protection for our woollen manufactures against competition from abroad.

In 1821 the duty on foreign wool in England was 6d. sterling, about 11 cts., per lb. But in order to give the woollen manufacturer a boon to compensate him for the effect of our high tariff on British woollens, the British government reduced the duty on foreign wool to one penny per lb. Hence the hardship of the provisions of our compromise act in relation to woollen cloth, as it reduces the duty on foreign fine cloth, without a correspondent reduction of the duty on fine foreign wool.

Should Congress take off the duty on foreign wool, our wool growers would have a right to complain.

What then is to be done for our woollen manufacturers? I reply, revise the compromise act so as to give them that relief which their necessities and the justice of their cause demands. Let the advocates of free trade reflect that in a moderate protection extended to our woollen manufactures, they are also encouraging the wool growers, by giving to this class of our agriculturists that stability of demand, and consequent regular profits, they have never yet enjoyed.

The friends of a high tariff in the United States are continually urging that England extends towards her manufacturing interests, an almost unlimited protection. On examination we find that out of 1150 articles on which an impost duty is levied, only 20 of them pay a duty for protection—the remaining 1130 paying a duty for revenue only. Is it not rather the cheapness of capital and the low price of labor, rather than a highly protective tariff, which enables England to sell so much, and to become the great creditor nation of both the civilized and pagan world?

Much has been said of late about the prejudicial operation of the English Corn Laws upon the trade of the United States. What right have we to complain of England for thus saving her agricultural interest from utter prostration and ruin, by the free admission of our more cheaply raised productions? We have at least one salvo in our dilemma—the protection England gives to her agriculture is a direct charge upon her manufacturing interests. Manufacturing England, under her corn law restrictions, is a much less dangerous competitor to manufacturing America, than she would be if American bread stuffs were admitted free into English ports.

There is another reason why the recinding of the English corn laws would fail to give any considerable demand for bread stuffs from the United States. Germany and the north of Europe, can at all times supply England with grain on quite as good, if not better, terms than the United States.

Let farmers then, instead of depending on the device of legislation, learn to look to their own resources, and “make not haste to be rich.” Let them diversify their productions to suit the varied capability of the soil, and the probable state of the markets. If prices are low, so far as the farmer is the consumer of his own productions, he loses nothing. If his surplus does not bring as much as in other times, neither does the manufactured article he needs cost as much. If he owes old debts, he is indeed the loser by the cheapness of the times; but this loss must be chargeable to the year in which the debt was incurred, and not to the present era of exploded humbug and sober reality.

S. W.

From the (London) Gardener's Chronicle of Feb. 27.

Trees and Shrubs.

The following list of the newest and most remarkable deciduous trees and shrubs, embraces all the more desirable, but many of them are at present extremely rare:—

Leucostera formosa, a handsome shrub from the North of India, produces its white flowers in August, and makes a pretty appearance with its red bracts which surround the flowers, and large leaves. It is particularly valuable in exposed situations near the sea where the bracts and leaves assume a deeper color.

Paucloenia imperialis, a low tree from Japan, in appearance very like *Catalpa syringifolia*, has beautiful lilac-colored flowers.

Cornus macrophylla and *[C.] grandis*, handsome shrubs, growing from 10 to 12 feet high—the former from the north of India, and the latter from Mexico.

Caragana Gerardiana, a handsome low shrub with yellow flowers from the north of India.

Cypripis Wallichii, a shrub from Dalmatia, producing spikes of yellow blossoms, like a Laburnum, but the spikes have an ascending direction instead of being pendent.

Spirea Lindleyana, a fine species from the North of India, nearly related to the well known *S. sorbitifolia*.

lia. S. cuneifolia, *[S.] laxiflora*, *[S.] raccinifolia*, and *[S.] rotundifolia*, are also from the North of India, and form pretty low shrubs. *S. fissa* from Mexico, is a handsome shrub, growing from 15 to 20 feet high.

Lonicera Ledebourii, a curious plant from California, remarkable for its bright blue berries.

The genus *Philadelphus* has had several accessions from the north of India and Mexico. *P. Gordonianus* from Northwest America, is one of the finest species, bearing its white flowers in great profusion in July, and forming a bush from 8 to 10 feet high. *P. mexicanus* from Mexico, *[P.] triflorus* and *[P.] tomentosus* from the North of India, are also desirable plants well adapted for the shrubbery.

Dentia corymbosa, from the Himalayas, produces white flowers in June.

Berberis coriaria is a handsome species from the north of India, with fine evergreen leaves and yellow flowers.

Coriaria nepalensis is a fine plant for a wall.

Ribes Menziesii with scarlet flowers from Northwest America, and *[R.] glaucote* with white flowers from the North of India, deserve a place in every collection of plants.

Aralia japonica, a curious shrub from Japan, growing from 12 to 20 feet high.

Betula Rhoxyptera, a very handsome large tree from the Himalayas, nearly related to the common birch.

Amygdalus incana, a Caucasian species, is extremely ornamental in April, when covered with its bright pink flowers; and in the summer, its light green leaves, covered with white down on the under side, make a good contrast when planted among evergreens. *A. Pallasii* from Russia, is also a pretty low shrub.

Clematis Hendersonii, a garden variety [a hybrid?] is perhaps the handsomest of the genus, producing a profusion of large purple flowers from June to September. It is adapted to covering a bower or trellis-work, and if trained umbrella fashion on a lawn, would form a most beautiful object.

Atragene macropetala, a Siberian creeper is by no means unworthy of a place on a wall.

Acer colechicum and *[A.] Lobelii*, the former a native of Colechia and the latter of Italy, form handsome low trees. *A. Lobelii* is remarkable for the fine purple bloom which covers its young shoots.

Decayed Turnips.

Seeing many inquiries as to the cause of the rotting of a turnip crop, without the least appearance of the disease externally, and having had much experience in the raising root-crops of various kinds, I would say, the evil arises from a wet and retentive subsoil. Four years ago I sowed a fresh broken up piece of land with ruta baga; it had been in wood, and this was the first cultivated crop that had been raised upon it. The plants came well, and flourished for a season when some of them began to turn blue, and they were then soon full of the animal, called familiarly the plant louse; others, however, retained their healthy appearance, while their internal parts were one mass of corruption; and it was curious to observe, on putting one's foot on a large healthy looking turnip, and full of foliage, how suddenly the whole superstructure would crush down into complete rottenness, the shell not being more than half an inch in thickness. On examining the top roots of many of them, they were found rotten, although the disease had not extended in some cases, to within several inches of the bulb while the effluvia which arose from many, even of the comparatively sound looking roots, was convincing proof of incipient decay. Many of the roots, to appearance perfectly sound, were packed away for winter provender, but I believe I may say, that no one of them proved in reality so, and no cattle would touch them.

The winter following revealed the truth, for, on examining the land, it was found to be full of stagnating water to within a few inches of the surface; since then it has been drained and well cultivated, and I have no idea that the crop of turnips which I intend to grow upon it the present season, will decay on the land. Should they, however, deceive me, I will tell the truth, and inform you of the result, “right or wrong.”—*Far. Cub.* J. STURGES.

From the New England Farmer.

Decayed Turnips.

I observed in the last number of the Farmer, an article from the Farmers' Cabinet, in which it is stated that this disease is the consequence of a wet or too retentive subsoil. That a soil of this description is no suitable to the cultivation of turnips, is generally admitted; but how does Mr. John Sturges account for

the rotting of crops on land where there is no such cause existing! The "rot," popularly so called, is often found to prevail on free and light soils as well as on those of a more heavy texture, and indeed in situations where there is no substratum for yards, and even rods below the surface. The farm which I cultivate is a free sandy loam, and so open that in order to obtain water it is necessary to dig from eighty to ninety feet. No water can be obtained in the village short of that distance, but we have often had rotten turnips in great abundance, even in this soil, as well as on the slopes of our eminences, where the soil is so light, that in order to prevent the surface from being washed away by heavy rains and showers we have found it necessary to haul on clay and muck. If Mr. Sturges' theory be correct, the tap-roots of our ruta bagas, like those of the Ohio parsnips, must be "rather long." Again—Mr. Sturges assures us that the grub never attacks the turnips, unless when previously diseased. But until he proves that the tap-root of the ruta бага is capable of penetrating a light sandy soil, or earth, to the depth of 80 or 90 feet from the surface, and of tipping upon the stagnant (?) waters of the earth's interior, I shall reject the latter theory, as no less unsatisfactory than the first. H. D. W.

Windham, Me., April 5, 1841.

The article from the "Farmers' Cabinet," referred to by our correspondent, was as far from being satisfactory to us as to him. But it was an attempt to exhibit the cause of frequent losses of a crop which many of our farmers wish to raise. The attempt was praise-worthy. The matter of rot in the ruta бага is a serious evil. If its cause can be ascertained, and rules given by which the action of the cause can be avoided, a great good will be conferred upon our community. It will give us pleasure to receive information, or even hints and conjectures, upon the subject, from any of our readers.

We have seen this rot where it was impossible that superabundant moisture in the subsoil could produce it: in one season it prevailed more among that part of the crop which was sowed (about the first of June) upon unfertilized dung, than upon the part manured with a mixture of ground bones and ashes. And more in each of these lots than in those sowed about the 1st of July. This was in 1838; and the crop that year was not by any means a failure. In 1839, we sowed upon fresh manure from the barn cellar, on the last Wednesday of May. Land, a light loam—subsoil *dry*. This crop was very badly injured. We conjectured that the failure was owing either to the early sowing, or the fresh state of the manure. In 1840, we sowed where the manure had been applied the preceding autumn, and the same evil was experienced.

The season of sowing and the condition and nature of manure or soil, it is not improbable, have influences increasing or diminishing this rot. But what the proper season for sowing is? what the safest soil and subsoil? what the best kind of manure? what stage of decomposition should the manure be in?—these questions our experience and observations cannot answer. We are in the dark. And we put the question distinctly to *any man* who can, or to *any man* who *thinks* he can, answer it—What is the cause of rot in ruta бага?—ED. N. E. FAR.

Influence of Solar Eclipses on the Weather.

Extract from "Travels through the Western Country in 1816,"—(By DAVID THOMAS)

"On the day of our arrival in Pittsburgh, we had several thunder showers from the west. The weather then became clear; and for three days we had brisk gales from the north-west, of unusual severity for summer. The surface of the rivers was rolled into foam, and each night was attended by considerable frost. Indeed, it still continues. (6 mo. 10.)

"It is said here, (as in New York,) that the seasons are much colder than formerly; and the conversion always terminates, whenever the subject is introduced, by a reference to the great eclipse of 1806. At this turn, I have always listened with diminished respect.

"This popular opinion took its rise, from some cool weather, in the summer seasons of 1806 and 1807. A retardment, in the average progress of vegetation, for a few days was deemed cause sufficient to overlook all terrestrial agents for the absorption of heat, and to charge it directly to the moon.

"Of the facility, with which errors not palpable to the senses, may be propagated, we have long been a rare; but that men of understanding should adopt his notion,—which originated in the grossest ignorance of the causes of eclipses,—is surprising. Such, however, is the case, and to these I offer a few observations.

"The same shadow that attends the moon, has constantly projected its dark cone since the creation. Within every term of a few years, its point has touched the earth; at least twice in every year; our satellite has passed so nearly between us and the sun, as partially to hide it; and once in every month, it has revolved round the earth, and approached as near to us as it did on the day of the great eclipse. These are facts that admit of no dispute; and the inference is clear and consistent, that, if eclipses affect the weather, the seasons ought to be equalized by such an equality of causes.

"Other views of this subject would justify the assertion, that a solar eclipse has no effect whatever on the atmosphere, except during its continuance. The darkness is nothing but a transient shadow. No reason can be given why the moon, in passing between us and the sun, should produce more extraordinary effects than when the earth rolls between us and that luminary. The latter case happens every twenty four hours; and the clearness in clear weather is not only much greater, but the duration of the darkness will average more than three hundred times longer than in other eclipses.

"But every point of view, in which this belief can be placed, shows its absurdity; and whether it be said that a pernicious vapour escaped from the shade of the moon, or that the atmosphere received a shock, the supporters of this doctrine are equally discomfited.

"It will be proper to inquire, if the seasons have been uniformly colder since the year 1806 than before that period? A correct answer to this question would show that much fallacy attends this popular opinion. Pennsylvania has been subject to summer frosts since its first settlement; not, indeed, very destructive, but sufficient to show that cool weather was frequent. The celebrated DAVID RITFENHOUSE, who resided many years in Norriton, twenty miles north-west of Philadelphia, asserted, "that he had discovered frost at that place in every month of the year except July." He died in 1796.

"This was in times of old. In more modern days, but before the eclipse, I remember a severe frost in some parts of Cayuga, in the 6th month, 1800; and a considerable fall of snow happened at Philadelphia in the 5th month, 1803. Many of the citizens were awakened in the morning, by the crashing of Lombardy poplars, the branches of which were in full leaf, and unable to support the load.

"We will now notice some seasons, since the eclipse, of a different character. The spring of 1808 opened so early, that flax was sown near the Cayuga Lake in the 3d month; and on the first of the 4th month, young cattle were turned to pasture, because there was a sufficiency of grass. The whole summer was unusually pleasant, excepting some extremely hot days. Similar observations were made in the year 1811, one of the most remarkable which the oldest settlers in this country remember. The spring opened about the middle of the 3d month, without any subsequent frost; and the autumn was so fine that its mildness was ascribed to the comet.

"It thus appears, that the popular doctrine of eclipses is inconsistent with reason and contradicted by facts.

"This reference, to which I object, however, compares well with certain operations of the human mind. When two remarkable occurrences in the sky and on the earth, have happened near the same period, the ignorant of all ages, have been subject to believe that one depended on the other. Ancient astronomers arranged the disasters of the times with their accounts of comets and eclipses; and in our own day we have had three remarkable illustrations of this principle. In Eastern Pennsylvania,

— the swift

And perilous lightning, from the angry clouds, were thought by some to be much increased, on the introduction of plaster. To the north-east, the frequency of cold winds, since the great eclipse has been observed beyond all former example; but in the south-western part of the United States, where no great eclipse appeared, some of the old inhabitants declare, that this change of seasons arrived with the Yankees, from the north."

Ripening Pears.

Bourne's Dial, as well as some other kinds, require a peculiar mode of management after they are gathered. Two that were beginning to turn black on the skin, were put in a drawer near the fire, where they lay for a week or two. When cut they were perfectly melting and delicious.—*Gardener's Chronicle.*

To the Ladies.

In our last number we promised to find both the time and mode for ornamental gardening,—and we shall find them both in one intelligent word—*inclination*.

We know of one poor woman who lives in a log cabin, does all her own work, takes care of four young children and a baby, for whose support she takes in washing. Yet in front of her door you may see a neatly tended border of flowers,—the seeds bought with a few hard earned pence, and planted and weeded after the toils of day are over, or in a few stolen moments before her children are up in the morning. We remember too, another wash-woman, whose windows were curtained on the outside with scarlet beans and morning glories; and whose double balsams, marigolds, and sweet peas, often drew a look of admiration towards her otherwise cheerless dwelling. So much for instances among the very poor. Among those to whom fortune has been favorable, we know of one matron, who has reared a large family of children, and whose hands of course were full of domestic care, whose garden and grounds have yet been the admiration and ornament of the neighborhood; and in the wholesome spirit stirring exercise attendant on the cultivation of plants and shrubbery, she has found both recreation and rest when wearied with family cares.

Surely there are instances enough to convince every one that inclination can supply both time and money. The beautiful productions of nature are so abundant, that the poorest can afford the cheap, yet delightful ornament they afford; a dwelling unadorned by their presence, can only be accounted for, by supposing its fair inmates destitute of that love of the beautiful which is one of the most engaging traits in woman.

We know there are some that affect a distaste for the more common flowers and shrubbery, that any body and every body can have. "Could we afford to keep a green house," say they, "and to purchase plants really worth having, we might feel some interest in the thing; but these every day affairs are not worth the raising." Such show that they have no genuine love and appreciation of the beautiful creations of nature, but regard them merely as matters for ostentation and display. Let the fragrant myrtle, or the splendid pomegranate, once become common flowers, adorning the open field and fringing every brook, and they would henceforth lose every charm in their eyes; and the stupidest cabbage that ever vegetated, might become delectable by becoming so rare that only the possessors of thousands could own it! Those who have a genuine love of nature, must have something; if they cannot possess the costliest and most elegant, they will have the cheap and the humble, and are thankful that the Author of nature is no aristocrat, but that he has shed a grace and beauty on the more common of his works, far superior to that which adorns the rarer ones.

We would that we could point our readers to the gardens of some of our female friends, where a very beautiful show of flowers and shrubbery has been created with scarce an item of expense.

Our friend Mrs. A. is an example—will you walk with us in her shrubbery a few moments? See that noble rose geranium!—it was the growth of a slip sent to her in a bouquet, and cultivated by herself till it has reached its present size—those honeysuckles that entwine the porch, were at first small cuttings taken from the vines of a friend; but Mrs. A. nursed them to their present growth—that white rose, whose snowy blossoms cover one end of the house, was in the beginning a small offset, from the garden of one of her neighbors, but she has cultivated and tended it till it has reached its present maturity—that orange tree perfuming the air with its blossoms, she raised from the seed and inoculated with her own hands, and so with many others of her choice shrubbery—in like manner the cape myrtles, the oleanders, the dahlias; these splendid ornaments have been sources of very little expense. Mrs. A. does not garden by proxy. After the gardener has once arranged the borders in the spring, the planting and watering and nursing and transplanting is mostly done by her self; and early every morning you may see her in her cottage bonnet and gardening gloves, busy among her shrubbery; and if you will ask her, she will tell you that she gains health and vigor daily by the exercise.

If any of my readers are half persuaded to undertake a like course, we will next month give a few hints as to the laying out and arranging of a garden, and the selection of plants for persons in moderate circumstances.—*Western Farmer and Gardener.*

For the New Genesee Farmer.

Experiments with Potatoes.

MESSEURS. EDITORS—Observing in your first volume, various experiments suggested on the culture of the potato, I have performed the following. I selected ground in my potato lot, the soil a mixture of clay and gravel, a moderate portion of stable manure was put upon the sod, then well ploughed and harrowed, and lightly marked with a small plough, about 3 feet apart and 18 or 20 inches between the hills. They were planted on the 2d of June, the cultivator passed through them, plaster applied, and some time after they were ploughed and hoed. G. S. T.

Eric co. Pa., March, 1841.

1. *Pieces one eye only, 21 hills to a row.*

1.	5 pieces each hill.	Product 95 lbs.
2.	4 " " "	" 96 "
3.	3 " " "	" 99 "
2. *Pieces usual size, from the top half of the potato, 16 hills to a row.*

1.	pieces each hill.	Product 81 lbs.
2.	3 " " "	" 83 "
3.	2 " " "	" 88 "
3. *Pieces usual size, from the root half of the potato, 16 hills to a row.*

1.	4 pieces each hill.	Product 87 lbs.
2.	3 " " "	" 87 "
3.	2 " " "	" 89 "
4. *Potatoes ordinary size, the pieces quarters, parings thick, and cut in 4 pieces, 16 hills.*

1.	1 whole potato each.	Product 84 lbs.
2.	4 pieces " " "	" 89 "
3.	4 parings " " "	" 72 "

5. *Potatoes small; 8 hills.*

1.	4 whole ones each.	Product 41 lbs.
2.	3 " " " "	" 43 "
3.	2 " " " "	" 44 "

The above experiments were with Calico potatoes; the following with Scotch Greys.

6. *30 hills to each row.*

- | | | |
|----|-------------------|------------------|
| 1. | 1 whole one each. | Product 180 lbs. |
| 2. | 5 pieces " " " | " 127 " |
| 3. | 4 " " " " | " 157 " |

REMARKS.—Accurate experiments are always valuable, but they require repetition and considerable variation, to establish any point. For instance, a very slight variation in the soil of each row, may cause a difference in the result, greater than any difference in the mode of planting. Hence in trying one mode, several rows should alternate with each other, and their difference be individually, as well as collectively, compared. Again, in cutting potatoes, whole ones succeed best in dry seasons, in dry soils, or when planted shallow and perhaps cut ones when the opposite is the case. These, and many other circumstances, are to be taken into consideration.

Indian Corn.

MESSEURS. EDITORS—I had two pieces of corn; the first two acres were clover sod—the seed the twelve and sixteen rowed, known as the *Stenton corn*; it was put into the ground dry, on the 15th of May, the rows three feet apart each way. During the season I plastered one half, and sowed the other once, and went through with the cultivator once each way, and once each way with the plough, followed with a hoe each time. About the 20th of September, the corn was cut up at the roots, and stacked for ripening. After husking and sorting all the small ears, I sold eighty-eight bushels of shelled corn from the two acres. Had I managed it as I did with the other piece, I think I should have got double the crop, with one-third more labor. The other piece, one half acre, was corn stubble of no richer soil than the other; I drew on it fifteen loads of long manure, and spread it equally over the ground; planted it in rows three

feet apart, and eighteen inches in the rows, the same time as the other, and in the same manner. As soon as it was of convenient height I went through it with the cultivator, followed with the hoe, and plastered it; the next time with the plough, followed with the hoe. About the 15th of Sept. I cut up the corn at the roots. After husking and sorting the small ears, I had eighty bushels of ears from the half acre.

Berkshire Pigs.

Major E. Corning brought into our neighborhood, in the town of Hastings, a full blood Berkshire boar, and I, like some of the rest of my neighbors, thought that our native breed was equal to them; but after seeing some of his stock, I purchased a sow that had seven pigs from his boar. The sow was quite small. I favored her, she weighed only 250 lbs. The pigs I wintered on one-third less feed than I could have done the native breed. On the first of March, I moved into Cayuga county, and drove my pigs; I could have sold them on the way two or three times for six cents per pound, whereas the native breed fetches only three cents. I will give you the result of my pigs when fattened. Very respectfully yours,

WM. K. JOHNSON.

Cato, April 9, 1841.

The Cross Pear.

In the last number of the Magazine of Horticulture, there is an account of this new native variety of the pear, with an outline and description of the fruit, by the editor of that journal. It is supposed to have originated in Newburyport; and bears the name of the proprietor of the garden where it was discovered about fifteen years ago. Our friend R. Manning, whose judgment will not be disputed, has pronounced it without hesitation, "a most excellent fruit;" and the editor says, "The beauty of this pear, together with its abundant and constant bearing, and its melting flesh and perfumed flavor, render it a desirable variety in collections, and one which will rank with the Cushing, Seckel, and others of our finest American kinds."

We copy his description of the fruit:

"Fruit medium size, roundish, two and a half inches in length, and two and a quarter inches in diameter. *Stalk* three-quarters of an inch long and very thick, inserted in a slight cavity. *Eye* small, and considerably depressed. *Skin* smooth, deep yellow, red on the sunny side, very russety round the eye, and covered all over with russety dots, and sprinkled with small black spots. *Flesh* melting, juicy, and sweet, with a perfumed and agreeable flavor. In eating in December, sometimes earlier (in November) and occasionally keeping till February."

The Season.

Amidst the oft-repeated remarks upon the peculiarity of the season, let us recur to the records of past years for their evidence upon the point.

	1st half	2nd half	mean	month.
Mean temp. of Mar.	1838, 30,53	36,66	mean	33,59
" " "	1839, 32,15	35,60	"	34,02
" " "	1840, 33,95	34,58	"	34,28
" " "	1841, 23,82	23,76	"	28,88
" " "	April, 1838, 37,04	37,45	"	37,24
" " "	1839, 48,30	48,87	"	48,58
" " "	1840, 42,86	54,71	"	48,78
" " "	1841, 35,21	45,15	"	40,20

This comparison shows the uncommon cold of March and April. The first half of March was as cold as the mean of February. March 17th, was the coldest morning in the three years past, being 5° below cypher. On the 7th day there fell 11 inches of snow, and on the 13th also 12 inches, and several inches more in the following days, so that the snow was nearly two feet on the level after settling several inches. The birds appeared about the 20th, which

usually come in the first week of March. A shower and some lightning happened on the 27th, at which time the Genesee was high from the melting snow; the change to below freezing point on the 29th, doubtless prevented much desolation.

The first half of April was uncommonly cold; indeed it was not till the 23rd that the mild south wind began to blow upon us, and the flowers, which open in the woods near the beginning of the month, began to appear. Till after this day the grass scarcely showed any signs of returning spring.

April 25, 1840, the temperature was 88°, extremely hot. April 21, 1841, it was 76°. Examination shows the great peculiarities of this season. For the raising of fruit the lateness of the season is considered favorable. At the same time it increases the farmer's expence for the support of his cattle, &c., in no inconsiderable degree. C. D.

For the New Genesee Farmer.

Education of Farmers' Children--No. 4. ON REFINEMENT OF MANNERS.

MESSEURS. EDITOR—It has been my endeavor to show the necessity of giving more education to our sons, that they may have advantages equal to those of our daughters, and take equal rank with them in society. I was brought up a farmer's son, and rejoice that I know by experience the necessity and virtue of labor and industry. I am able to speak of what I have seen; and can give some reasons for facts which I did not then understand. I saw indeed that the daughters were generally in advance of the sons in all those acquisitions which make an impression upon others, and see the same to hold true at the present day. Besides the greater degree of education in proportion and the greater facility with which the female attains that which is interesting, there is another fact which has far too wide and great an influence for many years, and often through the growth of both.—*There is not the same successful moulding of the manners of the sons, nor the same attention to their dress, nor the same introduction of them into society.* If there is company at all, the daughters more naturally fall into it, and enjoy its advantages; the sons are in the field, or at work in the garden or yard, and their clothing is suited to their work, and not to visiting or attending on company. The dress of the daughters is often, not of a better kind, but *more attractive*. The sons, when in early youth, often acquire a distaste for seeing company for these reasons, and avoid far more than is for their good all the means of social improvement thus thrown in their way. Often too, they are associated with hired help of no refinement and improvement, whose influence is pernicious upon their minds in every social respect. It thus happens that youth passes away before they begin to feel the importance and desirableness of society; and their manners and course of life have not fitted them to interest others or to impart to them much pleasure. I know that often the son is in fault, in that he excludes himself far beyond what his parents or his sisters desire, from seeing company and enjoying the benefits of social intercourse. Let, however, the circumstances be considered, and probably there will be found room for improvement on more than one side. The possession of good-breding, politeness, and good manners, is not made of as much consequence to the son, and in the view of the son. His mind is not impressed with its value in an equal degree. And yet rusticity, coarseness, vulgarity, impoliteness, have no necessary connection with a farm and our agricultural pursuits. The fine manners and gentlemanly appearance of many a farmer, who have in some way become exceptions to the too general fact, present us with all the testimony needed in the case. But manners will be rude and coarse, and the appearance unprepossessing

without effort and cultivation and social intercourse. Even education, though it naturally places persons in a situation for the improvement of the personal appearance, will not of itself render one agreeable and interesting in society. Many a scholar is unpolished in his manners compared with many a farmer. We often indeed deride appearances as contrasted with intrinsic worth; but, after all, the maxim of the German is true, "That every person is to others what he appears to be." At the first sight of a person this is and must be true; and on intimate acquaintance it is equally true. The son that disregards appearances, or cares little what his appearance may be to others, does himself a great injury; for he will lead others to a lower estimate of him. The parents that are not attentive to the manners and social appearance of their sons and daughters, commit a high injury upon themselves and children. Let there be an equal reprove from coarseness and vulgarity on one side, and from affectation and dandyism on the other.

The remedy is obvious to every intelligent farmer. Let the sons feel the kind transforming influence of the mother, and the father lend his efficient aid in ringing that moulding influence to bear upon the mind. Let not the daughter alone share in this plastic power of maternal love. Let the benefits of society be enjoyed to all reasonable extent. Let the good influences begin to be exerted early, and let them be continued without intermission. In this particular, *Be not weary in well doing.*" D. C.

Mr. Earl's Stock—Yates Co.

MESSENGERS—I wish to call your attention to full blood Durham calf, belonging to Mr. Jephthah Earl of Cashong, in this county.

Mr. Earl has long been celebrated for his excellent breeds of hogs, both Berkshire and Leicester; and he recently has turned his attention to the imported English breeds of cattle. The Durhams are his favorites, and of them he possesses some fine specimens; the one to which I now shall particularly advert, is a bull calf, which, in elegance of form, and symmetry of proportion, approaches, in my opinion, very nearly to perfection. He is of a white color, with a few spots; and has reached his present remarkable size, nothing more than what would be called ordinary attainment, for such an animal. He was accurately weighed a few days ago, in the presence of several persons, and his weight was seven hundred and eight pounds, being, at the time, only seven months and five days old.

Before sending this to the post, I called on Mr. Earl to get the pedigree of the calf, which I now add. Comet was bred by Jephthah Earl, sired by Forage; dam, Bellflower.

Forager, dam, Victoria, by Rover. By Rockingham, dam, Cherry, by Wonderful, grand dam by Alf; gr. gr. dam by Chilton's old red bull.

Bellflower's pedigree extends to North Star, Comet, Perry and Danby. A FARMER.

London, Yates co., 1841.

Holkham Hall,

is known as the Seat of the Earl of Leicester, better known as "Mr. Coke of Holkham."

No part of Great Britain is to be found a finer specimen, either of the style of life of a country gentleman, or of the management of a first-rate practical proprietor's estate. In the year 1770, Mr. Coke entered, in the English House of Commons, the discomposure of the American war—which was carried by majority of one—and headed a committee to make up an address to the King, in pursuance of the vote, in a white-top boots and frock—his customary dress—and every American must respect him for the achievement; nor will they regard him the less, when they are told, that every day at his table, during the time of that barbarous war, he was accustomed to drink the health of the greatest man in existence—GENERAL WASHINGTON; and this liberal spirit has al-

ways distinguished the man, who, were he now in the House—which his age, 82, prevents—would be, by many years, "the Father of the House of Commons."

The extent of Holkham is about 3500 acres, nearly surrounded by a high brick wall, about ten miles in circuit. This comprises plantations of wood, and a beautiful lake of water, and nothing can appear more rural than its borders, completely overshadowed with forest, and wild as in the depths of some solitude in Michigan. All the woods have been planted—the work of his own hand—the whole estate being plentifully sprinkled with various species of trees, arranged in coppices, in acres of forests, and long avenues; so that, instead of a vast park in one body, it is everywhere an ornament and a shelter, over hill and dale, nowhere in excess or in the way of the farmer. Immediately around the mansion are gardens, delightful walks, and a wide extent of velvet lawns on every side; but these are marked by their own schemes of practical utility, for here may be seen the stately pheasant and the graceful deer, that feed and browse and bound about on these soft lawns, and enjoy the seclusion of the cool shades in perfect security.—These are charms to the eye, and exhibit the tasteful elegance of the noble proprietor. Here are woods, too, and while riding through their long winding lanes, one is charmed with the perfume of the forest flowers of most exquisite fragrance, and the chirping and fluttering of birds—the yellow-hammer, whirling on his gay speckled wings; the shining blue jay, glancing "like the jayhawk by," and the wood-pecker "tapping at the hollow beech tree."

The remoter lawns are sprinkled over with flocks of sheep—of which more than three thousand are kept—of the famous South-Down breed; and in the pastures are to be seen the fine, sleek, bright-looking Devon cattle, browsing in herds, more than three hundred in number, besides an immense dairy of Scotch cows.—Beyond these pastures, one comes at once into the midst of cultivation, and a ring of this, skirted and sheltered here and there with avenues and copes and trees, encircles the whole estate. Here may be seen a field of one hundred and thirty acres in barley, another of sixty acres in wheat, with fields of pens twenty-five and twenty-seven acres each; the arable lands being divided about equally between these grains, and turnips and grass, which crops, sometimes having grass for two years, constitute the routine of the succession of tillage on the same ground. There are in cultivation at this time, about four hundred and thirty acres of wheat and barley, each in fine condition; in the steward's estimation, thirty bushels an acre are indifferently crops—forty and fifty, more the "right thing."

It must never be forgotten, that Holkham has heretofore been made what it is by Mr. Coke. When he succeeded to the estate it was a mere waste; not a tree, nor was it believed that the land would grow them—the only creatures that could exist upon it were rabbits, and they were starving! Now, what a triumph is here! But go into the village of Holkham, which belongs virtually to the estate, and subsists by it in one way or another. Here are five hundred persons probably, with cottages that are a curiosity of rural neatness and comfort; delightful gardens surrounding them, with flowers hanging around the windows and over the doorways! About one hundred and fifty persons are employed on the Farm alone; those in the gardens, which are surrounded by a wall one thousand four hundred yards long and fourteen feet high, are perhaps forty more; in the brick-yard twenty; in the smith's shop ten;—with carpenters, bricklayers, wheelwrights, game-keepers—a little army of servants without; while in the mansion, besides male servants of every grade, twenty females are employed when the family are present. Women also assist in the labour of the farm, in hay and grain harvest, as well as in weeding and hoeing the crops, which are all drilled.

Beyond, and outside the walls of the regular estate, is another plantation of six hundred acres more: here all were hard at work sowing turnips, all the parts of the process going on at the same time—twenty men and boys spreading manure from five or six carts drawn by three horses each (one hundred being kept); half a dozen ploughs with two, without a driver; cast-iron rollers with two; three and four harrows with two; drill machines with two, with burrows again, brining up the rear. And to crown all, the noble asylum for the old, and schools for the young! Truly this is one of NATURE'S NOBLESSES! Here, the sons of gentlemen come from all quarters to learn the science of agriculture, under the care of the steward, the whole establishment being a model both of the science and practice of farming.—*Boston Transcript.*

Spring.

"This delightful season has, after a long and tedious winter, made its appearance. Bright beautiful Spring! we again greet thee with joy, and welcome thee with a smile of delight. The heart of that man must be callous and cold indeed, whose spirits do not sympathize with this delightful season. Poets may well gather inspiration from the clear unclouded face of nature at this season of the year. The song of birds—the bounding of the playful lambs—the green pastures—the budding trees, are objects which have in every age been the theme of the poet's song.

"Say ye that know, ye who have felt and seen,
Springs morning smiles, and soul enlivening green,
Say, did you give the thrilling transport way?
Did your eye brighten, when young lambs at play,
Leap'd o'er your path with animated pride,
Or gazed in merry clusters by your side?"

Spring is endeared to us by a thousand recollections of our boyhood days—when we wandered o'er hill and dale, or followed the swallow brook to its source, or chased the robin from bough to bough, free as the very air we breathed. Youth may well be styled the spring time of life, the Elxir, the very cream of our existence, but like the seasons it quickly passes away, but not like them, to return."

THE VOICE OF THE SPRING TIME.

BY MARTIN THAYER, JR.

I come! I come! from the flowery South,
With the voice of song and the shout of mirth;
I have wandered far, I have wandered long,
The valleys and hills of the South among;
On woodland and glen, on mountain and moor,
I have smiled as I smiled in days of yore;
In emerald green I have decked them forth,
And I turned again to my home in the North.

I have roved afar through the storied East,
And held on her hills my solemn feast;
Through her cypress groves my voice was heard,
In the music sweet of my favorite bird;
Each plain I have clothed in sunlight warm,
And slumbered in peace 'neath the desert palm;
A garment of light to the sea I gave,
And melody soft to each rushing wave.

I come! I come! with the song of the thrush,
To wake with its sweetness the morning's blush;
To hang on the hawthorn my blossoms fair,
And strew o'er each field my flowers rare.
The lark, he is up, on his heavenward flight,
And the leaves are all gemm'd with diamonds bright;
The hills are all bathed with purple gold,
And the bleating of flocks is heard from the fold.

Go forth! go forth for the spring time is come,
And makes in the North his bright sunny home;
The sky is his banner—the hills his throne—
Where in sunshine robed, he sits all alone;
In the depths of the woods his footsteps are seen
By each moss-covered rock and tall-tale stream;
And his voice is heard through each leaf-clad tree,
In the plaint of the dove and the hum of the bee.

Graham's Magazine.

STANZAS.

Why does the rose conceal the thorn,
And fairest flow'rets hasten from us—
Delusive pleasure never yields
One half the joy she seems to promise.

Say, why so much commingled is
Life's every scene with joy and sorrow;
To-day our cup o'erflows with bliss,
'Tis filled with woe and tears to-morrow.

'Tis better thus, or we should cling
With madness to time's fading pleasures,
Our light afflictions are to bring
Our hearts to seek enduring treasures.
Yes, just enough of grief is given,
To lead earth's wandering sons to heaven.

From the Farmer's Cabinet.

Hessian Fly and other Wheat Insects.

In the last two numbers, 6, and 7, of the current volume, 5, of the Cabinet, and also in some former volumes, several communications have appeared, treating of the Hessian fly (cedidomyia destructor of Say,) but I shall pass them by, inasmuch as the natural history of that insect has, for a considerable time

past, been as clearly ascertained as that of any other whatever. The first publication that I know of, is by General J. H. Cooke of Virginia, dated 1-17, which describes the fall deposit; see American Farmer, Vol. I, p. 234. The second is by myself, dated 1st February, 1821, also describing the fall deposit; see same work, Vol. II, p. 180. The third is by Dr. Isaac Chapman, communicated to the Agricultural Society of Bucks county, 14th August 1820, and to have been written in 1797, stating its appearance in Bucks county in 1786, and its progress for some time afterwards, also describing its several changes and habits; but the Doctor has only noticed two generations, having blended the second and third together; See Memoirs of the Philadelphia Agricultural Society, Vol. V. The fourth, by myself, dated 12th February, 1821, which traces the history of the insect throughout the year; see American Farmer, Vol. III, p. 187. The fifth is by myself, dated 1st June, 1821; see same volume, p. 213. The sixth is by myself, dated in 1823, treating of the fly and three other insects injurious to the wheat crop, and proposing a remedy; see Memoirs of the Pennsylvania Agricultural Society, p. 165.

I refer you to all of the above-mentioned papers, particularly the last; but as many of your readers may not have an opportunity of seeing them, I will transcribe what I deem to be essential.

The Hessian fly, I believe first made its appearance on Long Island, N. Y. in 1776, or soon after the Hessians were there, and is supposed to have been introduced among some straw which they brought with them; hence the name; but the late Judge Peters, that great friend and patron of agriculture, in his notices for a young farmer, says, that the insect was unknown in Hesse, "that its name does not prove its importation, for that appellation was bestowed during our revolutionary excitements, when every thing we disliked was called Hessian." The insect has been accurately described by Mr. Say and Dr. Chapman; but Mr. Say was mistaken respecting the deposit, as the aperture which he noticed in the sheath of the leaf, was occasioned by the insect passing into the winged state, and not perforated in the act of depositing its eggs. The fly is of a dark color, about the size of the musquito, and the male much like it except the wings; the body of the female is larger; the wings rest horizontally, and where they join the body are almost pointed, gradually expanding towards the other end, where they form nearly a semicircle. The egg is scarcely discernible to the naked eye, is oblong, of a pale red or amber color, and placed in the gutter of the leaf, from half an inch to an inch or more from the stalk; the caterpillar, of a pale red color, is hatched in a few days time (according to the state of the weather) and it passes down the leaf to its junction with the stalk, thence between the sheath and stalk, to near the root or joint; it there becomes stationary, feeds on the sap of the plant, and, being concealed by its covering, is mistaken for the egg. The first deposit takes place from the fifteenth to the last of April (as the season may be) changes to the pupa from the first to the middle of May, and evolves in the winged state, the latter part of that month. The second generation commences from the first to the middle of June; the fly chooses the stunted plants, and deposits both on the top and underneath the upper leaf, and the larvae pass to near the two upper joints, but are found mostly about the upper, and in such numbers as many perish for want of food, the increased number being so disproportionate to the plants which suit their purpose; I have counted upwards of two hundred eggs on a single leaf. The third deposit is made in the manner of the first, and commences about the fifteenth or later in August, and is continued on until cold weather; The irregularity of this generation is occasioned by the various situations in which the pupa of the second is thrown, it is lodged in the straw of the stunted plants, so that in harvesting, much of it is scattered about the stubble-fields and the rest is carried to barns or stacks; such as is early exposed to heat may produce a fourth generation, whilst that which is covered till winter may not give a third.

On discovering a fly in the act of depositing, I searched it, and on examination (making the best calculation that I could, and not knowing whether it had deposited any eggs before) I supposed it to contain one hundred eggs; such is the fact, the first deposit would be one hundred; the second ten thousand, and the third one million, all in the course of one year; happily, however, they have enemies which vastly reduce their number.

The only plants, according to my observations, which are subject to the depredations of the fly, are wheat, rye, and barley; rye, owing to its early spring growth, is not much injured; grains should be sown

(in this climate) about the first day of October, as that sown afterwards suffers more from the winter than the fly.

The only remedy which I have any confidence in, must be applied to the second or summer generation, (it is the only one that I think can be assailed with any prospect of success) whilst in the pupa state, by ploughing the stubble-fields before putting in the next crop; in that case, grass seed could not be sown among the grain; but by changing the course of cropping, beginning with wheat, rye, or barley, followed by corn, and ending with oats and grass, the difficulty might be avoided; nor need the stubble be ploughed till towards the first of April, or any time during the winter; plants about stacks and other places must also be attended to; and let it be remembered that farmers must pursue the same plan, as it is vain for a few individuals to attempt an object, whilst thousands are united to oppose it. I will further observe, that the surest way to raise a good crop of any grain subject to injury from the fly, is to put the lands in a proper state of cultivation, as where that is the case, and when the season proves favorable, little or no damage will be sustained, although the fly may be very numerous, as it certainly is every year. It is folly to sow wheat on a poor soil.

The insect described by Miss Morris is not the Hessian fly, and I think she is mistaken in the manner of depositing its eggs, it appears to be the same as that noticed by me in 1823; it has three generations in the course of a year, and is observed a few days earlier than the Hessian fly, and the same remedy may be applied to both; the spring and fall generations are to be found near the roots of the plants, and the summer are at the several joints. There is another insect lodged in the straw above the upper joint, which causes the premature appearance of ripeness of the head and prevents the grain from forming; it has not yet done much injury, but may hereafter increase.

There is also an insect which attacks the roots of wheat and causes the stunt or sedge; it is probably a species of aphid, and the remedy must be applied to the soil. I would recommend salt or ashes; perhaps lime might be good.

JAMES WORTH.

Sharon, March 1, 1811.

The Artesian Well at Paris.

Late accounts from Paris mention the complete success of obtaining water from beneath the beds of chalk which underlay that city, after seven years of assiduous toil, and an expenditure of one hundred and sixty thousand francs. The depth is variously stated—one account makes it 1837 feet. The iron rod of the auger was "as thick as an ordinary axle tree" (just the thickness of a lump of chalk;) and "on the 26th of February," at the moment of withdrawing it, a copious gush of warm water followed. The temperature was 86° of Fahrenheit. Warm baths for public accommodation are to be constructed. The engineer was honored with a decoration, and he is to be employed on three other such wells. Enthusiasm was at its height. Ministers had been to see it. Crowds had carried away portions of the water in vials and bottles, and some had shared themselves in public with the warm fluid!

It has long been supposed that the central parts of the earth consist of melted matter at a high temperature; and experiments in deep mines have invariably shown an increase of heat with an increase of depth. The mines of some countries however, are warmer than the mines of other countries, at similar distances below the surface; and this might be reasonably expected from chasms which allow the heat to rise through them in some places, and from thick masses of solid rock which resist its ascent in other places. In the mines of Cornwall, at 962 feet the water was at 74°; and at 1200 feet at 78°. This shows an increase of one degree to 302 feet.

It had been calculated however, by Cordier that 51 feet correspond to a degree in France; and that the depth at which water would boil from the natural heat of the earth under the city of Paris, is 8212 feet, or nearly a mile and a half.

* Cordier admits this may be twice, or even thrice, as great in one country as another.

In applying this rule for calculation, we must commence with the temperature of the earth near the surface; and if we assume this at 50°, and divide 1837 by 51, the quotient (36) added to 50 will give the observed temperature with great exactness.

Warm springs may therefore only indicate the great depths from which they rise; or they may derive their heat from volcanic action in the neighborhood.

The temperature of the sea, on the contrary decreases with its depth; because if the rocks at the bottom were even at the boiling point, the heat would be speedily carried up to the surface, and colder portions of the water immediately come in contact. The coldness of the sea therefore, constitutes no argument against central heat. But the water under the great basin at Paris could not escape till the reservoir was tapped, and consequently the heat was retained. †

Farmers—their independent condition—their happy exemption from the evils of the times.

Messrs. Editors—Blessed is that man who from his own farm can, by ordinary industry, procure all the comforts and necessaries of life, and sleep contented.

Look at the great mass of speculators, and see what is their condition. The country brought to the brink of ruin by their example; new varieties added to crime by their high handed practices; the whole trading and manufacturing community paralyzed or embarrassed, solely by the consequences of their inflations!!!

In excluding farmers from sharing the evils of the times, I do not mean him who has left his legitimate calling to join in speculation, nor him who with the poor ambition for banking, lends his title to fee simple, as if he were only eager to join in the general ruin. But, I repeat, blessed is that man who is contented to receive from his own farm, those comforts which moderate industry never fail to procure. To him alone is permitted the heart to feel, and the eyes to see, the true glory of heaven at night, and the brightness of the earth in the morning. No feverish dream poisons his sleep; no rising sun wakes him to grinding responsibility, diminished self-respect, ruin and disgrace.

If he loves reading and study, rainy days, long evenings, and the hours of relaxation from his daily task, give him sufficient leisure. If he lacks books the School District Library alone, enlarged as it now is, contains a store house of useful and even scientific knowledge. If he loves agricultural chemistry, his farm is a laboratory in which, with little aid from the schools, he may most delightfully unite the *utile* with the *dulce*.

S. W.

The only things in which we can be said to have any property are our actions. Our thoughts may be bad, yet produce no poison; they may be good, yet produce no fruit. Our riches may be taken from us by misfortune, our reputation by malice, our spirits by calamity, our health by disease, our friends by death; but our actions must follow us beyond the grave. These are the only title-deeds of which we cannot be disinherited.—Lucan.

From the American Citizen.

British Corn Laws.

Having seen with much satisfaction, several articles in the American Citizen, on the oppressive nature of the English Corn Laws, I am induced to send the following tables, taken from an old newspaper which accident lately threw into my hands.

ENGLISH CORN LAWS.—The N. Y. Courier say the following accurate and very valuable table, exhibiting the rate of duty per barrel on flour imported in England, was prepared several years since, by a big intelligent American merchant, then residing in Liverpool. Its accuracy cannot be questioned, and we consider it a table well worthy of preservation, all who are in any way interested in the exports of bread stuffs to Great Britain, under the present existing Corn Laws of Great Britain. Act 9th, Geo 4th

4th, chap. 60, the duty on foreign wheat is as follows, viz., when the average price of wheat is at and above"—

Table with 3 columns: per qr, Duty per qr, Duty per bbl on flour. Lists prices for various quantities of wheat and flour.

On barley and Indian corn, if the average price is 31s. and under 31s., the duty is 12s. 4l. per imperial quarter, and for every 1s. per qr. that it advances, the duty is decreased 1s. 6d., until it reaches 41s. per qr., at which price and upwards, no more than 1s. per qr. is levied; and the duty increases in like manner 1s. 6d. per qr. as the price declines 1s. or part of 1s. under 33s. per qr.

On oats, if the average price is 25s. and under 26s per qr., the duty is 9s. 3d. per qr., decreasing 1s. 6d. per qr. as the average price advances 1s. until it reaches 31s., when at that price or more the duty is only 5s. per qr., and in like manner it is increased 1s. 6d. per qr. for every 1s. or part of 1s. per qr. the average exceeds below 24s per qr.

For the convenience of those who do not readily understand quarters and sterling money, I have prepared the following tables, exhibiting the rates of duty per bushel in federal money, together with the duty on flour per bbl in federal money, so arranged that they correspond with the preceding table, and will be at once understood. Thus when wheat is at and over—

Table with 3 columns: per bush, duty per bush, on flour per bbl. Lists prices for various quantities of wheat and flour in federal money.

From an inspection of the above tables, it will be seen that the duty on flour is 50 per cent. higher than

on grain: consequently shippers generally send wheat in bulk to England, unless the price is very high, when the duty is so small as to make the freightage more than counter-balance the extra duties. At best, however, it is but a hazardous business, and often attended with ruinous loss to American exporters. The extra duty on flour is no doubt intended as a sort of protective tariff to English flour manufacturers, and is abundantly characteristic of English tact and statesmanship. I have no wish to make comments now; the time is coming when this subject will be canvassed in all its parts, and an administration elected that will put forth all its powers to procure either a total repeal of these unjust laws, or such a modification of them as will justify American merchants in seeking the ports of Great Britain as an available market for our increasing surplus of bread stuffs.

J. H. HEDLEY.

Castor Oil Beans--Sun Flower Seed--Cotton Seed Oil.

Messrs. Editors—You ask if the Castor Oil plant will come to full maturity in our climate. As the (Ricinus communis) castor bean, is a tropical plant, it is hardly probable that it will attain its greatest perfection in our climate. There are many tropical plants which perfect their seed in our climate, without attaining the enlarged growth of the torrid zone.

Half an acre of sun flower seed was planted in this vicinity last season, with the intention of using the crop for oil. The seed was planted on a strong muck soil about the first of June; it grew very large, but continued green until September. When harvested, the fall rains had commenced, hence it was got in in bad order. It was a little neglected, and the seed got mouldy and spoiled.

Had it been planted earlier so as to have been harvested and thrashed with our flax seed crop in August, I think the success of the experiment would have been complete.

I was told by a white lead manufacturer of Pittsburg, that cotton seed oil, mixed with one-third spirits turpentine, made the best paint oil for inside work; it being much lighter colored than linseed oil. Why would it not answer equally as well for lamp oil, as castor oil mixed in the same manner with spirits turpentine? SENECA

Waterloo, N. Y.

Countervailing Duties.

The effect calculated to be produced by countervailing duties may be seen by the second resolution passed at the meeting of the American Chamber of Commerce held in England on the 2d of March of this year; in which a reduction of duties on the agricultural products of the United States, of flour, rice, tobacco, cotton, and other articles, is recommended, from the anticipation that the tariff in the United States would otherwise be augmented in the course of this year, on the manufactures of Great Britain; this anticipation being founded, doubtless, upon the discussions in the United States as to the suitability of a policy of countervailing duties, with the view of bringing about a more liberal scale of duties on our products in England.—Nat. Intell. A. FARMER.

Resolved, That this Chamber, being composed of members deeply interested in furthering the commercial relations between this country and the United States of America, feel it incumbent on them to express their thorough conviction, that unless some important modification of the existing duties takes place in respect to flour, rice, timber, tobacco, cotton, and other articles, the growth of that country, changes in the tariff in the United States will be introduced, in the course of this year, highly injurious to the British interests, and especially detrimental to its principal manufactures.

To Render wood Imperishable and Incombustible.

(FURTHER PARTICULARS.)

We last month gave a somewhat detailed account of the remarkable discoveries made by Dr. Boucherie for preserving wood from decay and combustion. A late number of the London Gardener's Chronicle contains

the following additional information on this important subject, extracted from a pamphlet published by Dr. Boucherie.

It is obvious that to render a power of preserving timber generally useful, it is necessary not only that the substance to be employed and the means of applying it should be extremely cheap, but also that the former should be perfectly free from all unwholesome qualities. Among the many substances that occurred to Dr. Boucherie was the impure pyrolignite of iron, manufactured abundantly from refuse iron for the use of dyers, which the following experiment led him to believe would be perfectly efficacious. The soft part of the melon differs from hard wood only in the greater quantities of soluble matter which it contains; and as the decay of wood has been ascertained experimentally to be caused principally by its soluble contents, it appeared highly probable that whatever substance would preserve so perishable a vegetable substance as the melon, would a fortiori act with energy upon timber. A melon then was divided into two equal parts, one of which was immediately placed upon a plate, and the other was plunged for a few hours into the pyrolignite, after which it was laid upon a second plate by the side of the first. As usual, the unprepared half speedily became putrid; but the other gradually became dried up, and at last acquired the hardness of wood. Experiments upon saw-dust, beet root, carrots, and flour, having given the same result, Dr. Boucherie proceeded to apply the pyrolignite to wood. To gain this object completely was his next inquiry. Mere immersion will produce only a superficial effect and to force the pyrolignite into the tissue by means of pressure is too expensive. It occurred to him that the simplest, the most certain, and economical method would be to take advantage of the vital forces of a tree while in full vegetation, and to present the pyrolignite to the lower extremity of the trunk, as if it were food to be taken up into the circulation. Upon trial, this mode of impregnating the trunk was found perfect; the pyrolignite rising rapidly through all the permeable parts of the timber up to the extremities. The method employed is simple immersion of the lower end cut off, when small arms of trees are to be operated upon; but when the weight of large timber trees prevents their being so treated, without expensive tackle, the following contrivance has been adopted.— At the ground line, a hole is bored, horizontally through the trunk, so as to open a passage from side to side; a coarse-toothed saw is then introduced into the hole, and worked right and left horizontally, till about an inch in thickness remains undivided on either side; by which means nearly all the sap-vessels are cut through, and the trunk remains supported by two opposite points. The wound is then carefully closed externally with pitched cloth, except at one point, through which a pipe passes from a reservoir containing the pyrolignite. A few days in the summer or autumn are sufficient to saturate a large tree, for which purpose pyrolignite to the amount of about one twentieth of the weight of the green wood is required. Timber thus impregnated becomes so hard and tough, as to be very difficult to work.

Having thus ascertained the practicability of introducing substances into the interior of trees without having recourse to any expensive process, Dr. Boucherie turned his attention to the possibility of increasing the elasticity of wood, and of diminishing its combustibility. He found that these most important results could only be arrived at by the use of a deliquescent salt. His experiments taught him that the elasticity of wood is generally in proportion to the quantity of moisture it contains, and that those qualities are universally lost when perfect dryness is produced. Such cases as appear to form an exception to this rule, are either dependent upon some particular structure of wood, or upon the alkaline salts which it naturally contains. Muriate of lime, an exceedingly cheap deliquescent salt, was employed with perfect success; a weak solution increases the elasticity and flexibility a little; concentrated solutions render those qualities excessive. Veneers of pine-wood prepared with a concentrated solution of muriate of lime became so pliable, that they could be twisted in any direction, or bent into a perfect spiral, without giving way. It appears probable that the same preparation will render wood durable; but in the absence of proof of this, a fifth part of pyrolignite is added to the muriate. The cracking, splitting, and shrinking of wood, are all prevented by the same means; and what is of much greater moment, its combustible qualities are almost destroyed. Upon this most interesting subject we quote the words of Dr. Boucherie:—"As soon as I had discovered that a certain amount of moisture could be

constantly maintained in wood by the employment of the artly merrants, it became easy to conceive that by the same means I should not only diminish very considerably its inflammability, but also render the combustion of its charcoal difficult in consequence of the melting of the earthy salts at its surface and in its substance; and so it is. Wood prepared with these salts catches fire with great difficulty, and burns to ashes excessively slowly; so that it may be regarded, for practical purposes, as incombustible. Two cottages (cabanes) exactly alike were constructed; the one with prepared, the other with unprepared wood. To set them on fire, an equal quantity of combustibles was employed. The latter was burnt to ashes, while the inside of the other was hardly charred, the fire having been unable to maintain itself. These, and other facts lead us to conclude that condignations might be rendered almost impossible, except in consequence of the inflammable materials that houses may contain.

REMARKS.—As some of our readers will doubtless desire to test this subject by experiments, they will naturally inquire, *How the necessary ingredients can be obtained?* We therefore subjoin a few remarks, kindly furnished for the purpose by Professor Dewey.—*Edw. N. G. Fay.*

The pyrolignite of iron is used chiefly by *calico printers*, and may doubtless be procured in those sections of our country where the manufacture of calicos is carried on. It may be readily formed too from the pyrogenous acid and filings of iron. The pyrogenous acid is produced from the distillation of wood, and is the liquid which drops from many stove-pipes when green or wet wood is burned. A few years ago it was abundant in the northern States under the popular name of *essence of smoke*, and used for the curing of hams, instead of the common process of smoking them. This acid can now be obtained at Messrs. Hawks, druggists, in this city, and probably at other places; and the pyrolignite of iron can easily be made (as mentioned in the former article on this subject, p. 52). It would be premature to decide upon the merits of the discovery of Dr. Boucherie. High authority has given it support. The subject deserves a fair and full trial. The pyrolignite of iron seems to be commended for its cheapness. It is not improbable that a solution of coppers will produce the same result; and salt which will not materially be decomposed on mixture, may be still more profitably employed.

REVIEW OF THE MARKETS.
NEW YORK, April 25.

CORN EXCHANGE.—Flour has moved but slowly, and this has been the case generally through the winter; yet the very large stock which was in store last fall has almost all gone off, so that now not more than a few days' supply remains. The price of Genesee and Ohio is at \$1.91 a \$5, scarcely any thing to be had however at the lowest price.—Troy is selling freely at \$1.75. Of Michigan there is none.—Greenwich sold for exportation at \$1.75; Howard Street is \$1.75. Rye Flour, \$2.15 a \$1; Corn Meal, \$2.75 per bush.—Several parcels of Genesee and Ohio Wheat have been sold at 95 cts. per bu.; say 20,000 bushels in all, and 1000 bushels very prime 14 cts. bu. more. Rye and Corn are rather scarce; the last sale of Rye was at 55 cts. time and interest, but 4 was demanded on parcels to arrive. Corn closed at 51 cts. weight, with several sales at that price. There is but little change in Oats; Northern are 30c., Jersey 31c., and Southern 26 a 27.

SEEDS.—Clover is very dull; 12 trees, not free, sold at 6 1/2 cts. lb. Timothy sells at \$25 a \$26 tree in lots. Some Clover is exporting.

CATTLE MARKET.—April 25.—Beeves—\$09 at market. 370 were from the South, balance from this State—sales reached to 750 at \$7 to \$9, averaging \$8 per cwt. with a fair demand.

Cows and Calves.—There were 110 offered, 110 of which were taken at \$20 to \$20 each.

Sheep and Lambs—150 at market, 110 taken; Sheep at \$2 to \$3, and Lambs at \$2 to \$3 each. Good demand.

HAY.—Sales by the load at 75 to 7 1/2 cents per cwt.

ENGLAND.

The steam ship Columbia brought Liverpool advices to the 4th ultimo. Foreign Grain and Flour were somewhat depressed in price. A sale of 800 barrels L. S. Flour had been made in London at 23 shillings, being a decline of one shilling per barrel since the previous advices. This price, it is said, would not net to the shipper \$1.50 per barrel in New York at the present rate of exchange.

Sales of Flour were made at the canal at \$2.53, which is a slight advance; the receipts were small. The produce market was animated—sales of 50,000 lbs. bacon, hog round sold at 1 1/2 cents, each; and 250 kegs lard at 6 1/2 cents, each.

THE IMPORTED HORSE "ALFRED."

WILL stand this season, commencing on the 12th of May, at the stable of Mr. Rodney Russell, adjoining the old Norton Farm, East Bloomfield, Ontario co., as follows, viz: From Wednesday, May 12th, to Tuesday, May 15th; from Wednesday, May 26th, to Tuesday, June 1st; from Wednesday, June 9th, to Tuesday, June 15th; from Wednesday, June 23rd, to Tuesday, June 29th; from Wednesday, July 7th, to Tuesday, July 13th; and at Mr. G. Forden's, near Geneva, at the humane sale time.—TERMS, the same as last season.
Rochester, April, 1-11. THOMAS WEDDLE.

RITTENHOUSE & BLACKWELL'S PATENT CLOVER SEED MACHINE.

This is acknowledged to be the most perfect and portable machine now in use, for cleaning clover seed. It only weighs about 200 lbs., and is of less size than a common flaring mill. It is as easily kept in repair as a thrashing machine; and when the teeth are worn smooth, new irons can be turned by the manufacturers.

This machine will be furnished to order, at Buffalo or New York, for Eighty Dollars, or at this place for Seventy-Five Dollars, (payable on delivery,) with right of use for the purchaser alone.

The following certificates, from gentlemen of the highest respectability, are given as evidence of the utility of this machine, and of its reputation in this vicinity.

WEST FAYETTE, March 5, 1841.

I certify that I have used Rittenhouse & Blackwell's Patent Clover Machine, by horse power, for the two last seasons; and have no hesitation in saying that I believe it to be the most simple of construction, and can be kept in repair with as little expense, and will perform the best of any I have seen in use. I have hulled, ready for the fanning stall, when the chaff was in good order, with a cylinder two feet four inches in length, at the rate of seven bushels of seed per hour.

NATHAN SAUGER.

HALSEYVILLE, Tompkins co. N. Y., Feb. 20, 1841.

I have used for two seasons past, and am now using, propelled by water power, Rittenhouse & Blackwell's Patent Clover Machine, and am well pleased with its performance, and give it a decided preference over any machine that I have seen for cleaning clover seed.

NICOLL HALSEY.

FAYETTE, Seneca co., Jan. 27, 1841.

This is to certify, that I have had one of Rittenhouse & Blackwell's Patent Clover Machines attached to horse power in my barn, and in forty minutes it hulled out of the chaff, five bushels and a half of clover seed, ready for the fanning mill.

SAMUEL THOMAS.

A. M. Henn, of this place, is agent for the transaction of all business relating to these machines. All letters addressed to him (post paid) will receive prompt attention. He has full power of attorney, and will sell rights for towns, counties, or states, on very favorable terms. Orders for machines should be sent early in the season.

JEHU V. BLACKWELL

Waterloo, Seneca co., N. Y. Proprietor.

P. S.—Dr. George Lewis of this place, has the agency for the state of Michigan, and for the counties of Erie, Chautauque, Cattaraugus, Chemung and Tioga, N. Y. J. H. V.

A FARM & COUNTRY SEAT FOR SALE.

A FIRST RATE Farm, with new Buildings and Fences, situated only one and three-fourths of a mile from Rochester Post Office, on the Stage Road leading from Monroe-street, east.

The Farm contains Fifty Acres of Excellent Land, most of which is in a high state of cultivation, a Two Story House, with a Wing and Columns in front, good Barn, Carriage House, &c., about 300 bearing Fruit Trees of various kinds, good Water and Wood. More or less Land can be had with the Buildings, if desired. A fine Horticultural Garden is now in progress adjoining said Farm.

This property is worthy the attention of a purchaser, either for farming purposes, or a pleasant place of residence, being near a good market, good schools and seminaries.

For further particulars, please apply at the house on said farm, or address, post paid,

C. INGERSOLL, Rochester Post Office, N. Y.

Brighton, May 1, 1841

PLOUGHING MATCH!!

This is to certify, that, wishing to purchase the best Plough I could obtain, I proposed to Mr. Langworthy, proprietor of "Whiting's Wisconsin Prairie Plough," and also to Mr. Wright, proprietor of "Wright's Patent Genesee Plough," to take a plough of each of their manufacture, and give them an impartial trial before purchasing either, which I accordingly did. Mr. Langworthy requested, I being a stranger to him, that I should select some of our best farmers who were unacquainted with either of the parties concerned, to judge of the merits of the plough, which I have done, as will be seen below. After a fair trial, they came to the decision as appears in their certificate, with which opinion I cordially concur, and therefore have purchased the "Whiting Plough."

EDGAR F. BENJAMIN, Perrinton.

We, the undersigned, practical farmers, and residents of this town, being requested by Mr. Edgar F. Benjamin, to judge between "Whiting's Wisconsin Prairie Plough," and "Wright's Patent Genesee Plough," (both made at Rochester.) After giving them a fair and impartial trial both in green sward and stubble lands, we agree, that the "Whiting Plough" has the decided preference, both in doing good, clean work and the amount of power required to propel it.

LARRY WILCOX,
JESSE HANFORD,
STEPHEN H. FULLAM,
SAMUEL BENJAMIN.

Perrinton, April 28, 1841.

PEAR AND CHERRY TREES.

DAVID THOMAS

OFFERS for Sale the following select kinds which ripen in succession:—

Pears: Madeleine or Early Harvest, Jargonelle, Juliette, Skinless, September, Seckel, Virgaten. Most of these are of large size.

Cherries: Knight's Early Black—called Black Tartarian—White Tartarian, Black Crown, May Duke, Transparent Gairn, Canton.

Ornamental Plants.

Trees, shrubs, and herbaceous perennials in great variety, which will be sold cheap.
Greatfield, near Aurora, Cayuga co. 3 mo. 30. 1841.

FRUIT TREES, MULBERRIES.

THE subscriber offers to the public the usual very large assortment, comprising the choicest Fruit Trees, of every class, and embracing all the newest varieties. Also an immense collection of Ornamental Trees, Shrubs and Flowering Plants, Green House Plants, Bulbous Roots, and the most extensive assortment of splendid Dahlias in the Union.

All these articles will be sold at a reduction to suit the times, and as cheap or cheaper than they can be elsewhere obtained. For the silk culture, are offered the finest varieties of Mulberries, which are the Cremona, Elata, Alpoue, Multicaulis, and Brons—all of which are very hardy except the Multicaulis, and that withstands ordinary winters.

The State of New York having now granted a bounty of \$2 per lb on Silk, and Massachusetts and Vermont having done the same, they will no doubt take the lead in this great national pursuit.

WM. R. PRINCE.
Flushing, March 7th, 1840.
N. B.—Priced catalogues will be sent to every applicant. Any persons who wish to establish silk plantations will be supplied with trees, payable by a share of the proceeds.

ROCHESTER SEED STORE—1841.

BATHAM & CROSMAN, the proprietors of this well known establishment, respectfully inform the public that they have now on hand a general assortment of superior English and American SEEDS of the growth of 1840, and other articles in their line of business.

For the FARM—choicest varieties of Corn, Grain, Grass, Clover, &c., and seeds for Root Crops, such as Mangel Wurtzel, Sugar Beet, Carrot, Ruta Baga, English Turnip, &c.
For the GARDEN—all the most valuable and approved kinds of excellent Vegetable Seeds. Those which grow in greater perfection in Europe, are annually imported from England, such as the different varieties of Cabbage, Cauliflower, Broccoli, Radish, Turnip &c. Onion seed is obtained from Wethers-field, and other articles are raised for this establishment with great care.

FLOWER SEEDS—about 200 varieties of the most beautiful and interesting kinds.—(Price 50 cents per doz. papers.)
ROOTS AND PLANTS.—Choice kinds of Potatoes, Asparagus and Pie-plant roots, Cabbage, Cauliflower and other plants in their season.

TOOLS AND IMPLEMENTS, of various kinds, for the Farm and Garden. And a large collection of valuable BOOKS on subjects connected with farming and gardening, silk culture, &c.

SILK WORM EGGS—of different kinds, on hand in the season.
CATALOGUES gratis on application. Merchandise supplied with Seeds at wholesale, on liberal terms. Orders from a distance containing a remittance, or good city reference, will receive attention.

BATHAM & CROSMAN.

Arcade Hall, Rochester, April 1, 1841.

The Imported English Horse, "Emigrant."

WILL stand for Mares the ensuing season, at the barn Mr. C. Ashton, in Shelly, one mile west and half mile south from Medina, Orleans Co., where he has sto the two last seasons.

It is but just to say that he is not probably surpassed any horse in Western New York. Good judges who were at the Fair in Rochester, last fall, think that if he had been there he would have taken the premium without any doubt. His stock is right—just the thing for farmers and the market. Gentlemen who wish to raise good horses will do well to call and see.—He is extensively known in Livingston county.

T. H. ASHTON,
J. SHERWOOD,
R. L. CHASE.

AN APOLOGY.—Our paper was delayed a day or two this month, by an accident happening to the machinery connected with the power press on which it is printed.

To Delinquents.

There is a large amount of small sums due us from agents and post masters. They will greatly oblige us by remitting their balances without delay, so that we need not trouble them with a more particular call.

The State Law—County Societies.

By a reference to the act to promote agriculture, as published in another column of this paper, it will be seen, that where no society exists already, the County Clerk is required to give four weeks' notice of a public meeting for the purpose of forming one.—Notices have been given accordingly in a number of counties, and many societies will doubtless be organized during the present month. We repeat our request that the Secretaries will send us a list of their officers.

Monroe County Society.

The Annual Exhibition of this Society will be held at Rochester on the 15th and 16th days of October. The list of premiums, regulations, &c. will be published soon, in handbill form, and circulated throughout the county.

Ontario County.

The Cattle Show and Fair of this Society will be held at Canandigua, on the 12th day of October. The list of premiums and regulations has been published and circulated.

Genesee County.

This Society will hold its Annual Fair at Alexander on the 13th and 14th days of October. The list of premiums, &c. has been circulated, and may be had of the Secretary, C. P. TURNER, Esq., Batavia.

Remedy for the Turnip Fly.

The following simple mode of guarding against the depredations of the Turnip Fly, if not new, is certainly not generally known, and may be of great benefit to some of our readers:

MESERS. EDITORS.—It is well known that the great enemy of the Ruta Baga (and other turnip) crops is the small flea or fly that destroys the plants almost as soon as they appear above ground; and as this crop is becoming extensively cultivated, it is very important that some method be devised and made known for guarding against this insect.

I have long been in the practice of raising Ruta Baga, and for the past five years have not failed of obtaining a good crop. My mode is simply to soak the seed 24 or 48 hours in *Tanner's Oil*, and then roll it in Plaster to facilitate the sowing. A very small quantity of oil is sufficient, as it is only necessary to moisten the seed thoroughly, and allow it time to penetrate. The offensive odor of the oil is imparted to the seed, and the first leaves of the young plant are so impregnated with it that the flies will not eat them. I have frequently tried the experiment of sowing a small quantity of seed without any preparation, and have almost invariably found those plants nearly or quite destroyed, while those from the prepared seed escaped uninjured.

To the incredulous I would say, the trouble is but little, the expense nothing—therefore, *try the experiment.*

The oil does not seem in the least to injure the vitality of the seed. I have known it to vegetate well after soaking *ten days* in the oil; but I think two days is sufficient, and prefer it to a longer period.

L. B. PARSONS.

Perry, N. Y. May 26, 1841.

Hints for the Month.

Among the most important operations this month, is the sowing of ruta baga seed. Farmers who want an excellent and cheap feed for their horses and store cattle, and especially those who have been sadly pinched this spring for hay, &c. must not omit the proper season.

But, one thing must be remembered—that ill success is nearly always to be attributed to *bad management*—and not to the nature of the crop itself. Where the soil has been well enriched by previous manuring: is not too wet; has been well mellowed by frequent ploughings and harrowings; the seed planted as early as the middle of the month—and rolled smooth where

the surface from the stiffness of the soil may incline to be cloddy, to prevent the fly—and where the weeds have been completely destroyed at the outset, and kept out of the field,—failures have been extremely rare. Planting in drills, ridging, or sowing broadcast, are of secondary consideration, though drilling is to be preferred where practicable; and ridging is useful on shallow soils, or those inclining to too much moisture.

Of different operations already commenced and in progress, the following must be closely attended to:—

Keep your beet and carrot crops perfectly free from weeds, especially when they are young.

Thin them out at proper distances in the row.

Give corn fields early and frequent cultivation.

And remember that *five or six* early dressings, to corn, or any other crop, are quite as cheap as *one* tedious and laborious one, after the weeds are a foot high and as thick as grass on a meadow;—

And benefit the crop incomparably more.

And in all work with *hoes*, remember that a touch on the grindstone, at least once a day, is strict economy, and great comfort to the laborer.

Canada thistles must be mowed before seeding to prevent spreading;—and to destroy them, keep them constantly below ground by ploughing or otherwise, and they will soon be smothered and destroyed.

All other troublesome weeds should be wretched, and destroyed.

Keep in mind the importance of frequently stirring the soil about cultivated crops—and let all young and newly transplanted fruit trees be well hoed about, and kept clear of all grass and weeds.

The Weather of May

Has been no less remarkable than in the preceding months. The temperature of the first half was 44.98, of the second half 63.04. Of May 1840, was 50.62, 64.87.

The first half continued to be cool, vegetation made very slow progress, some trees and plants shot forth their flowers and their leaves. From Thursday the 20th, when the warm weather began to appear with some power, vegetation put forth with astonishing rapidity, plums, cherries, apples and quinces followed in rapid succession, indeed some apple flowers appeared with the late peaches blossoms. The same plum trees which last year blossomed fully on April 26th, were this year in full bloom May 21st. Some cherries blossomed fully in the morning, began to drop their petals in the afternoon, and the next day showed clearly their fruit. The leaves and flower stalks of the Horse Chestnut burst forth on the 21st, and in four or five days the blossoms were fully formed. The rapidity with which the forests were covered with foliage, was unparalleled in this region. The earth was covered as in a day, with its verdant carpet. It required constant attention to keep up with the profusion and variety of the flowers. In ten days more the season will be nearly as forward as usual. The mean temperature of the month was 45.30, and of 1840 was 57.97. The Barometer has stood almost at the same point, 29.59, for the last half of the month. C. DEWEY

Pear Trees.

We find pear trees in less demand than almost any other article in the nursery. Why should this be so? The pear is one of our most delicious fruits; though from the scarcity of trees in the country, it is not improbable that many cultivators have never tasted the better kinds.

As an excuse for neglecting the pear tree however, we have often heard it said, "they are so long before they begin to bear." Now this is the very reason why they should be planted without delay—why no time should be lost.

The remark however, is only true in part. Some pear trees indeed, like the Bergamot, require much time to get ready; but others, like the Julienne, appear to come into bearing as soon as the apple tree; and this trait of character is certainly of no less importance than the color or the size of the fruit, which pomologists are always so careful to mention. If the time required by each kind to come into bearing, was generally known, purchasers of young trees could be much better secured in their choice. Delicious sorts would in all cases be wanted, but we could well afford to wait several years for the Summer Rose, the Rouselette de Rheims, or the Belle et Bonne, to grow large and get ready, when Williams' Bon Chretien, the Summer Frankland, or the Bloodgood, were bearing in the mean time. Of 81 sorts noticed by Manning in his "Book of Fruits," 17 are mentioned that "come early into bearing," though several belonging to this class, he has not marked; and at this time we have in the nursery, many trees of the Julienne, not more than six or seven feet high, in full flower. Grafts of this variety, of the Cushing, of the Johannot, &c. set up on old stocks, bore in two years.

The pear is one of our hardest fruit trees; and so far as our observations have extended, it is neither subject to the attacks of the caterpillar, nor the borer. Some parish however, with the fire-blight; but it should not be allowed. The owner has as much right to complain of bad luck when he stands by while his cattle are destroying his young trees, as he has when he stands idle, without reaching forth a hand, while Scolytus pyri destroys his old trees. Possibly however, there are two kinds of fire blight; but be this as it may, many of our trees have stood more than twenty years, without any losses of consequence, though the fire-blight has been several times amongst them,—owing entirely as we believe, to this circumstance: we have cut off the dying limb, and burnt it without delay.

Ripening of Pears.

After selecting the article on this subject from the Gardener's Chronicle, which appeared in our last number, we brought two kinds of pears from the cellar, where they had remained all winter as hard as when they were taken from the tree, and placed them in a warm room. In about ten days, one sort which had been as green as grass, changed to a golden yellow, and became melting and delicious. An accident has prevented us from giving the name. The other sort also softened soon after, and was considered fine; but it is clearly a misnomer.

In winters past we have had several kinds of pears in the cellar, that either rotted or were thrown to the pigs in the spring, which we are now satisfied would have ripened in a warm room.

For the New Genesee Farmer.

"Grubs in Cattle."

Messrs. Editors—Perhaps your correspondent, Mr. Miller of Ohio, will find a satisfactory answer to his inquiries on the above subject, in the remarks on "Bots and Horse Bots," in the last two numbers of the Farmer. It is well known that these grubs are the larvae

of the goud fly or gad-fly, so often seen on the backs of cattle in summer, the scientific name of which is Oestrus botis, or the Ox-stinger. The eggs are deposited in the skin, and the larvae produce considerable swellings on the backs and sides of cattle. They irritate the flesh, and become a disease, often painful, weakening, and emanating to the animal. There is not any prevention of their depredations, or any remedy for their action, which has fallen under my eye. Their effects are much more powerful upon poorer and weaker cattle, and perhaps their eggs are laid with greater ease in such animals, or that they may meet with less resistance from weaker cattle. If such is the fact, the farmer will find the grand prevention in the good strength and power of the animal, and the best remedy in the good keeping and consequent vigor of his cattle. Let him not winter any inferior animals, either of cattle or sheep, as both these seem more subject to suffer from the larvae peculiar to them.

Rochester, May, 1841.

C. DEWEY.

From the New England Farmer.

How can Farming be made Profitable?—Subsoil Ploughing.

Letter of E. Phinney, Esq. to A. Huntington, Esq. published in the Transactions of the Essex Agricultural Society, 1840.

A. HUNTINGTON, Esq.—Dear Sir—The question is often asked, How can farming be made profitable? I answer, by liberal manuring, deep and thorough ploughing, and clean culture. I will venture to affirm, without fear of contradiction, that no instance can be cited, where a farmer who has manured his grounds highly, made a judicious use of the plough, and cultivated with care, has failed to receive an ample remuneration for the amount invested—may more, that has not received a greater advance upon his outlay than the average profit derived from any other business. One great difficulty is, that most farmers seem not to be aware of the fact, that the greater the outlay, to a reasonable extent, when skillfully applied, the greater will be the profit; they therefore manure sparingly, plough shallow, and the consequence is, get poorly paid for their labor. This has raised a prejudice and given a disinclination to the business of farming, especially among those who are in the habit and are desirous of realizing something more from their occupation than a naked return of the amount expended.

The farmer who is so sparing of his manure that he can get but thirty bushels of corn from an acre, gets barely enough to pay him for the expense of cultivation; and in addition to this, by the ordinary method of ploughing his field, at each successive rotation, is deteriorating his crops becoming less, and in a few years he finds he must abandon his exhausted and worn out fields, to seek a subsistence for himself and family in some other business, or in some other region, where the hand of man has been less wasteful of the bounties of nature.

Instead then of his scanty manuring of ten cart loads to the acre, which will give him but thirty bushels of corn, let him apply thirty loads. This additional twenty loads, at the usual price of manure in this part of the country, will cost him thirty dollars. But he now, instead of thirty bushels of corn, gets sixty bushels, and the increased quantity of sower will more than pay for the excess of labor required in cultivating and harvesting the large crop over that of the small one. He has then added thirty bushels of corn to his crop by means of twenty loads of manure, which at the usual price of one dollar per bushel, pays him in the first year for his extra outlay. His acre of land is laid to grain after taking off the corn, and the effect of his twenty loads of additional manuring will be to give him, at the lowest estimate, three additional tons of hay in the three first years of mowing a worth fifteen dollars a ton standing in the field. Now look at the result. His thirty dollars expended for extra manuring was paid for in the first year's crop, and at the end of three years more he will have received forty-five dollars profit on his outlay of thirty dollars; and in addition to this, his land is improved, and in much better condition for a second rotation. There is no delusion in this. It is a practical result, of the reality of which any farmer may satisfy himself, who will take the trouble to try the experiment.

From no item of outlay can the farmer derive so ample and so certain a profit, as from his extra manures for manure to a certain extent. This has been most strikingly verified by some of our West Cambridge-

farmers. It is not uncommon among some of the farmers in that town, to put on their grounds one hundred dollars' worth of manure to the acre, and in no more instances than one, the gross sales of produce from ten acres under the plough, have amounted to five thousand dollars in one season. This is the result of high manuring and judicious cultivation of a soil too which is exceedingly poor and sandy.

The subject of subsoil ploughing is one upon which there has been little said, and less done, in this part of the country. In all our grounds, except those which are very loose and sandy, there is no doubt that great benefit would be derived from the use of the subsoil plough. In England, the effect of subsoil ploughing in increasing their crops, as stated by some agricultural writers, would seem almost incredible. By this means, the crops in that country have been doubled, and in many instances tripled. The expense however, is stated to be very great—so great, as to be beyond the means of most of our farmers. In one case the expense of subsoil ploughing on a farm of over five hundred acres, was estimated by the owner to cost the enormous sum of thirteen hundred pounds sterling. This calculation took into consideration the use of the heavy Denston plough, which always required four, and in some stiff clays, six horses to work it. I am aware that an implement might be constructed, which though it might not do the business quite so well, could, nevertheless, be made highly beneficial in the hands of our farmers, and obtained at a far less cost. I am informed that Mr. Boeson, of the Yankee Farmer, has, with a highly praise-worthy zeal in the interest of agriculture, imported from England a subsoil plough, which may be worked with a less powerful team than the one commonly in use in that country.

In a climate like our own, which at that season of the year when our crops, particularly our root crops, most need the benefit of moisture that may be derived from deep ploughing, and are most likely to suffer from drought, the use of the subsoil plough would be attended with unquestionable benefit. On a field of my own, which had been set to one orchard, and therefore kept under the plough for some years, in attempting to underdrain a part of it that was usually flooded by water in the spring of the year, I noticed what the English call the "upper crust." This lay some inches below the surface, at the depth to which the land had been usually ploughed, formed by the treading of the oxen and the movements of the plough over it. This I found to be so hard as to be apparently as impenetrable by the roots as a piece of marble, and discovered to me at once the cause of the failure, in a great measure, of my crop of potatoes the year before. Having discovered what I supposed to be the cause of the failure, I set about devising means to remedy it.

I have never seen a subsoil plough, there never having been one seen or made in this part of the country. I consulted my ingenious friends, Messrs. Prouty & Moore, and, at my request, they made an instrument of very cheap and simple construction, consisting of a wooden beam, about three inches square, and three feet long, with three tines or teeth of the common cultivation, placed in a direct line in the beam, extending about eight inches below the beam; to this handle we attached similar to the handle of a plough. On trying this by running after the drill plough, I found, in my hard stony soil, it was quite inadequate to the business, being too light and of inefficient strength. I then had one constructed of similar plan, but much heavier and stronger. The beam five feet long, six inches square, of white oak, well mowed, with three tines nearly a right line, made of the best Swedish iron, one and a half inches square, extending twelve inches below the beam, with a spout at the foot, some less than that of the tines of the cultivator, with strong handles and a non-beam extending from each end to the centre of the beam, by which the balance is easily preserved. This implement, drawn by two yoke of oxen, followed the drill plough in getting in corn, and performed the work better than I had anticipated. The "upper crust" gave way, the resistance made by the hard gravelly bottom and smaller stones was readily overcome. The earth was loosened in most places twelve or fourteen inches from the surface, and though not so thoroughly pulverized as it probably would have been by a perfect subsoil plough, yet, in my very hard stony soil, I am inclined to believe, that for simple drill husbandry, this will be found to be a valuable substitute for the English subsoil plough. And considering the small price of the implement, and the greater ease with which it is worked, the friction being much lessened by dispensing with the sole, I shall continue to use it until I can find a better. A part of my crop of corn was sowed upon the same land appropriated for that crop last year; no more manure

was applied than in the previous year, and notwithstanding the severe drought which greedily injured most of our root crops, my crop on this piece of land was nearly double to that of last year. There is no known cause to which I can attribute this great increase of the produce, but the use of my new constructed sub-irrigation for a sub-irrigation. The soil was stirred to the depth of four teen inches; by this means the roots of the carrots were enabled to strike deep, and thereby not only find more nourishment, but to overcome, in a great measure, the effects of a very pinching drought.

With great respect,
Your ob't serv't.
E. PHINNEY.

Lexington, Mass.

From Western Farmer.

American Society of Agriculture.

An Address to the farmers of the United States; to every friend of agricultural improvement; to every citizen of the United States who desires to see elevated the character and standing of the cultivators of American soil.

Most respected and most respectable friends and brothers, give me your attention for a few fleeting moments; your humble brother, who now addresses you, published a suggestion about three years ago, for the purpose of arousing your attention to the subject of forming a National Agricultural Society; that suggestion was then responded to with a hearty good will throughout the country. But action upon the subject has been overwhelmed by the political whirlwind that has swept over our country. In the first bill of the succeeding calm, the proposition to form such a society has been renewed, and with one exception, has met with a cheering "God speed the project." None doubt the utility of the proposed society, yet doubtless there are many who would like to see the object, end and aim of the society more fully explained. To such I now offer some of my views, and in doing so, invite you all to give yours: for this is one object of a National Society to interchange our views.

Many warm friends of the measure, who are anxious to see the society in operation, cannot see how it is to be organized. They say "No doubt if once organized, it would daily increase in strength and usefulness; but it is like a great complicated piece of machinery, of great use and value when once in motion, but very difficult to start." Now, to me there is no difficulty in the way. All that is wanted is a few active engineers to put the machine in motion. Immediate and decided action of a few of the active friends of agricultural improvement, who must assume the responsibility to act as engineers as well as pioneers for the whole Union; and having once given the society an existence, it will flourish and increase in strength just as our political Union has done.

The following plan of organizing the society is suggested to your consideration:

Let as many of the friends of the project as can be induced to do so, meet at the city of Washington, on some day of the month of 1844, (the particular day to be hereafter fixed,) and there form a constitution for the society, and elect officers, to wit: a president, a vice president for each state, a recording secretary for each state, county, city and principal town in the United States, a treasurer, and probably a publisher of a national paper, to be called the Journal of the American Society of Agriculture.

The first officers will hold their offices until the next annual meeting, which should be held at the capital of that state which had furnished the greatest number of members at the time when the president of the society should issue his proclamation to convene the second meeting.

The place of each annual meeting should be fixed at the preceding one, in some state other than the one where it was then held, so as to give the members in each state an easier opportunity of attending.

As in the formation of all such associations it is necessary to have some cash funds, are you willing to donate "a mite" to accomplish this great national object?

If so, an opportunity will hereafter be offered you to do so. Upon some of you I hope to make a personal call for that purpose, should it be thought advisable, after due reflection, to proceed in the organization; therefore, I pray you to give this subject your serious consideration.

If you should aid in the formation of this society, will not your children "rise up, and bless you?" For one of the first objects of the National Agricultural Society should be to connect with it a "National Agricultural School."

Not such a "National School" as the only one we now have, which has, with too much truth, been cal-

led "a nursery of aristocracy"—where the humble son of a farmer is rarely admitted, and if admitted, what is he taught? Not how to cultivate his mother earth, and make her sons glad; not how to increase life, but the art of destruction, the trade of blood!! Such is now your only national school.

Such will not be the only one, in a few short years, if you will lend your energies to form a National Society, whose motto will be, "to elevate the character and standing of the cultivators of the American soil." For when once organized, you will show a united force of many thousands, whose voice will be heard in the halls of Congress demanding our birthright. Be assured we shall be heard. "Let all our energies be concentrated, and we can do any thing in the power of man; but divided and scattered as we are, we spend our forces, as it were, drop by drop; whereas, union would make us mightier than a torrent." We can, shall we say we will, form such a torrent as will overwhelm our political rulers, unless they will do justice to the agricultural class of the community.

As soon as the National Agricultural Society is formed let us ask Congress to appropriate the "Smythsonian fund" of half a million of dollars to establish a National School. If we unite as we should do, our "torrent" will be too strong for time-serving politicians to resist.

I look upon the National Agricultural School as the greatest blessing to flow from the National Society.

But the Journal of the Society will also prove of immense advantage. It will embody a vast amount of matter, useful and interesting to every cultivator in the Union. The most carefully prepared tables of the productions of the earth, from every section of the Union will be kept constantly before the reader, totally different from those vehicles of deception, and often fraud upon the farmer, called "prices current." It is by the quantity produced, and the probable demand therefore, that we can understand whether it is for our best interest to sell our crops now, or store them up. At every meeting there would be numbers from every state in the Union, as ready to impart as to receive information.

"All the inducements of the business of a National Society, a National Fair, and a National School," and the honor of being a member of such a society, would be enough, I think, to make us all feel that it would be a greater honor to be elected a state delegate to one of the annual meetings of the National Society than to be elected a member of Congress.

It cannot be expected in this short address, that I should point out all the good that would flow from the action of the proposed society. But if we are convinced that the effect would conduce to the interest and happiness of the great mass of American agriculturists of the Union, let us act, and with spirit too.

And now my friends, one and all, do you approve of the plan of organization? Speak out boldly if you do not. And if you do not object, the leading friends of the measure will fix upon a day for the first meeting, and proceed in the manner proposed.

There has been an argument raised against organizing such a society at present, "because the public mind has not been sufficiently instructed, and does not sufficiently appreciate the advantages of such an association to render it successful."

Now it is on this very account that the friends of the proposed National Society wish to see it established, that the operations thereof may wake up an excitement throughout our "wide scattered population," that shall be the moving cause of changing the "condition of the country."

It is also argued that the failure of several state and county societies is proof that a national one must fail also.

Let me ask if this is a valid argument? This short quotation, in my mind, is sufficient to knock the whole force of the argument into nonentity: "Divided and scattered as we are, we spend our force as it were, drop by drop; whereas union would make us mightier than a torrent."

The object of all state and county societies has been of a local nature. Their existence has been known only in their own locality, and they have been too weak in numbers to command legislative aid. Who can tell what would have been the effects if all the members of all the local societies in the Union had been attached to one National Society? If all the exertion of all these societies, collectively and individually, had been concentrated upon one object, would it not have formed a "torrent" as mighty, comparatively speaking, as the thundering Niagara? If the nation, instead of individuals, had received all the light of the intelligent minds that have been devoted to these local societies, would it not be said "that the public

mind was not sufficiently enlightened to appreciate the advantages to be derived from a National Society?" If all the money that has been devoted "drop by drop" upon "model farms" and local schools had been concentrated, should we not now have an institution worthy the great country we inhabit?

If our population is scattered; if "long distances" intervene between the most efficient friends of agricultural improvement, "so much the more need of forming such a society as shall draw them together in "one strong bond of brotherhood."

Is it a fact "that the time has not yet arrived when such an association can be organized with a reasonable certainty of success?" If such is the fact, I am disappointed in the energy and character of my countrymen.

Once more I call upon you to answer me this question: am I so disappointed in your character?

Do not refuse your countenance to the measure because it does not originate in high places. For "if ever we are to have a National Society of Agriculture, it must be got up by the farmers themselves;" and as one of that class I now address you.

If the present attempt at organization fail, the matter may be considered as decided for the present generation.

The only question then is, shall the matter sleep until you and I are past waking?

I am a devoted friend to present organization of a National Society of Agriculture, and a National School, that will elevate the character and standing of the cultivators of the American soil,

And your friend and brother,

SOLOMON ROBINSON.

Lake C. H., Ia., April 1, 1844.

For the New Genesee Farmer.

Letter from Wisconsin.

Messrs. Editors—Among the interesting articles in your paper, none are esteemed more highly, or looked for with more solicitude by me, than those relating to the flower garden and to horticultural products, by your valuable assistant, D. T. He is always entertaining and useful; and I should like to take a peep over his garden fence in a month or two, although our prairie and woodlands can boast of their peerless beauties in the way of flowers, not to be exceeded by those cultivated in eastern gardens. I am not a scientific botanist, but can appreciate well the beauties of Flora. Here many plants grow wild, that are nurtured and esteemed among the florists of the east. I shall make a collection of the most of them and place them in my front garden, and will some future day, do myself the pleasure of sending some of the seeds, &c. to you.

By the way, I see you are making a collection of grasses. I think you could find quite a variety in this country; for we have many varieties growing wild in our marshes and low lands, many of which make very good hay. We have also wild rice in abundance; for you must know that this neighborhood was the residence of the Menominee Indians, or wild rice eaters, as they were called by the French, and a few of whom still linger round their ancient homes.

I wish to inquire what is best to apply to cure a loss of the eye in neat cattle. I have a favorite half blood Durham cow, which last summer had the misfortune to lose her left eye, the sight having all run out. Now I wish to know what to apply to heal over the wound. Will you inform me?
E. B. QUINER.

Milwaukee, W. T.

Large Hogs.

Mr. George Baker, of Edgmont, Delaware county, Pa., slaughtered, on the 10th of March last, a hog which weighed, when dressed, 879 lbs.!

Another.

Mr. Philip S. Bishop, of Edgmont Delaware county, Pa., also slaughtered, on the 30th of March, a hog which weighed, when dressed, 937 lbs.!! Those two hogs were about 2½ years old, and of common stock; both of one litter. The litter consisted of twenty-three. We challenge the Berkshires to best this.

▲ SUBSCRIPTION

The Flowers of Spring.

Some travelers have spoken of the *punctuality* of the seasons in both high and low latitudes, as if the lines there were stretched tight: though we know the oscillation in more temperate climates, is very great. Thus Dr. Clarke says the snow in Russia went off on the day that had been foretold: and Bruce observed a tree in Abyssinia to bloom on the same day for several years. In this county however, in 1834, the flowers of the Japan Quince were "nearly ready to expend" on the first of the fourth month; but in 1841, on the twentieth of the fifth month.

The difference however, is not so great with the apricot. In 1834, it bloomed on the thirteenth of the fourth month—in 1841, on the 10th of the fifth month, showing a difference of only twenty-seven days.

The peach tree blossoms later than the apricot. In 1834, the difference was three days; in 1835, six days; in 1841, ten days. But this delay is easily explained: Cold winds from the north, continued several days, and vegetation was nearly at a stand.

We will now notice flowers that appear earlier in the season.

Erythronium dens-canis from England is a beautiful little plant. One variety has white flowers, others of a reddish purple. It is earlier than our native species, and increases more slowly.

Of *Corydalis*, we think the American species are rather more delicate than those from Siberia. All do best in a shady soil abounding with vegetable earth, particularly *C. formosa*, and *C. nobilis*; but *C. cava*, *C. cucullaria*, and *C. canadensis*, are very pretty in the open border. *C. solida* with us, has not brought its flowers to maturity.

The Crown Imperial is "a thing to wonder at;" but it is splendid as well as curious. Some other species of the same genus (*Fritillaria*) are also interesting. Of these, *F. pyrenaica*, and *F. meleagris*, with brownish variegated flowers, are the finest that we have seen. *F. persica* has very little beauty.

Some species of *Narcissus* are too tender for this climate; but others are very hardy. The Trumpet Major in two varieties, is remarkable for its earliness and the great size of its nectary. The single Daffodil is showy, though less so than its double varieties known under the name of Phoenix. *N. biflorus* of a yellowish white, is interesting. *N. argustifolius*, and *N. poeticus* with white petals and shallow nectaries tipped with crimson, are very fine; and though nearly allied are sufficiently distinct for both the botanist and the florist.

The Jonquils are sometimes arranged as a separate group, though belonging to the same genus. These are the great jonquil (*N. catathinus*) and the common or fragrant jonquil (*N. jonquilla*.) The latter has a variety with double flowers.

The Hyacinth is a most desirable plant for its beauty and its fragrance. Its varieties spread into almost every color, though in neither red nor yellow, are the marking intense. Loudon quotes Miller as saying that in his time the Hoarlem florist had 2000 varieties; and he adds, that though the passion for this flower had greatly declined, they have still upwards of half that number.

The grape hyacinth and nutmeg hyacinth, both remarkable for their fragrance, are now placed in the genus *Muscari*. The former has small flowers of a rich blue-purple.

The common Tulip is called "the king of florists' flowers;" and certainly ranks among the most splendid. Red, yellow, white, are almost endlessly compounded; while blue, purple, violet, are eschewed. Loudon says a late London catalogue contains more than 630 varieties of this flower.

Another species (*Tulipa turcica*?) has bright yellow flowers, increases from seed, and makes a fine display in the border. It is sufficiently distinct from the common tulip to excite attention.

The *Iris* is a genus that long continues to decorate the garden. Soon after *I. persica* has faded, the purple *I. pumila*, another with light yellow flowers, and a third (*I. cristata*),—come into bloom. The last is the most of a dwarf, but nearly covers the ground as it spreads, and is remarkable for the delicacy of its tints—a light blue finely variegated with purple, white, and yellow.

The trailing species of the *Phlox*, also exhibits masses of bloom; and few spots on earth are finer than those covered by *P. subulata* and *P. setacea*. *P. nivalis* appears to be a variety of the latter; and a bank of snow may give some idea of the multitude and whiteness of its blossoms. It requires some protection in winter.

Pulmonaria virginica, a native plant from the alluvial soil of our rivers, eighteen inches high, has large delicate leaves and fine blue flowers suspended from the top of the stem. A white variety is rare, though we have seen it on islands in the Schuylkill, and on the banks of the Tonawanda.

Magnolia abocato, a shrub from China, blooms when only two or three feet high. It is almost hardy, and quite so in mild winters. The flowers are large, purple on the outside and white within. It is magnificent. †

Wheat turning to Chess.

We had hoped to have kept clear of this controversy—we hope so still. Several communications have been received, favoring transmutation, but as they appear to us not only wholly inconclusive, but as not affecting in the least degree the immutability of the law of nature that plants or animals of one genus never change to another, we beg leave to decline their publication, as well as all others which do not amount to a demonstration of such change. In the mean time, we may state two facts, capable of the clearest proof, which may be furnished if necessary, either of which we consider a demonstration that wheat does not turn to chess.

1. No plant, nor animal, has ever been known, to change from one genus to another, as a swan to an eagle, a hen to a humming bird, an elm to a hemlock, or a *Triticum* to a *Bromus*; and to admit such changes would be to throw the beautiful order of Creation into inextricable confusion.

2. There are farms, and regions of country, where chess has been carefully excluded or eradicated, where it does not return, and which it would of course do, if a change occurred.

To those who may be puzzled to explain the frequent appearance of chess where wheat has been injured or destroyed, except by the conclusion that such injured wheat is transformed to chess, we will merely instance a few, out of many facts, to assist them. 1. Chess, like the seeds of many other weeds, will remain for years, without growing, in the soil. 2. It has been seen, when overshadowed by wheat or grass, with a single grain growing on a stem two inches high, ripening and perpetuating its species on the soil, wholly unobserved by a common eye; and when the wheat has been destroyed, it has been seen to shoot up from a single seed, four feet high, and bear thousands of seeds. 3. Seeds of chess generally escape the teeth of animals, and are scattered with their manure wherever they may pass; and birds may scatter it profusely in the same way, unobserved. 4. Chess, from its insignificant appearance, frequently escapes the eye of the farmer, and is sown by him over his fields, when it might be detected by careful examination, as by spreading it on a table or floor. 5. When allowed a

fair chance, it multiplies with far greater rapidity than wheat, and hence the constant tendency it has to the ascendancy.

And those, who like our correspondent "R." have seen, or heard of, head-of-chess growing out of wheat heads, or on wheat stalks, we would respectfully request to forward them to this office, where they can be seen. It is a little singular that such great curiosities are never preserved; or if they have been in some instances formerly, they have invariably on rigid examination, proved impositions. If any of our correspondents, or any other person, will procure us such a specimen, which shall be pronounced by an experienced examiner of plants, such as Prof. Dewey, as no hoax, he shall have one hundred dollars for his trouble, with our thanks.

Manufacture of Silk in State Prisons.

It is well known that for several years past numerous memorials have been presented to the Legislature of this State complaining of the mechanical labor performed in the State Prison at Auburn. Gov. Seward has lately called the attention of the Legislature to this subject, and recommended that the present system be gradually abolished, and the culture and manufacture of silk adopted in its stead. Experiments already tried have shown the practicability of the enterprise, and as it would entirely obviate the evils complained of by the mechanics, it appears to us to be a very wise measure. The only difficulty in the way of its immediate success is the want of materials, and this will doubtless soon be obtained. Mr. Polhemus, the Prison Agent, has issued the following notice, which we cheerfully give a place in our columns:

TO FARMERS AND OTHERS.

State Prison, Auburn, N. Y. }
MAY 15th, 1841. }

The subscriber as agent of said Prison, having commenced the manufacture of SEWING SILK, by convict labor, will pay three dollars per bushel for all the Cocoons of a good quality that may be offered at this Prison, hereafter. Any communication upon this subject, addressed to the subscriber, (*post paid*,) from any part of the United States, will receive immediate attention.

Having become thoroughly satisfied of the fact, that the *Morus Multicaulis* Mulberry will endure the frosts of winter in this latitude, without care or attention, nearly, if not quite as well as the common Apple Tree, the subscriber has determined upon extending the business of manufacturing Silk at this prison, to any amount that the procurement of the material will allow; and hopes ultimately to make it the principal employment of the convicts here confined. Under this determination he will be prepared at all times to purchase for cash, at the above price, all the Cocoons of a good quality that may be offered from any part of the United States.

The immense amount of foreign Silks annually imported into the U. S. demonstrates the policy, if not the necessity of a combined effort on the part of the citizens of this country, generally, for the production of *American Silk*, which when properly fabricated, it is believed far excels in quality that produced in any other part of the world; hence every individual in the community, from motives of patriotism, as well as interest, should feel a deep solicitude for its culture and success.

It is believed that most farmers will, to a certain extent, find it profitable, so far at least, as the necessary labor in feeding the worms, etc., can be performed by the juvenile members of their families.

The tree may be planted by the fence side and in other unproductive portions of their grounds, to an extent sufficient, after a few year's growth, to produce a large amount of Silk—nor is it necessary (as has been supposed) to incur any expense in preparing buildings or fitting up apartments for the feeding of worms—a common barn, or out house of any description will answer all the purposes; barns in particular may be used to great advantage during the early part of the season, previous to the ingathering of the crops.

Being aware that very erroneous opinions are entertained by many in regard to the process of producing

the Cocoon, to obviate which, any person desirous of correct information upon this subject, will be furnished the same gratuitously on application to Mr. J. MORRISON, at this prison, who has a thorough knowledge of the business in all its parts, having for many years had the entire charge and superintendance of an extensive silk manufactory in Europe.

HENRY POLHEMUS, Agent.

P. S. Editors of Newspapers in this State who are friendly to a change in the mechanical branches now carried on in our State Prisons, are requested to give the above a gratuitous insertion. H. P. Ag't.

Galvanic Plant-Protector.

It appears by a late English paper, that a galvanic battery has been successfully employed to guard the Dahlia against slugs and snails. Most of our readers will get a correct idea of this apparatus from a tin basin, six inches in diameter, with the bottom out. The material however, must be zinc, surrounded by a band of copper one inch wide, neatly fitted on the outside near the rim, and held up by dots of solder. It is pressed into the ground, so that no insect can crawl under it; and its effect is thus described:

"The mollusca may crawl up the zinc with impunity, but on coming in contact with the copper, will receive a galvanic shock, and immediately turn away, or fall to the ground. I have repeatedly watched them, and have observed they were extremely cautious in approaching a second time.—The apparatus acts in wet or dry weather, and is therefore always in action."

We ought to mention however, that the upper edge of the zinc has an indented flange, turned horizontally outward, just above the copper band.

We have thought of applying this apparatus to the plum tree, &c. to protect the fruit against the curculio. Insects that fly into the trees, of course will not be interrupted; but the curculio, like the snail or the slug in England, is decidedly a crawler. To prevent the hogs from interfering, a guard of thorns or briars may be useful; or perhaps it may be found to act several feet up the trunk, where rags or tow may be stuffed in between the tree and the magic circle. †

Wilkie's Scotch Plough.

John M'Connell, of Ontario, very justly objects to the want of accuracy, in the statement of the committee on the Worcester trial of ploughs, where they describe the performance of a "Scotch plough," without naming the inventor or manufacturer. If our correspondent will turn to the very full report of that trial, given at the time, by Henry Colman, in the New England Farmer, he will find this deficiency of the committee supplied, and that it was Wilkie's plough, imported, which was there exhibited.

In justice to Wilkie's plough, it may be proper to state, that at the late trial of ploughs, under the direction of the Committee of the Ayrshire Agricultural Society, it accomplished a given quantity of work with more ease than any other, except Ransom's plough, though the latter did its work in a far more imperfect manner than Wilkie's, when the experiment was made on sward land. We do not consider the Worcester trial as at all decisive, as circumstances, and especially differences in the tenacity and condition of the soil, are found to vary the results very materially. We believe however, that experiments of this kind, are the only accurate test of the merits of different ploughs, and we hope they may be repeated with every necessary variation, as in clay and in sand, in sward and in stubble, with wide furrows and narrow, shallow and deep, lapping and flat, and we have no doubt that some which may prove imperfect in one way, may be excellent in another.

Darlington on the Grasses.

We have received from the author, Dr. Darlington, of West Chester, Pa. his "Discourse on the Character, Properties, and Importance to man, of the Natural Family of Plants called Gramineæ, or True Grasses.

[Delivered as a lecture before the class of the Chester County Cabinet of Natural Science, Feb. 19, 1841.]

This little pamphlet contains a large fund of information relative to this very important order of plants, and the high attainments of the author as an American botanist, and the plain and colloquial style of the lecture, render it uncommonly interesting to the young student in botany. With the exception of one instance, where a *nauseous* and pernicious drink is termed a "rich potion," we have also been pleased with the occasional remarks of a general and moral character contained in it.

N. Y. State Agricultural Society.

We have received a letter from H. S. Randall, Esq. Corresponding Sec'y of the N. Y. State Agricultural Society, complaining of some remarks in our April number, in relation to that Society. Mr. R. thinks our remarks do injustice to its managers, and afford evidence that we labor under erroneous impressions respecting the character of that Society. We cannot consistently publish the whole of the letter, without following it with a lengthy rejoinder; and wishing to avoid all cause of animosity, we prefer to explain, or retract, our remarks, and only give some extracts from the letter.

In the first place, by way of explanation, we remark that the article alluded to, was written in great haste, and under a feeling of considerable disappointment, in view of what appeared to us the meagre appropriation, named in the bill reported to the Legislature—being only one half of the amount asked in our petitions. In the second place, we wrote under wrong impressions, in supposing the bill was reported before any of our western petitions were received—which we have since learned was not the case. We also supposed that the "N. Y. State Agricultural Society" would, as heretofore, confine its operations mainly to Albany, and be managed chiefly by gentlemen of that vicinity. With these impressions on our mind, and its past history in view, we think it not surprising that we did not cherish the most favorable opinion of the Society, or expect much general good to result from it.

We are happy to say however, that the late proceedings of the Society, and the zeal and public spirit now manifested by its officers, have made a more favorable impression on our minds; and so long as its operations are governed by the principles we believe they now are, the New York State Agricultural Society shall receive our cordial approbation and support; and we think we can safely promise it the good will and co-operation of the majority of our readers in this State.

With the worthy Secretary therefore, we say, "let all bickerings and jealousies be forgotten," among those who labor in this great cause; and let us put forth our united efforts to help on the work of improvement,—let our motto be "Onward for the good of all." Then glorious success, the increase of happiness and prosperity, will surely crown our efforts.

We heartily concur with the sentiments of the following extracts, and hope that we and our readers may be favored with a farther acquaintance with the writer.

"The meetings of the State Society have heretofore been held at Albany, to secure the co-operation of members of the Legislature, and such other business men as resort to the Capitol during the sessions of that body. This might have been an error. But if so, it was one that escaped the notice of the most western members of the Society. * * * The annual Fair is to be held this year at Syracuse. It was placed there on the motion of an individual, who has been for years a member of the State Society—and the vote received the concurrence of every Member of

the Board, residing "about Albany." All that the old members of the State Society demand is *respect for their motives*,—when it comes to the matter of dollars and cents, they ask no priority—no privileges.—The eastern members will meet their western friends at Syracuse, and compete with them on fair and even terms. Is not this all that can be demanded."

The cause demands that there should be no bickerings—no jealousies in our ranks. The New Geneese Farmer will certainly not be the first to scatter dissension and jealousy among friends and co-workers. If there be rivalries between men or periodicals, or sections of country, let it be manifested in a struggle to outvie each other in *excellence, in efforts to advance the cause*. Instead of destroying each other, let us, like the rivals of old, see who can plunge deepest into the ranks of the *enemy!* * * *

I have the honor to be, Gentlemen,

Your obt' servant,

HENRY S. RANDALL.

A Tariff on Imports, acting incidentally for Protection, not generally unfavorable to our Foreign Trade.

MESSRS. EDITORS—It strikes me that the protective policy of government towards its own manufactures, when the protection is incidentally given by a tariff for revenue, cannot impair the legitimate importing trade of the country.

We admit that the amount of capital employed in the foreign trade in New York alone amounts to 48,000,000, but if we refer to the statistical details of the articles on which this trade is based, we shall find that our own manufactured articles of cotton, wool, and iron, besides cabinet-ware, upholstery, and the thousand and one other Yankee notions, form a large item in the aggregate amount. It is true that our trade with England and France may be diminished so far as imports are concerned, if our silks, wines, woolen goods, rail road iron, &c. &c., are in part supplied by home production. But will not our trade with all the rest of the world be proportionably increased by it?

Before the protection which the tariff of 1824 gave to our cotton manufacturers, such a thing as an export of American cotton goods was unheard of; but now so great is the export demand for our cotton fabrics, muslins, calicoes, drillings, &c. &c., that the prices of those articles have actually improved of late, when foreign goods are a drug in the market.

Is it sound policy for the north to consume more French silks than they can pay for, in order that the south may sell France a few hundred more bales of cotton? Would not the south be more profitably employed, if in varying her productions, she becomes less dependent on a fluctuating unsteady foreign market; more free from the effects of competition in the production of a single staple, which of late years has so disastrously effected the pecuniary condition of the Union?

Even the advocates of protection would not oppose the cotton growing, or as they too arrogantly call themselves, the "exporting" states, from exchanging their staples in Europe to any extent they please, for articles solely for their own consumption. If they can buy their negro cloths, woolen and cotton goods, boots, shoes, cabinet-ware, &c. &c., on better terms than the north will exchange with them for their cotton, the north will not complain. But is it right that the north and west, who have no market in England and France for their agricultural staples, to be compelled to support an impoverishing importing trade with those nations, merely to enable the south to export more cotton? In order to import we must first be able to consume; and how can we consume foreign fabrics, if we cannot sell the productions of our own industry?

S. W.

The Wheat Interests.

The name of our paper has become almost synonymous with *wheat growing*; and this being the leading business of at least nine-tenths of our readers, we feel assured that no apology is necessary for the space allowed the following document.

This memorial, with its accompanying statistics, was prepared, with great labor, by JOSHUA LEAVITT, Editor of the N. Y. Emancipator, who, to say nothing of his zealous labors for the abolition of slavery, deserves the thanks of the farming community for his valuable efforts to promote the interests of agriculture. The Senate deemed this memorial worthy of being printed for public distribution; and unless we greatly misjudge, it will do more to open the eyes of the nation on this great subject, than any other paper that has appeared. The complete document is for sale by the author, at the low price of \$1 per hundred; and we hope all of our readers who feel interested in the subject, will not only secure a copy for themselves, but distribute some to their friends.

We regret that our space does not allow us to publish it complete.

MEMORIAL

OF

JOSHUA LEAVITT,

Praying the adoption of measures to secure an equitable and adequate market for American wheat.

IN SENATE, FEBRUARY 27, 1841.

Referred to the Com. on Ag. and ordered to be printed.

To the honorable Senate and House of Representatives of the United States in Congress convened:

The undersigned, a citizen of New Jersey, respectfully solicits the attention of Congress to the following memoir, presenting a few considerations connected with the wheat product of the northwest.

The six northwestern states, (including, as such, the two territorial governments, soon to be admitted as states,) of Ohio, Indiana, Illinois, Michigan, Wisconsin, and Iowa, spread over a surface of 236,211 square miles, not including the portions of Wisconsin and Iowa, still held by the Indians. Being situated in a temperate and healthful climate, with the greatest natural facilities for communication abroad, with a soil of amazing fertility, they constitute a region of country as well adapted to the residence, support, improvement, and happiness of man, as any equal portion of the globe. Their present population is 2,969,696, being only 12 1/2 to a square mile. (* 1, 3.) Of the 178,606,672 acres of land in those states, (excluding Indian lands, as above,) 72,693,414 acres, or 40 per cent., have already passed into private ownership, by sales, grants, or reserves; leaving 105,923,258 acres in the hands of the Federal Government. In the settlement and value of this land, the national treasury has a deep interest, as may be seen in the fact that it has already received the sum of \$72,214,932 from the actual sale of 52,166,414 acres in these states; (2.) The land in private ownership gives 24 1/2 acres to each inhabitant, and is more by 11,771,414 acres than all the lands in Great Britain and Ireland that is capable of cultivation. (3, 5.) The land actually sold by the Government may be regarded as all bought for cultivation, and exceeds by more than five millions the quantity now under cultivation in the United Kingdom.—The sales in the last eight years are 31,758,666 acres, being only two and a quarter millions less than the lands now cultivated in the island of Great Britain. Of this quantity, 10,065,999 acres, or 31 per cent., were sold in the last four years, since the season of speculation was over; which fact, taken in connection with the vast influx of emigration during the preceding four years, conclusively proves that a much smaller proportion of the land sales of that remarkable period, in these states, were taken for speculation than is generally supposed. At the rate of sales of the whole eight years, the lands in these states would be entirely disposed of in less than twenty years; and at the rate of the last four years, the whole would be sold in twenty-two years. (4.)

The whole quantity of land in the United Kingdom of Great Britain and Ireland is 77,394,433 acres; of

* The figures in parenthesis refer to numerical tables appended to the memorial, which we are obliged to omit.—E. S. N. G. FARMER.

which 46,922,970, or 60 1/2 per cent., is cultivated; giving an average of but 1 1/2 acre to each inhabitant, of the 27,704,115 supposed to be the present population of those islands. Fourteen millions, or 17 per cent. more, are deemed capable of cultivation, leaving 15,871,463 acres, or 20 1/2 per cent. of the whole, worthless for human subsistence. (5.) At the same rate of productiveness with the cultivated land in the United Kingdom, the land already sold by the Government should produce subsistence for near 30 millions of people, while the vast quantity still unsold admits of a nearly proportionate increase. The lands being all held in fee simple, in farms of sufficient size to insure the greatest product with the least labor, unumbered with rents, tithes, or poor-laws, and no part engrossed by noblemen's parks or royal forests, the products may be expected to reach this amount far in advance of the proportionate increase of population, provided such a market shall be found for the surplus as will furnish the adequate motives and rewards to industry. It is to this point that the attention of Congress is particularly requested.

The actual increase of population in these states shows that there is something in our land system, our freedom from taxation, and the general character of free institutions, as spread over this region by the benign influence of the ordinance of 1787, eminently calculated to impart a healthy vigor to a rising empire, beyond any precedent in the history of the world.—Forty years ago, the whole civilized population of this district was but 50,240; now it is 2,970,696. The ratio of increase during each decennial period of this century is 48,320,285, and 102 per cent. The numerical increase of the last ten years is 1,592,604, being more in number than the whole increase of England and Wales during the first sixty years of the last century. The increase per cent. is greater than the increase per cent. of England and Wales during the whole of that century.

Of the actual growth of trade it is impossible to speak with equal precision, although some valuable data for an estimate may be found in the appended tables. (7, 8, 9.) So great has been the influx of emigrants, that it is only within three or four years that large portions of this district, the best adapted for wheat, have ceased to import bread stuffs, and it is but just now that the actual pressure of a surplus of these products begins to be felt upon the general market of the country, barely suggesting to the wisest forecast what is to be. Let the estimate of the future be formed in view of the tables, and of the facts, that the soil is as fertile as any other, with a smaller proportion of waste land, from rocks, mountains, or swamps, than in any region of equal extent; that there are no barrens; that both soil and climate are favorable to the production of provisions of all kinds, while at least two-thirds of the whole is eminently adapted to the culture of wheat, that the population is almost exclusively agricultural, with the advantage of owning every man his farm in fee—purchased, too, at so low a rate that no probable reduction of prices can bring their lands down to the original cost, while cultivation is constantly increasing their value, instead of turning them to waste as in some regions; that the character of the people, for industry, skill, education, general intelligence, order, and regard for law, is surpassed by few other sections of the world—affording assurance that they will always raise as much produce as they can, if there is a market for it, and will always require as much of the products of other regions, in manufactured goods and other comforts, as they can pay for, while their general integrity and the reign of just laws afford a guaranty that they will not run in debt to buy what they cannot see a way to pay for by the products of their labor.—The trade of such a country will be limited only by the physical ability of the people, stimulated to the highest industry by the wants of the most civilized state of society, unless it is clogged by obstructions interposed by the policy of our own or other Governments.

Until the year 1805, wheat chiefly in the form of flour, was the leading article of export from this to foreign countries. The average value for the five years preceding the one named, was \$8,205,000. (10.) In that year, cotton reached the value of \$9,415,500, and took the precedence of wheat which it has since maintained. The increase since, in the value of domestic products exported yearly, is about fifty-two millions of dollars, the whole of which is in cotton; while the value of wheat and flour has sunk to the fourth place in the columns of exports. The settlement of the wheat region of the northwest, to such an extent as to begin to furnish a surplus, already increases the export of this product; while the prospect for the future calls upon the philosophic statesman and

merchant to look upon this growing interest with the deepest concern.

Wheat flour—from its value, its lightness of freight, capability of preservation, and adaptability to the wants of different countries, as well as the natural indications of the soil and the abundance of water power, either in that country or along the lines of communication with the seaboard;—wheat flour must be the principal reliance of the northwest for foreign export, and for the means of paying for articles of necessity or comfort brought from abroad. The more extended introduction of this staple into our foreign trade would not only increase the actual commerce and revenue to that extent, but would tend to relieve our general monetary interests from the severity of the fluctuations arising from the present almost exclusive reliance upon a single staple. But the most advantageous foreign markets for wheat are grievously obstructed, and rendered so uncertain and fluctuating, as to be nearly valueless to the American Farmer, by the corn laws of Great Britain and France.

The British corn law, as settled in 1828, by the act of 9 Geo. IV. c. 60, is one of the most ingeniously contrived schemes that can well be imagined, calculated to injure the grain-growing interests of other countries, and the grain-consuming portions of its own people, without, it is believed, a corresponding advantage to the agricultural interest, for whose benefit it was intended. The variable scale of duties, rising as the price of grain falls, and falling as the price rises is but little understood in this country. The "general average," as it is called, is declared every Thursday, at the exchequer; and is obtained by first finding the average of all the grains sold during the week ending on the preceding Saturday, at 150 of the principal towns and markets, and then taking an average of that with the five last preceding general averages; and the last is the declared or general average for that week. When the declared average of wheat is 73s. or upwards per quarter of 8 bushels, the duty is 18s.; at when the price is 52s. or under, the duty is 34s. 8d. the intermediate duties being graduated by a scale tariff. (11, 12.) Wheat and flour may be stored under bond for any length of time, without paying duties, and re-exported at pleasure.

The object of this complicated arrangement is, first to protect the landlords against foreign competition and keep up the rent of land so as to sustain the load of taxation imposed by the public debt; secondly, to secure the people against the danger of famine, which, from the density of the population, and the uncertainty of the seasons, they are greatly exposed to; thirdly, to prevent, as far as possible, great fluctuations in the price of grain. The attempt to override the great and irreversible laws of trade, which strike a balance between demand and supply—or, in other words, to prevent fluctuations in a market where demand was constant and the supply variable—could not but fail. Twenty years ago, it was considered that a deficiency of one-tenth in the harvest would raise the price of wheat three-tenths, and a deficiency of one-fourth would treble the price. This theoretical sensitiveness of the market increases, as the increase of population overpasses the increase of production. The yearly consumption of all kinds of grain in Great Britain, is estimated at 52 million quarters, equal to 416 millions of bushels, or 15 bushels to each inhabitant; of which 13 millions of quarters, or 14 million bushels, being 3 1/2 bushels to each inhabitant, is wheat. The supply of 4 1/2 millions, or nearly 10 per cent., in 1839, was at an average price of 7, which was 80 per cent. above the price in 1835, and nearly 50 per cent. above that of 1836. (14, 16.) In the ten years, 1829 to 1838, the yearly range between the highest and lowest weekly average, averaged 1 1/2 d., equal to 30 per cent. The greatest fluctuation was in 1828, rising from 52s. 4d. to 78s. 4d., making a range of 50 per cent. These fluctuations of a market in England produce still more disastrous fluctuations in the markets from which supplies are to be drawn. In the ten years above named, the yearly fluctuations were 54 per cent. on an average; and in 1838, the fluctuation was 154 per cent. (13.)

In those ten years, prices ranged from 76s. to 79s. 4d.—a range of 42s. 4d., or 118 per cent. The average of the whole is about 56s. In 1828, the price rose, between 28th September and 24th October, from 68s. 6d. to 76s. 6d.—eight shillings in four weeks. In 1829, it fell, between 6th August and 17th September, from 71s. 6d. to 55s. 4d. or 2s. 8d. a week.—The general weekly averages, taken year by year, vary, on an average, 1s. per week; and the weekly parts of a single market, (Liverpool, for instance,) fluctuate up and down, on an average, about 1s. 4d.

per week per quarter, equal to $4\frac{1}{2}$ cents in a bushel of wheat, or \$2.34 a year.

The commercial effect of this system has been to encourage speculation. The moment a deficiency appears in the slightest degree probable, the grain dealers naturally withhold their stock on hand from the market; orders are sent to the continent for grain, to be imported in bond, to be entered as soon as the fall of duties will answer; prices are pushed up by all the arts of trade; and, as soon as the duty sinks to the desired rates, (say 6s. 8d.) the whole stock in bond is entered for consumption, and thus added to the general stock; and, if the deficiency proves imaginary, or small, prices fall as rapidly as they rose before, the duty runs up again, and the speculators have received the whole benefit. Thus a gambling character is imparted to trade, as detrimental to commercial morals as to the general prosperity. From July, 1828, to December, 1838, the quantity entered was 6,785,880 quarters, of which 5,688,946, or 75 per cent., paid duties not exceeding 6s. 8d.; and of this, 3,225,263 or nearly 50 per cent. of the whole quantity, paid only 1s. duty. In the year 1837, there were entered for consumption, 232,793 quarters wheat, and 49,187 hundred weight of flour, paying duties to the amount of £396,861. In the year 1838, there were entered 1,740,806 quarters wheat and 393,657 cwt. flour—being more than seven times the quantity of wheat, and nearly ten times the quantity of flour entered the preceding year, paying only £146,533 duties, or less than 50 per cent.; whereas, had the rate of the duty been equal in both years, the duty in the latter would have been £233,129. From 1st September, 1838, to 30th November, 1839, duty was paid on 4,532,651 quarters wheat, the prices ranging in the time from 61s. 10d. to 81s. 4d., and the duties ranging from 1s. to 20s. 8d.; but the average of duties was under 3s. 7d. (15, 16.)

The tendency of this system to general impoverishment, and to the increase of misery and discontent among the poorer classes, is already awakening in tense observation in Great Britain. The manufactories stop work, because orders do not come from America; and the orders are not sent, because that which payment might be made to a large amount will not be received on any just and reasonable terms. The goods are wanted here, and our free industry is abundantly able to produce the means of payment, but the great staple of the northwest is under an interdict. The operatives are thrown out of employment, and reduced to the lowest means of subsistence, and unable to consume a full measure of the products of agriculture, and thus an are made paupers, and become an absolute charge upon the land. The consumption of agricultural products is diminished; the agricultural laborers share the common distress; and agriculture itself, the very object sought to be benefited by this unnatural arrangement is oppressed by its own protection.— It is demonstrable that a well-employed, well-paid, well-fed, prosperous community of operatives would consume and pay for more agricultural products, in addition to the wheat they might import from America, than a depressed and starving community would without the wheat.

The best authorities agree that a very large proportion of the misery which we hear of among the factory children, is the result of the corn laws; first diminishing the employment and wages of the parent, and then raising the price of his provisions, until sheer want drives him to sacrifice his children for bread! Thus, while we are wanting goods, (not, indeed, the necessities of life, but the comforts of civilized and refined life,) our national revenue falling short, and our granaries bursting with abundance, England's mills are standing still, and her poor perishing with hunger— Surely the common instincts of our nature, the enlightened and philosophic benevolence which regards human happiness as the great object of human society and government, require a faithful examination of this system by all nations.

The question, where Great Britain is to look for supplies of wheat to meet either the occasional though frequent deficiencies of her harvests, arising from her uncertain climate; or the regular demand, not now very distant, caused by the increase of population beyond production, is one already exciting the attention of her statesmen and political economists. The Baltic countries are an unsafe reliance, because it is supposed they have already reached their maximum. Ireland, from which large quantities of grain have been brought, is now in process of a great moral and social revolution, which, by enabling every peasant to eat his daily bread, will not only furnish a home market for Irish wheat, but ere long, create a demand for American flour in exchange for Irish linen. The quantity

of wheat brought from Ireland in 1832 was 552,740 quarters; in 1839, but 99,639 quarters. (14.) The Buckle is another source, but the wheat is of inferior quality, few goods are taken in payment, leaving the balance to be met with specie; the voyage is long, and what very likely to be injured; and the cost of freight enormously disproportioned—the cost of freight and charges from Oleso being from 16s. to 19s. per quarter. The six northwestern states of this Union, with their present products, consumption of goods, and capability of increase, exactly meet the exigency. The examinations made by the persons employed last year in taking the census, show that the product of wheat in those states, excluding Wisconsin, in the year 1839, was 25,241,697 bushels, equal to 8.6 bushels to each inhabitant; of Indian corn, 87,620,868 bushels, or 29.8 to each inhabitant; of other kinds of grain, 29,735,202 bushels, or 10 to each inhabitant; and the total of all kinds of grain was 48 bushels to each inhabitant. There can be no doubt that the products of 1840 was very much greater than this; but there are no means of ascertaining the extent of the increase. In some extensive sections it has been estimated at one-fourth, and even one-third. The wheat crop of the whole United States, (excepting North Carolina and Kentucky,) was 75,965,787 bushels, or 5 bushels to each person; and of Indian corn, the crop was 301,947,658 bushels, or 20 bushels to each person. (17.)

If we now turn again to the six northwestern states and territories of the Union, we shall find that one of the greatest interests of the nation is the filling up of those countries with a sufficient population to complete the social organization. Without requiring that they should be made as populous as England, with her 294 inhabitants to a square mile, it may be safely assumed that the structure of society will not be rendered complete, in a country so destitute of mountains and waste lands, with a less population than 50 to a square mile of this number, they now have but a quarter. Any policy, of course of events, which hinders the influx of population, is therefore calculated to protract the period of comparative unorganization.

In addition, those states have burdened themselves with heavy debts,—all incurred for the purpose of making roads, canals, and railways. All these improvements were calculated with reference to the conveyance of the products of the soil to markets out of their borders, and all converging, in effect, towards the great Atlantic seaports, whence those products should seek a European market. The stocks of those states are greatly dissipated,—chiefly, it is believed, through the unfortunate neglect of a well-established axiom in finance, which forbids the creation of a public debt, without a specific pledge of revenue, from taxes or some other source, sufficient to prevent the accumulation of interest. And even now, the states are reluctant to tax themselves, and greatly injuring the country by delay, because they do not see a fair prospect of sale for the products of their land, which is all they have to sell. And how are they to acquire the means of paying the taxes necessary to sustain these stocks, unless they have a market for their staples? And how are those public improvements ever to pay for themselves, unless the produce of the country can be carried on them? And whether shall it be carried, if there is to be no foreign market?

The Federal Government has expended more than a million of dollars in creating artificial harbors on the upper lakes; and two or three millions more are required to complete them in such a way, that what has been done shall not be destroyed. In addition, harbors are required by the most urgent necessity, along the coasts of Lake Michigan, now, for hundreds of miles, destitute of a shelter for shipping. These works are all standing still, because the revenue is short; while the tooth of Time is rapidly consuming the unfinished constructions. (18.)

Should it, indeed, come to be settled that there is to be no foreign market for these products, the fine country under contemplation is not, therefore, to be despaired of. Let the necessity *outré* become apparent, and there will be but one mind among the people of the North-West. The same patriotism which carried our fathers through the self-denying non-importation agreements of the Revolution, will produce a fixed determination to build up a home market at every sacrifice. And it can be done. What has been done already in the way of manufactures, shows that it can be done. The recent application of the hot-blast with anthracite coal to the making of iron, and the discovery of a mine of natural steel, would be auxiliaries of immense value. We could draw to our factories the best workmen of Europe, attracted less by the temptation of wages, than by the desire to leave liberty and

land as the inheritance of their children. But it would take a long time to build up a manufacturing interest adequate to supply the wants of the N. West, or to consume the produce of those wide fields; and the burden of taxation for internal improvements, uncompleted and unproductive, would be very heavy and hard to bear, and all the population on that is concentrated upon manufactures, is so much kept back from the occupation of that noble domain; and the national treasury would feel the efforts of the curtailment of imports and the cessation of land sales; and the amount of misery which the loss of the American market would occasion to the starving operatives and factory children on the other side of the Atlantic, is worthy to be taken into the account, by every statesman who has not forgotten that he is a man.

On the other hand, let it be supposed for a moment, that the landholders of England would be satisfied with a fixed and moderate duty, in addition to the protection afforded by the cost of freight and importation, now amounting to 30 per cent. of the net proceeds. There would then be a constant market for wheat in England, to which the uncommonly uniform climate of the North West would furnish a constant and full supply; and the whole returns would be required in British manufactured goods, generally of the description that yield the greatest profit. Immediately, orders would go from this country to set every wheel and spindle, and hammer in motion. Immediately, these states would be willing to tax themselves for the interest of the public debt, because they would see how taxes could be paid. Immediately, the state stock would rise, because the interest would be secured, with a certainty that the public works would be completed and rendered productive. The manufacturing industry of England, and the agricultural industry of the North West, would be stimulated to the highest productiveness, by the best of all encouragements—the hope a fair reward. The great cotton staple, too, would feel the benefit of a new and healthy impulse given to trade. The public works would be finished, and the lines of communication now open would be thronged with freight. New York would abolish the duty on salt, for the sake of securing to her own enlarged canal the transportation of the produce from the Ohio, the Maumee, the Wabash, the Illinois, and the Wisconsin canals, now strongly tending in that direction. (19.)

The demand for the public lands would pour a steady stream into the national treasury on the one hand; to be met by a current from the imports on the other, furnishing an adequate revenue for the completion of our harbor works and national defences. The exports, no longer confined to a single staple, and drawn from the most productive of all branches of labor—the cultivation of a rich soil that costs next to nothing—would keep foreign exchanges in a healthy state; new ties of mutual advantage, and new inducements to mutual justice, forbearance, and peace, would arise between two nations of common origin, from whose influence the world has so much to hope for; our own manufactures would be left, under their present protection, to a healthy and natural growth with the growth of the country; and our nation would be saved from another tariff controversy, to occupy and embitter the debates of another political generation.

Are not these objects worthy of the consideration of American statesmen? May an obscure citizen, who loves his country, be pardoned for his presumption in spreading these imperfect suggestions before the American Senate?

Your memorialist respectfully requests that useful information may be collected and diffused respecting the wheat product of the North West; the condition and extent of the foreign market now open for American wheat and flour; the obstructions interposed by the regulations of foreign governments, and the probability of any repeal or modification of those regulations; and that Congress will adopt such measures as shall be deemed wise and proper, to secure an equitable and adequate market for this valuable product.

Your memorialist has prepared, from the best materials in his reach, with some labor, a number of tables illustrative of several of the topics in this memoir, which are appended hereto.

JOSHUA LEAVITT.
Washington City, Feb. 25, 1841.

It is moral excellence alone that renders a free people great and happy. Without it, all is empty splendor and hollow decency. Religion is the source of most of the moral excellence of the race. Its influence, when pure and liberal, is the most wholesome and ennobling.

ROCHESTER, JUNE, 1841.

Cheering Prospects.

It is highly gratifying to observe so many signs of returning prosperity, as we think we do at present. The unusual interests which is now awakening throughout the land on the subject of agriculture and domestic industry; the expected modification of the American tariff and of the English corn laws; and last, though not least, the smiles of Divine Providence, in sending us warm and favorable weather and promising crops, is certainly calculated to drive away the gloom and despondency which have enshrouded the minds of too many farmers of late, and to fill their hearts with hope and cheerfulness.

To our Friends.

This number completes the first half of our present volume; and the friends of the New Genesee Farmer, who have labored so efficiently to increase its circulation and promote its usefulness, will be gratified to learn that complete success has attended their efforts. Our circulation exceeds our most sanguine expectations, being now 17,000; and before the close of the season it will doubtless exhaust our edition.

We are conscious that this result is to be attributed mainly to the favor and aid which the paper has received from the friends of the cause throughout the country; and while we express our sincere gratitude, we desire to assure them that no reasonable pains shall be spared on our part to merit their continued confidence and aid.

We regret that a pressure of other business, together with some poor health, has prevented us from bestowing that amount of time and attention to the Farmer and its correspondents, which we could wish. We intend to make better arrangements in future, so as to increase the interest and usefulness of the paper.

Pleasing Letters.

We have not made a practice of publishing the numerous complimentary and encouraging letters received by us during the few months past, although they have been highly gratifying to our own feelings. But when, like the following, their tendency is to edify and encourage our friends and correspondents as well as our lives, justice to our readers demands their publication.

The first letter is from a worthy Minister of the Church of Scotland in Canada, and was written shortly after the commencement of the present year. It was not intended for publication, but we are confident the writer will pardon the liberty we have taken.

MESSRS. EDITORS.—Your determination to persevere gives me much pleasure. You will please continue sending me the New Genesee Farmer, for I cannot afford to lose the instructive enjoyment of my arm-chair intercourse with your various correspondents. When one has become acquainted with their ways and words, and expects periodically to have the pleasure of their conversation, the stoppage of your publication would be like the receiving of an hundred funeral cards at once! Who could easily resign himself to the loss of the enjoyment of their dry humour and practical sense? Besides the palpable advantages of their invaluable information, one has the entertainment of holding converse with almost every variety of

human genius. This, to me, is one of the principal charms of your publication, although I am aware it is not the most important advantage. The principles of agriculture are to be inferred only from facts, and the facility which you offer for the statement of these facts to every worthy and public spirited, young or old individual around you, is the gathering in of sheaves for a great harvest of science. That is the rare and great merit of the New Genesee Farmer.

I cannot exactly say that it belongs to the office of a Minister of religion to publicly recommend and pray for the success of the New Genesee Farmer, though things more absurd have in that way been done, but there can be no objections to his doing so in private. One of my deepest convictions is, that a good farmer, of all orders of men, is most likely to be a good christian. He must be a steady man; he must love to work for the work's sake as well as the wages, and above all he must be a lover of all sorts of cattle. Now no one that loves the different races of cattle can have the nature to hate the race of man, and he that loves man—just go on and see where you will end.

Excuse this, Messrs. Editors, and convey, if you have any means of doing so, my earnest request to my friends of the by-gone year, that they will continue to correspond *with me*—I ought to have said *with you*, gentlemen, but beg pardon, and remain,

Yours, &c. L. T. W.

A Compliment from Ohio.

We have seldom received a more gratifying letter than the following from a worthy and influential gentleman in Ohio. The approbation of such men is no small reward; and it encourages us to persevere in our attempts to merit such praise.

MESSRS. EDITORS.—I have been making an effort to increase the circulation of your paper among the members of our Agricultural Society, and as the result, I herewith send you the names of sixteen subscribers. The superior value of the New Genesee Farmer to us, above all other papers of the kind, I consider to consist in its freedom, thus far, from speculative theories—its refusing to publish the grumbings of discontented and prejudiced men, calculated to discourage farmers from adopting the most approved system of tilling the soil—and its plain practical common sense and safe directions to the farmer.

I am enthusiastically fond of the cultivation of the soil, and if I had time, I would give you the results of any experience in raising and feeding roots, &c.—perhaps I may do so hereafter. I have often risen from the perusal of your paper with this thought, *Now that one number is worth more than the price of the whole volume.* I hope you will 'go on and prosper.' Don't humbug the farmers and discourage them about any thing, if you can help it. They are too easily discouraged at the best; and the failure of a new production, or of an agricultural implement to answer its recommendations, will throw (some of) them back years in their improvement. When a good cause gets well established, a single failure don't injure it much; but improved agriculture is not thus established among the mass, and a puff of a poor thing, or the discouragement of a good one, will alike do mischief. I know it is difficult for you to avoid all these evils, but you have hitherto been very successful, and I trust you will still continue to be careful. Wishing you great success, I remain yours truly,

Lorain co. Ohio, May, 1841.

We sincerely thank the writer of the above, and hope he will excuse the liberty we have taken. We should be happy to hear from him often.

*. We should be pleased to add the signatures to the preceding letters, had we permission to publish them.—EDS.

The Self-Protecting Bee-Hive.

Mr. Julius Smith has left several of these hives at the Rochester Seed Store, and is desirous of introducing them into use in Western New York. We believe them to be of an improved construction, and at his request publish the description given in the Cultivator, by the inventor and patentee, Wm. M. HALL, of New Haven Conn.

The hive at your office, is of the exact form, and of the most suitable size and workman-ship for use; and it contains all the principles of my patent. By the construction of this hive, three very important principles are brought into operation. 1st. The communication from drawer to drawer, thereby enabling the bees to pass freely from one drawer to the other, making as it were, but one drawer, when in fact there are two, thereby producing the most happy effects, and causing the bees uniformly to build in both drawers at the same time, when without the communication, they usually fill one drawer, before they commence in the other. These drawers are removed by means of two right angled metallic slides. 2d. A perpendicular hive is obtained which should always be the case; without which the economy of the bees is much disturbed. It is well understood among apianians, that bees always build their combs in perpendicular sheets, without regard to form or size of the apartment, consequently if the bottom of the hive is contracted, some of the filth must lodge in descending, thereby causing much derangement in their operations; but if the hive be perpendicular, all filth disengaged by the bees, immediately falls to the bottom when it is at once discharged by means of the inclined plane. 3d. The base or protector. The base is the best possible discharger of worms and other filth. The planes may be constructed to any degree of inclination desired, without injury to the hive or bees; they furnish an opportunity for the bees to alight and enter both at front and rear sides of the hive, at the same time enabling them to *crawl* to any part of the hive without again flying. Bees on returning to a hive, at a cool season of the year, partially benumbed, are obliged to fly after once alighting as from a suspended platform, frequently die for want of strength to rise; and that too at a season when their numbers are more wanted to produce annual brood sufficient for the wants of the brood. It is not infrequently the case that whole colonies when thus treated, perish in the month of April. The hive is ventilated by closing the planes more or less as circumstances seem to require.

I describe the construction of the Self-protecting Bee-hive, as follows. Observing that my improved hive consists of three parts, viz. 1st. A perpendicular hive thirteen inches square more or less, as seen in the accompanying drawings, fig. 15, A. 2d. The chamber with communicating drawers at the top of the hive for extracting the surplus honey, without destroying the bees, as seen in fig. 15, B. B. 3d. The base or protector. The base is a square frame of the top of the body of the hive, about 4 inches deep, without top or bottom, on which the hive rests, as seen in fig. 15, C being connected and held in place by dowels, as seen at X. X. and books as seen in the figures. The front and rear sides of the base are narrower than the other sides by about an inch, leaving room at the bottom, for the play of the inclined planes, which form a bottom for the hive; consisting of two inclined planes slanting from the top of the base to the bottom. These inclined planes consist of boards hung within the body of the base, on pivots passing through the sides near the top edge of the center of the sides, and extending below the lower edge of the base in front and rear with a play of about an inch, as seen at F, which represent the plane inclining to the front. G. The front of the base. H. The pivots on which the incli-

planes hang. D. The projection of the inclined plane at the bottom of the base. E. The hook to close it tight against the bottom of the base when required.

"The base or protector should be separated from the hive during the process of hiving, when the bees have entered the hive, it may again be added, and the planes hooked up, when it may be carried to any situation desired, without injuring the bees. The base may also be added to any hive of suitable size and form already containing bees."

Julius Smith of North Brantford, Conn., has purchased of Mr. Hall, the right to make, use, and vend to others the right to make and use the above hives in the counties of Chautauque, Cattaraugus, Erie, Niagara, Orleans, Genesee, Allegany, Livingston, Monroe, Wayne, Ontario, Yates, Steuben, Seneca, St. Lawrence, Franklin, Hamilton, Montgomery, Fulton, Clinton, Essex, Warren, Washington and Schoharie, State of New York. He therefore offers to sell rights for counties, towns, or single hives, on reasonable terms. The hives can be examined at the Rochester Seed Store, and Messrs. Bitcham & Croaman are duly authorized to sell hives and rights. Price of a hive \$5.

The public are invited to call and examine the above hives and read the certificates of those who have used them.

B. & C.

Oneida County Awake.

Messrs. Editors—An Agricultural Society for the county of Oneida, was organized at Rome, on the 21st of April. An address, full of interest, was delivered by H. S. Randall, Esq., Corresponding Secretary of the State Society.

The following officers were chosen:

Hon. POMEROY JONES, President.

Thomas Goodsell, Harvey Bradley, Riley Shepherd, Lester Baker, Ernesta Jeffers, Salmon Case, John Barker, A. Carmichael, V. Tutthall, Ingham Townsend, Vice Presidents.

Benj. P. Johnson, Corresponding Secretary.

S. Moulton, 3d, Recording Secretary.

J. Hartway, Treasurer.

Eon Comstock, J. G. Green, W. B. Wright, G. Walsworth, Geo. Bristol, Managers.

At a subsequent meeting of the officers it was Resolved, To raise the sum of \$400, and to hold a fair on the third Wednesday of October.

From the interest manifested, it is believed a new impulse will be given in Oneida, to Agriculture, and I trust the time is at hand, when our county, rich in her natural resources, will be rendered still richer, in their successful development.

Yours,

Rome, May 21, 1841. B. P. JOHNSON.

Important from England—Corn Laws.

Late English papers bearing the welcome intelligence that Parliament has commenced a discussion on the subject of the odious corn laws, which it is confidently expected will end in their repeal or modification.—The highest excitement is said to prevail on the subject among all classes, and petitions, with millions of signatures have been presented to the government, praying for the repeal of this oppressive system of taxation. Lord John Russell has announced that it is contemplated to establish a fixed moderate duty on bread stuffs, in lieu of the present fluctuating and exorbitant rates. The subject was introduced into Parliament by a motion adopted by a unanimous vote of the Cabinet Council; whereas only two years ago the head of that Cabinet, Lord Melbourne, declared the corn laws could be approached, touched, or altered, only by a madman!!

The London Times contains the following remarks which may doubtless be regarded as the language of millions:

"THE CORN LAWS.—It is no slight addition to the claims of a cause, which has already so much justice and reason on its side, that they are backed by the most appalling statements of the present destitution and progressive decline of our manufacturing population. The sufferings of millions demand relief, even though that relief were not identical with the truest policy of England. But the welfare of the mass is identical with the interests of the country; and it is because the general privation and the general loss have not fairly measured against the particular advantage of a protected interest, that the energies of the country are weighed down by an unequal and injudicious system of taxation. We argued the other day, in favor of a reduction of the sugar duties on behalf of the West India planters; and we now confidently await that measure, with some others of equal importance, from the Government. But with how much more weight should we have spoken if we had dwelt on the sufferings of a people afflicted by the curse of scarcity; and if we had asked our rulers not only to benefit the planter, and to increase the revenue, but to feed the people by diminishing the duties on colonial produce—by adjusting the taxes on corn upon a system better calculated to avoid the evils of excessive fluctuation in price and entire prohibition, and by sweeping away the duties which exclude us from foreign markets without adding to our own revenue."

The London Chronicle (indices) of the 3d May says—

The sensation produced by the Government notice of Friday night on the Corn laws is rapidly extending through the country. Every where it is the signal of excitement and determination. By the monopolists it will never be forgotten; and by the people it will never be forgotten. Ministers have fairly thrown themselves on the nation for support in the assertion of a great national right and interest. The response will soon be heard in thunder. The untaxing of the people's bread is a prospect full in view; and the people will spring towards it like lions on their prey.

Soaking Onion Seed.

Messrs. Editors—I have tried the experiment of sprouting Onion seed as per directions of a correspondent of the Genesee Farmer. After covering the seed with warm water several times in the course of three weeks, I despaired of their sprouting, and planted them by themselves—planting the adjoining bed with dry seed. The result is, that the soaked seed came up in four or five days, during the cool weather of the early part of this month—they are now ahead of the weeds. The dry seed just begins to appear, after two weeks planting. SENECA.

Striped Bugs—Inquiry.

Messrs. Editors.—Is there any certain preventive of the yellow striped bugs that destroy our vines? I have never seen any thing yet that would keep them off, that did not destroy the vine. If there is any thing that may be depended upon, please make it known. T.

REMARKS.—The only sure and effectual way that we know of is to cover the vines with mill net frames. Perhaps some of our correspondents can inform us of a better.—Els.

BEEBE'S STRAW CARRIER.

The above engraving represents a machine for removing the straw from the cylinder of a thrashing machine—invented and patented by Uriah Beebe, of Riga (formerly of Clarendon.) It consists of six (or more) revolving rakes (B) set in a frame in such a manner that when in motion the teeth pass between each other, and take the straw from each other to the end of the frame; while the grain is shaken out and carried through a screen to a blower below, where it is separated from the chaff.

One end of the shaft of each rake (A) passes through the side of the frame, and has a whir attached (D.) The third, or middle whir, (C) is made of double thickness, so as to receive a band from the thrashing machine. Another band is passed round all the whirs, and a strip of board is fastened to each, with a single screw, so as to give uniform motion. Thin boards are placed above the sides of the frame, to prevent the straw from scattering, and a floor or apron, of boards, is placed below to catch the short straws, where they are taken up again by the rakers till carried off.

The inventor has been several years experimenting with and perfecting this machine; and he now feels confident that it will be found well worth the attention of farmers. It can be seen at any time at his residence in the town of Riga, half way between Churchville and Caledonia. Single machines, with a blower, will be sold for \$30. County or State rights on reasonable terms. Address, URIAH BEEBE,

Riga, Monroe co. N. Y.

Testimonial.

We the undersigned, residing in the towns of Wheatland and Riga, having seen Uriah Beebe's Patent Straw Carrier in operation, believe it to be the best machine for the purpose now in use; for the following reasons: It performs the work in the best manner and with the least power. It performs the labor of at least four hands in the ordinary way; and the power required to propel it is only about the same as for the common fanning mill. It separates the straw from the wheat, and with a blower attached, the chaff also. Possessing, as it does, these superior qualities, we cheerfully recommend it to the public.

Answers to Inquiries.

Our correspondent at Augusta (Ill.) is respectfully informed that we have not room in our columns for the article on flowers that he wishes to be republished; but if he will examine our *first volume*, he will find the proposed alternative in some measure anticipated.

Many varieties of the pear, apple, &c. are much finer in some parts of our wide spreading country than in other parts. For instance: the most popular pear in this district is the Virginia. The fruit is delicious; and the tree is hardy, thrifty, and productive; but it is thrown out as worthless in some parts of Massachusetts. Every nurseryman ought to ascertain what fruits are best adapted to his peculiar climate and situation; and if he dies this extensively, taking his seeds only from bearing trees in his own district, every thing that our correspondent wishes on this point, would be accomplished.

It would be a great labor to give a list of our apples. For winter fruit, the Swaar and Spitzenburgh are among the best; but to have them fine, it is necessary that the trees be well pruned. As the branches become crowded, the fruit less in size and in *flavor*. The Roxbury Russet is chiefly valued for its long keeping; but some new kinds, much finer in quality, are said to keep equally well; and of these, some account may be given hereafter in our columns. †

Thorn Hedges.

Messrs. Editors—I wish through the columns of your paper to inquire the best method for making live fences (a hedge). Last spring I took up what small thorn bushes I could find, and set them out about six inches apart. Nearly all grew, and I should think they would make a good fence if they could be obtained in sufficient quantities. In the fall of 1839, I gathered a quantity of thorn apples, mixed them with earth, and let them lie so. In the spring, I planted them, but none have come up. I wish to know in what way they may be made to grow? and if common thorn is as good as the English? and where English seed can be obtained? In short, I wish to find out the best way to commence and raise a live fence?

L. H. BRANCH.

York, Ohio, March, 1841.

Remarks.—In Cuyuga county we have seen the English thorn (*Crataegus oxyacantha*) in two places, six or eight miles apart, and in both it was suffering from *fire blight*. In Ontario county also, a correspondent of the (Old) Genesee Farmer says, "where the English thorn was tried, that part of the hedge which was clipped [as all hedges ought to be] was mostly destroyed by a small snow white insect, with which it was in many places literally covered." On the contrary in Niagara county, we have seen hedges of the English thorn that appeared to be healthy; but we should be unwilling to employ much labor or expense on this *exotic*. Many years ago, in the town of East Hampton on Long Island, nearly two hundred miles of this kind of hedge had been planted; but it all died. Writers in that vicinity, ascribed their loss to a fly that deposited its eggs through the bark, and to a worm that preyed upon the twigs.

In the southeastern parts of Pennsylvania, we have seen many miles of hedges made of the Washington or Potowomac thorn (*Crataegus cordata*). The seeds appear to grow as freely as those of the pear or apple. A box containing a parcel of them for us, had been detained over winter on the canal, and when it arrived in the spring, dozens of the roots had penetrated the cloth that contained them, sticking through it on every side like the spines of a hedge hog.

This thorn however, though so easily propagated, is subject to a malady that greatly impairs its beauty, and hereafter may prove ruinous. In particular

neighborhoods the leaves become spotted with yellow. We have not understood that any of the hedges have yet perished from this cause; but we had a crab tree (*Pycnus coronaria*) which died last season, after suffering several years with spotted leaves of the same kind.

While hedges of the Washington thorn were discolored in this manner, we have seen hedges of the New Castle thorn (*Crataegus crus-galli*) on the same farm and closely adjoining, in perfect health and greenness. No dangerous insect is known to attack it; and farmers who have planted miles of thorn hedge, decidedly prefer it to all other sorts.

The seeds however, are much more difficult to germinate. We have seen them treated in the following manner; and we have understood with uniform success. A small trench was cut on the north side of a building, directly under the eaves. Into this, the haws mixed with sand, were deposited in autumn; and as they received in this shaded place, the droppings of every shower, they were kept always moist through two winters and one summer. After softening in this manner for eighteen months, they were removed to the seed bed.

Many other shrubs have been recommended for hedges, such as the Red Cedar, Osage Orange, &c. With E. Hersey Derby of Massachusetts, both the English thorn and the Honey Locust were entire failures; but with the Sea Buck thorn (*Rhamnus catharticus*) he was completely successful. A part of the Buck thorn however, like the Honey Locust and *Crataegus punctata*, have no thorns on them. We raised hundreds, and never saw a thorn on one of the kind; but we have lately procured seed which may do better. †

High Prices induced by High Tariff on Imports, cannot make the country rich, or pay its foreign debts—Protection necessary to Silk Culture.

Messrs. Editors—A correspondent of the New Genesee Farmer takes exceptions to my text, "that low prices are more favorable to a nation's wealth than high prices."

Had who takes this text in connection with the illustrations of the context, will find that, like a "plant of bitter growth, it bears on its head a sweet fruit."

It has always been the case in England, that when the prices of agricultural productions are low, capital is cheap, her manufacturing industry receives a new impetus; competition reduces prices of manufacture at home, by inducing greater economy and renewed improvements and division of labor in every department of industry; her export trade is increased to an unparalleled extent, and she becomes now, more than ever, the creditor nation of the world. On the other hand, when agricultural productions are high in England, the most distressful state of things exists: the banks curtail their issues, that they may not be ruined by a demand for coin to send to the continent to buy corn; manufacturing industry is paralyzed or embarrassed, and the screws are immediately put upon the debtors of England in the United States.

What but the high prices of '35 and '36, has caused the general bankruptcy of our cotton growing States? It is certainly not the low prices since 1836, for they are no lower than they were on the average for eight years previous to 1835. The rise in cotton in 1834, from 10½ to 13 cts., and then in 1835, to 16½ cts., turned every head; the United States Bank endorsed the *mania*, and furnished the facilities to accelerate the common ruin.

The high prices of cotton, our great agricultural staple, in 1835 and '36, was the great stimulating cause of all the bank inflations, and consequent speculation and high prices throughout the whole union at

that time. New England got great prices for her manufactures at the South and South West. New York felt herself rich when she saw upon her ledger such vast amounts due from the South. England, in 1837, wanted our flour at \$8 per barrel in New York but our commission houses said, if we hold on, New England will give us \$10.—Instead of exporting, we imported grain from Europe. The same with manufactured articles. In 1836 we imported \$60,000,000 while we exported next to nothing, owing to the high prices at home.

We now have the sad spectacle of a country growing poor in the midst of high prices. How has it been with the year of low prices, 1840? An unusual export trade—our exports exceeding our imports \$27,000,000—an export of manufactured articles treble the amount of any former year.

Our export of flour, and pork, and Indian corn, has also been unusually large the past year: it has done much towards paying our foreign debt. But had the price of flour been only one dollar per barrel higher it must have been consumed at home, as bread stuff from the ports of the Baltic and the Black Sea, would have supplied the hungry parts of the earth at lower prices.

Your correspondent says that by a protective tariff we may soon extend our manufacturing interests, so as to create a home market for the "great part of the cotton grown in our country." I would then ask him how we are to pay our great foreign debt of \$260,000,000?—and besides, the most radical high tariff advocate does not claim any further protection for our cotton manufactures from foreign competition, than they now have. Our Western farmers seem to understand the great importance of cotton to the Union. I not only pays the foreign debts of the South, but the North and West also. Cotton alone makes up in value four-fifths of our agricultural exports. I would then ask what would be the state of the nation without this great staple, as an article of export, and an element of our foreign trade?

Your correspondent says, that in protecting our manufacturing industry, "aid is not so much needed from our State Legislature as from Congress." In relation to the culture and manufacture of silk, would invoke aid from both. The State should grant a bounty, and Congress should pay an impost on the foreign article, as high as the spirit of the Compromise Act will permit. Silk is by far the greatest item in the account of our foreign importations. It has been computed that the amount of foreign silks consumed in the State of New York alone, for the last 10 years, will exceed \$50,000,000—an amount greater than the cost of all our canals and other public improvements.

But too much protection, like high prices, only brings about those evils they are intended to cure. Mr. Clay was once a radical on the subject of a protective tariff; but he is a man of too much genius not to profit by the lessons of experience. He also found that a tariff for revenue and protection was often inconsistent with itself; hence his Compromise Bill is intended to be a bill for revenue only. We hope it now may be so revised and amended, as to serve the ends of protection to such of our manufacturing branches of industry as most need it, without infringing its character as a bill for revenue only. S. W.

Waterloo, May 10, 1841.

Important Discovery.—A Jamaica paper says, that an ingenious physician and naturalist in this island, has discovered the practicability of using mosquitoes as a substitute for the leech, fifty of the large speckled kind being found equivalent to one leech; of the smaller bred, from sixty-five to seventy being required.—The greater irritation produced by the new application has also been found advantageous.

Native Fruits.

The last number of the Magazine of Horticulture contains Professor Rutsells' Address before the Middlesex Horticultural Society, from which we make the following extract:

"The venerable relic of the far famed Chelmsford pear is yet extant on one of the oldest farms in that town. It is a natural fruit, of excellent market qualities, and known as the Chelmsford, Tungsboro' and Magal Summer. A mere thin shell of the once extraordinary trunk, yet bears a few scraggy branches and in its roots are four strong suckers, all of which are identical in fruit with the trunk. Before the great gale of September 1816 [?] it was a very large tree; but being injured by that tornado, it rapidly declined to its present condition. The stem however, bears an occasional crop, but was entirely barren the last season. Mr. Manning, the great pomologist, of Stillen, remarks that it is a pear of the largest size, and extremely productive. For many years he searched in vain for its origin, sparing no expense in importing pears from the French nurseries to identify it. Inquiry on my part enabled me to confer a trifling favor on my friend, and to establish the claims of old Chelmsford to a fine native fruit.

"The history of the valuable Baldwin apple is familiar to you, bearing in its cognomen a family name yet extant in our midst. A fine early apple has often been exhibited on your tables, originating also in Chelmsford, and known as the Spalding. The addition of these three natural fruits in our vicinity, to pomology, is sufficient to encourage a research into natural varieties, which are as yet but little known. It should be our endeavor to find these out, and no pains should be spared in the attempt. * * * Our own country is the region and natural location of the finest fruits."

For the New Genesee Farmer.

The Importance and Utility of the Dissemination of Knowledge among Farmers.

Messrs. Editors—The influence of a publication like yours, devoted to agricultural interests, should be directed towards the improvement of the minds of farmers as well as the introduction of improvements in the science of farming. Your columns have already furnished evidence that you are aware of this; and therefore my object is not to urge upon you any new duty, but to suggest a few reflections on the importance and influence of the dissemination of intellectual knowledge among farmers.

It would be a useless waste of words to enter into any argument to show that among this class of our fellow citizens there is no want of intellectual capacity. And if among those who are engaged in other pursuits, there are any who arrogate to themselves a superior order of talents, they betray an ignorance unworthy of a man of common sense. The occupation of a farmer, it is true, will not furnish an opportunity for a senseless display of fashion; nor will his robust form and hardy countenance, give him the exquisite appearance of the straight laced and pale faced dandy. Yet, undorned by the trappings of art, he is still one of nature's noblemen; and his intellect, when cultivated, will display an enlarged and useful capacity, not alone fitted to the occupation in which he is engaged, but to any station to which he may be called through the operations of liberal institutions. And whenever the cultivated capacity of a farmer has been called forth to display itself, either as a legislator, or in the performance of any other public duty, it has by no means suffered from a comparison with those of much higher pretensions. It is not to be denied that there has been a lamentable apathy manifested by the great body of agriculturists in this country, for the acquirement of intellectual knowledge, which is the only thing that can develop the resources of the mind; and perhaps among no other class has there been such apparent neglect of books, or no little disposition to depreciate the useful publications of the day. But while we admit that they have neglected their own interests in this respect, it will not follow that they

have not the mental ability. It has heretofore been a too common error among farmers to suppose that it would be great sacrifice of time which ought to be devoted to their business, to appropriate any portion to reading. And even now it is not uncommon, to hear "want of time" urged as an excuse for neglecting to nourish the immortal mind from that fountain of knowledge, which is accessible to those of restricted means as well as to those of greater competency. This mistaken notion however, is daily becoming less prevalent; and I believe there need be no hesitation in saying, that the circulation of agricultural papers has done more than any thing else to accomplish a reformation so desirable. Besides these however, there are numerous other valuable means afforded for improving the mind. The amount of knowledge which may be gathered from these various sources would, when compared with the amount of dollars and cents which it costs to obtain it, be like a comparison of the magnitude of the most lofty mountain to that of a mole hill. If any one thinks his means are too restricted to afford the expense of a weekly newspaper, or the still less amount charged for agricultural papers, let him reflect for a moment, and he will discover that the means for such purposes are at the control of every one. It only costs the labor of a day, at farthest a week, to lay up a store for the mind upon which it may lean for a year. Neither the lack of means nor the want of time, can be considered a valid excuse to such as properly consider the subject. What farmer is there that can say he has not the time to give one paper at least, a thorough perusal, and only appropriate to it one-fourth of his leisure?

Happily for us in this country, labor affords the means of obtaining whatever may be necessary for the comfort of the body, and at the same time may also provide for the necessary endowments of the mind. And if incentives be wanted beyond the comfort and happiness which an individual will secure to himself, our institutions have not failed to make the most ample provisions.

Perhaps, Messrs. Editors, I have extended these remarks too far, inasmuch as they are only intended as an introduction to what I propose to submit to you on this subject hereafter, when time and opportunity permit, provided my remarks shall be deemed worthy an insertion in your valuable paper.

Yours, &c., C. P. T.

Batavia, May, 1841.

Treatment of Hired Men.

Entreat not evil the hiring that bestioreteth himself wholly for thee.—Ecclesiasticus.

Altho' a man employing others to till thy grounds? Then remember that thou hast a Master who commands thee not to over-task or to abuse them. They are free men—the rights of free men are theirs. Obey them as thy equals in intelligence, character and respectability. But duty and interest require you to regard their rights. They may demand, at a reasonable time, as much palatable and wholesome food as is needed to preserve unimpaired their health and strength. They may demand as many hours for rest and sleep as the human constitution ordinarily requires. They may demand comfortable beds, in rooms not unhealthful. They may refuse such excessive torts or great exposures as would prematurely break down the constitution. They may claim kindness and civility in all your language towards them, and in all your treatment of them. It is no part of their contract that they should listen to oaths and curses, should such things pass your lips. It is no part of the contract that they shall bear such mental suffering, as unreasonable reproaches, unprovoked fault-finders, or ungoverned passions on your part, may produce. Until they forfeit it by misconduct, they may claim your confidence that they will be faithful to you and to your interests. When found unfaithful, let the fault be stated, and a full mutual understanding be obtained. But it is bad, very bad for both employer and employed to be suspicious of each other. Mutual confidence is for the comfort and good of both.—"Every body knows eve-

ry thing;" and if you undertake to thrive by keeping laborers on a short allowance, by working them an excessive number of hours, by dint of scolding and fretting; by any secret artifices, they will read your heart's secret purpose, and will find ways and means to thwart you in the accomplishment of your designs. Impudence and injustice on the part of employers, create in part the mistrustworthiness complained of in the employed.

We may preach next to the employed—the hired.—N. E. Farmer.

From the (Nashville, Tenn.) Agriculturist.

Is the Tariff a Political Question?

There is not a more ignorant and vulgar notion in society, than that which declares partyism to claim protection in the sales of our own products. Can any one tell what party it was that lay so heavy a duty upon foreign cotton goods, twenty five years ago, as to enable Americans to make better fabrics at one-fourth the value of those imported? Can any one tell what party it was that taxed foreign books, iron, sugar, salt, &c.? Oh, says the pseudo politician, all parties contributed to these matters, for that was right. Very good; but it both the north and the south enjoy the benefits of, and simultaneously advocate measures to promote their respective interests, does it not show that protection is the wish of every American citizen? The question of party originates then, not from the thing itself, but from the manner of administering it. The north will never consent to a tariff which seems to favor the south, and the south will not agree to a system that will favor manufactures more than planters. But as every man is for promoting a system of protection that will favor his own interests, should it not be the study of all to fix such articles as would be the interest of every section of the country to do so? It does not seem that partisans have become so sensitive and fearful of shadows, that fear they will do wrong, they do nothing. Suppose the English make cotton to supply her own factories, and then bring a little for sale at a low rate to our own factories. The Southern will come forward and advocate a cotton tariff, but acting under the *Latibians*, he should have no fears. However, we think it would be right, even in this event, and it is a very probable one, to protect our own citizens. The old maxim, that "charity begins at home," is pretty nearly always correct. At present it's doubtful, the interest of every citizen of the United States to buy less foreign silk, and raise more at home. The best means of affecting these ends, in our judgment, is to lay a heavy tax on foreign silks, and give premiums to our citizens to produce both the raw material and manufactured articles. Some one may ask, if we can produce silks equal to others, and as cheap, why do we need protection? There are but few, as yet, acquainted with the business, and a certainty of getting something, if it is a small price, will be sure to induce many to embark in the business. Another reason is, before we become well acquainted with the feeding of worms, and man facturing wearables, for want of knowledge, we may expect to meet with unforeseen difficulties and sustain severe losses, and here our country's encouragement would cause the disappointed and dispirited to try it again, and continue effort after effort, till abundant success could be seen.

There is a certain training, or time of pupilage, essential to the success of any thing that is new, and the most watchful may expect to meet difficulties. There is but little doubt silk can be produced in this country, twenty years hence, at less than one half what it can be now. We well recollect in our boy-hood days, having to set up, on a "noding stool," at the late hours of night, "picking cotton"—it's consisted in pulling the fibra from the seed with the fingers, and if a man got enough in a week of nights to make himself shirt, he'd be very well; but see now what improvement has done! Instead of half pounds, we count bales. And a better article can now be produced at less than a fourth what it could twenty-five years ago. Should we not anticipate similar results for silk? Losses may be anticipated at first, but improvements in care, machinery, &c. will produce wonderful changes. Statesmen then become sensible, and the people gain enough of patriotic sense, to make their servants smile upon their labors. When the people come to understand their own interest, they will not address their members of Congress, or State Legislatures, as humble petitioners, but as sovereign lords of the land, whose commands must be obeyed, as the *Barzard* of being recalled. When the great mass get ripe for action, legislation will be favorable, not before. Let none be ashamed or afraid to talk of this matter, and teach it to both young and old, and the intelligence of the people will soon establish the silk culture

N. Y. State Bounty on Silk.

The bill to encourage the growth and manufacture of Silk, was passed by the Legislature a short time before its adjournment. We believe it was slightly amended, though not materially, but as it will be some time before it will be published by the State paper, and knowing the anxiety of many of our readers on the subject, we give it them this month as reported by the Assembly, and if any alterations were made by the Senate, we will mention them next month.

We first thought to omit all the preliminary remarks of the committee, but on examination we found them to contain so much important information and correct reasoning, that we felt unwilling to withhold them from our readers.

REPORT

Of the select committee on the bill entitled "An act to encourage the growth and manufacture of Silk."

[Committee to the Committee of the Whole.]

Mr. Ward, from the select committee to whom was referred the bill "to encourage the growth and manufacture of silk,"

REPORTS:

That your committee have had the subject under consideration, have collected many interesting facts in relation thereto, and submit the same for the consideration of the House.

Your committee are surprised to find how great a field is here open and how long it has been neglected. They are satisfied beyond a doubt, that we have the power to produce and manufacture silk in this State to an immense extent, and that no difficulty is to be encountered either from soil or climate.

In their investigations upon this subject, the committee hardly know whether they have been most surprised at the beneficial results which have eventually accrued to those nations or governments where the growth and manufacture of silk have been encouraged and brought to a state of comparative maturity, or at the inattention and apathy hitherto manifested in regard to this great interest in this country, by a people so pre-eminent for their spirit of enterprise, and unequalled in their ability and resources, whether mental or physical, for the adoption and the successful prosecution of any and every branch either of science or the arts, by which their wants may be supplied, their desires satisfied, and their independence of foreign labor and foreign ingenuity be fully achieved.

Your committee can attribute this reluctance or neglect on the part of the American people to embrace a subject of so much importance to themselves as the culture and manufacture of silk—an article which for years has ceased to be considered a luxury, and become one of daily and almost indispensable necessity—only to an ignorance which prevails of the great and increasing amount which their wants demand, the heavy tribute which they annually pay to foreign industry and foreign skill, and their want of a correct and general knowledge of the adaptation of the soil and climate to the growth, and our ability to manufacture silk, equal, if not superior, to that of any other nation on the globe.

According to the report of the Secretary of the Treasury, the value of silk imported into the United States in 1833 amounted to \$3,478,366; but had increased in 1836 to the enormous sum of \$22,980,212; while all our exports, except tobacco and cotton, amount to only about \$10,000,000 annually.

The nations of Europe and Asia, are generally engaged in the culture and manufacture of silk; and your committee are of opinion that, in order to a full understanding of the subject, a brief history of the rise, progress and final success of the culture of silk in those countries, should be given at this time.

The first knowledge that we have of the cultivation of the silk worm, and the manufacture of silk, was by the inhabitants of Serica, the northern part of Asia, from whence it derives its name.

More than 2,000 years before the Christian era, an emperor of China, desirous of rendering silk worms more extensively useful, collected them from the mulberry trees, and introduced them to the Imperial apartments. Thus sheltered and thus protected, they yielded silk superior in quality to that produced in the forests. She also taught in what manner to manufacture silk from the cocoon. This employment, although at first confined to ladies of the highest rank, gradually became general among all ranks in China.

As the manufacture increased, it became an article of exportation to neighboring countries, and finally became the great and inexhaustible source of wealth to China.

From China, it was exported to India, to Persia, to Arabia, and indeed to the whole of Asia. The expedition of Alexander to Persia and India, first introduced the knowledge of silk to the Greeks, 350 years before the Christian era. As in China, so also in Greece, India of the greatest distinction attended to the rearing of silk worms at their introduction there. For upwards of four centuries, the cultivation of silk was confined to the countries of Greece. Sicily and Naples were ignorant of the art, and its introduction into the rest of Italy was extremely slow.

At Rome, 630 years after the introduction of silk into Italy, a silk attire of purple, was accounted by an emperor, as a luxury too expensive for an emperor; its value being equal to that of gold, by weight. But so extensive is its culture at the present day throughout Italy, that two-thirds of their whole exports to all countries consists of silk.

Its first introduction into France was in 1491. But it is less than 240 years since its final and successful introduction into that country by Henry IV. That government has continued its fostering care, until silk and its manufacture has become the most productive source of the wealth of France.

In all countries the culture of silk has engaged the particular attention of governments, and every encouragement has been given to increase its culture, and with success. Yet in our own country, so highly favored in all respects by nature, the successful introduction of the silk culture, is mainly due to individual enterprise. Until recently, individuals have struggled single handed and alone in the cultivation of this article.

On a careful examination of the subject, your committee are of opinion that the period has fully arrived, when the policy of the State of New York should be directed towards encouraging, by every consideration, the growth and manufacture of this valuable product within our own territory.

A number of our sister States have thought it advisable to encourage the culture of silk, by legislative bounty for a limited period; and why should the Empire State be behind her sister States, in encouraging and fostering the benevolent enterprises of the day.

A State bounty of fifteen cents per pound on cocoons, and fifty cents per pound for reeled silk, continued for a few years, will induce farmers to engage extensively in the culture, and when once fairly established, we have no fears for the result. The State may then venture to leave the silk culture to rise on its own merits.

It is an employment in which all may engage. The rich, with honor and profit to himself and to his family; and the poor man can by its successful cultivation, place himself and family beyond the reach of poverty and want.

Silk can be raised to a much greater profit than wool, because three pounds of silk can be produced from the same land that would produce but one pound of wool, and the raw silk will sell for eighteen dollars, while the wool will sell but for fifty cents. The labor of raising silk is performed in six weeks, and may be performed by children or feeble persons, whose services would be worth but very little for any other purpose, while the labor of taking care of sheep and providing them with food lasts all the year; and a man with but little land, who has a family, can keep them employed at home, without the risk of sending them abroad for employment.

The cultivation of silk is an object more congenial with the domestic habits of the farming population, than almost any other of our household employments. And nothing can be said against the successful cultivation and manufacture of silk, but what was with equal propriety urged against the raising of cotton on its introduction into this country as an experiment, yet its success has been complete—triumphant.

Cotton was first raised in this country as an experiment in 1788, and although but fifty-three years have elapsed since its first introduction, we now manufacture annually from 45 to \$50,000,000 in value of cotton goods, and export of raw cotton more than \$60,000,000 in value annually. Such is the effect, and such the result, of well directed and properly protected domestic industry. Our success in the growth and manufacture of cotton encourages the belief that similar success will attend the growth and manufacture of silk.

The history of the past may be the history of the future. And we trust the time is not far distant when we shall see our wives and daughters arrayed in silk

of their own manufacture; when, instead of paying foreign nations \$20,000,000 annually for this article we shall export and receive back a sum of the same millions we have paid to others for this article of luxury.

Entertaining these views, your committee have examined the bill referred to them, and report the same with amendments.

AN ACT

TO ENCOURAGE THE GROWTH AND MANUFACTURE OF SILK

[As reported amended by the select committee.]

The people of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. To any person or persons residing in this State, who shall present for examination, to a justice of the peace of the city or town wherein such person or persons reside, a pound or more of good silk cocoons, or a pound or more of good, well reeled silk, and shall, by his, her or their oath or affirmation, or by the oath or affirmation, of some other credible person, prove to the satisfaction of such justice that the cocoons presented, were raised in the city or town where such justice resides, or that the silk was reeled in such city or town, and from cocoons raised in this State. The said justice having examined and caused the same to be weighed, shall give his official certificate specifying the number of pounds of cocoons or silk presented, the time when, and the place where the same was raised or reeled, and the names of the person or persons by whom the same was raised or reeled, together with the name of the person by whose oath or affirmation the facts have been verified. And on the presentation of any such certificate to a board of supervisors of the same county, they have examined and found the same to be duly given, shall audit and allow said certificate, and cause their allowance to be endorsed upon the same, requiring a treasurer of said county to pay to the bearer thereof a premium of fifteen cents for every pound of cocoons and fifty cents for every pound of reeled silk specified in said certificate.

§ 2. It shall be the duty of each county treasurer, whom such certificates thus audited and allowed shall be presented, to enter in a book kept by him for that purpose, the date of said certificates, the number of pounds of cocoons or reeled silk named therein, and the names of each person or persons for whose bene the same were given, and to endorse upon said certificates his acceptance thereof, and the time when presented to him, and return the same to the bearer thereof, to be presented for payment as hereinafter directed.

§ 3. On or before the first day of May, in each and every year, the several county treasurers of this State to whom shall have been presented for acceptance any such certificate or certificates as are specified in the preceding sections of this act, shall cause to be made an abstract or abstracts of all such certificates so presented and accepted; stating the number of pounds of cocoons or reeled silk, and the amount of premium due therefor, and shall transmit the same to the Comptroller of this State, who shall by his warrant, authorize and direct the Treasurer of the State to pay to the county treasurers the several amounts specified in the abstracts by them transmitted. And the said county treasurer shall thereupon proceed to pay the premium due upon the certificates by them respectively accepted, as the same shall be presented for payment.

§ 4. False swearing or affirming under this act shall be deemed perjury; and any fraud practiced under the same shall be a misdemeanor, and be severally punished as such.

§ 5. A justice of the peace shall be entitled to receive, for every certificate given by him, by virtue of this act, the sum of twenty-five cents, to be paid by the person receiving the certificate.

§ 6. This act shall continue in force until the first day of June, in the year eighteen hundred and forty-six, and no longer.

Liebig's Agricultural Chemistry.

We observe that an American edition of this work has just issued from the press, and such of our readers as are interested in agricultural science, will be richly repaid for its perusal.

The high character of the work may be inferred from the fact, that it was prepared by Prof. Liebig at the special request of the British Association for the advancement of Science; and the ability with which the task was performed is evident from the extracts we have seen.

The author has advanced some theories, which are overturned by able chemists of the day; and he appears also to have made some important discoveries.

His theory of the operation of gypsum is interesting, and altogether plausible. After having ascertained the existence of ammonia in rain, he was led to the following conclusion. "The nitrate of ammonia, contained in rain water, is deposited by gypsum in precisely the same manner as the manufacture of sal ammoniac. Soluble salts of ammonia and carbonate of lime are formed, this salt of ammonia, possessing no volatility, is frequently retained in the soil. All the gypsum usually disappears, but its action on the carbonate of ammonia [of the rain] continues as long as a trace of it exists."

The great mass of the opinions contained in the above, of course are not expected to be original with Liebig, although he has amplified them, and presented them in an interesting light; and we have not been surprised to see the Cultivator and New England Farmer, attribute to him discoveries and opinions in vegetable chemistry long ago; especially the useful explanation of the equilibrium maintained in the atmosphere by the combination of oxygen and carbon on the one hand, and the respiration of plants on the other, in the latter journal.

Ashes--An Important Suggestion.

Gypsum has been frequently observed by farmers, that on some soils, loses its efficacy, after several successive applications. The crop of grasses becomes very diminished, and the gypsum possesses no power to restore it. The following extract from the Cultivator, contains a most important suggestion, and the experiment is well worthy an accurate trial. The writer will bear in mind that potash is an important element in most vegetables, especially grasses.

"When we increase the crop of grass in a meadow of gypsum, we remove a greater quantity of potash, than can, under ordinary circumstances, be restored. Hence it happens, that after a few years, the crops of grass diminish on meadows manured with gypsum, owing to the deficiency of potash. But if the meadow be strewn from time to time with wood ashes, even with the heaviest, which have been used by soap-boilers, then the grasses flourish luxuriantly as before. The ashes are the means of restoring the potash."

Log Houses.

Our Editors--A log house in a newly settled country, has always struck me as exceeding good taste, and a rate domestic economy; although I have often heard sensible men and women remark that such a house would be "much better employed in hauling lumber to the saw mill with a view to a frame house, than in piling them up into such an unsightly dwelling."

Who ever heard of a first rate frame building in the first settlement of a country? Such houses are necessarily built of green stuff, by rude workmen, with a hasty constructed crazy foundation; so that much greater expense in the beginning, will come to be as worthless and more unsightly than a simple log cabin, and equally unfit for profit.

The man who first builds a log house has more respect in the premises, than may appear to the eye. In the first place, instead of exciting the jealousy or envy of his poor neighbors, they now all wish hearty good will to his aid, and his house is like Jonah's gourd, in a single day. He now has substance to build a barn and improve his land.

At his leisure he draws his logs to the mill, and covered the boards and scantling for a new

house. He barter off his surplus products as he can spare them, for brick, lime, nails, glass, &c. In the end he builds within his own means, a substantial house, which adds to the comfort of his family and the value of his farm.

When I see a rickety frame house standing on a farm badly fenced and worse improved, ten to one but the story is, that the proprietor sealed his ruin by the building of that house, before his acres were cleared and fenced to an extent necessary to enable him to afford it; that he is now in debt, discouraged, and compelled to employ that time in providing for his debts which is so much needed by his farm. S. W.

From the Journal of the American Silk Society Varieties of Silk Worms.

GIDEON B. SMITH, Esq.

Dear Sir--Since your favorable notice of my proposition to simplify the silk business by the adoption of simple names which shall be understood by all, I am induced to follow up the subject, reminding you at the same time, that I proposed that you should make any alterations in my classifications which you thought proper, and to show my readiness to take good advice, I shall henceforth adopt your classification, as follows:

- No. 1. Mirabel-Jaune or Large Nankin Pea-nuts.
- 2. Small Mirabel or Large White Pea-nuts.
- 3. Common Pea nut or Small White Pea-nuts.

As the other varieties are all inferior to those, which silk growers will learn sooner or later, and then discontinue the use of, I deem it of no importance by what names they are called.

In the mean time, I recommend all who wish to ascertain the precise value of each kind for themselves, to adopt the same experiments made by James Manney of Beaufort, N. C. in June, 1840--see Journal, vol. III. p. 10. The important part of this experiment is to learn how many worms will make 1 lb. reeled silk of the different varieties--not how many cocoons will fill a bushel--for, of course, a bushel of the smallest cocoons (the small pea-nut) will yield more silk than the oval sulphur, and so also in drawing comparison between the large pea-nuts and small pea nuts; the expense of feeding an equal number of worms, say 100,000, being equal--the question is not how many bushels each will make, or how many pounds each kind will weigh, but how much reeled silk will each 100,000 produce, after having been reared with equal care.--Mr. Manney's experiments show--1st. 8 oz. mammoth cocoons, in number 141, yielding 350 grs which is 3008 cocoons, or 10 lbs. 10 oz. for 1 lb. reeled silk; 2d. 8 oz. pure white pea-nut (whether large or small is not stated) in number 134, yielding 359 grs. which is 2866 cocoons, or 10 lbs. 11 oz. for 1 lb. reeled silk; 3d. 8 oz. mammoth sulphur cocoons, in number 145, yielding 327 grs. which is 3408 cocoons, or 11 lbs. 12 oz. for 1 lb. reeled silk.

Upon this basis it is easy for every silk grower to calculate for himself which is the most profitable kind of worms to feed, and weight of cocoons, to produce 100 lbs. reeled silk.

No. of Worms,	lbs. Cocoons.	
Mammoth White, 300-500	1,067	} for 100 lbs. reeled silk.
White Pea-nut, 2-6 600	1,069	
Mammoth Sulphur, 340-500	1,175	

If our friends will institute comparison the coming season, by carefully reeling, say 1,000 select cocoons of each variety of worms which they raise, and communicate the exact weight of silk produced from the same, to you for publication, the question will not then rest upon the opinion of one or two individuals, who may be interested in rearing a particular species of worms, but the facts will be ascertained from the whole silk-growing public, and again diffused through your Journal to those most interested in the subject.

I shall endeavor to experiment on your New Theory the present season--I shall not be able to do it as fully as you desire, but will frankly communicate the result of my experience. Truly, yours,

W. A. WOODWARD.

Uxton, April 10, 1841.

☞ Eggs of the large pea nut varieties, of Mr. Woodward's raising, can be obtained at the Rochester Seed Store, if applied for soon.

The most honorable, the most useful, the most independent of men, is the well informed farmer, who cultivates his own soil, and enjoys the advantages that health, competence and intelligence are sure to bestow.

To Destroy Rats and Mice.

We copy from the (London) Gardener's Chronicle:

"Monsieur Thenard in 1832, submitted to the Academy of Sciences, a plan for destroying noxious animals in their hiding places. The instrument of destruction is sulphuretted hydrogen gas, which is peculiarly destructive to animal life. Animals when allowed to breathe the pure gas, fall down as if struck with a bullet. Even when considerably diluted with atmospheric air, its effects are deadly. A horse dies in less than a minute in air containing 1/250 of this gas. A dog of moderate size is speedily killed in air containing only a thousand part of it, and a small bird expires in a few seconds in air possessing 1/1500 of sulphuretted hydrogen.

"M. Thenard's first trial was in an apartment infested by rats, which showed themselves occasionally during the day, and at night were actively engaged in plundering articles kept in the room. There were 13 rat-holes; and M. Thenard adapted to each of them in succession, retorts capable of containing half a pint, by introducing the beak, and filling up the interval round the neck with plaster. [The mixture will be mentioned below.] In a few minutes not a rat remained alive in the building.

"His next experiment was in an old abbey, when he was equally successful, and having opened part of the wall, he found numbers of dead rats. He recommends the application of this method to the destruction of moles, foxes, and all animals that cannot be extirpated by the usual means.

"Mix 4 parts of iron filings, or very small nails, or scrapings of iron, with 3 parts of flower of sulphur, and moisten it with 4 parts of boiling water, stirring it with a piece of wood. Add gradually afterwards 4 parts more of water, and introduce it into the retort. Pour upon the mixture, common oil of vitriol diluted with 5 times its quantity of water, and continue to add it gradually until the effervescence ceases."

These directions appear to us incomplete; and we wish to inquire of some practical chemist, how the operator is to avoid the ill effects of the gas, while he is pouring on the oil of vitriol? and while he is closing the rat holes round the retort? †

The following poem, by MARY HOWIT, we insert by the request of a fair friend, who justly observes it may be new to some of our readers, and cannot fail to excite feelings of gratitude towards that Being who provides so liberally for our pleasures as well as necessities.

The Use of Flowers.

God might have made the earth bring forth
Enough for great and small--
The oak tree and the cedar tree,
Without a flower at all.
He might have made enough, enough,
For every want of ours--
For luxury, medicine, and toil,
And yet have made no flowers.
The ore, within the mountain mine,
Requires none to grow,
Nor does it need the Lotus-flowers
To make the river flow.
The clouds might give abundant rain,
The nightly dews might fall,
And herb, that keepeth life in man,
Might yet have drunk them all.
Then wherefore wherefore were they made
All dyed in rainbow light,
All fashioned with supremest grace,
Up springing day and night:
Springing in valleys green and low,
And in the mountains high,
And in the silent wilderness,
Where no man passes by?
Our outward life requires them not,
Then wherefore had they birth?
To minister delight to man,
To beautify the earth:
To comfort man--to whisper hope,
Whene'er his face is dim,
For who so careth for the flowers,
Will much more care for him!

The first elements of wealth are obtained by labor from the earth and water.--Franklin

For the New Genessee Farmer.

Cheese Making.

Messrs. Editors.—Communications are occasionally made through your paper, giving the best method of making cheese from practical experiments.—As your journal is designed for a medium through which our farmers can interchange their views upon the various subjects connected with their high calling, I submit the following, if you think it worthy of occupying a corner of your Farmer.

The plan generally proposed by your correspondents, is to strain the milk in the tub over night, and warm it in the morning, carefully stirring in the cream. Mr. A. F. Bill, in the October number of the *New Genessee Farmer*, says,—"In the morning take off the cream with a skimmer and put it in a vessel by itself; then warm the milk, or a part of it, over a slow fire till about blood heat; then pour in the cream, and stir it moderately till there are no particles to be seen floating upon the surface."

It seems to me evident, that when the cream is once separated from the milk, it can never be so thoroughly incorporated with it again, as to set the milk as soon as taken from the cow.

Our method is this: Immediately after the cows are milked at night, (and the quicker the operation is performed the better,) we strain it into the cheese tub and put in the rennet—as the milk when it first comes from the cow is in precisely the right temperature to set. If the rennet is good, and properly prepared, a large table spoonful is sufficient for a pailful of milk. The tub should then be covered with a cloth, and allowed to stand undisturbed—in about 40 minutes it will coagulate. It is then carefully cut, the tub again covered and left to stand till morning. When the tub is wanted for the morning's milk, the night's curd is dipped into the cheese basket, or cheese sink, to drain, and the morning's milk strained into the same tub. The rennet is then put on, going through the same process as with the night's milk. When sufficiently drained, the two curds are ready to be put together, scalded and salted according to the discretion of the maker.

Those who have had the least experience in the management of milk, must know that warming it after it has once coagulated, gives it a tendency to sour the quicker. Any person who will take the trouble to try the experiment, will find that curd made from milk warm from the cow, will keep *sweet* much longer than that which has been warmed over the fire; and, besides this, it saves the time and trouble of *skimming* and *warming*. Nothing will make a good cheese maker assume a beligerent attitude so quick, as to see the skimmer flourished over the cheese tub.

From a long experience in a modern sized dairy, I am persuaded that in no way can so much, or cheese of so good quality be made, as to set the milk wide warm from the cow.

Yours,

E. BISHOP.

Attica, Genessee co. April, 1841.

P. S.—While upon a subject connected with cows, let me suggest to your correspondents who occasionally send you the quantity of milk given by a particular cow, to give it in *pounds*, and not in *quarts*. It can be done much easier, and with greater accuracy; and not only so, but in the latter case it is too often *guessed at*, or measured, froth and all, in brimmed and tapered quart measures.

For the New Genessee Farmer.

Cure for Murrain.

Messrs. Editors.—I have seen several inquiries respecting the murrain in cattle, and being in possession of a recipe which in nine cases out of ten, has proved successful in curing the same, I herewith send

to you, in hopes that if you give it publicity, it may be of some benefit to those who are yearly losing many of their cattle.

RECIPE.—Give 1½ oz. pearl ash, dissolved in 2 qts of iron-water, from black-smith's trough. If not better in 5 hours, give ½ an oz. more in 1 qt. water. The water should be warm. Give no drink but warm water, for two days. Give warm mash to eat.

The person from whom I got the recipe has cured a great many cattle in this vicinity, at one dollar per head, and a fed \$10 for the recipe. I take this mode of making it as public as possible.

Yours truly,

THOMAS FORSYTH.

Chatham, Canada, April 10, 1841.

Leached Ashes as a Manure.

Leached or drawn ashes possess a highly beneficial effect, particularly when applied to lands deficient in calcareous matters, as lime or marl. They serve to improve the permanent texture of such soils. The ashes from the soap boilers of London yield 90 parts in 100 of calcareous matter. They serve to free light lands of sorrel, and in swampy lands they effectually destroyed rushes and other aquatic weeds. They are extensively used on the light sands upon the Atlantic coast, and are bought up at a shilling a bushel, in the towns and cities upon our navigable waters, and transported thither. There are immense quantities of these ashes in the interior, on the shores of old rivers, which may be employed to great advantage to agriculture, whenever the agriculturists of frontier districts had time and disposition to arrest the deterioration of their lands. The small quantity of alkaline salt and gypsum which they contain, also, renders them much superior to common calcareous matter as a top dressing for every kind of grass. Soapboilers' ashes, according to the "*Complete Grazier*," are also excellent on peat moss, in strong cold soils, when applied in the quantity of two or three cart loads an acre. In Lancashire, they have been found good and durable on dry pastures, and have also been successfully used in other parts, and in various proportions. They are generally considered better for pasture than arable, and crops of clover hay have been more than doubled by them. The effect of this manure is, that it *always destroys weeds and cures up every kind*. Evidence of these latter facts may be found in communications to the British Board of Agriculture, vol. vi. part ii.—*Cultivator*.

Make your own Measures.

We give below a rule by which every one can easily make his own measures.

A barrel contains 10,752 cubic inches. A box 24 inches long, by 15 inches wide, and 28 inches deep, will hold just a barrel.

A half barrel. Make a box for this 24 inches by 16, and 14 inches deep. This will contain 5,376 cubic inches, or just half a barrel.

A bushel. This has 2,150 4-10 cubic inches. A bushel box will be 16 inches by 16 8-10 inches square, and 8 inches deep.

Half bushel. A box 12 inches long by 11 2-10 inches wide, and 8 deep, will hold just half a bushel.

Peck. A box 8 inches by 8 4-10 inches square, and 8 inches deep, is a peck.

Half a peck is 8 inches square and 4 2-10 inches deep, or 268 8-10 cubic inches.

A half gallon. This contains 131 4-10 cubic inches. A box 7 inches by 4 8-10 inches deep, has just that quantity.

Quart. 4 inches by 4 inches 4-10 deep.—*Ball's Farmer*.

Agricultural Ranks of the several States.

It seems from a recent statistical statement, that the rank of the several States in agricultural productions, is as follows:

- In Wheat—1st, Ohio; 2d, Virginia; 3d, New York.
- In Indian Corn—1st, Tennessee; 2d, Virginia; 3d, Ohio.
- The results in Kentucky are not given. It is possible she might be second or third.
- In Potatoes—1st, New York; 2d, Maine; 3d, Pennsylvania.
- In Cotton—1st, Mississippi; 2d, Alabama; 3d, Georgia.
- In Tobacco—1st, Tennessee; 2d, Maryland; 3d, Virginia.

In Wool—1st, New York; 2d, Ohio; 3d, Vermont or In Swine—1st, Tennessee; 2d, Ohio; 3d, Kentucky, probably.

In Lumber—1st, New York; 2d, Maine.

Louisiana, of course, in sea the most Sugar. B there are immense quantities of maple or count sugar, made in New York, Ohio, and other States.

Looking at the above rank of the leading States, eight of the principal articles of agricultural production, some enormous facts may be noticed. First: All the States in the Union, that which probably he and admits of future, the *most curious production* (not the greatest aggregate,) is *TEXAS*. The reason of this will be obvious from an inspection of the map. The State embraces both northern and southern productions, the most fertile land, and the most abundant mineral resources.

Secondly: The State capable of sustaining the *largest productions*, is OHIO. This is obvious from its position in reference to Wheat, Corn, Hogs, Wood and many other productions which are essential to the sustenance of human life.

Thirdly: The State which at this time produces most in aggregate value, is New York. This is owing to the combination of capital, experience, and population.

Looking to the means of sustaining a very great population, Ohio stands ahead of every other State and it is this great fact, united with powerful means, which has given it such an extraordinary growth. Fertile, alluvial lands have, over the whole, been the seat of the densest population; the most flourishing empires—*Cincinnati Chron.*

An Act to Promote Agriculture.

[Passed May 5, 1841.]

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

§1. The sum of eight thousand dollars per annum shall be and hereby is appropriated for the term five years, for the promotion of agriculture and household manufactures in this State, in the manner following, to wit:

- To the county of Albany, the sum of two hundred and five dollars.
- Allegheny, one hundred and twenty-three dollars.
- Broomfield, sixty-seven dollars.
- Cattaraugus, eighty-six dollars.
- Cayuga, one hundred and fifty-one dollars.
- Chemung, one hundred and forty-three dollars.
- Chemung, sixty-two dollars.
- Chemung, one hundred and twenty-two dollars.
- Columbia, one hundred and thirty-three dollars.
- Columbia, seventy-five dollars.
- Delaware, one hundred and six dollars.
- Dutchess, one hundred and fifty-seven dollars.
- Erie, one hundred and eighty-six dollars.
- Essex, seventy-one dollars.
- Franklin, fifty dollars.
- Fulton and Hamilton, sixty dollars.
- Genesee, one hundred and seventy-nine dollars.
- Greene, ninety-one dollars.
- Herkimer, one hundred and twelve dollars.
- Jefferson, one hundred and eighty-three dollars.
- Kings, one hundred and forty-three dollars.
- Lewis, fifty-three dollars.
- Livingston, one hundred and seventeen dollars.
- Madison, one hundred and twenty dollars.
- Montauk, one hundred and ninety-four dollars.
- Montgomery, one hundred and seven dollars.
- New York, nine hundred and fifty dollars.

- Orange, one hundred and fifty-two dollars.
- Oswego, one hundred and thirty-one dollars.
- Oswego, one hundred and thirty-eight dollars.
- Potomac, thirty-eight dollars.
- Queens, ninety-one dollars.
- Rensselaer, one hundred and eighty dollars.
- Richmond, thirty-four dollars.
- Rochester, thirty-six dollars.
- Saratoga, one hundred and twenty-one dollars.
- Schenectady, fifty-one dollars.
- Schoharie, ninety-seven dollars.
- Schenectady, seventy-four dollars.
- Steuben, one hundred and thirty-eight dollars.
- St. Lawrence, one hundred and seventy dollars.
- Suffolk, ninety-seven dollars.
- Sullivan, forty-seven dollars.

Tioga, sixty-one dollars.
 Tompkins, one hundred and fourteen dollars.
 Ulster, one hundred and thirty-seven dollars.
 Warren, forty dollars.
 Washington, one hundred and twenty-three dollars.
 Wayne, one hundred and twenty six dollars.
 Westchester, one hundred and forty-six dollars.
 Yates, sixty-one dollars.

And to the New York State Agricultural Society, ten hundred dollars.

§2. When the New York State Agricultural Society, and any county agricultural society now formed, which may hereafter be formed in this State, or the American Institute in the city of New York, shall be by voluntary subscription any sum of money, the president and treasurer shall make an affidavit of the facts of the formation of such society, and of the sum raised a certain sum, specifying the amount thereof, which affidavit shall be filed with the comptroller of this State, who shall draw his warrant on the treasurer for a sum equal to the amount of such voluntary subscription, not however exceeding the amount which such county or State society would be entitled, according to the appointment aforesaid.

§. The New York State Agricultural Society and several county agricultural societies now formed or to be formed in this State, during the continuance of this act, shall annually elect such and so many officers as they shall deem proper; and it shall be the duty of such officers annually, to regulate and promote in such articles, productions and improvements, as they may deem best calculated to promote the agricultural and household manufacturing interests of this State, having especial reference to the profits which accrue, or are likely to accrue, from the mode of raising the crop or stock, or the fabrication of the article thus offered, with the intention that a reward shall be given for the most economical or profitable mode of competition; provided always that no premium shall be delivered, the person claiming the same, or to whom the same may be awarded, shall deliver in writing to the president of the county, as accurate a description of the process of preparing the soil, including the quantity and quality of manure applied, and in raising the crop, or feeding the animal, as may be; and also of the expense and product of the crop, or of its increase in value of the animal, in the view of showing accurately the profit of cultivating the crop, or feeding or fattening the animal.

4. The president of the State Agricultural Society, the several presidents of the said county societies, shall receive or expend any of the moneys hereby appropriated, shall annually, in the month of December, transmit to the comptroller, a detailed account of expenditure of all the moneys which shall come into their hands under this act, and stating to whom, for what purpose paid, with the vouchers thereof; the said presidents of the several county agricultural societies shall, annually transmit in the month of December, to the Executive Committee of the New York Agricultural Society, all such reports or returns as they are required to demand and receive from accountants for premiums, together with an abstract of the proceedings through the year.

5. The Executive committee of the New York State Agricultural Society shall examine all reports and returns made by the presidents of the county agricultural societies, and condense, arrange, and report the same, together with a statement of their own proceedings, to the Secretary of State, in the month of January in each year.

6. The presidents of the several county societies, delegates to be chosen annually by them for the purpose, shall be ex officio members of the New York State Agricultural Society.

7. It shall be the duty of the county clerks in the several counties of this State, to cause notice to be given in one or more newspapers in each county, of the time and place of a meeting to be held in such county for the purpose of organizing such county agricultural society; and notice thereof shall be given at least four weeks previous to such meeting.

8. This act shall take effect immediately.

State of New York,) This act having been approved by the Secretary of State, and signed by the Governor on the 5th of May, 1841, I do hereby certify that the same became a law on that day.

JOHN C. SPENCER,
 Secretary of State.

Flowers and their Colors.

I have observed that the flowers of sweet flowers which have a copious or loose-stone buds, may be benefited by a knowledge of the fact, that disintegration of silica or sand, if not essential to the formation of

the aroma of flowers, certainly promotes it, and renders it more abundant and delicate. Flowers of the richest perfume are the natives of sandy lands—Paris, Arabia, and the southern shores of the Mediterranean. Roses, Violets, Lemnons or Homysuckles, &c., in pots, should be supplied with a considerable portion of sand; and those growing in gardens and pleasure grounds also. In many indigenous plants which are destitute of bark, the stem or culm is strengthened by silica, taken up by the sponges or elaborated by the organ of the plant from its elements. Analysis detects it in considerable quantities even in the stalks of wheat and Indian corn; and I believe in all the grasses, &c. flowers of which are aromatic. In line to think, too, that in the rich calcareous lands of the west, away from the sandy alluvial soils of the rivers, grapes will be rendered of better body and will give wine of a superior quality, if sand, (instead of manure, when the land is rich,) be mingled with the soil; and I should for these prefer even gravel to fine sand. I am not aware that the experiment has been made in regard to the grape, but it is worth a trial, if analogies are good indices.

Very truly sir,
 your obt. serv't.
 JOHN LEWIS.

H'es. Far. & Gar.]

To the Ladies.

In our last, we promised to give some hints respecting the laying out and arranging ornamental grounds, for those in moderate circumstances. If persons cannot afford to keep a gardener, and have not much leisure to give it themselves, they had better not undertake with the more delicate species of shrubbery or flowers, however tempted by their beauty; but select such kinds as will thrive and make the most show, with the least care and attention. The whole tribe of roses, with some few exceptions, are of this description. They are easy to be obtained, increase rapidly, and though well repaying a careful cultivation, will still flourish and bloom under almost entire neglect—among these we will mention the Ohio Multiflora, a flower indigenous with us; and though a rustic belle, scarce exceeded in beauty by her more cultivated sisters of the name. It will grow either from cuttings or seeds, and so rapidly as in a short time to overtop the trouble of setting it. The same is true of the fragrant sweet briar—a delightful ornament, and yet so hardy as to be almost regardless of soil or of cultivation. The scarlet trumpet creeper (we won't trouble you with the long names of flowers) is a plant that abounds along our high-ways and hedges; very showy, and so rapid of increase as to be a terror to farmers. It answers a fine purpose for overgrowing and concealing unsightly spots about your premises, and for planting on the north side of houses, where more delicate shrubbery often languishes. The various species of honeysuckle are also very easy to be obtained, as they will all grow from cuttings and take care of themselves with very little attention of yours.

It is well for you, if you intend to keep shrubbery, to have a little nursery of your slips and cuttings in some shady nook; where you can weed, water, and tend them all together. Do not crowd them so close that they will not have room to grow, for sometime before you remove them. Very young slips, or shrubbery, planted here and there along borders, requiring twice the time and care, besides being liable to many accidents. Choose, if possible, a spot where your young proteges may have the morning sun, but be sheltered from the heat of the afternoon of the day. Cut your slips just below a bud,—for a very bud contains the rudiments of a root. In this way you may raise all kinds of roses, altho, honeysuckles, all the varieties of lilac, serings, and flowering almonds, with very little time, trouble, or expense. The best time for setting out such a nursery, is in the early part of the spring, when showers are frequent. Slips set after this time require but more care and trouble.

But the department of the garden on which you may rely most for elegance, variety, and constant succession, is undoubtedly the annuals.

In regard to the raising of these, it is best to plant them together in a sort of nursery—designating the kind by labels. This bed you can protect with bushes or wood from the ravages of domestic fowls, and other invaders of flower borders. This bed should be in a dry and warm situation; for the long rains which occur in the spring of the year often & cruelly damage and retard the growth of early planted seeds. If the season be dry, you can water the seeds occasionally at evening, for moisture, as well as heat, is indispensable to germination. When the seeds are up, and before the roots have time to strike deep, remove them in little bunches with a transplanting trowel—taking care to have the earth well around the roots. Transplant,

if possible, when the skies give promise of a shower—but if your plants come to a proper state for removal, and the skies do not seem disposed to accommodate you, transplant in the evening; water and protect them for a day or two from the heat, by covering a flower pot over them, leaving it off at night for the benefit of the dew.

In planting annuals it is a common mistake to set too many in a bunch. Putting a four or five plants so set together, and the consequence is that all are so small and puny. After your plants begin to creep up themselves, weed out the more slender ones, and leave only one or two in a bunch. Plant your different bunches at a very good distance from each other, with reference to the space which they will occupy. Thus we have seen a thirty double bellini, in good ground, spread over the face of more than two feet all around. In many borders the flowers are crowded, and the general effect of them much injured, by not calculating beforehand the growth of each species. Flowers should be set, too, with regard to the effect of their colors in a border, with as much care as you would arrange them in a bouquet. Pale and delicate flowers should be enlivened by bright ones; and gay bright colors relieved by rich blues. Thus the dark maroon tints of the carnations, or the deep blue of the larkspur, contrast finely with the golden tints of the cornicopsis or marigold.

In the department of creepers there are many annuals capable of producing sudden and beautiful effects. While your honeysuckles and roses, &c. are in training, you can produce an immediate and very beautiful substitute in the rear of them, purple pans, and the variegated convolvulus, and many other annuals of the kind. In the garden of Mr. Jackson, near the Clevelot, may be seen seven or eight varieties of creepers, extremely beautiful and rare, and some of them possess a freedom and rapidity of growth, that renders them worthy the attention of those who wish to witness some immediate results from their horticultural efforts. Some of these grow from seeds, and others from roots, which increase very rapidly. We recommend all our fair friends who wish to procure something rare and beautiful in this department, to examine his collection.

If, after reading these few lines, any of your readers say, "after all, this raising of flowers is going to be too much trouble!" We say to them—only try it—get your husband or brother, or hire one of our men to lay you out a border and begin; and if you do not find after a time, that nothing seems to be trouble that is done with a willing mind, we are much mistaken.—
H'es. Far. & Gardener. H. E. B. S.

Modesty.

Who shall win the prize? There was a meeting of the flowers, and the judge was appointed to award the prize of beauty. "Who shall win the prize?" asks the rose, proudly stepping forward in blushing beauty, with full assurance of its winning worth. "Who shall win the prize?" asks the rest of the flowers as they come forward, each conscious of its attractions, and each equally sure of receiving the award. "I will take a peep at the assemblage," thought the violet, not intending to make one of the company, "and see the beauties as they pass." Just as it was raising its modest head from its humble and retiring corner, and was looking in upon the meeting, the judge came to render his decree. To the violet, says he, I award the prize of beauty, for there is no that more rare, none more exorbitantly beautiful, than—*Modesty.*

Time.

It is a truism that time passes rapidly away. The wheel is constantly revolving, and carries with it our griefs and our joys—and finally life itself. The time cuts rope and Time with a iron lock, to show that it should be seized without delay, and that if once lost, it cannot be secured. The duration of a man's life should not be estimated by his years, but by what he has accomplished—by the uses which he has made of care and opportunity. The industrious man lives longer than the drone—and by musing our body to exercise and activity—we shall more than double the years of our existence.

"The hundreds of idle young men scattered throughout the country, and longing about in our large towns, furnish indisputable evidence that many of the rising generation are contracting habits which, in after life, must create a large amount of sorrow and wretchedness. Labor is not respected, it should be, and the consequence is, that idleness, the price of idleness, and poverty, pluckily and wretched, that of cheerfulness and content."

Letter from Annette. (AN EXTRACT.)

Messrs. Editors— I am pleased to observe that you do not forget your female readers, although they seem greatly to neglect you. It is a pity that my friend FANNY, and others of the sisterhood, who have the ability, should be so unwilling to "let their lights shine." Such talents should not be hid in a napkin, when their proper exercise would be productive of so much good.

I have read the articles of "D. C." on the Education of Farmers' Children, with great satisfaction; and I sincerely wish they could be read by every parent in the land. The subject is one of great magnitude, and the writer treats it with a masterly hand. I hope he will not leave it till he has exhibited all its bearings, exposed the numerous evils which exist, and pointed out the remedy.

I heartily congratulate you, Messrs. Editors, on the success of your noble enterprise. I am fully convinced that the New Genesee Farmer is destined to exert a most powerful influence on the farming community, the good effect of which will be manifested throughout succeeding ages. The arrival of your monthly messenger is always looked for with anxiety, and greeted with a hearty welcome by the inhabitants of maple grove; and should its editors chance to roam as far as our shady retreat, they may rely upon a most cordial reception. I am sorry to hear of Mr. Bateham's ill health—hope it is nothing serious. Why does he not relax himself awhile, and take a ramble among his numerous friends in the country, at this delightful season? He could thus better acquaint himself with the wants and feelings of his patrons, and observe whether they profit by the instructions they receive.

Very respectfully, ANNETTE.

Maple Grove, May, 1841.

REMARKS—Now, Annette, just "cease your fanning," the last paragraph of the above is too provokingly irritating to be patiently endured, although clothed in so much kindness. "Roam as far as your shady retreat," forsooth, when you know full well we have been puzzled in vain these twelve months to find out its location!

Mr. B. intends to spend some time in the country, as soon as circumstances will permit; and if Annette will make known her true locus habitations, he will not fail to visit the shady grove. (If his surmises are correct however, the journey will not be a very lengthy one!)—Eds.

An Inquiry from Michigan.

Messrs. Editor—Can you send me the first volume of the New Genesee Farmer? I find that had I commenced taking your paper a year ago, I should have saved by the means more than a hundred times its cost. I am convinced that however small a farm or in any cultivator, even if not more than half an acre, an agricultural paper may be of immense advantage to him—each number worth the cost of the volume.

Respectfully yours, A. C. H.

We can still furnish vol. I.—E's.

Eastern Ploughs.—One of Howard's celebrated early draught ploughs, and one of Protry & Meers' (small sized) do. for sale at the Seed Store.

Rochester, Monday, }
June 1, 1841.

MONEY MARKET.

Table with columns for par, N. England Bank Notes, par, dis. and various locations like Eastern Draft, Pennsylvania, Ohio, Maryland, and Susquehanna.

The Money Market is rather easier now than it has been for some time past. This is owing partly to the passage of the Appropriation Bill, which will give relief to the Banks which were largely in advance to contractors on the public works.

NEW YORK MARKET—May 27.

Corn and Meat.—The arrivals of Western continue to be comparatively light, and the market is very firm. Southern is also scarce and a favorite. We quote Genesee at 4 1/4 to 4 1/2; Georgetown and Howard at 4 1/2 to 5 00; Ohio and Michigan 4 1/4; Richmond City Mills 4 2/3. Brandywine Corn Meal is a favorite—this is 11 63, 8 1/2 to 9 00.

GRAIN.—The supplies of all descriptions are light, and the prices are considerably enhanced. Northern Corn has sold at 61 to 65; weight; Southern do 59. Rye very scarce; 57 to 60 demanded. Southern Oats 37; Northern do 35 to 41. SALT.—Some demand for Clover for export at 7 to 7 1/2; Timothy \$16 to \$19 per ton. At Philadelphia Flour has advanced to 55. Penn white Wheat 109; Rye 60; Southern Rye 51 to 52; Penn round Corn 60; Southern yellow do 57 to 58; white do 51 to 53—Oats 37 to 40. At Baltimore Flour has advanced 25. Howard-st. 5 7/8; supply light. City Mills 5 00; small stock. Susquehanna 5 1/2; light sock. Penn red Wheat 1 to 1 1/2; M1 Wheat 1 1/2; M1 white Corn 50 to 54; yellow do 50; Penn Rye 62; Md do 57; Md Oats 37 to 40. At Cincinnati Flour has improved to 3 to 4.

ENGLAND.

LONDON CORN EXCHANGE, May 3.—At our market this morning we had moderate fresh supplies of English wheat. The announcement made by Lord John Russell in the House of Commons on Friday last regarding the corn laws, although it is allowed that the present government is too weak to carry any measure they may propose on the subject, had the effect of rendering the trade dull this morning, and with a continuance of very fine weather a decline of 1 from 1s. to 2s. per qr. had to be submitted to both on English and foreign wheat, and even at this reduction sales were low. In flour, no change occurred.

Errata.

Page 66, col. 3, line 9 from bottom, for "plant" read plan. Page 67, col. 1, line 11 from bottom, for "so" read as. Page 71, col. 1, line 10 from bottom, for "uplifted" read uplifting. Page 75, col. 2, line 1, from bottom, after the word "year" exchange the semi colon. Page 75, col. 2, line 11, from bottom, for "Cayuga," read Cayuga county. Page 75, col. 2, line 16 from bottom, for "lightning" read lightning's.

RUTA BAGA AND TURNIP SEEDS.

A full and choice assortment of Ruta Baga and other Turnip Seeds, are now on the way from England, and will in a few days be received at the Rochester Seed Store.

BATEHAM & CROSMAN.

June 1, 1841

THE THOROUGH BRED HORSE YOUNG HENRY.

THE PUBLIC are informed that the above thorough bred Horse, raised by H. Woolsey, Long Island, and now owned by the subscriber, will stand at O. Culver's, Brighton, Monroe Co., and will be let to mares at fifteen dollars the season. Enclosed a good pasture will be provided, and all possible care and attention will be paid to mares brought from a distance and left with the horse; but no responsibility for accidents or escapes, should any occur.

Pedigree.

Young Henry was got by Henry, the competitor of Eclipse, out of Sandhill, by Eclipse. Young Henry is now 7 years old on the 4th of June next: he is a splendid figure, with his points finely developed; he is a dark sorrel, and somewhat over 16 hands high. For further particulars, apply to OLIVER CULVER.

Brighton, Monroe Co., N. Y., May 20, 1841.

THE THOROUGH BRED HORSE, FLORIZEL.

FOR the information of those who may wish the stock of this celebrated horse, notice is hereby given, that he will stand for mares the ensuing season, at the stable of H. V. Weed, Genesee; and also at the stable of the subscriber, in Gowland, where pasture will be provided, and attention paid to mares from a distance. C. H. CARROLL. May 15, 1841.

SILK WORM EGGS.

LARGE White Peanut, and large Nankin Peanut eggs: (the Siva Mirabel, and Mirabel-pune, of the French) and the common Sulphur varieties, are for sale at the Seed Store, by BATEHAM & CROSMAN. Rochester, April 1, 1841.

A FARM & COUNTRY SEAT FOR SALE.

A FIRST RATE Farm, with new Buildings and Fence, is situated only one and three-fourths of a mile from Rochester Post Office, on the Stage Road leading from Monroe-street, east.

The Farm contains Fifty Acres of Excellent Land, most of which is in a high state of cultivation, a Two Store House, with a Wing and Columns in front, good Barn, a Garage House, &c., about 300 Bearing Fruit Trees of various kinds, good Water and Wood. Mares or less Land can be had with the Buildings, if desired. A fine Horticultural Garden is now in progress adjoining said Farm.

This property is worthy the attention of a purchaser, either for farming purposes, or a pleasant place of residence, being near a good market, good schools and a Seminary.

For further particulars, please apply at the house on said farm, or address, post paid.

C. INGERSOLL.

Rochester Post Office, N. Y.

Brighton, May 1, 1841

THE IMPORTED HORSE "ALFRED,"

Will stand this season, commencing on the 12th of May, at the stable of Mr. Rodney Russell, adjoining the old Norton Farm, East Bloomfield, Ontario co., as follows, viz: From Wednesday, May 12th, to Tuesday, May 14th; on a Wednesday, May 20th, to Tuesday, June 1st; from Wednesday, June 4th, to Tuesday, June 15th; from Wednesday, June 22d, to Thursday, June 26th; from Wednesday, July 7th, to Tuesday, July 13th; and at Mr. G. Forden's, near Geneva, the entire five times.—TERMS, the same as last season. Rochester, April, 1841. THOMAS WEDDLE.

The Imported English Horse, "Emigrant,"

Will stand for Mares the ensuing season, at the barn of Mr. C. Ashton, in Shelby, one mile west and half a mile south from Medina, Orleans Co., where he has stood the two last seasons.

It is but just to say that he is not probably surpassed by any horse in Western New York. Good judges who were at the Fair in Rochester, last fall, think that if he had been there he would have taken the premium without any doubt. His stock is right—just the thing for farmers and the market. Gentlemen who wish to raise good horses will do well to call and see.—He is extensively known in Livingston county.

T. H. ASHTON, J. SHERWOOD, R. L. CHASE.

Medina, Orleans Co., March 9, 1841.

ROCHESTER SEED STORE—1841.

BATEHAM & CROSMAN, the proprietors of this well known establishment, respectfully inform the public that they have now on hand a general assortment of superior English and American SEEDS of the growth of 1840, and other articles in their line of business.

For the FARM—choice varieties of Corn, Grain, Grass Clover, &c., and seeds for Root Crops, such as Mangel Wurzel, Sugar Beet, Carrot, Ruta Baga, English Turnip, &c.

For the GARDEN—all the most valuable and approved kinds of esculent Vegetable SEEDS. Those which grow in greater perfection in Europe, are annually imported from England;—such as the different varieties of Cabbage, Cauliflower, Broccoli, Radish, Turnip &c. Onion seed is obtained from Wethersfield, and other articles are raised for the establishment with great care.

FLOWER SEEDS—about 200 varieties of the most beautiful and interesting kinds.—(Price 50 cents per doz. papers.

ROOTS AND PLANTS—Choice kinds of Potatoes, Asparagus and Pie-plant roots, Cabbage, Cauliflower and other plants in their season.

TOOLS AND IMPLEMENTS, of various kinds, for the Farm and Garden. And a large collection of valuable BOOKS on subjects connected with farming and gardening, silk culture, &c.

SILK WORM EGGS—of different kinds, on hand in the season.

CATALOGUES gratis on application. Merchants supplied with seeds at wholesale, on liberal terms. Order from a distance containing a remittance, or good city reference, will receive attention.

BATEHAM & CROSMAN.

Arcade Hall, Rochester, April 1, 1841.

ROCHESTER PRICES CURRENT.

CORRECTED FOR

THE NEW GENESEE FARMER, JUNE 1, 1841.

Table listing prices for various commodities: WHEAT, CORN, OATS, BARLEY, RYE, BEANS, POTATOES, APPLES, CIDER, FLOUR, SALT, PORK, BEEF, POULTRY, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, PEARL ASHES, POT, WOOL, HAY, GRASS SEED, CLOVER, FLAX, PLASTER.

We have made several alterations in our table of produce since our last.

Wheat is now up to seven shillings and seven and three fourths the supply is very small.

Oats are also in good demand at thirty-one cents. Butter and Eggs are eagerly sought after at quoted price. The Produce Market is not very brisk at present.

THE NEW GENESEE FARMER

AND GARDENER'S JOURNAL

B. BATEHAM, } VOL. 2. ROCHESTER, JULY, 1844. NO. 7. } JOHN J. THOMAS,
 F. CROSMAN, Proprietors. } M. B. BATEHAM, Editors.

PUBLISHED MONTHLY.
TERMS,
 FIFTY CENTS, per year, payable always in advance. Post Masters, Agents, and others, sending money free of charge, will receive *seven* copies for \$3.—*Twelve* copies for \$4.—*Twenty-five* copies for \$10.
 The postage of this paper is only one cent to any place within this State, and one and a half cents to any part of the United States.
 Address BATEHAM & CROSMAN, Rochester, N. Y.

CONTENTS OF THIS NUMBER.

Publishers' Notices—Harvesting and Thrashing Machines. A New Oil Plant—*Madia sativa*. The Striped Bug. Farmers, don't sell your Ashes. Clarifying Maple Sugar with Indian Meal. 97

Cure of the Locality of the Canker Worm. Best Method of Improving New Farms. Culture and Use of Millet. 98

Agricultural Societies—The "Act to Promote Agriculture." Sheep Poisoned by the Red Cherry. 99

Presences on Plum Trees. Rust on Wheat. "S. W." and the Corn Laws. Rotation of Crops. Root Culture. 100

Draining level land in Broad Ridges. Locust Tree Insect. American Society of Agriculture. New varieties of Turnip Seeds. 101

The Show and Fair of the N. Y. Agricultural Society—List of Premiums, &c. Complementary Colors. The Feltows in Peach Trees. 102

Irony. Farmers and Mechanics. How to Eradicate the French Honey. Inquiry—Postage. 103

Prize and Expectations. Downing's Landscape Gardening. Acknowledgments. Scarcity of Fodder—Seasonable Hints. Sale of Berkshire. The Deanston (Seotch) Sulphur Plough, (with cut.) 104

C. H. Bedford Ox, (with cut.) The New England Farmer—Hay Making. 105

Parasites. Disease of Silk Worms—The Muscardine, living Bee. 106

Journal of the American Institute. To prevent Fence posts from Heaving. Fat Cattle. Proper Season for cutting Grain. Application of Lime to soils. 107

Flowers of Summer. Spurious Ruta Baga Seed. 108

Weather—the Crops—Harvest Prospects. Sowing corn for Fodder. Killing Rats. 109

Best Trees in the West. The Fruits of the Soil. The Silk Business in Pennsylvania. Protection against rrouk. The Duty to Labor. 110

Merion Woolen Factory. Devon Cattle. Monroe Co. g. So. Markets. Avertisements. Prices Current, 112

Some of our Canadian neighbors seem to forget that there is any postage on letters in this State; and others remember it to but little purpose. We have on several occasions received letters containing one or more small bills, and then a ten cent piece enclosed "to pay the American postage!" We can assure the postage is charged on each piece, whether large or small, and the ten cent piece just paid its own postage and no more! The people of Canada generally, and even many of the post masters, do not seem to be aware that the law allows American postage to be paid together with the Canadian, at the office where the letter is deposited. All that is necessary is, for the post master to mark on the outside the amount so paid. We hope we shall not soon have to write another homily on this text.

Harvesting and Thrashing Machines.

"Pitt's Grain Thrasher and Separator" is now in operation near this city; and, as in other places, is gaining the approbation of the farmers who witness it. We are happy to announce that Mr. Pitts is making arrangements to manufacture the machines in this city.

One of Hussey's Harvesting Machines has just arrived in town, and measures will be taken to afford the farmers of this vicinity an opportunity for seeing it in operation. Mr. Hussey is now manufacturing his machines at Auburn, and will soon be ready to supply orders. More about these machines next month.

A New Oil Plant—The *Madia sativa*.

The superintendent of the Belfast (Ireland) Botanic Garden, presented Mr. Bateham a package of the *Madia sativa* seed. Part of this was sent to the Hon. H. L. Ellsworth of the Patent Office, who requests us to publish some information concerning it. The best account of this plant we have seen, is in London's Magazine of Gardening for March, 1832, from which we gather the following:—

"M. Bosch, superintendent of the gardens of the king of Wirtemberg, has made numerous experiments for many years on acclimatizing exotic plants, during the course of which one plant, *Madia sativa*, attracted peculiar attention, as he found from the reports of travellers in Chili, that it is cultivated in that country as an oleiferous plant, and an excellent oil is extracted from it. During the last few years, M. Bosch has given this plant a fair trial on a large scale, at considerable expense; and the results of this trial have surpassed his most sanguine expectations."

It is an annual plant of the natural order Compositae, growing to the height of one and a half to two feet. The seed should be sown in the spring, on rich soil, at the rate of about 7 lbs. to the acre. The produce is about 1,500 lbs. per (English) acre; and 100 lbs. of seed yield about 23 lbs. of oil.

According to a chemical analysis, 100 parts of the *Madia* oil consists of 45 parts of oleine (or fluid part of the oil), 40 of stearine (the mucilage, or fatty part), and 15 of glycerine (or sweet solid part, a honey-like and glutinous substance). This oil does not congeal at 19° below Reaumur, but only becomes a little less fluid, which makes it an incomparable substance for keeping all sorts of machines in order; and there can likewise be a solid and well lathering soap made of it. That it may be advantageously used in cloth manufactures has been proved by experiments already

made, by which it was found preferable to the olive oil which had been previously used."

"For all these reasons, it is to be hoped that the *Madia sativa* will soon take that place in agriculture, to which, by its usefulness, it is justly entitled; and which, also, the king of Wirtemberg has already acknowledged, by rewarding with a gold medal the merit of M. Bosch, in introducing a plant into field culture which promises to become uncommonly useful, not only to our agriculture, but to our manufactures and trades."

We should be pleased to hear whether any experiments have been tried with this plant in the United States.

The Striped Bug.

Several correspondents have favored us with answers to the inquiry in our last, for an effectual mode of protecting vines from the striped bug. We give the substance of these methods, although they are not new, and we know from experience that most of them are not fully effectual. In a season like the present, however, when the bugs are not very numerous, these preventives may answer the purpose.

1. Water the plants with a decoction of tobacco.
2. Spread tobacco stems, or refuse tobacco, around them.
3. Sprinkle the plants frequently with water in which burdock leaves have been soaked a few days.
4. Spread soot upon and around the plants.
5. Apply ashes, plaster, or sulphur, in the same manner as the last.
6. The last and most effectual, if not the most easy: get up—we mean go out—early in the morning while the dew is on their wings, catch them, and with the thumb and finger, pinch off their mandibles. Or administer a dose of the Frenchman's flea powder, thus:—

"First den, you catch de flea;
 You pin ur some little powder down he trout;
 Begar he choke!"

Farmers, don't Sell your Ashes.

Mrs. Emmons—According to late discoveries in Agricultural Chemistry, Professor Lubig says, that in taking the hay from meadows, the principal cause of exhaustion to the soil, is the loss of the potash contained in the hay; and that this may be readily restored by sowing the meadow with a thin covering of wood ashes.

I once heard a very successful farmer say, that he never suffered a bushel of ashes to be sold from his farm—that it was worth 50 cents a bushel to sow on grass and corn. SENECA.

Clarifying Maple Sugar with Indian Meal.

W. S. Tupper, of South Venice, informs us that he tried an experiment according to the directions in our April paper, for clarifying Maple Sugar by the use of Indian meal. Owing to the advanced state of the season, the trial was not very complete; still, the result satisfied him that a quality of sugar can be produced in this way, far superior to that clarified in the old way by the use of milk and eggs. He advises sugar makers to give it a fair trial next year, and publish the results.

An Apology for Correspondents.
 It is well known that most of our correspondents are practical farmers, and with most of our readers we are sure is sufficient excuse for their not writing more of it this season of the year. In the mean time, it gives us an opportunity to select some choice treasures from the columns of contemporaries. We trust, however, that our old friends improve the time afforded by a rainy day, occasionally, and do not allow our readers to forget them; and as soon as the hurrying season is over we shall again exhibit a goodly number of honorable names.

One More Call.

Some post masters and agents deserve our thanks for the honorable manner in which they have responded to the call of our last; but there are many others still behind hand, and we dislike to be personal, we hope they will remit the amounts due without delay, and save us further trouble.

"Thou shalt not steal."

It does but little good to scold, but really the way our pockets are picked by some persons in the matter of postage, is truly enlivening. One writes from Ohio that his paper has been carried or lost, another in Michigan asks some unimportant question for his own benefit, and each robs us of two shillings! A gentleman (?) in Canada writes a letter entirely for his own benefit, and encloses a business card, making double postage and cheating us out of three shillings. Another orders two copies of the Farmer and Encyclopaedia Dollar Bill, which is at a discount of from 7 to 10 cents, and then subjects us to double postage in the bargain.

The Curculio.

We are but partially acquainted with the Curculio. Its manner of providing for its young by depositing the nit in our stone fruit, may be familiar to most of our readers,—together with several other particulars; but its food after it has passed into the perfect state, its place of abode during the autumn and winter, and the age it may attain, are things which appear to be very imperfectly known.

If the life of this insect extends to several years, the chief advantage to be derived from having hogs and geese under the trees, must be to prevent its increase. A few of the old ones indeed, may be trampled to death; but in a large fruit garden, it is likely that most of the young ones will escape; and if to these we add such as immigrate from other places, there will be an increasing array of them in the trees, beyond the reach of the hogs, geese, and poultry.

That such has been the case in our fruit garden, we are much inclined to believe. Six years ago, the hogs were not permitted to run there; and without doubt many hundreds of young curculios were added to those already in possession. We have lately undertaken to lessen their number by catching them on sheets; and we now have about 1700 on the list.

From their difference in size, we infer a difference in age. Further proof indeed, is wanted; but some of them are not less than four or five times as large as others. If they live through a period of years, they must continue to provide for their offspring in some kind of stone fruit. If we exclude them from the plum tree, the apricot, and nectarine, they will attack the peach and the cherry. The latter indeed suffers annually to some extent; and a few years ago, owing to a scarcity of other fruit, our peaches were almost entirely destroyed by them.

These considerations have induced us this season to pay more attention to them than in years past; and we have been surprised to find them so numerous. In a late article on this subject, we proposed to jar the trees before the tin troughs were put up; but one, or even a dozen jarrings are not sufficient to get them all down. The troughs therefore, should be fixed and filled, very early in the season, before the insects ascend the trees, or the labor may be vain. We offer some proof of this remark: For nine mornings in succession, some of our trees had been repeatedly struck with an axe, so as to produce violent concussions, each time obtaining a goodly number of curculios; and yet on the tenth morning, from the same trees, we caught more than double the number that we had at any other time, owing to the cold which benumbed them, and rendered them less able to hold on. From the same trees we have since obtained many more.

Some persons have doubted the efficiency of water troughs; but from what we have seen of them, our confidence has not been diminished in the least. We have frequently caught curculios on the rim, as if waiting for a passage; and have sometimes found them in the water perfectly helpless. Now to prevent them from climbing up, is all that we can reasonably expect from a water trough. It cannot bring them down.

For large trees, the expense of these fixtures will be greater than on small trees, the amount of material to make them being greater. If a sufficient space be left between the trough and the tree however, it may remain several years without being taken down—a hole being made in the bottom as soon as the curculio season is over, to let off the water which might collect there, from rain or from melting snow. A small chisel, cutting through the tin into a block of wood held firmly under, would make a sufficient aperture, which might be closed the next spring, and secured by a drop of solder. Three or four wooden

by small nails, support the trough; and rags or tow stop up the remaining vacancy. We cap the whole with a coat of mortar to prevent the insects from working their way through the crevices.

Hogs sometimes neglect to eat the fallen fruit when it is very green; but shorter commons will generally bring them to their duty. If the fruit lies long under the tree, the worm escapes into the ground. †

Locality of the Canker Worm.

The Nashville Agriculturist (as quoted in an exchange paper) recommends taking up the earth round fruit trees to the depth of six or eight inches, and to the distance of eight or ten inches, for the purpose of burning it, in order "to destroy the germ of the canker worm." Is the canker worm an inhabitant of Tennessee? Perhaps some of our readers can inform us in regard to this particular; and also the boundaries of that district on which the genuine canker worm (*Phalena cernata*) is found.

Deane in his New England Farmer or Geographical Dictionary says, "It is not less than about fifty years since this insect began its depredations in New England, in the parts which had been longest cultivated. But perhaps there is some reason to hope that Providence is about to extirpate them: for a little bird has lately made its appearance in some parts of the country, which feeds upon the canker worms. Should these birds have a rapid increase, the insect will be thinned, so as to be less formidable, if not wholly destroyed."

The second edition of that work was issued in 1797, "soon after the first," and perhaps we may set the time of their first appearance about one hundred years ago. It will be safe to conclude they were not newly created about that time, however; and we may ask whence they came? or what other tree supplied them with food before that period?

The little bird was doubtless the cedar bird—one of the greatest marauders of our land; but having no canker worms for him to feed on in this district, we should be glad to send him where he might find useful employment. †

From Western Farmer.

Best Method of Improving New Farms.

If heavily timbered with oak, maple, beech, bass wood, ash, &c., together with a heavy growth of underwood or brush, the best method in the opinion of the writer, or at least that has fallen under his observation, to clear such land is, if it be undulating and dry, to enter in the months of June, July or August, upon the land to be cleared, when the leaves are large and full, with axe and bush hook in hand, and cut down all the trees and brush of and less in size than six or eight inches in diameter, on the first five, ten, twenty, or more acres, according to the means at command, leaving the larger trees standing.

Trim up the fallen trees by lopping off the branches, and then cut up their branches into suitable length for rails, or to be thrown together into piles for burning, leaving the brush scattered over the surface of the ground to dry. The next step recommended, will be, after the leaves have fallen from the trees in the fall of the year, and before the buds start out in the spring, to girdle the timber or trees left standing so effectually as to kill them; and as soon thereafter as the weather will permit, (if the season be favorable, the last of April or first of May,) put fire to your "fallow," and the probability is, you will get a "good burn." When once cleared off, put on a brisk team of young cattle or horses, and harrow up your land thoroughly till it becomes mellow and pliable to the hoe; you may then plant it in corn or potatoes, or sow it to oats or other spring grain, at your option, or as your wants may dictate. If you sow to oats, you can immediately seed down after them to "timothy grass," "red top" or "clover," which will soon furnish your farm with hay for your stock of cattle, &c. Nor will the "girdlings" become dangerous to your cattle, or prove detrimental to your crops for the first three or four years, and in the mean time they can be

almost any season of the year when he may have the most leisure time to do it.

It being generally the case with those hardy industrious men who most frequently break in upon new farms, that they are limited in their means, and having families to support, and some of them large ones too, they require a quick return of the outlay of their small capitals. And this method of clearing the first forty acres of timbered land, if pursued, will place a family in circumstances to raise their own food for consumption, sooner than any other, as much labor, time and expense are thereby saved the first year or two, while the new beginner is beginning anew with every thing new around him. If "openings," "prairies," or "plains," are to be worked, where there is a heavy coat of herbage upon the ground, and no obstacles in the way of the plough, in the month of June or July enter upon the land to be broken up with a sufficient team to turn over the sward with ease, while the wild grass and herbs are yet tender and vegetating.

The depth of ploughing should be regulated according to the depth of the soil. And as a general rule, prairie can be ploughed deeper than either openings or the willow plains. "Oak openings," the first ploughing should be turned over to the depth of about six inches, and great care must be taken to turn a "clean, handsome furrow," so as to cover entirely the vegetable matter, for one acre well ploughed and tilled, is better to the farmer than five but half done, and if the *welshen bottle* is suffered never to enter the habitation nor the field, and proper care be taken, the farm work is sure of being not only seasonably, but well done. The land thus ploughed should be suffered to lie in fallow, undisturbed until the following spring, when it may be cross ploughed, harrowed and prepared for spring crops.

It may be well, perhaps, here to advert to one reason why the first ploughing in openings or plains, where the sub-soil tends to clay should not be made too deep. Argillous soil, in its natural undisturbed state, lies in a compact firm layer, and is of a cold sour nature; and as new beginners are somewhat impatient for early crops, they cannot wait for the seasons with their accompanying attributes of heat and frost, shower and sunshine, to modify and subdue the natural sourness of a clayey soil if ploughed to the depth of ten or twelve inches at first; so therefore, as soon as the vegetation and mould which were turned under at the first ploughing, have sufficiently rotted to mix with the under soil that was turned up, and which being thin, (if ploughed but six inches,) and lying over a compost formed of the vegetable matter soon manures, by exposure and the air changes of the weather, and will if planted or sowed, yield a tolerable crop, the time is improved by the new beginners, to avail themselves of the earliest possible harvest. And furthermore, as all newly cultivated lands, if properly managed, will yield a yearly increase of the products of the soil for the first five or six years; the depth of ploughing can be gradually increased without materially lessening the productiveness of the crop. At the same time the farmer is receiving a rich reward for his care and labor. As I have already occupied a larger space of your useful columns than may be interesting to most of your readers in partly answering a short inquiry, I shall close by observing that if your "Tussock" correspondent, "O. S." needs any further information on the subject, after he shall have cleared or broken up the first ten acres of land, by so intimating through the medium of the Western Farmer, he can be accommodated by

"CINCINNATUS."

Lapeer County, March 20th, 1841.

Millet.

Culture.—This plant will grow upon any soil of tolerable richness, though it does best on loam. The ground should be prepared as for ordinary crops. The seed should be sown broad-cast, and covered with the harrow. If sown early, the crop may be gathered in August, though if sown any time before the 25th of June, it will come to maturity. If seed is the object, four quarts of seed to the acre will be enough; but if intended principally for cattle feed, the quantity of seed may be increased to eight quarts. It grows to the height of from two to six feet, according to the quality of the soil. Birds are fond of the seed, and devour it as soon as it begins to ripen. The crop should be therefore cut before the whole has matured and while the straw is green. It may be cut with a sickle, scythe, or cradle, and should be housed as soon as it is sufficiently dry.

* When fodder is the chief object, millet may be sown in July.—E. S. N. G. FARMER.

cut down and used for rail timber, or fire wood, and being dry, can be burned out of the farmer's way at

Product.—The product will be according to the soil, and will vary from ten to thirty bushels of seed, and from one to three tons of forage, on the acre. It sometimes produces more than a thousand fold returns.

Use.—We have found it an excellent substitute for corn, in fattening hogs, either ground or boiled; and if ground would probably be useful for neat cattle and horses. The straw is eaten freely by cattle, and both the seed and straw abound with nutritious matter.—*Albany Cultivator.*

The following opinions were advanced by Messrs. Colman and Buckminster, at the Agricultural meetings in Boston:

"Millet was both grass and grain. Mr. C. had himself raised it at the rate of three tons to the acre. It is an annual plant, and is useful when other crops fail. He had known millet sown in August, and a good crop obtained after the crop of hay had been cut off with drought. Cattle prefer it to almost any other kind of hay. When ripened it is a valuable grain, weighing from thirty to forty pounds to the bushel."

"Millet be (Mr. B.) believed a great exhauster of the soil; it probably would not exhaust so much when cut for hay before it was ripe. It could not be profitably cultivated in this country for any other than a late crop."

For the New Genesee Farmer.

Agricultural Societies.—The Act of 1841 "To Promote Agriculture."

Messrs. Editors—There has been much difference of opinion amongst practical farmers, as to the utility of Agricultural Societies. Some have said they are altogether too partial in their operations, excluding from competition all, or mostly all, of those who have not ample pecuniary means of preparing subjects for exhibition and premium at the annual air. It is urged that the principle on which premiums have been awarded, instead of rewarding skill, economy, and good husbandry, has encouraged a few individuals to vie with each other in pampering a select number of animals, while perhaps their average stock may in consequence be stinted below ordinary allowance, and be of the most common description. Some have bestowed all their manure on one or two acres, and by great expense of time and pains extorted great crop of grain or roots, while the remainder of the farm has met with corresponding neglect; and finally, he who has succeeded in cramming the most mudding into a pig, or has been able to draw the milk from the greatest number of cows with one calf, has, as a matter of course, drawn the premium. Sir, how have you fed this fine animal of yours? Oh, he has ever had more than he could get, has been in some cases about the necessary amount of scrutiny and investigation as to method and means.

The man who, regardless of expense, obtains the richest crop from an acre or half an acre, will accomplish the same result. The same may be said of the otherwise frugal housewife, who neglects important domestic duties, in order to produce a highly wrought air of silk stockings or a curious hearth rug.

These objections I confess are not altogether groundless; yet, upon the whole, agricultural societies, with all their errors of management, have stirred up a spirit of emulation, showed farmers what can be done, and been of great benefit to the interests of agriculture. I think the friends of improvement may felicitate themselves on the final attention which this subject has received from the legislature, and the passage of an act, which if carried out according to its true spirit, will obviate these objections, and place every one within the sphere of fair competition.

Although the allowance provided in this act is very limited; yet, as an incipient step, it is much better than no action; and it is to be hoped that the importance of the object will stimulate our farmers promptly to co-operate in making up the duplicate to this fund. I propose to make a few remarks on section 3d of the act, which will be found entire in the June number of this paper.

Mention is made of "articles, productions and improvements, best calculated to promote the agricultural, household, and manufacturing interests of this State." All articles seem to be excluded from exhibition for premiums, except those which fulfil the above intention. The officers of the society are to have "special reference to the net profits which accrue or are likely to accrue from the mode of raising the crop or stock, or the fabrication of the article thus offered, with the intention that the reward shall be given for the most economical or profitable mode of competition." The above clause seems to embrace the true principle on which agricultural societies ought to operate and premiums be awarded. Farming in general is not carried on as an amusement, but as a source of profit, as an agreeable and healthy employment. The data which are to determine "net profit," seem to be perfectly evident. He who succeeds in eliciting the most animal or vegetable nutriment from a given quantity of material, with the same economy of time and labor, shows the most skill; or, in other words, he who can produce a fine crop or a fine animal at the least expend of means, will reap the most "net profit." It is well known that two animals of the same age and weight may be placed in separate pens, each may be fed the same quantity of grain or roots—at the end of a given time weigh and examine these animals and there will be found a difference (sometimes very great) in their weight and form.

The only possible circumstances which can produce this difference, are as follows:—

1. Method of preparing the food.
2. Time and manner of feeding.
3. Constitution of the animal, which embraces,

1. Voracity of appetite, which makes them what are termed "good feeders."

2. Power of the digestive and assimilating organs, by which a greater quantity of chyle is elaborated from the same aliment in some animals than in others.

In regard to field crops, it is likewise known that the most striking difference in the appearance and produce is sometimes only separated by a division fence. This is caused,

1. By the previous condition of the land, quantity and quality of manure applied;
2. Season of the year when manure is drawn and method of application.
3. Number of times and manner in which the land is ploughed and harrowed.
4. Preparation of seed and mode of planting or sowing;—
5. And lastly, time spent in tending the crop and manner of doing it.

A proper discrimination is required to hit right in every particular, and so adjust the labor and expense as to secure a profitable crop. The more skilful and judicious consideration of the above circumstances, can alone render one man more successful than another. Here is ample scope for the exercise of thought and experiment; and the man who by well directed and careful experiment, establishes some principle in the rearing of stock, or cultivation of the soil, and in proof of this principle brings forward to the Fair a specimen of production, which not only excels, but has yielded a handsome "net profit," will, by imparting his peculiar method, confer benefit on the whole farming community. In pursuance of this latter consideration, the act goes on to provide that the "person claiming the premium shall deliver in writing, to the president of the society, an accurate description of the process of preparing the soil, including the quantity and quality of manure applied, and in raising the crop, or feeding the animal, as may be; and also of the expense and product of the crop, or of increase in value of the animal, with the view of

showing accurately the profit of cultivating the crop or feeding or fattening the animal. This latter clause strikes at the root of the whole matter. It excludes all mere fancy farmers, who by dint of money can exhibit some huge animal, or produce an enormous crop from a few rods of ground.

It will be seen I think, that the spirit of the law is to give the "race to the swift and the battle to the strong," and as far as can be, reward and encourage genuine merit.

Farmers of 1841, why are you not still muzzling over the surface of your farms with the old bull plough with wooden mould board, and putting in your grain with the triangular harrow of nine teeth? Who amongst you now, who if your stock is not all thorough bred, have not a sprinkling amongst your flocks and herds of some of the best blood in Europe? To whom are you indebted for the amazing improvement which has taken place in farming for the last twenty years? To the ingenious, to the enterprising, to the men who were willing to hazard time and means in doubtful experiments—many important hints on which you are almost unconsciously practicing with success, you can trace to these men—men of thought, men of persevering exertion.

I need not say that real excellence in any department of business is not the result of accident, or blind chance. It must be the fruit of cool reflection, of "patient thought." The brilliant emanations of genius, like those luminous appearances in the heavens which sometimes occur, may dazzle and surprise and excite our admiration; but most of the great practical improvements in the arts which have raised men from barbarism, have been the fruit of laborious exertion, of protracted experiments. They have caused much racking of the brain and many sleepless nights.—These remarks apply as well to farming as to any other pursuit. The door of improvement is still open—let the tide flow on. Every farmer, if he studies his own interest, will become a member of the county society; and if he has not the taste or the time to devote to agricultural experiments, let him cheerfully contribute a little for the encouragement of those who, for his benefit, are willing to search out the most successful and economical method of raising a crop, and will be at the pains of introducing the most approved breeds of horses, cattle, sheep, and swine.

Ogden, June 10, 1841.

J. B. SMITH.

For the New Genesee Farmer.

Sheep Poisoned by the common Red Cherry.

Messrs. Editors—Some six or eight years since, while carrying on farming at Rock Stream, one of my orchards, in which was a variety of fruit trees, including a number of the common red sour cherry, became covered with a luxuriant growth of grass, to destroy which, I turned in, about the first of September, fifty or sixty merino sheep. The animals seemed unusually fond of eating the young cherry sprouts which had sprung up very thick under and about the cherry trees. In less than an hour a large proportion of them were discovered to be diseased, and they were immediately turned out. They staggered continually, pitching forward upon their heads, and often turning entirely over upon their backs. In the course of two or three hours several of them had died; the remainder gradually recovered.

Post mortem examinations proved that their stomachs were compactly filled with the leaves of the cherry sprouts, containing, I presume, prussic acid sufficient to destroy animal life.

E. BARNES.

Note.—A neighbor of mine lost a cow from her eating the leaves of a cherry tree, which had been blown down by a wind storm.

E. B.

Geneva, May 29, 1841.

Excesses on Plum Trees.

We first observed the new excesses on plum trees about the 15th of last month; but as vegetation has been unusually backward, it is probable that in other cases they will appear much earlier. The worms on some of these bunches are more advanced than on others.

The more we see of the works of this insect, the more we are satisfied it may be easily kept in check, or entirely destroyed. Excepting the few that migrate, it is not much inclined to wander from its native tree, unless others are very near. Where it attacks plum trees with thick branches, the proprietor may find an advantage in cutting out a part with all their leaves and fruit on,—because he can find the bunches so much more readily, and because the fruit that remains will be finer and more valuable. Summer pruning is much approved by some horticulturists.

Possibly some of our readers may think we are bestowing an undue share of attention on this subject. We don't think so. We expect the most indolent will be the first to complain; and it is this class that we more especially want to stimulate into action. Get up half an hour before the usual time—steal away from a nap spell contend to it—take the neighbor that comes to spend an idle hour along to see the operation and assist—it will do him good—and the plum trees will be saved from ruin.

Then as it is when our paper makes it appear, in these northern parts, it is probable that many worms will still remain in their nests. Cut open the bunches, and kill it as soon as they are found, destroy them. If half of them are stopped on their way to maturity, it will be something of great value, not only as it gets a man's hand into the business, and prepares him for doing his duty next year, but he will have much less to do.

Rust on Wheat.

A well written paper on the cause of Mildew, Blight, or Rust, was lately read before the Philadelphia Society for Promoting Agriculture, by Kender-ton Smith, in which he endeavors to show that this malady is occasioned by sowing grass seed amongst the wheat. We have no doubt however, that in different and very different circumstances, the presence of rust may be owing to more than one cause; yet, if sowing grass seed with wheat, often, or generally produces it, it is an important discovery.

Then in a paper, published in the Farmers' Cabinet, we give the following extracts:

"The wheat of several fields which came under my observation [in 1835] and which had not been sown with grass seed, was good, the straw bright, and the grain of excellent quality. I also remarked, that other fields which had been sown with grass seed, and in deed the crop generally throughout the country was greatly injured, and in most instances, utterly destroyed by mildew or rust. What appeared very remarkable was, that we heard of excellent crops which had been raised in the very midst of this ruin and desolation.

"In the summer of 1835, I was appointed by the Society, one of a committee to examine a reaping machine, then recently invented. We visited the farm of Mr. John Fox, of Oxford Township, Philadelphia county, for the purpose, where the machine was put in operation upon a field of eight acres. This grain was remarkably fine in all respects. It was tall, and much of it was branched, yet the berry was perfectly filled, and the straw was in no respect touched with mildew. There was no grass sown with this grain; and I have no reason to think that Mr. Fox and his brother have for many years, always sown their wheat without grass, and I find that crops have been uniformly good.

"A second year this field was another in wheat, the straw of which was tall, and the growth of which had been apparently vigorous, but the grain was shrunk and of little value. This field was sown with timothy the previous fall, and with clover in the spring, and the ground was covered with a thick and

healthy coat of these grasses. The soil, situation, and advantages of these lots, for the growth of wheat, were to all appearance the same. There was another field of wheat on the opposite side of Mr. Fox's field, and only separated from it by a road, which was also utterly worthless from mildew. This lot had also been sown with grass, and there was a strong growth upon it. Here then was a field of very superior wheat, situated between two other fields which were scarcely worth cutting.

"Within the last two years I have heard of many instances of good grain, and but one instance of mildewed wheat having been produced on lands not sown with grass, or on which there was not a strong growth of grass or weeds. In every case of mildew during that time, I have ascertained upon inquiry, that grass had been sown with the grain, or prevailed to considerable extent naturally.

"I do not wish to be understood as stating that the presence of grass always produces mildew or rust, for I know that good crops of wheat have grown with it in dry seasons; but I do contend that the presence of a thick growth of grass or weeds upon the surface of the land, predisposes the crop to disease or mildew, and that in wet seasons it is almost invariably noxious and hurtful to the wheat plant.

"P. S. I am informed by Mr. Isaac Newton, an active and zealous member of the Society, and one of our most enterprising farmers, that he had last year, a field of about eight acres of wheat, which he sowed in the fall with timothy and herd-grass, except one land, nearly in the middle of the field, which by accident was omitted. The wheat upon this land was not affected by mildew, and the grain was of superior quality, while the rest of the field was rendered worthless by mildew."

The foregoing statements are very interesting; but we would refer our readers to an able article on this subject, published in our current volume, at pages 38—50, which is worthy of a careful perusal. Now is the season for farmers to make observations in regard to this matter. Let them take notice, in addition to the above suggestions, whether stable manure is favorable or unfavorable? Whether compost, including a portion of lime, has a bad effect? Whether head-lands in fine till, but trodden hard after the wheat was sown, are more free from rust? Whether this fungus often spreads from low wet places into the drier parts of the field? and whether it rarely occurs under the shade of trees? The satisfactory determination of these points may lead to very important results; and we should be pleased to hear from correspondents on the subject.

"S. W." and the Corn Laws.

To the Editors of the New Genesee Farmer:

Your correspondent, "S. W." appears to have paid much attention to the subject on which he treats; but, on the whole, his speculations are much better adapted to the state of information and feeling which existed fifty years ago, than to the present time.

While every laborer must, as he ought, acquire by his daily wages sufficient to clothe and educate respectably his family and provide something for future use, it will be difficult to convince our farmers that their profits will be increased by the "low prices of agricultural products." It may be replied that this will regulate itself—that the cost of labor will be proportioned to the prices of the articles produced; but this is not true, except in part; and can only be the result of great uniformity in the cost of the articles consumed, according to their value. For instance, if the bulk of our importations are purchased at high prices, the wages of the working man would doubtless exceed the means of the farmer to pay, if wheat was at a low price.

It is gratifying to observe, notwithstanding the lessons of patience read to us by "S. W.," and his conclusion "that we have no right to complain of the English Corn Laws, which save her agricultural interests from utter prostration and ruin," that the spirit of free trade is spreading in England as well as this

country. He has doubtless observed, that though generally opposed by the landed interest, which seeks but its own selfish ends, regardless of the claims and sufferings of community, a mighty movement has taken place, which must result in the repeal of those laws, at no distant period. When this takes place, it must be obvious that the market for our wheat will be much better than at the present.

If "S. W." will take into consideration the unlimited capabilities we possess of producing this great staple and the certainty that in a few years at farthest, our market will not be adequate to the supply, he will agree with Gov. Davis, of Massachusetts, in saying, "that the policy of our nation in sustaining the cotton growing interest to the neglect of wheat, is unwise and unjust."

It has often seemed passing strange to me that so little has been done to promote the prosperity of millions at the North, in this important particular, when a few hundred thousand men at the South have an accredited representative at the Court of St. James, watching every movement which may affect in the slightest degree their favorite exports.

But there is another aspect to this question, to which I would direct the attention of your correspondent. He thinks we have no right to complain when the landed interests seek their own protection; but did he ever reflect that this protection was the cause of want and misery incalculable? It is not the only result of this system, that the English laborer is absolutely precluded from any higher expectation than providing a scanty support for his family; thus extinguishing those noble incentives to exertion, which lie in the path of the humblest individual among us; but let him bear in mind, that no small share of the people of that country, from the operation of those laws, inhabit damp and noisome cellars, crowd to an incredible extent every garret and hovel, and drag out a most miserable existence, that "the agricultural interests" may ride in splendid coaches and feast upon the dainties of the earth. Surely the dictates of philanthropy should outweigh those of cold selfishness. It is however, by no means certain that English proprietor would be the losers by an act of justice and mercy for, says Lord John Russell in his motion for the reduction of duty on foreign grain, "the safety of free trade has always been considered as an axiom by writers on political economy, and I see no good reason why it should not be reduced to practice."

S. R. W.

For the New Genesee Farmer.

Rotation of Crops—Root Culture.

Messrs. Editors—I am often asked by brother farmers how they can change from their old impoverishing mode of farming, and adopt an improved system. I say to such, fix on a proper rotation of crops—begin on a small scale till 'sure you are right, then go ahead.' My rotation for a five or six years' course is 1st. Pans, on green sward; 2d. Corn or roots, with manure; 3d. Spring wheat; 4th. Oats, and seed with clover, or clover and timothy; 5th. Hay or pasture. I find winter wheat a rather uncertain crop, on a count of its winter killing, and therefore prefer spring wheat. The Italian I have found the most productive variety. I have raised more than thirty bushels of this kind to the acre for the last four years, since have adopted the above rotation; and last year I cut from one acre, 1010 sheaves, which yielded fifty-six bushels; and I believe I can do it again.

My ruta baga crop last year was 1836 bushels, for three acres. I kept twenty pigs entirely on them, a four working horses in good condition, without grain I also feed sheep, calves, and cattle on them. I some farmers say, "my pigs will not eat them;" yet

likely. Then boil the roots for them the first day; half boil them the next, and the third day feed them raw, and you will have no further trouble.

I raise the carrot and sugar beet, but do not think my land as well adapted to them as to the ruta baga. Last year my white beets yielded about 500 bushels to the acre, and carrots 450 bushels. I should prefer carrots to the ruta baga for horees, if as easily raised; but with me they are more expensive.

Farmers think it costs too much labor to raise ruta baga; but if they will try it, and note the expenses, it will satisfy them they get well paid for it. As I have kept an account with my crops for several years, I have ascertained that more value may be realized from ruta baga than almost any other crop. I give you the account of one acre raised last year, on land which the year previous was sward, turned over and cropped with pease.

Rent of land to cover int rest and taxes,	\$3 00
Ploughing,	1 50
Thirty loads barn yard manure,	7 50
Ridging before and after manure,	1 50
Planting and seed,	1 50
Hoing and churning, four days,	3 00
do. do. 21. time, 2 days,	1 50
Horse and man with cultivator, three times,	1 50
Harvesting and pitting, two hands and team, } two days, }	6 50
\$27 50	

600 bushels ruta bagas a 16 cts. \$97 92

Nett gain, \$70 42

Cost only 4 1/2 cents per bushel.

I call the manure only 25 cts., as it only fits it for after crops, and is nearly saved—I used to make but one hundred loads of rotted manure, and now I make three hundred from the same means.

As many of your readers have never seen the "Ruta Baga Hook," would it not be well for you to publish a description of it from the Cultivator, vol. 7, p. 124? I consider your paper invaluable to the farmers in this region: as it is more particularly calculated for Western New York than any other; and wish it was in the hands of every farmer.

You may publish any, all, or none of this, as you may see fit. If you wish, I may give you an account of some other crops hereafter; but I can hold the plough better than I can wield the pen.

With respect,

ERASTUS SKINNER.

Prattsburgh, June 15, 1841.

Remarks.—Thank you, Mr. Skinner. We like your mode of wielding the pen, and should be happy to hear from you often. We will show the Ruta Baga Hook next month.—Eds.

Ploughing level Land in broad Ridges.

We have some acres of level land with a hard close subsoil, through which the water soaks very slowly; and sometimes in rainy weather stands for days together in the furrows.—(Why don't you drain it?—We intend to—) one thing at a time: but in the meantime we have been gathering it up into broad lands of fifty feet or thereabouts. This is done by ploughings, repeated in the same order, without leveling it back again; and a very fine effect has been produced. Instead of the soil soaking for a month or two during our wet spring, and seeming almost prepared when dry, for the brick-kiln, it becomes light, mellow, and greatly increased in fertility. Crops, double in value, whether of grain or grass, may now be readily obtained.

As the middle part of the land is much elevated, so the dead furrows are proportionably depressed; and in the bottom of these, now a foot or eighteen inches

below the original surface of the land, we intend to make covered drains, perhaps three feet deep which shall freely discharge all the water that soaks down from the lands into them.

In conclusion, we would just remark, that the lands are raised without extra expense or labor, the work being done in the ordinary routine of cultivation.

Locust Tree Insect.

A correspondent in Seneca county informs us that his locust trees are infested with "small insects about a quarter of an inch long," and he thinks they will inevitably destroy the trees, unless we or our correspondents can point out a remedy.

We are not informed in what manner this insect commits its depredations—whether it preys on the wood, the bark, or the leaves—nor are we informed whether it is a worm, a caterpillar, a beetle, or a fly—but it is an insect about a quarter of an inch long! Very definite indeed! Who can tell what it is, or how to destroy it? We know of but one insect that infests these trees, and that is the *locust borer*, which in its perfect state, is a beetle about five-eighths of an inch in length, of a dark brown color, with bright yellow stripes across its wings and body. In its larva state, it is from one half to three quarters of an inch in length, and does its mischief by boring holes in the body and limbs of the trees, so that they break off or die. They first made their appearance in the Eastern states, we believe, about 15 or 20 years ago, and soon destroyed many of the trees there. They began to appear on the trees at Rochester about eight years ago, and in four or five years they destroyed or disfigured nearly all the large trees about the city, and they are still prosecuting their work of destruction.

We have not discovered them in many places beyond the vicinity of the city, but they are doubtless extending themselves, waging a war of extermination against locust trees; and we have no doubt this is the insect found by our correspondent. We only regret that we are unable to offer him a remedy against their ravages. Scraping off the rough bark and giving the tree a coat of white wash, has been practiced here as a preventive, but with only partial success. They do not seem to increase very rapidly at first, and their numbers can be reduced by picking them out of their holes with a barbed wire. The perfect insect may be seen at this season of the year, running rapidly about the body and large limbs of the tree.

American Society of Agriculture.

We last month published the address of Mr. Robinson on the formation of a National Agricultural Society. We now give a circular and form of a subscription paper received from him. If any of our readers desire to send their names or contributions to aid in this laudable enterprise, we shall be happy to forward the same to Mr. Robinson or to Mr. Ellsworth.

To the Editors of the New Genesee Farmer:

Gent.—The object of the annexed form of a subscription, is to ascertain whether there is a sufficient number of the friends of this great measure in the Union at this time, willing to lend their influence, to warrant a call of a *primary* meeting to organize the Society. Should the indications appear favorable, a committee of the friends of the cause will take upon themselves the responsibility of naming a time and place for the meeting; of which you will be duly notified.

I fondly hope you will promptly lend your own name, and procure a few names of other friends of agricultural improvement in your vicinity, and then forward the subscription by mail in time to reach Washington by the 10th of August; addressed to the

Hon. H. L. Ellsworth, Chairman, corner of the Patent Office, for Solon Robinson.

If you areaverse to asking your friends to give pecuniary aid to this measure in its incipient state, please make use of the first part only of the paper.

I hope you will excuse the liberty I take, to the zealous aidour I feel in promoting this great National object.

I have the honor to subscribe myself your agricultural friend and humble servant,

SOLON ROBINSON.

Lake C. H., Indian, Jan. 2d, 1841.

[FORM OF SUBSCRIPTION PAPER.]

National American Society of Agriculture.

"To elevate the Character and Standing of the Cultivators of the American Soil."

The subject of forming such a Society, being now agitated in the United States, we do hereby pledge ourselves to the support of such a measure, according to our ability; and we earnestly hope that the respective friends of the measure will take the necessary steps to organize the society in the course of the year 1841.

Knowing that funds will be necessary to bring this great beneficial National Institution into active operation, particularly as we have no National School of Agriculture connected with the Society; and also a scientific Journal worthy the name of such an institution—those of us who have added certain sums to our names, have hereby communicated those sums, and placed them in the hands of those to be expended in aiding the formation of such a Society.

New Varieties of Turnip Seeds.

A large assortment of Turnip seeds from England, have lately been received at the Rochester Seed Store, including, besides the more common varieties, several kinds quite new, or but little known in this country. We extract the following description of some of them from the London Farmer's Magazine.

Green-Topped Yellow-Ball—This turnip attains a medium size. The bulbs are globular, or somewhat flattened, with a very smooth top; it is an old variety, and is not in decayed condition.

Or-Heart Yellow—is an excellent turnip; although it comes early to maturity, and attains a considerable size, it is by no means deficient in hardness.

Hoed's new large Yellow—is a very superior, large, globularly shaped, hardy turnip, remarkable for its perfect symmetry, and less rather a highish green top. It was introduced by Charles Hoed, Esq., an eminent farmer at Inverbroom, Sutherlandshire, a gentleman who has devoted much attention to the cultivation and improvement of field turnips generally.

Pomeranian Globe—This variety was introduced some years since from Pomerania, and may be considered the most perfect globe turnip shape, as well as the most regular or uniform grower. Its skin is of a smooth white, and some what shining or tawny green-like appearance; leaves smoothish, of a dark green colour with whitish nerves.

Red Tombarl—In size, shape, and texture, this variety may be considered as occupying an intermediate place between the white and green tombarl. It is of a bark and clover on the upper surface, and white on the under.

Lincoln Hybrid—This variety, which was introduced by James White, Esq., of Lincoln, near Peterborough, may be considered as bearing the same relation to the Swede as Dale's hybrid. Its leaves are dark green, rather small and softish, roots round, or somewhat heart-shaped, being often tapered at the under side; white below and green above the surface of the ground. They are pieces of fine quality and firmness of texture than in any other of the sort.

Liverish Green-Topped Or-Heart—This is an excellent variety, grown in some of the best districts of England and in Scotland. It is named from having been first introduced by Messrs. Willmott and Co., of Liverpool. It is of a round shape, it is very much resembling the Pomeranian Hybrid, but somewhat smaller in size, and of a lighter and higher green colored leaves.

CATTLE SHOW AND FAIR

OF THE N. Y. STATE AGRICULTURAL SOCIETY—TO BE HELD AT SYRACUSE, SEPT. 29 AND 30, 1841.

The New York State Agricultural Society will hold a Cattle Show and Fair at Syracuse, on the 29th and 30th days of Sept., 1841, at which time the following Prizes will be awarded. The Premiums offered, are numerous rather than large, the Society preferring to make their appeal to the emulation and public spirit of our farming population, rather than to that avarice which can alone be called into action by the inducement of large rewards.

List of Premiums.

ON CATTLE.

I. BULLS—Of any breed—3 years old and over.

For the best, \$20 For the third best, \$8 For the second best, \$12 For the fourth best, Diploma.

II. BULLS—Of any breed, over 2 and under 3 years old.

For the best, \$20 For the third best, \$8 For the second best, \$12 For the fourth best, Diploma.

III. BULLS—Of any breed, under 2 years old.

For the best, \$12 For the third best, \$5 For the second best, \$8 For the fourth best, Diploma.

IV. COWS—Of any improved breed, 3 years old and upwards.

For the best, \$20 For the third best, \$8 For the second best, \$12 For the fourth best, Diploma.

V. HEIFERS—Of any unproved breed, 2 years old and over.

For the best, \$12 For the third best, \$5 For the second best, \$8 For the fourth best, Diploma.

VI. HEIFERS—Of any improved breed, under 2 years old.

For the best, \$10 For the third best, \$5 For the second best, \$8 For the fourth best, Diploma.

VII. COWS—Cross between the native and improved breeds.

For the best, \$12 For the third best, \$6 For the second best, \$9 For the fourth best, Diploma.

VIII. HEIFERS—Cross between the native and improved breeds.

For the best, \$10 For the third best, \$5 For the second best, \$8 For the fourth best, Diploma.

IX. COWS—Native breeds.

For the best, \$10 For the third best, \$5 For the second best, \$8 For the fourth best, Diploma.

The greatest combination of those points or properties which indicate milking qualities and an aptitude to take on flesh on the more valuable parts, together with general beauty of form, (size in itself not being considered a criterion of excellence,) will be the considerations which will govern the viewing committee in awarding premiums in the above classes.

ON HORSES.

For the best Stallion, \$20 For the best breeding Mare and Colt, \$20 For the second best, \$12 For the second best, \$12 For the third best, \$8 For the third best, \$8 For the fourth best, Diploma. For the fourth best, Diploma.

A variety of horses possessing size, strength, and endurance for field labor, combined with that action which qualifies for the carriage or saddle—in short, the horse of all work, is probably the most profitable class which our farmers can now engage in rearing, and to such therefore, will the preference of the Society be given.

SWINE—Over 10 months old.

For the best Boar, \$10 Best breeding Sow, \$10 For the second best, \$8 For the second best, \$8 For the third best, \$5 For the third best, \$5 For the fourth best, Diploma. For the fourth best, Diploma.

In awarding premiums on hogs, reference will not be had exclusively to size or to present condition, but to that form and that proportion of bone and ossil to more valuable parts, which promises the greatest value from the least amount of feed.

SHEEP—I. LONG WOOLED.

For the best Buck, \$10 Best pen of 3 Ewes, \$10 For the second best, \$5 For the second best, \$5 For the third best, Diploma. For the third best, Diploma.

II. MIDDLE WOOLED.

For the best Buck, \$10 Best pen of 3 Ewes, \$10 For the second best, \$5 For the second best, \$5 For the third best, Diploma. For the third best, Diploma.

III. FINE WOOLED.

For the best Buck, \$10 Best pen of 3 Ewes, \$10 For the second best, \$5 For the second best, \$5 For the third best, Diploma. For the third best, Diploma.

The term "long woolled" is designed to include the Leicesters, Lincolns, Cotswolds, and all the English varieties of sheep which furnish the quality of wool suitable for combing—the "middle woolled" the South Down, Norfolk, Dorset, Cheviot, native, &c.—the "fine woolled" the Spanish and Saxon varieties of the Merino and some of their crosses.

FARM IMPLEMENTS.

For the best Plough, \$30 For the second best, \$20 For the third best, Diploma. For the best Harrow, \$8 For the second best, \$5 For the third best, Diploma. For the best Cultivator, \$7 For the second best, \$5 For the third best, Diploma. For the best Drill Barrow, \$5 For the second best, \$5 For the third best, Diploma. Best Threshing Machine, \$20 For the second best, \$10 For the third best, Diploma. For the best Horse Rake, \$8 For the second best, \$5 For the third best, Diploma. Best Fanning Mill, \$7 For the second best, \$5 For the third best, Diploma. For the best Straw Cutter, \$5 For the second best, \$5 For the third best, Diploma.

Discretionary premiums will also be awarded to manufacturers of the best sub-soil and side-hill ploughs, hoes, shovels, spades, forkes, rakes, and other farming utensils.

The economy and durability, as well as the excellence, in other respects, of farming implements, will be taken into consideration.

Discretionary premiums will be awarded for the best samples and best varieties of winter and spring wheat, corn, rye, barley, oats, peas, beans, buckwheat, hemp, flax, broom corn, maple, and beet root sugar, &c. &c.

Also, potatoes, turnips, sugar beets, mangel wurtzel, carrots, pumpkins, and horticultural products generally.

Also, fruits of all kinds, and flowers. The varieties, when different from those in common use, should be properly explained, the method of culture, &c.

Prizes to be Awarded in Albany.

The following premiums will be awarded at the annual meeting of the Society, on the 3d Wednesday of January, 1842:

BUTTER AND CHEESE.

For the best sample of Butter, not less than 100 pounds, \$20 For the second best, \$12 For the third best, \$8 For the fourth best, \$5 For the fifth best, Diploma. For the best sample of Cheese, not less than 100 pounds, \$20 For the second best, \$12 For the third best, \$8 For the fourth best, \$5 For the fifth best, Diploma.

FIELD CROPS.

Best acre of Wheat, \$20 For the second best, Diploma. Best acre of Barley, \$15 For the second best, Diploma. For the best acre of Rye, \$15 For the second best, Diploma. For the best acre of Oats, \$15 For the second best, Diploma. Best acre of Indian Corn, \$15 For the second best, Diploma. Best acre of Potatoes, \$15 For the second best, Diploma. Best acre of Sugar Beets, \$15 For the second best, Diploma. Best acre of Ruta Baga, \$15 For the second best, Diploma. Best acre of Carrots, \$15 For the second best, Diploma. For the best acre of Peas, \$15 For the second best, Diploma.

The rules and regulations which will govern the Society in awarding their Premiums, will be published in our next.

The prizes will be paid in plate or cash, at the option of the winner. Should not the Society obtain a Diploma in season, some Agricultural Work or Print, may be substituted for their Diploma.

Complementary Colors.

It has been long known that some colors when arranged together, are much more pleasing than the arrangement of other colors; or, that there are concordant and discordant colors as well as concordant and discordant sounds. The late Baron Cuvier took this notice of the subject in his "Biographical Memoir of Count Rumford."

"He determined by physical experiments, the rules that render the opposition of colors agreeable. When one looks steadily for some time at a spot of a certain color on a white ground, it appears bordered with a different color, which however is always the same with relation to that of the spot. This is what is called THE COMPLEMENTARY COLOR; and the same two colors are always complementary to each other. It is by arranging them that harmony is produced, and the eye flattered in the most agreeable manner. Count Rumford who did every thing by method, disposed according to this rule, the colors of his furniture, and the pleasing effect of the whole was remarked by all who entered his apartments."

In a recent number of the Gardener's Chronicle, this subject is discussed at some length, and the Essay of Chevreul (who has lately examined it with much attention) is referred to, for several particulars. In this way, the editor says, "complementary colors always suit each other. Now the complementary color of red is green; of orange, sky blue; of yellow,

violet; of indigo, orange-yellow; and consequently, blue and orange colored flowers, yellows and violets, may be placed together; while red and rose colored flowers will harmonize with their own green leaves. White suits blues and oranges, and better still reds and roses; but it tarnishes yellows and violets. In all cases however, when colors do not agree, the placing white between them, restores the effect."

To the lovers of beautiful flowers who may wish to arrange them with the finest effect, these notices may be interesting and useful; and the following succession of colors is recommended, where the flowers are placed in lines; viz:

"White, reddish-scarlet, white, rose-lilac, yellow, violet or purple, orange, white, reddish-scarlet, purple tinged with green, rose-lilac, yellow, violet or purple, orange, white, red-scarlet, deep purple, rose-lilac, white, yellow, violet or purple, orange, white, &c."

"To produce the best effect in patches of seven arranged thus—

we may have 1. Six orange with a purple or violet centre. 2. Six purple or violet with a yellow centre. 3. Six yellow with a purple or violet centre. 4. Six scarlet with a white centre. 5. Six white with a scarlet centre. 6. Six rose with a white centre. 7. Six blackish green purple with an orange centre. These seven patches forming a straight border, may then be repeated in an inverted order which would give 13 patches: and there should be a patch of seven whites at each end. If the border is circular, without any central point of view, the foregoing arrangement should be repeated ad infinitum without inverting the order after the 7th patch.

"Another advantageous disposition would be the following:

- white * * pink white * * orange
pink * * yellow * * white orange, violet * * white
white * * rose white * * orange
violet * * yellow scarlet * * white
yellow * * white * * violet white, yellow * * scarlet
violet * * yellow scarlet * * white

blue-purple * * white

white * * pink * * blue-purple

blue purple * * white." †

From the Magazine of Horticulture.

The Yellows in Peach Trees.

I have noticed occasional useful remarks on the best varieties and the culture of fruit trees, in your valuable Magazine; but I have not, as yet, seen any remarks upon the disease called the yellows, which affects the peach tree, or reasons assigned for its prevalence. If the cause could be found out, it might lead to a cure, which would render a lasting benefit to our country. However valuable most other fruits are, none are equal to the peach in delicious flavor and healthiness, and I should therefore be pleased to see this subject carefully investigated, and the experience of some of your intelligent correspondents communicated through your pages.

And as I have, for about thirty years, occasionally had my attention drawn to this subject, I am willing to throw in my mite of experience. I am fully satisfied that the complaint exists. Some persons say that the worm at the root is the cause of the yellows. I acknowledge that any disorder that destroys the trees will cause the leaves to turn yellow; but the complaint I call the yellows will kill a whole orchard, without any visible wounds, on or before the third or fourth full crop. I think where any neighborhood abounds with peach orchards, it will be nearly impossible to keep clear of the disease.

On planting out young peach trees on the site of a peach nursery, two years after the nursery was abandoned, and although the ground was in other respects

well suited for the growth of the peach tree, yet by the next autumn, many of them were dead, and the balance so sickly that I had them all dug up, and there was no sign of the worm at their roots. From this, and other similar experiments, I think the disease may be generated by planting in or near where a nursery or orchard of peach trees has been, or where the latter is; consequently, where a neighborhood abounds with peach trees, there is danger of its becoming over-spread with disease, without greater care than is usually taken to prevent it.

I think I have seen evidences of its being in some degree contagious. Richard Cromwell, the respectable and worthy peach raiser, near Baltimore, has for upwards of thirty years supplied that city with peaches of the best quality, on a large scale. Some time since, when I was walking with Mr. Cromwell through his peach orchard, when the trees were hanging full of ripe fruit, he pointed out a tree he said had the yellows, having a full crop upon it, at that time worth one dollar per peck, and to me it appeared healthy; but he observed to me, "as soon as I take the fruit from the tree, I shall dig it up, in order to prevent the disease spreading any farther, for I expect the side of the adjoining trees next to it will be affected next season." I had occasion to pass through Mr. Cromwell's orchard the next fruiting time, and the sickly tree had been dug up, but, as had been predicted, parts of the four neighboring trees were evidently much affected, but only the sides next to the diseased tree, which made it the more striking, and convincing of the contagion, if this is a proper term.

On another occasion, I had a favorite early purple peach, before I had a nursery, that I suspected was partially affected by the yellows, and being desirous of preserving the variety, I cut the healthiest branch I could get, and I had twelve buds inserted in healthy peach stocks, but when they had grown about three feet, they showed the disease so plainly that in order to prevent it from spreading, I pulled up all the trees, and had them burnt.

From these cases, it seems to me the disease may be generated by planting old peach orchards or nurseries too soon after the removal of the old trees, and also by planting too near those already affected with the disease; and if cuttings or scions are taken from diseased trees, their product will be also diseased. I also think the yellows may be communicated to young trees by planting seeds taken from diseased peach trees. Respectfully your friend,

ROBERT SINCLAIR.

Clairmont Nursery, March 18, 1841.

Botany.

In the whole family of sciences there is not one more instructive and pleasing than Botany. It cultivates and purifies the better feelings of our nature, by directing our minds to the goodness of God, as displayed in a very extensive portion of His works. And while it refines the taste and captivates the fancy, it enlightens the understanding and strengthens the judgment.

Cold and unthankful indeed must that man be, who feels no warm emotion while he beholds the beauties and smiles of an Omnipotent Creator. How then can that science fail to be interesting which treat of so important an operation in nature, as the process of vegetation, and which classifies plants and explains their properties. Whether we survey nature in the wild luxuriance of the forest, or in the most delicate beauties of the garden, without some knowledge of this science, all is equally irregularity and confusion. We may admire the wilderness of the one, or be pleased with the variety of the other, but we cannot feel that interest which even a partial acquaintance with this science will impart. All then is order, beauty and harmony. We see the sturdy oak of ages, and appropriate to it its legitimate place in the vegetable kingdom; we scrutinize the polished petals of the flowers and glow with admiration and delight. We no longer walk in the woods, or the fields, or amuse ourselves in the garden without discovering new beauties in every shrub, and plant, and flower, which comes under our notice. The vegetable world at once becomes animate. We read new lessons of wisdom and goodness in every blade of grass, and find that there is not a leaf nor a fibre, which does not perform its proper office in the production of the plant.

The science of Botany has already secured itself a place in almost all schools of the higher order, and only needs an introduction to be generally received and studied, in our schools of even the humblest character. It has nothing abstruse in it, but is entirely within the capacity of every grade of intellect, and may be acquired even by children. True they may not become

thoroughly versed in it, nor are they capable of fully understanding many other branches of knowledge which they study. It is a matter worthy of investigation and trial whether the introduction of as pleasing a study as that of flowers, for which all children have a great fondness, would not have a happy influence on our schools. It would be connecting pleasure with improvement, and would have a tendency to create a taste for study which should not be the least object of schools.

It would be an instructive amusement too for youth of both sexes to study this science even after leaving school. Youth is a period in which amusement will have a place in the distribution of time. This is as it should be, but that course cannot be an unwise one, which makes that amusement a source of instruction. The study of which we speak, is one where the path of science is literally strewn with flowers. How many an hour which we spend in idle lounging, might be occupied in some pursuit, which while it recreated, would improve us. And at this season of the year nothing could be better suited to such a purpose than the study of Botany.—*Western Star*. PHILO.

Farmers and Mechanics.

We heartily concur with the *Louisville Journal* in the following remarks. The *New York Mechanic* is one of the cheapest and most interesting of our exchange papers. It is published weekly at the low price of \$1.50 per year. All mechanics and most farmers, will find it worth many times the price of subscription.

"Among the many valuable papers which we receive, there are few possessing more substantial merit than the 'New York Mechanic.' It is a weekly paper published in the city of New York, by Rufus Porter & Co., and, as its title indicates, is devoted to the diffusion of information on subjects connected with the arts and sciences—notice of the progress of mechanical and other improvements, discoveries and inventions, scientific essays, philosophical experiments and general miscellany. Each number contains plates illustrative of some new invention or improvement in machinery, with accurate and copious explanations, calculated to keep the mind of the reader well informed of the progress of the useful arts.

"The success of a paper of this kind is a cheering evidence of the increasing interest of the reading community in whatever tends to develop the genius and unfold the resources of our people, as well as of the growing intelligence and enterprise of the mechanics of the country. In times past, no class of society has been so poorly represented in the world of letters, as the mechanics and farmers. Literary periodicals are every where to be found—political papers have multiplied until their name is legion—even until every political party and fragment of a party has its horde of sycophants, performing its behests with a blind and heedless devotion—theology has its champions—law its advocates—medicine and surgery their defenders, and even phrenology, animal magnetism and Graham's system of sublimating the mind on bran bread and Taunton water, have secured the aid of the PRESS, which, with its thousand times multiplied voices, has heralded the merits of each all over the land, and compelled the public eye and ear to entertain its claims to attention.

"But the interests of agriculture and the mechanic arts, and the beautiful and glorious sciences in the midst of which they spring into life and usefulness, have scarcely been deemed worthy a place in the archives of the age. It has been deemed enough for the farmer to plough and sow and reap, as his father did before him; and for the mechanic to learn his trade and pursue it in the beaten and unimproved track that his master trod—as though labor were the only means on which to rely for success and experience—interchange of opinions—diffusion of knowledge—intellectual cultivation and generous emulation, out of place or, not worth the pursuit.

"Of late however, those classes on whom the prosperity, wealth, and glory of our country so much depend, have assumed a more commanding position. A newspaper devoted to the interests of the mechanic and the cultivator of the soil, and conducted with taste, ability and effect, is now no strange thing. We see no surer mark of the progress of society than the elevation of the laborer to his proper dignity, wherein his moral power is brought into action as well as his physical strength.

"Of all the varied employments of men, there are none so well calculated to unfold the powers of

the mind and lead it on from discovery to discovery—from invention to invention, as the cultivation of the soil and the pursuit of the different branches of mechanical science. The mind has always a fund of fresh materials to work upon, capable, by a thousand changes and combinations, of being improved without limit, yet without ever reaching absolute perfection. The chemical properties of soils—their adaptation to particular crops—the cultivation of the fruits of the earth, and the rearing of the useful animals, afford a never ending series of instructive lessons. And the mechanic arts, how noble—how useful—how well calculated to enlist the inquiring mind in the pursuit of those improvements which, while they develop its own powers, enlarge the sphere of human happiness, and strengthen the dominion of the intellect over the material world."

How to Eradicate the Bramble.

I observe that a correspondent in your last number inquires how the blackberry bush may be destroyed. As I have encountered and eradicated some formidable patches, which existed on the lands which I have at different times added to my farm, I think I may venture to recommend to your correspondent an infallible prescription. Some time in the winter or spring cut them close to the ground, and repeat the operation the last of July. A few will appear the second year, be sure to cut them also the last of May, and the last of July. This specific is based upon the scientific principle, that no tree, shrub or plant, can long maintain the life of the root without the aid of the top. The leaves, &c. are as indispensable to the long life of a vegetable, as lungs are to an animal.

The same plan will destroy the iron weed or devil-bit, which so much infests the blue grass pastures of Kentucky, and which some farmers have vainly endeavored to eradicate by cutting once a year for thirty years in succession. Such nests are not to be exterminated by cutting in the blossom or in the moon, but by the dint of scratched hands and sweated faces.—You may have remarked the freedom of my farm from them, though a scattered one here and there shows the propensity of the soil to produce them, and that my predecessors were industrious enough to raise their own blackberries.—*Western Farmer and Gardener*.

Consumption of Meat.

There are few things in the habits of Americans, which strike the foreign observer with more force, than the extravagant consumption of food—and more especially of meat. Truly we are a carnivorous people. With all our outcry about hard times, the quantity of provisions consumed in America would support, in health, triple our population in Europe. The vast consumption of meat is not only wasteful, but injurious to health, and to activity, of body and mind. The body if made of iron, would be unable to perform all the functions imposed upon it at one time—especially is it, we should suppose, without pretending to any science on the subject, deleterious to eat meat suppers—or to eat a heavy meal immediately preceding any action of body and mind. How well this is proved by the experience of the turf. Suppose a race to be made for a heavy sum, half forfeit, and on going into the stable, the trainer finds that although he is sure that his nag is the better horse, the groom has been bribed to give him a gallon of oats and water at pleasure, would he not at once withdraw, and pay forfeit sooner than encounter the uncertainty of paying the full amount? May it not be averred that one half of the provisions consumed in this country might be saved with certainty of avoiding the numerous diseases that arise from plethora, impaired digestion, and disordered blood? Let the heads of any family examine, and they will find that a substitution of bread and vegetables and milk for three-fourths of the meat consumed, would be attended with economy and better health.—*American Farmer*.

Recipe for Making French Honey.

Take six eggs, leaving out two whites, one pound of loaf sugar, a quarter of pound of butter, the juice of four lemons, and the rind of two grated; the sugar to be broken into small pieces, and the whole stewed over a slow fire until it becomes of the consistency of honey. It is very nice. A SUBSCRIBER.

Montgomery co., Pa., May, 1841.

Inquiry.

A person renders me services, and I write a letter of thanks, acknowledging the obligation. How ought to pay the postage? Q.

ROCHESTER, JULY, 1831.

Our Aim and Expectations.

When the *New Genesee Farmer* was commenced, the publishers announced that they should aim to make it the most useful and most extensively circulated agricultural paper in the country; and, although some may have thought this savored a little of egotism, we are willing to repeat the assertion, and do so with an assurance of success immediately in prospect. It is unnecessary to mention here what our friends say respecting our labors thus far; we only wish at present, to inform our readers that such arrangements are now making as we have the utmost confidence will fully accomplish the objects named. Our circulation is now double what it was last year, and we have good reason to believe that next year it will be double what it is this; or in other words, that we shall print and circulate about 30,000 copies per month! Does any one say "it can't be done?" We reply, *the world can't be in our vocabulary*, and we expect, next month to make all this appear reasonable.

One word in the ears of our readers. ¶ Please tell your friends and neighbors that we have now a supply of Vol. I. and Vol. II. from the commence-ment, but this will not be the case many months, and some will regret it if they do not subscribe soon. We have no time for stereotyping or reprinting back numbers. PUBLISHERS.

"Downing's Landscape Gardening,"
Adapted to North America, with a view to the Improvement of Country Residences, and with remarks on Rural Architecture.

It is with no little satisfaction that we announce to our readers the appearance of the above work, from the pen of our gifted friend, A. J. Downing, of Newburgh.

We have had opportunity but for a hasty glance at its contents; and wish our readers could have shared our enjoyment, and we may add, pride, as we looked over this truly elegant volume. The engravings are very creditable to our artists, and the quality of the paper, and the mechanical execution generally, leave nothing to be desired.

The arrangement appears to us very simple and judicious, and so far as we have examined, his subject is treated in such a manner as to show a just conception of the wants and means of this, as distinguished from European countries. His motto is,

"Insult not Nature with absurd expense,
Nor spoil her simple charms by vain pretence.
Weigh well the subject, be with caution bold,
Profuse of genius, not profuse of gold."

But we must defer further notice until our next number, which we design to enrich with extracts from the work.

Acknowledgments.

Our sincere thanks are due to Mr. Charles Downing, of Newburgh, for a copy of his brother's beautiful work on Landscape Gardening, and a copy of Lindley's Theory of Horticulture, republished, with notes by Dr. Gray and A. J. Downing. More about these hereafter.

We are also indebted to Hon. H. L. Ellsworth, for several packages of seeds.

To Mr. James Greay, of Kent, England, for an interesting letter received some time since, and the annual report of the Nonington Farmer's Club.

To some kind friends in London, for valuable English books and papers.

To Thomas Ailcock, one of the editors of the Western Farmer and Gardener, Cincinnati, for a copy of "Bee-breeding in the West," a small manual, intended as an accompaniment to the "Subsided bee hive," well calculated to increase the *secrets* of rural life.

To J. D. Bemis, Canandaigua, for several interesting papers, among them a catalogue of teachers and pupils of the Ontario Female Seminary, an institution which we are happy to know *deserves*, as well as receives, the liberal patronage of the community.

Scarcity of Fodder—Seasonable Hints.

Farmers who "work it right," will of course take measures to provide sufficient food for their live stock the coming winter, and endeavor, as far as possible, to make up for the deficiency of hay and the failure of some other crops. It is not yet too late to sow millet—it produces both grain and fodder. Corn may also

be sown now, broad cast like oats, and will afford an abundance of the best of fodder. ¶ See remarks on those subjects in another part of this paper.

Those who have not sown any root crops, or have lost them, should now sow ruta baga—just in time—and if they fail, sow English turnips about the middle or later part of the month. Much time has been lost this season by the farmers and their crops, and both must now exert themselves to the utmost, or winter will find them unprepared. We advise our readers, therefore, to be-ir themselves, and keep stirring, and above all to stir the ground often among their corn and other cultivated crops.

Sales of Berkshires.

Mr. Lossing of this city, informs us, that he has recently sold his famous breeding sow *Maxima*, to Mr. Cren of Kentucky, for the handsome sum of \$300. The animal is well known to breeders of Berkshires, as one of the largest of her kind in this country. Mr. Lossing has also sold his imported boar *Newberry*, to the same gentleman, for \$200. He was shipped a few days since, and weighed, including cage, 820 lbs.—*Albany Cultivator*.

THE DEANSTON (SCOTCH) SUBSOIL PLOUGH.

The Subsoil Plough, we believe, is destined to effect a greater improvement in American agriculture than any other implement that has been invented or introduced of late years. We published last month, the remarks of Mr. Panney on subsoil ploughing; and we now copy from the Farmers' Cabinet some additional observations on the subject, together with a representation of the Scotch Subsoil Plough. We have seen these implements, both in Scotland and England. Those in the latter country were mostly of a better and more welded construction than the former; and we have no doubt but that a still better and cheaper article for the purpose will soon be manufactured in this country. We intend to give representations of several models in hopes to call forth the *ingenuity, constructiveness* and *enterprise* of some of our readers.

The Deanston Plough.

"The plough from whence the above drawing has been made, was brought to this country and deposited in the Franklin Institute by the late James Ronaldson, Esq. It is a gigantic implement, measuring 12 feet 6 inches in length, constructed throughout of wrought iron, weighing upwards of 300 lbs., and capable of rooting up stones of two hundred pound weight; it is intended for a team of 4 or 6, or even eight horses or oxen, when it might be let down to the depth of the beam. But much of the soil of our country would be effectually worked with an instrument of far less magnitude, constructed chiefly of wood and properly ironed, the *solo* or *share*, probably, being of cast iron: the length of the handles being in proportion to the weight of the plough to be raised by means of their *leverage*."

"Subsoil ploughing has formed in Europe—as it is destined to do in this and every other country—a new era in agriculture; it is applicable to all soils, and even in the most sandy will be found of superlative importance, preventing the disease called the *stod* in wheat, which is supposed to arise from a superabundance of moisture which cannot pass away, by reason of some impervious substratum, until it has chilled and deadened the roots of the plants and brought on a mortification of their sap-vessels: the disease is in some parts known as the *stunts* or *stunned*. It is understood that the subsoil plough does not turn the furrow—it passes along the open furrow made by the common plough, rooting up the bottom to any depth it might be put to, thus leaving it stirred and pulverized, to form a bed of loosened soil, into which the lower or tap roots of the plants might penetrate, when they will easily find moisture in seasons of the greatest drought, and from whence it is *pumped* up by them for the supply of the lateral roots, which are deemed to seek food in the upper stratum of the earth. The subsoil plough will be found, in many cases, to take the place of under-draining, especially if on plough-

ing, the land can be laid to give a *gradual fall* throughout its whole length—a matter of the highest importance in the cultivation of every soil."

From the *New England Farmer* Subsoil Plough.

On Thursday last, we spent the afternoon in holding the plough. The work was on land which has been long pastured. The surface mossy, the sward tender, the soil light. The subsoil partly a loose and fine gravel and partly a yellow loam. With two yoke of oxen we ploughed one half an acre with Howard's plough E. 2, to the depth of 7 inches, and subsoiled with Howard's subsoil plough about 7 inches. We found that 10 inches of subsoiling, with which we commenced, would worry the team. The stirring of the earth to the depth of 12 or 14 inches, we thought that might be an improvement upon shallow ploughing. And where it can be done as cheaply as in this instance, the experiment is not costly. But our case must not be taken as a fair instance of dispatch, for the furrows were 30 rods long upon a plain, and the ploughs were changed only 14 times in the half day. Ordinarily, where it is a day's work to break up an acre, it will take more than two days to break up and subsoil the same. In a few spots where the subsoil was slightly rocky, the subsoil plough appeared to be moved more easily by the team than any where else.

The extent to which the earth was stirred by this new implement, surprised us. The seven inch furrow was scarcely three inches deep after this plough had been passed under it.

We have strong faith that this instrument will come into extensive use. It is true that no great reliance should be placed upon theories until confirmed by experiment; and we are not inclined to devote much space to the praise of this implement the present season; but should our anticipations be fulfilled we hope to be permitted to urge its use another year.

THE HEREFORD OX.

Correct representations of distinct breeds of cattle, are more useful to farmers than portraits of living animals which do not serve the purpose of illustration. The Hereford is one of the oldest and most celebrated breeds, and one which particularly interests the American farmer, owing to its entering so largely into the composition of our common mixed breed.

The above portrait, which we find in the Farmers' Cabinet, copied, we presume, from Low's illustrations, exhibits the true form and characteristics of the Hereford Ox in perfection.

MR. MARSHALL'S description of this famous breed of cattle, is as follows:

"The countenance, pleasant and open; the forehead broad; eye, full and lively; horns, bright, tapering, and spreading; chest, deep; toson, broad and projecting forwards; shoulder bone, thin, flat, and no way protuberant in bone, but full and mellow in flesh; loin, broad; hips, wide and level with the former quarters long and wide; rump, even with the general level of the back; tail, slender; hams, roany, with carcase throughout deep and well spread, ribs, broad and standing close and flat on the outer surface, forming a smooth, even barrel, the hindmost large, and of full length; round bone, small and snug, and not prominent; thigh, clean and regularly tapering; leg, upright and short, with bone below the knee small; flank, large; twist, round and full; flesh, everywhere, mellow, soft, and yielding pleasantly to the touch, especially on the clene, shoulder, and ribs; hide, mellow and supple; coat, neatly haired, bright and silky; color, a middle red, with bald face.

"The breeders of these cattle would do well to preserve the old blood in as great a state of purity as possible, for they possess one of the most valuable breeds of cattle in the world. The distinguishing qualities of the Hereford Ox are, the great produce of beef, quick feeding in proportion to their growth and size, with immense strength and speed in labor. With respect to the most profitable return in quantity of beef, it may be presumed that no breed in England can stand in competition with them, and they have accordingly been most successful at the annual prize cattle shows, commanding the first prize, alive or dead. A writer observes: "This breed, so celebrated for producing quantity of beef, seems to combine all other desirable qualities—length, depth, substance, roundity, fineness, yet softness of bone. Their origin is supposed to have been a cross of the old Hereford and the Northern breed, and this opinion is strengthened by the remarks of a Herefordshire breeder, who says, about 80 years ago, a Mr. Galloway, of the Grange, procured a bull from Yorkshire with a white face, and wide horns, and bred from him; the produce became fashionable, and actually laid the foundation of the present famous breed—and hence the bald face of the Herefords, a breed which, conjoining beef and labor, stand on the summit; they fatten speedily at an early age, and will live and grow fat where others would scarcely subsist. It is however, universally admitted, that as milkers they are inferior to the Devons and many other breeds, while compared with these, they are shorter in the leg, higher and broader and heavier in the clene, rounder and wider across the hips, and better covered with fat; the thigh fuller and more muscular, and the shoulders larger and coarser."

The weight of Mr. Westcar's Hereford hire prize Ox, 2192 lbs. the four quarters.

THE NEW ENGLAND FARMER.—We mentioned some months since, that AYLEN PERHAM had resumed the editorship of this old and respectable paper; but as it had failed reaching us for some weeks previous, we could not speak of the effects of the change. Since then however, it has arrived regularly, and we ought before now to have stated that Mr. Perham's administration has, in our opinion, wrought a decided improvement in its character. The following article on Haymaking is a fair specimen of the genuine farmer style of Mr. P. We thank him for saving us the trouble of writing an article on that subject for our readers.

Hay Making.

Scythes.—Procure a good scythe for every man and boy on the farm, who is to do any thing in mowing. This work of cutting the grass is hard enough, with the best implement that can be made. And where the tool is poor, the work must be done either poorly or slowly—and in either case the farmer is losing more than the cost of furnishing a better instrument. We know not—(by the way, this term *we*, I am tired of, and shall, when it so pleases me, use the more proper representation of my single self, *I*)—I know not that any one of the manufacturers of this article excels the others: some scythes from each factory are good, and others are not so;—if you are unfortunate enough to

get a poor one, there is no economy in trying to work through the season with it; mowing off your grass; whetting every five minutes; fretting your own body or that of your hired man; going to the grindstone every two hours;—these attendants upon a poor scythe are such consumers of time, that it is better to throw the soft or the brittle thing aside at once, and purchase another. As a general rule the scythe that crooks towards the point works better than the straight one—at least it is so in my hands. The cast off scythe should not be put into the hands of the boy who is learning to mow—he wants in his feeble and unpracticed hand, a sharper edge than is required by the man. Give him a good and a light tool, or else excuse him from this work.

Horse Rake.—The value of this implement for use on a farm of common inequalities of surface, and of common size, is often over-stated in the advertisements and puff's. But the actual worth of it justifies its purchase. We have used the revolving horse rake for four or five seasons, on a farm where two acres is perhaps the amount mowed per day; the raking up of the thick green morning's mowing in the later part of the afternoon, is a fitting appendage to the previous hard work of the day. The old horse who has been in the pasture all day, and has nothing to do at present but kick his heels, can greatly lighten and considerably shorten this labor: we generally save in time probably from 15 to 60 minutes, and in strength more than

half. This saving towards the close of the day, comes in very opportunely, and we would not part without a rake for twice its cost.

To manage this instrument skilfully, requires some practice—but as soon as one gets a little accustomed to it, he can lay the winnow very well. On hay's turns its use must be more valuable than on small ones. Where grain is mowed and raked up, this rake is very convenient and comfortable; it takes all clean, and saves from hard land raking.

This instrument deserves more extensive use than it has found hitherto.

Time of Cutting.—Where grasses are not lodged, it is well to cut when they are fully and fully in blossom; but to avoid having some of them get far past this state before time can be found for scaring, it is prudent to begin upon the more luxuriant fields before they reach full blossom.

Curing.—In the early part of the hay season, while the grass is quite green, and much care is required for curing, it is well to be busy in turning it up to wind and sun; help it along as fast as you can—but later in the season, if the weather be good, it will be sufficiently cured the day after mowing without much assistance.

Some little matters amount to considerable in the course of the season.—in turning up hay, take the help of the wind; do this too in raking;—in raking after the cart, regard the corner of the wind and the direction in which the team will next move, and so arrange as not to be obliged to rake the ground over twice. In this simple labor of raking after the cart, I have found "head work" as profitable as in any of the operations upon the farm.

Salt.—Hay that would be liable to heat and sour because not quite cured, may often be mowed away with safety, if six to ten quarts of salt to the ton are applied. The use of salt upon nearly all the hay as it goes into the barn may be wise. I am inclined to the belief that a farm in my neighborhood on which salt has been very freely used in this way, had been greatly improved by it; that is, I think the manure has been much more efficacious in consequence of the salt applied to the hay. At home we find no hay so palatable to the stock as that which is cut young, three-fourths dried and well salted.

Clver.—This should be cured without much exposure to the sun. I can tell a story that goes to show that clover need not be so thoroughly dried as many suppose. Last year, about the middle of June, we mowed some very coarse clover, severely legging to blossom, and as full of sap as clover ever was. The weather was cloudy and foggy for several days, so that but little progress was made in curing it—it continued heavy and green; after four or five days, and while the corks were damp with fog we loaded it, because the indications of rain were strong. It was taken to the barn, stowed away, and very thoroughly salted. In four or five days it was dripping wet and burning hot; in fifteen days it was mouldy; in December it was the hay preferred above all others in the barn by "old Big Horn," a dainty cow that was chosen for the shambles; every animal in the barn would devour it greedily—and this too, when most of the hay, and all the corn stalks in the barn had been salted;—the salt taste was no rarity.

Drinks.—The hay-maker must have a full supply of drink; perspiration will be free, and he must have something to support it. There is no danger from frequent drinking in the hottest weather. Take cold water as often and as freely as you please; there is no danger from it, if you have not been too long without drink. Cold water is the best of all drinks for stalling thirst—it may be sweetened with molasses or with sugar; and if milk is taken with them, the drink is the most servicable we have ever found—furnishing nourishment while it slakes thirst. Rum and Cider, and their kindred spirits, are not to be admitted to the field of the prudent and worthy farmer. I know they are not needed; I know they are not useful there. The hay will be cut and cured with more despatch and comfort, when true temperance practices prevail, than where alcohol intrudes.

None but the intemperate are injured by drinking cold water. It told that I know not the birds'hip of swinging the scythe, and the need a man then has for the stimulus, I reply that I do know what it is to swing the scythe, and that on the very hottest day of 1840, I was mowing from half past four in the morning till three in the afternoon, with the exception of time enough to eat, drink and grind the scythe; and neither then nor on any other day of the season, did I require the use of any other drinks stronger than milk and water. And no man, after one month of temperance, will ever require any thing stronger.

Asparagus.

An observant neighbor proposed to us, the other day, to recommend planting asparagus in a single row, each plant two feet apart. In beds, the plants crowd each other; and if surrounded by weeds, send up more slender stems. These remarks agreed entirely with our own observations; for though we have been at the expense of making deep beds of the best materials, our finest asparagus grows in common soil where the seed was accidentally dropped. In beds it is difficult to remove such seedlings as spring up, without injuring the roots of the older plants; but from a row this may be easily done; and all plants that intrude on them should be treated as weeds.

To raise the plants: Separate the seeds from the berries, and sow them in a bed *late in the fall* (not in the spring) covering them with fine earth half an inch deep. If put in rows, so that the hoe can pass between them the next season, they may be kept clear of weeds more conveniently; and when one year old, if they have had plenty of room, they may be transplanted. One long row may be the best. And be careful that not more than one plant is set in a place.

The cropping that asparagus endures, is very severe; and it seems reasonable that the plants should be strengthened by the growth of three years before they are molested. To cover the stools in the fall with stable manure, and to rake off the coarser parts in the spring, is an old and excellent practice: It protects them from the frost of winter and manures them at the same time. Strewing salt over them liberally in the spring, also adds to their vigor.

In a few years, an asparagus plant, neither crowded on by others nor over-cropped, will form a stool from twelve to eighteen inches across.

Disease of Silk Worms.

The subject of Silk culture is assuming a degree of importance, which, in our opinion, justifies us in devoting to it considerable space. The passage of the law giving a bounty on Silk and Cocoons in this State, will induce many to engage in the business who have not done so heretofore; and we shall endeavor to impart as much information on the subject as appears to us important and is consistent with justice to the majority of our readers.

The following article is from the April No. of the Journal of the American Silk Society, a monthly publication by Gideon B. Smith, Baltimore, which ought to be taken by every person engaged in the Silk business. Price, \$2 per year.

IMPORTANT TO SILK GROWERS—THE MUSCARDINE IN AMERICA.

Probably the most important information it has ever fallen to the lot of the editor of the Silk Journal to communicate to the public, on the subject of Silk culture in this country, will be found in the present article.

It has long been known to every reader of publications on silk culture, that by the ravages of a disease called *muscardine* in Europe, the average loss of worms, taking one year with another, amounted to 45 to 50 per cent. of all that were hatched, and this too, after the greater portion of the expense of rearing had been incurred. This evil has been continued from time beyond the reach of history, till within a year or two past. In the United States all of us have heretofore considered our worms exempt from this fatal disease; as it has generally been supposed that it did not exist here at all. This was a fatal delusion. We have just received from France a copy of the "Annales de la Societe Sericicole, fondee en 1836, pour l'amelioration et la propagation de l'industrie de la Soie en France," for 1837, 1838 and 1839, in one of the volumes of which we find a most excellent plate representing silk worms in the various stages of the muscardine, the first glance at which showed us that it was the identical disease of which a great portion of the silk worms in this country have perished. All who saw the disease last year and have seen this plate,

identify the disease instantly. We shall endeavor to have translations made for our next number, descriptive of the disease, and if possible—if we can get the means—publish the plate also. In the meantime, however, we have thought it advisable to take this hasty notice of the fact, that all silk growers may be enabled to apply the remedy. Happily the remedy will do no harm, whether the worms are affected with the muscardine or not; nor will it injure the worms even if they are perfectly healthy, or if they have other diseases. The remedy is the free application of air-slacked lime to the worms, and also over the floors of the cocoonery, and white washing all the wood-work of the fixtures. The lime should be sifted through a fine sieve on the worms two or three times a week if healthy, and once a day if diseased, in the morning before the first feeding, and always after cleaning the hurdles. The quantity of lime to be sifted on the worms may be just sufficient to whiten the worms and leaves well. This remedy has during the two past years enabled those persons in France who have used it, to save and obtain cocoons from 97 per cent. of all the worms hatched.

Now that we know the disease that has done us so much injury, and also know the remedy, the latter should be applied; and as there are very few, if any, who yet know the disease by sight, we would most earnestly recommend that the remedy be applied in ALL CASES, whether the worms be sickly or not, as a preventive, for it is even more effectual as a preventive, than as a remedy, and, as before stated, will do no harm to either healthy worms or those affected with other diseases. It must be borne in mind that this is a contagious disease, and if but a single worm be affected by it, the disease speedily spreads among the others, until all or a large portion of them are destroyed. The French have discovered that the disease consists of a *fungus growth*, something like mildew, or mould on cheese, scarcely discernible to the naked eye, but perfectly developed by the microscope. The fungus is propagated with great rapidity—so much so that from the small speck on a single worm it will spread over a whole cocoonery in a very few days. It generally attacks the worms after a fourth moulting, and when not arrested, carries off the greater portion of them. Sprinkling the worms with slaked lime, however, effectually prevents the disease, and will cure all the worms in which it has not made too great an impression.

We have already been asked how this discovery corresponds with our New Theory, in relation to retarding the hatching of the eggs, and anticipate further questioning on that point. In our opinion, it is perfectly consistent with the principles inculcated by the New Theory. Retarding the hatching of the eggs beyond the natural period, the New Theory says, weakens the constitution of the young worms, and predisposes them to disease. The present discovery points out the particular disease thus induced, or at least, one of them, and that the most formidable. Let the eggs be hatched at the *natural period*, that is about the time in which their parents were hatched in 1840, and then the constitutions of the worms will not be debilitated or vitiated by the unnatural process of retarding. By this means we shall usher the young ones into the world with good sound constitutions, subject to no other disease than those they may contract from contagion or bad treatment. By this discovery, therefore, we have only found out the name and nature, and means of prevention and cure of a disease we have all along had amongst us. It must not be considered in the light of a new calamity that threatens us; but rather as the discovery of the means of averting one that already afflicts us. It is fortunate that this invaluable information has reached us at this particular moment—just in time to be of immense service to us in this our day of ordeal.

It must not be supposed that the above remedy is alone to be depended upon, or that the application of lime as above directed, and for the purpose specified, will authorize the omission of the usual precautions and attention to cleanliness, ventilation, &c. On the contrary, the strictest attention to cleaning the hurdles, removing rubbish, purifying the air by ventilation, &c. must be observed at all times. Every worm found on the hurdles in a sickly condition or dead, should be immediately removed. We have never seen any valuable result from a sickly worm, and would therefore recommend that all such be removed to a distance and destroyed. Some of the French silk growers have *hospitals* for the reception of such *invalids* as afford any hope of recovery; but we think it is better economy to get rid of them at once.

We hear occasionally of fixtures being contrived for rearing the worms upon, that save the trouble of clean-

ing the hurdles. We have ourselves years ago pursued such a plan, and with success too. But there is danger in all such, which must not be overlooked. If disease occur among the worms, the sick are apt to be concealed by the accumulating rubbish and branches and dying in their concealment, the first notice we shall have of the existence of disease to any considerable extent, will be the offensive odour evolved by the dead worms; and very probably a rapid spread of contagion among the healthy worms. In feeding with branches, therefore, we should clear the hurdles just as often and as necessarily, as when feeding with picked leaves.

That no one may be misled by the remarks in this article on the muscardine and its preventive, by the use of lime, it seems necessary to say, that several other diseases affect silk worms, and many worms were destroyed last summer by other diseases. It must not, therefore, be taken for granted that the application of lime is to prevent and cure *every* disease, though we believe it will act as a preventive of most of them when accompanied by other necessary and proper treatment. If from any cause the worms have a debilitated and sickly constitution, they will be liable to various diseases, and the proper preventives will be the above, viz: cleanliness, thorough ventilation, the use of lime, &c. We most truly believe that the most prolific source of all the diseases of silk worms last summer, was the retarding of the hatching of the eggs. The worms were weakly in consequence of it, and thence more liable to be affected by the various exciting causes of disease, than they would have been had they possessed robust constitutions. We believe that the muscardine may be, and probably is, generally generated by this very process in this country. The French say it is caused by a fungus growth, which fungus is a vegetable of an inferior order and produced by its own seeds. The inference then is that it cannot be produced in the absence of its seed. But we know that the mould of bread, cheese, &c. is also of the same order of vegetable growth, and that it is produced any time when the temperature of the weather is favorable to it; and hence we infer, not that it is a spontaneous production, but that its seeds *always* pervade a substance in which the growth is found, and are only prevented from growing by the *non-concurrence* of the circumstances necessary to their growth. Time, high temperature and moisture, are the circumstances that are generally required to concur in the production of mould, mildew, &c. Take away either, and neither mould nor mildew will be produced.

One remark more seems appropriate here. Our climate is unquestionably more favorable for silk worms than that of any part of Europe; and it is particularly so in regard to the muscardine. The extreme dryness of our atmosphere, compared with that of any part of Europe, is notorious; and it was this fact that induced the universal belief that the muscardine did not prevail here. But although our atmosphere is comparatively dry, the air in our cellars and ice-houses and cocooneries is not always so. The keeping of eggs in damp cellars and ice-houses, wherein they have become mouldy or mildewed, and especially when kept there for a long time and beyond the natural time for hatching, may very well be considered capable of developing the fungus growth constituting the disease called muscardine; and unless we take care to avoid such, it will be in vain to expect our climate to protect us against the consequences. G. B. S.

Hiving Bees.

I have practiced two methods of securing new swarms of bees when they leave the old hive, both of which I think preferable to the old fashioned way of rattling all the old tin pans and sleigh bells in the neighborhood, until the swarm settles, and then brush the topsy-turvy into the hive. My first method is this: as the season for swarming approaches, I cut an eye-green, such as fir or spruce, about six or eight feet high, and trim off all the branches on one side close to the tree so that it may be laid flat on the ground the lower end, or butt, is sharpened like a stake or set in a hole made by an iron bar in the ground about ten or fifteen feet in front of the hives. Swarms will very seldom seek any other resting place, when about like the above is at hand. When a swarm leaves its hive I say nothing, but stand and look on, until the bee become still and quiet on the bush. I then carefully raise the bush from the hole, and lay it flat on the ground, and place the hive over them. If the limb on the upper side interfere, I press the hive down and lay a stone or some heavy substance on to keep it in its proper place, till the swarm takes possession which is generally in ten or fifteen minutes. In this way I have never lost a swarm, and have frequent

nived a swarm and removed them to the bee house among the old hives in one hour from the time of their leaving the hive.

My other way is as simple, and as far as I have tried it, equally sure. I take a board wide enough to set a hive on, and two or three feet long, bore a hole in the centre, and drive in a pin, one or two inches in diameter, and eight or ten inches long; I then take two small cords and fasten the end of each to the corners of the board so that they form a loop at each end of the board about two or three feet long. This board thus prepared I suspend from two stakes in front of the hives, with the pin pointing downwards, taking care that the stakes slope towards each other so that the board may not touch at the end, around this in the bees will cluster, and when they get still, unhook the cord from the stakes, turn the board over carefully, lay it on the ground and set the hive over it, in this way much time and trouble may be saved, or here is no need of watching for swarms, only provide such resting places, and there you will find them. I have left a swarm suspended under the board as last mentioned, through the day and found them safe in the evening, and hived them after the other labor of the day was past. I think on the whole this method is the best, as they seem more contented under cover of the board than when more exposed, and not so likely to take wing before they are hived.—*Mechanic and Farmer.*

Circular.

to the Agriculturists, Manufacturers, Mechanics and Artizans of the United States.

The American Institute of the city of New York have directed us, the Trustees, to announce to the public, that the Fourteenth Annual Fair will be held in its city, in the early part of October next. The time and place, with a variety of details, will be made known and published by the Managers as soon convenient, after their organization shall be perfected. This Institute was established and incorporated by the Legislature of the State of New York, to promote domestic industry and improvements in the United States. Among the means suggested in its charter, are public exhibitions of meritorious productions, and rewards for such as are most deserving.

Thirteen Great Annual Fairs have already been held. Their beneficial effects in exciting emulation have been seen and directly felt in more than half the States of the Union.

The popularity of these exhibitions, the extended intense competition they have excited, is without precedent. More than one hundred thousand visitors have been admitted, and more than fifteen thousand specimens of domestic products have been exhibited at a single anniversary.

A Repository for the daily exhibition of improvements, and a Library, of great utility for practical purposes, have both been established by this Institute, and have been open for years free of expense to contributors and visitors. Five ploughing exhibitions have been held on fields in the vicinity of New York; and many eloquent addresses, instructive lectures, and able reports, have been made on different occasions, all having a bearing on productive industry.

The amount of gratuitous labor bestowed by the producers of this Institute in fourteen years, it is believed, is without a parallel in the history of our publications. Hitherto the Institute has been sustained by voluntary contributions, unaided by city or State bounties. Impressed with these ideas, the Legislature, in a law just passed, intended for the promotion of "Agriculture and Household Manufactures," has wisely included the American Institute, and on certain conditions appropriated to it nine hundred and fifty dollars per annum for five years, requiring premiums to be awarded as suitable means for accomplishing the objects of this enactment. In addition to the pecuniary aid contemplated by this act, which is timely, I will enable us to extend our premiums, it is a public testimonial of the high consideration maintained by the Institute in the opinion of our Legislature. The confidence reposed in the Institute is in the highest degree honorable to its conductors, making it therefore the direct agent to carry into effect a law important in its future effects, and expressly enacted to encourage the great and paramount interests of agriculture, which supplies not only the principal material which all other labor is employed, but also affords sustenance to the whole human race.

Accommodations will be provided at the Fourteenth Fair for the exhibition of every kind of agricultural and horticultural productions, for machines and implements, and steam power and engines. Separate and

suitable places will be assigned for exhibiting cattle, horses, sheep, swine and other farming stock. The best productions of the manufactory and the workshop, including woolen, cotton, silk and linen fabrics, will have their appropriate rooms. Labor-saving machinery will not only be examined by competent judges, but also tested by steam power. All new and useful labor-saving inventions will command attention, and publicity given to their merits. Purchasers will have the best possible opportunity to examine, compare, and select such articles as they may wish. Gold and silver medals, silver cups, diplomas, as well as rewards in money, will be bestowed on those most deserving. The appropriation will enable the managers more liberally than heretofore, to reward industry generally, and more particularly female industry, for ingenious fabrics of household manufactory.

On behalf of this Institute, we would earnestly invoke the patronage and exertions of prosperous and intelligent agriculturists, to enable us to fulfil the expectations of the Legislature. In its wisdom it has laid the foundation of great and lasting good to the State. But much of the success and popularity of the law to encourage agriculture will depend on the American Institute. Its position in the city of New York is of all others the most favorable. There will always be in this great emporium choice spirits, and such as know well the inestimable value of agriculture, and who are able and willing to aid any and all great and beneficial objects. The whole island is surrounded with fertile and highly cultivated farms and gardens, extending into the interior, which bring their supplies daily to our numerous markets, to meet the vast demands of city consumption. A large proportion of all the farming and gardening implements used in this and the adjoining States is supplied from this city; and with the facilities of conveyance by horses and by steam, by land and by water, it would seem to be the chosen place for agriculture and horticulture to present their fairest and best contributions, and the radiating point from which the knowledge of improvements may be readily made to flow to every portion of our country.

In conclusion we would also respectfully appeal to all the multiplied interests of industry and art to make their contributions of the best specimens, that the miniature view may be presented of the skill, the genius, and the ample resources of our country at the coming anniversary and to the public at large, whose countenance and cheering approbation has uniformly attended all our undertakings for more than thirteen years, and to whose favor this Institute owes its existence, we appeal with unqualified confidence, and, at the same time, with a strong desire for the special and best influences of our fellow citizens, at this time, to enable us triumphantly to carry out the coming exhibition, and discharge the obligation conferred by the recent legislative grant. By the kind aid which the public can confer, and with the means provided, a new impulse may be given to agricultural improvements, and to invention and the arts, over our whole State; other States, some of which are behind, will thereby be induced to profit by our example, and thus the benign influence of liberal legislation will be exemplified in every section of our wide spread country.

Repository of the American Institute,
New York, May, 1841.

For the New Genesee Farmer.

Fence Posts Heaving by Frost.

GENTLEMEN—Can you inform me how posts should be placed in the ground so as to prevent their heaving by the frost? My land is clayey, and a good fence in the fall becomes a poor one by the next spring. Should the holes be very deep and closely filled up, or left loose at the top? II.

Utica, June, 1841.

Posts set in clayey ground, if surrounded by the soil removed in digging the hole, will be thrown upwards by frost, in spite of any precaution we know of. But where they are put in a gravelly and not tenacious soil, they rarely, if ever, heave in winter. Nor do they in a clayey soil, if the holes about them

are filled with small or broken stone closely beaten in. Possibly other materials would accomplish the same end, though we have no experience on the subject. Deep and firm setting, is of course necessary.

Fat Cattle.

Since taking charge of the Keystone we have observed a very large number of fat cattle passing our office daily for the eastern market, and have made inquiries as to the probable number. Through the politeness of Mr. Kuhns, the toll collector at the Western end of the Harrisburg bridge, we have ascertained that from the 15th of April to the 17th of June, there have passed over said bridge, eastward, seven thousand eight hundred and fifteen head of fat cattle. Add to this three hundred which were enabled to ford the river yesterday and to day, and there has passed through Harrisburgh for the eastern market, eight thousand one hundred and fifteen head of cattle. These cattle, we understand, will bring upon an average \$55 per head, making them, in the aggregate, worth \$458,250.—*Keystone.*

Proper Season for Cutting Grain.

It is a good practice to cut every kind of grain rather before it is fully ripe in the grain or the straws. In a fine season, some farmers cut their crops when they find the neck of a grain straw jointly under the ear, free of juice when twisted round between the finger and thumb, and do not wait until the lower part of the stems are dry and yellow, because they find in such a season the straw to die from the ear downward. In a bad season, on the other hand, the lower part of the stem first becomes yellow and dry; after which, of course, the crop is not allowed to stand, for in such a season the ear never becomes mature, having less absorptive power, whilst the vitality of the root is early destroyed by the combined effects of bad weather and an ungenial state of the soil.—*Quarterly Journal of Agriculture.*

From the Farmers' Cabinet.

Application of Lime to Soils.

Read before the Philadelphia Society for Promoting Agriculture, April 7, 1841.

Lime has long been regarded by farmers in certain sections of our country, and cultivating districts, as a most valuable agent. Stiff and tenacious soils are greatly benefited by its application, as is admitted by all who cultivate them. Whether the various chemical influences which have been assigned to its presence, are really those which constitute its virtue, I shall not inquire in this essay; I propose merely to submit some views that have occurred to me, which the plain practical farmer can fully appreciate, without the aid of chemistry or science, or their technicalities.

Clays and red shell soils are compact and tenacious, and are therefore greatly benefited by an admixture of lime, as they are rendered more mellow or friable by its application; the color of the soil is also changed to a dark brown, and has a rich oily appearance. These combined influences give it a greater capacity for imbibing heat from the action of the sun, and this additional heat communicates an increased vegetative power; besides, the improved friability or mellowness of the soil gives greater facilities to the fibrous roots of plants to shoot further into it, and hence they obtain a larger supply of nourishment or food. Its capacity for absorbing moisture is also greatly increased, because, for the reasons above stated, the plastic properties of a stiff soil are removed, and moisture, either from rain or dew, is more readily admitted and absorbed; and having penetrated into the soil, is retained, as if by a sponge, for a longer period. Farmers who are familiar with stiff soils, know full well that they will not admit heat nor absorb moisture so readily as those which are lighter, and the latter do not bake and become so hard and dry as the former—besides, a purely clay soil is always cold at a short distance below the surface.

Such soils, so improved, have increased capacity for imbibing heat from the action of the sun by day; and this heat is maintained for a longer period at night; and hence, a protracted evaporation or emission of heat is secured, which, acting upon the cool atmosphere of night, produces a greater amount of dew. The soil is therefore rendered capable of creating a larger supply of moisture—of imbibing more heat, and of receiving and retaining those agents of vegetation alternately, for a more protracted period. Dews are occasioned by a cool atmosphere coming in contact with the exhalations from the heated earth, or

vice versa, and hence a condensation of the aqueous particles; the dew-drop of evening is first seen upon a blade of grass at its highest point.

Heat and moisture are necessary to vegetation, and the more you can obtain of these agents for your plants, the more vigorously will vegetation be sustained. Lime, when applied to a stiff soil, renders it more friable, porous or mellow, and it becomes more easy to cultivate; the plough does not meet with the same resistance; the roots of the grass and weeds are more easily separated from the soil, and may therefore be more readily destroyed, and a thorough tillage or pulverization of the land is thereby greatly facilitated. Besides, we find that vegetation is most vigorous where the soil is adapted to secure the largest amount of these supplies; and consequently that soil which by nature or cultivation is capable of imbibing and retaining the largest amount of these indispensable elements, has the greatest capacity for producing vegetation. A sandy soil appears too porous to retain heat at night, to promote to any important extent a condensation of the atmosphere, and thus supply itself with sufficient moisture from dew—besides, it is too readily drained; while a clay or compact soil becomes indurated upon its surface, and heat from the sun cannot sufficiently penetrate it to be available for a like purpose; but when these are properly mixed and combined with other earths, such as lime, sand, or with manure, the soil opens its pores to receive the invigorating influence of the sun during the day, and at night the heated exhalations escaping from it, producing a greater amount of dew, supply the plants, nestled in its bosom, with necessary moisture from the pure and bounding remains of the atmosphere.

Some farmers think that lime is injurious to wheat land—that it makes the soil cold, and that their lands, when dressed with it, are in no apt to produce mellowed grain than they were before it was applied. That this, in many instances, has appeared to be so, I do not doubt, because the soil, by its application, is rendered more productive, and therefore we have more grass, which, under our present system of sowing grass seed with wheat, is injurious to that crop, as I have contended in a former paper. Tall, in his excellent *Fauna on Blight*, says, "What being doubtless originally a native of a hot country, it requires, by its constitution a considerable degree of heat to bring it to perfection; and if much of that degree of heat is wanting, it will be the weaker, and when the solar rays cannot reach the lower parts of the stalks, the lowest leaves and knots cannot do their office;" and hence the maturity of the plant is retarded, because "the lower parts of the stalks must receive the greater share of heat, being nearer the point of influence of the sublimis reflected by the ground." Being deprived of this genial and necessary heat, since it is shaded near the roots by grass, and being imbedded in too moist and cold a soil, it has not the power of elaborating its sap or evaporating its fluids, and is therefore slow in ripening; and hence the crop, becoming diseased, is frequently destroyed by mildew.

In the application of lime to land, much care and close observation is required, to produce the best results. The farmer should not be too generous; he should not forget that lime and earth constitute mortar, and therefore his care should be only to apply so much to his soil, if light, as will render it sufficiently compact to retain moisture and heat; for a sandy soil is composed of spherical particles, and is too readily ventilated and drained of its moisture, and being mixed with lime, the interstices being closed, the soil is greatly improved. After several years of experience and careful observation, I am convinced that lime, when applied to a sandy soil, renders it more compact and much more productive; and that manure, when applied to it after a dressing of lime, will have a much more lasting influence than it would have had before its application. Upon heavy soils, lime should be applied only in such proportions as will render it most mellow or friable; any thing beyond this, will be found to be injurious. It is not material, as I apprehend, whether it be put on in a hot or cold state, because it is so soon cooled on by the atmosphere after being shaked, and cannot be ploughed in until it is a cold before it becomes chilled. I usually apply it in the spring, when preparing for corn, the winter crop of which, and the preparation of the land for subsequent crops, thoroughly mix it with the soil. I obtain the lime when ready to apply it, have it placed in a situation convenient for water, where it is immediately slaked; and as it falls, it is cut out and spread upon the land previously ploughed, which, after being harrowed, is struck out and ploughed. I have

applied it in other ways, but the results were never so satisfactory.

I have been told by some farmers, that the greatest benefits from the use of lime on their land are exhibited in about seven years after its application; some say in four years; some contend that they have seen its effects the second year, and others say that they never saw any effect whatever from its application, although they put it on in generous quantities. Now, I verily believe all these statements to be true, and I account for this singular anomaly in the following manner. In the latter instance, the lime was ploughed in so deep that it was never mixed with the soil, and therefore produced no effect; and in the former, the admixture took place probably in one, four, or seven years after it was applied. In some cases, it is said, land has been injured by it. I am inclined to believe that in those cases the farmer has been too generous, and would recommend as a corrective, that he plough deeper, and thereby mix more earth with his lime. He will thence have the advantage of a deeper soil. As the quantity best adapted to improve most soils, I would recommend from forty to fifty bushels unsifted to the acre. I have found excellent results on sandy, clayey, and loamy soils, from the application of that quantity. As I have never farmed limestone or red shell soils, I cannot advise respecting them.

I therefore repeat, mix your soil well with the lime which you may put upon it—pulverize it thoroughly—destroy all natural vegetation, if you wish to raise naturalized crops—exercise a sound judgment as to time and method, and you will seldom have reason to complain, in this part of Pennsylvania, at least, either of an ungrateful soil, or an unfavorable climate.

KENDERTON SMITH.

The Flowers of Summer.

In writing our sketches of the flower garden, we have not had leisure to examine what we said in our first volume on the same subjects; and possibly some things may be repeated.

Pennisia is an splendid genus, and 17 species were known in 1829. The single flowers are gone in a few days, but the double are more durable. The earliest kind that we have seen is *P. tenuifolia*, which spreads through the ground, and in a few years forms a stool of several feet in diameter—flowers single, of the bright crimson.

Soon after appears *P. montan*, a shrub from China, growing to the height of three feet in England, and attaining the same stature in this climate. A well grown "tree" (or so it is called) may be three feet or more across, presenting a magnificent display in all its varieties that have come under our notice, though the flowers vary in color. It is hardy, and suits to grow very early in the spring.

P. affinis was introduced from Switzerland in 1548, and has spread into some fine varieties. The double sorts are the common crimson, the rosy, and the whitish, or the *albicans*. Sabine's crimson is one of the finest of the single sorts.

This plant and *P. corallina* are the only two species credited to Europe, the eastern side of that continent having furnished most of the species. *P. albaflora* (called the Chinese) though herbaceous, sometimes attains the height of 4 feet, and is very showy. Four double varieties of this species are now blooming in our garden, viz: Humel, Whited, fragrans, and Reeves's—the last, a bluish color, fading after it opens. This species grows freely from seeds, springing up in many parts of the garden, but requiring several years to bring them into bloom.

The glutinous-leaved (*Rubinia viscosa*) produces its pink flowers in abundance; and but few trees are more ornamental. It increases sufficiently from its horizontal roots. It is a native of the Southern States, though hardly here; and is classed with timber trees, sometimes growing 40 feet high, according to Elliott. In this northern land, however, it has the habit of a shrub—10 or 15 feet high.

Philadelphus. This genus of six or eight species, produces only white flowers. *P. hirsutus* is much

taller than *P. coronarius*, though London only marked it 3 feet high! The flowers are also much larger and whiter, but scarcely so fragrant. The variety called "double flowering," has not a tenth of its flowers double. Another called "nanus" is hardly worth cultivating. Both these varieties belong to *P. coronarius*, which is a native of Europe.

The flowering ash (*Ornus europaea*) at the height of 5 feet bloomed with us this season for the first time. The flowers are white, very small, and grow in panicles.

The *Iris* is finely represented in this month. A large kind with light blue flowers, is remarkable for its delicacy; and appears to be a variety of *I germanica*. Four tall sorts with yellow flowers also shine out. While most of the species exhibit their blossoms conspicuously on their summits, one called the blue Russian, hangs its flag half mast high—down among the leaves. Two bulbous species from Spain (the Spanish and the English) have run into many varieties—of each kind have been advertised; but though some of the Spanish *Iris* are beautiful, others have a large or dingy aspect, and are not worthy of cultivation. All the sorts that we have seen of the English *Iris* however, are splendid.

Wistaria speciosa, a twining shrub, with blue purple flowers in dense racemes, is a native of the South but endures our winters. It deserves a place among fine plants.

Spiza aruncus, 4 feet high, is very showy; though its white flowers are small, they are very abundant. Its inflorescence is also singular. In our opinion, it is finer than any herbaceous species from the eastern continent; and a worthy congener of an American variety of *S. lobata*.

Drecocephalum ruschianum resembles the Hyssop, but its flowers are a fine rich blue. It is an old inhabitant of the gardens.

Jasminum herni is the only species of the genus that succeeds here in the open border. It is sometimes damaged by the winter; but when frosts are not very severe, its yellow star-like flowers make a pleasing display in the following season. It is probably a native of Italy.

We have two varieties of *Chionanthus virginica* now in flower both nearly of the same age, but the broad leaved kind is the taller, with fewer blossoms. The narrow leaved variety is loaded with bloom. This is the white Fringe Tree.

The fine purple flowers of *Verbascum purpureum* may be seen by early risers, but they begin to shrivel as soon as the sun shines out with power.

For Lilies, Pinks, Roses, &c. see New Geneva Farmer Vol. 1.

Spurious Ruta Baga Seed.

MISSRS. EDITORS—Last season one of our merchants bought a quantity of ruta baga seed, and sold it out to a number of farmers in this vicinity. It came well, and the plants appeared like genuine till after the second hoeing, when the roots were about as large as a man's finger, the tops then all branched out and run up to seed; so that the crops were an entire failure, much to the disappointment and loss of our farmers.

On inquiry, it was ascertained that the seed was raised from small ruta baga, and was surrounded mixed with mustard when growing.

Now, I wish to ask whether the mustard caused the degeneracy of the ruta baga seed, and if not, what did it? If you, or your correspondents can explain the matter, it may be of service to others. We farmers, at best, slow enough to adopt any new article or system of cultivation; and when failure or disappointment occurs, it often tends to check, if not entirely

revent, the introduction of valuable improvements. Some of those who sowed the above seed, had never attempted growing ruta bagas before; and this failure has discouraged them so that they will not try again soon.

Respectfully yours,

ERASTUS SKINNER.

Prattsburgh, N. Y., June 18, 1841.

Remarks—Several instances of disappointment, similar to the above, have come under our observation, within ten years past; and we have taken some pains to ascertain their cause, although we have not always succeeded to our own satisfaction. The different species of the genus *Brassica*, including the whole Cabbage and Turnip family, not only mix with each other very readily, but are very liable to degenerate from want of care in raising the seed, or other unfavorable circumstances. In reference to the case mentioned by our correspondent, we do not think the mustard was the cause of the evil, although we do not say it might not have been. Mustard (*Sinapis*) is considered by the botanists, a different genus from the ruta baga; but it is of the same natural family, and bears such evident marks of relationship that it is more than probable they will mix, when in blossom together. But if this had been the cause of the difficulty, the plants would not all have run up to seed uniformly. We therefore conclude that the true cause was another one alluded to—namely, *degeneracy*. It is stated that the seed was raised from small roots—perhaps from a crop that was not worth harvesting, and therefore left in the ground over winter, and allowed to go to seed—and it is not certain that the process of degeneration had not been in operation several years. At all events, it is well known that the greatest care is necessary in raising all kinds of turnip seeds, as well as that they be raised under favorable circumstances; and no more care is usually bestowed on this business in England, together with a more favorable climate, it is generally found that imported seed produces better roots than that raised in this country.

The Weather—The Crops—Harvest Prospects.

The longest and most severe season of drought ever known before harvest in this section of country, has been experienced this season, and we believe the same may be said of most parts of the United States and Canada. For about six weeks, scarcely enough rain fell in this vicinity to moisten the surface of the earth, or to encourage the hearts of its cultivators. Just one week ago, however, there commenced a succession of the most fruitful showers that can be imagined; and all nature now rejoices under their revivifying influence. About 10 days since, we passed over part of this and several of the adjoining counties, and it was truly melancholy to witness the suffering crops, and to hear the mournful complaints of the farmers. And truly many crops have suffered, past recovery. Grass, of course, is very light. Oats and barley the same. Corn that was planted early, and in rather moist soil, looks well, but some pieces are still failures. Wheat is generally light, and must all be somewhat short of an average crop, although we think it will be better than many have represented. Potatoes came up slowly, and are very backward, but here is still time for them to recover. Beet and carrot seeds, sown early, have mostly done well, but those sown later have generally failed, as is always the case in dry weather.

The latest accounts from other parts of the country, form a cheering contrast with those received two weeks ago.

"The New York Express states, on the authority of personal observation during an extensive tour, in the most productive parts of New Jersey and Pennsylvania, that the appearance of the fields of wheat, rye and oats, promises an abundant harvest."

"The Richmond (Virginia) Star says—A great deal of wheat has been cut, and we rejoice to understand, is of a very promising character. Indeed the harvest promises well. The probability is, that flour, the great staple will be very low during the coming year—and that is no slight comfort to poor people."

"The Albany Morning Advertiser says:—The crops throughout the country, generally, are represented as promising. Though in some parts we notice there may be a falling off, yet the average will be a good one."

The Fort Wayne (Indiana) Sentinel says:—"The season here has been remarkably backward, but crops are now coming on finely. Wheat never did more fair for an abundant harvest. Oats and grass are equally promising. Corn is more backward, owing to the wet and cold weather about planting time. Some did not come up well, but we have had fine weather for several days, and it has grown astonishingly."

WHEAT PROSPECTS.—We have the most flattering accounts from all portions of our country, of the prospect of a plentiful harvest. An unusual quantity of wheat was sown last fall, and its appearance now indicates a great yield.—*Harbor (Ohio) Advertiser*.

The Painesville (Ohio) Telegraph, of a late date, says:—

"Farmers may now obtain seventy-five cents cash, for wheat, in our streets. For Oats, 25 cents; potatoes, 16 cents.

These advanced and advancing prices, and sales for cash, are encouraging to our farmers, and inspire all with fresh hopes of better times. The prospect now is, that notwithstanding former fears, the present will be a season of great abundance."

THE CROPS.—The Germantown (Pa.) Telegraph says:—"Our farmers have begun in earnest their hay-making, though much of the grass appears, from the backwardness of the spring, to be yet growing. The crop generally, is as good as in any ordinary season; and should the weather enable it to be housed without injury, the supply of this staple production, which it really is here, will be equal to the demand of the customary prices."

The accounts from the western portion of Maryland are decidedly favorable to the growing crops. In Frederick they had refreshing rains last week. The last Uniontown (Pa.) Democrat had a paragraph complaining of the drought, but its complaint was cut short by copious rains which commenced falling on Monday.

The Savannah Republican has intelligence from the interior of Georgia, that the promise of the coming corn crop, now considered as half secure—is good, the wheat in Upson county, where the harvest is commencing, very good, the cotton crop, rather poorly for the present.

The (New Haven, Conn.) Farmers Gazette, of June 25, says:—

"If fine weather, and an abundance of it, can have a beneficial effect on the crops, there is reason to believe that our farmers will this year have no cause of complaint. The frequent and copious showers of the past week have had a most happy effect on the vegetation of this neighborhood, and dissipated the fears of those who have been disposed to distrust the goodness of Him who has promised that the earth shall yield food sufficient for man and beast. We are told that in consequence of the rain of one day last week, the price of hay was reduced two dollars. Except in some upland meadows where the drought was particularly severe, it is supposed that the crop of hay in this vicinity will be as heavy as an average of several years past."

Sowing Corn for Fodder.

The severity of the drought at the present time, threatens to diminish greatly the crop of mowing grass the present season. Red clover is now putting forth its full bloom, while the stalk is not more than ten or twelve inches high, instead of twenty-four inches, which it ought to be. The fox tail, or timothy as it is generally termed, is now shooting out its head, while the stalk, on dry soils, is scarcely a foot high, when in favorable seasons it would be two and a half feet. There is great reason, I think, to apprehend that the crop of mowing grass will be diminished one half.—The season is so far advanced, that moderate rains, even now, could not, I think, retrieve the crop.

To the farmer who has a large stock to sustain through another winter season, and whose calculations for a competent supply of food for them, are based on the certainty of a good, fair, average crop of mowing grass, the present prospect, I think, must cause much

anxiety; and should the drought continue, even a little longer, it may also seriously affect our root culture. In this state of things, I consider it an act of prudence to look about us, and see what remedial measures, if any, we can resort to.

In the course of my experience I have known occasionally just such a state of things. I have known not only just such, but much more pressing necessities to exist; and the best remedial counsel I have ever pursued, has been to sow a crop of corn, broad cast, as soon as the deficiency of the hay crop had become certain.

A small amount of good ground thus cultivated, will produce a very great amount of excellent fodder. I have sown from one acre to six acres. The product will be prodigious—several tons per acre.

My practice has been to sow two and a half bushels good seed corn per acre on the furrows before harrowing; then to drag it thoroughly the same way it was ploughed. The seed will fall mostly into the furrows, and being well dragged will thus be deep enough to have strength of root sufficient to sustain a tall stalk. I have tried different quantities of seed. The results from the quantity named above, I have found most satisfactory. With this quantity the stalks will stand so thick as to grow up tall and slender. Cattle will consume them entirely.

One, by no means unimportant item in the value of this crop is, there will ordinarily be found quite a quantity of small ears of corn—much of it ripe—a full sufficiency for stock which has been accustomed to a moderate feeding of grain during the winter season.

To harvest the crop, the sickle is used most advantageously. When cut, the stalks should be bound in small bundles, and be set up to cure in small stacks; and when stacked for winter, let it be stacked as at the South, around a sickle pole, only the length of a sheaf from the pole. In this case the butt, or bottom end of the stalk, will all be exposed to the air, and the process of curing will be gradual and safe. It must be remembered that it is an exceedingly succulent sink, and is cut green, and will need care and time to safely cure it. I have lost a large quantity by heating, after I considered it cured, by putting it into a large stack, so as to exclude the air.

Another benefit of this crop is, if sown about this time, it can be followed by wheat in the fall. It can be cut and taken from the ground in good season to sow wheat. I have had turf ground turned over, sowed with corn, and found it in a more satisfactory condition for wheat, than when summer followed.—The ground has been kept damp and moist by the shade of the corn, and the turf has been sufficiently decomposed. A single ploughing after the corn is cut off, is all that is needed for sowing.—*Rockester Daily Democrat*.

A FARMER.

The following remarks, by professor Dewey, were suggested by an article on this subject in our last.

Killing Rats.

Thénard has proposed sulphuretted hydrogen. The question is, how can it be applied? Use a tubulated retort, containing all the materials except the sulphuric acid. When the neck of the retort has been surrounded with mortar in the rat's hole, the sulphuric acid is to be turned in through the tubulure, and the stopple immediately inserted. The gas will then pass into the hole, and to the lower parts, as its specific gravity is a little greater than that of oxygen gas, and about one-fifth heavier than atmospheric air. While the gas is very fatal to animals it is not so to man, at least to near the same extent. Chemists often breathe considerable of it. Probably no danger would result from using a common retort, the neck of which should be moistened in the hole expeditiously. It is more probable that a worse evil would result from the death of numbers of rats in an inaccessible place. The existence of the sulphuretted hydrogen will be known by its offensive odors, which is that of putrefying eggs. If the rats cannot escape, they will doubtless be poisoned. If they can escape by means of their various passages under ground, they will flee with all rapidity from so noisome and fetid an intruder as this gas. This effect is as readily produced by the lighting of a drum in the cellar, without any exposure to a substance so offensive, and at a much cheaper rate.

C. D.

Locust Trees in the West.

The Peoria, Ill., Democratic Press, in an interesting manner, shows the great profits of cultivating this tree. It is of advantage to cultivate it in any section of the U. S.; but here on our prairies, where so much is said of the scarcity of timber, it is worthy of much attention. Besides being of most rapid growth, it furnishes one of the most durable kinds of timber; and if rail-fences are to be used (which we trust will not be generally,) the farmer will find it for his interest to give immediate attention to its culture. The Press makes the following estimate:

Prairie, 10 acres, at \$30 per acre,	\$300
Rails and putting up a fence round do.	45
Seed and attention to nursery,	20
Breaking up prairie, putting it in order, and setting out seeds,	40
Subsequent attention to same, fence, etc.	35
At 6 per cent. compound interest, this sum, \$190—in ten years will nearly double, making	380
Deduct this from 6,400 trees, 12 years old, say at only 50 cent each	3,200
Leaves a net profit of	\$2,820—

If we remember right, on the old homestead in Conn., they used to get \$1 per cubic foot for this tree for ship-building; so that the estimated value of the trees at 12 years old may be considered quite low.

The following are the instructions of the editor for its cultivation, who says he is qualified by experience to give advice. He significantly remarks:

"You'll begin this spring. The locust is raised either from the seed or suckers; but as the former mode is best adapted to our present purpose, we shall confine our remarks to it. Select a rood and a half or two roods of ground that has been under cultivation several years, and which is of a rich loamy soil, neither too wet nor too dry; put it in fine condition, and having procured the seed, in order to make them vegetate freely, pour upon them a quantity of water and let them soak a few hours. Then sow them in drills three or four feet apart, and two or three inches distant in the drills, covering them nearly as thickly as you would corn. But, we would have you bear in mind that this should be done while the earth is moist, and when done the whole should be passed over with a roller of sufficient weight to press together the earth so as to favor the retention of moisture which will accelerate the germination of the seed. If these directions are strictly adhered to, the seed will come up as certainly and regularly as beans, and in many cases the young trees will attain the height of four feet the first season. Care should be taken that they be kept free from weeds, and they may remain in their seeding location two years. At the end of this time, transplant them to the ground designed for the purpose, and which must, during the time the seedlings occupy their place in the nursery, be enclosed, broken up and prepared for their reception. There is no difficulty in transplanting them, and where the roots are taken up carefully it is a rare case to see a tree die. To give the above number of trees in the 10 acres they must be set 8 by 8 feet apart. In about two years after they are set out, the ground will afford a superior pasture to which it may be applied without detriment to the trees."

"But, you'll say we have made no allowance for paper calculation. True, we will therefore now throw in, to make up for that objection, the ten acres of land with the locust stumps, which will be of immense value for a new growth of trees, that will follow without a nursery, and with less care, more certainty and greater rapidity, than the first crop, at the same time affording an almost inexhaustible source for locust suckers."

The Fruits of the Soil.

The statistics accompanying the returns of the last census show, that the sixteen millions of people who live within the limits of the United States, possess lumber to the value of upwards of eleven millions of dollars, which, with brick and stone of an incalculable amount, constitute the materials for their dwellings. The income of their orchards which grow around these dwellings is upwards of six millions of dollars in value. They had more than twenty-six millions of pounds of wool to convert into broadcloths, blankets, and hosiery, &c., with which to shelter their persons from the inclemency of the weather, more than a thousand million of pounds of cotton to manufacture into various useful and necessary garments, and more than three hundred thousand pounds of silk for elegant and fancy dresses. The amount of their flax and hemp united, was nearly a million of tons.

For the food that was to sustain and nourish them, they had, the last year, more than 73 millions bushels of wheat, equal to more than 11 millions of barrels of wheat flour, a rare article with those who subdued and settled this domain. They had also more than seventeen millions of ears; upwards of six millions of bushels of wheat, and three millions of bushels of barley. The value of the poultry that strolled about the yards and enclosures, was more than nine millions of dollars. The number of swine was upwards of twenty millions, and the number of sheep more than nineteen millions.

These people of the United States had the last year, more than 200,000 bushels of Indian corn, and more than ninety-nine million barrels of potatoes, and upwards of thirteen millions neat cattle, which furnished them milk, butter and cheese, &c. to the value of more than thirteen millions of dollars. They had at their command the labor of more than three millions horses and mules, and upwards of an hundred and six millions bushels of oats, and nine millions of tons of hay, on which to feed these and their other cattle. To sweeten whatever seemed acid or bitter to the taste, they had more than two hundred and eighty million pounds of sugar. Their land yielded to them, for their indulgence, more than seventy-seven million pounds of tobacco, and upwards of two hundred and seven thousand gallons of wine with which to cheer their hearts. Such is the income of the soil only; and yet with all this income they are over head in debt. The public debts alone, in a time of profound peace, are estimated at near two millions of dollars.—*New York Journal of Commerce.*

The Silk Business in Pennsylvania.

On Saturday last, we visited the extensive cocooneries owned by Judge Blythe and Maj. Snelvely.—These enterprising gentlemen have three cocooneries in the vicinity of our borough "in the full tide of successful experiment," and by their estimate they are now feeding between four and five millions of silk worms. As yet the worms are all healthy and doing well, and we trust these gentlemen will meet with the most perfect success in their enterprise, as it will have a tendency to encourage others to go into the business. We have also, since visited the cocooneries of Wm. Bell and the Rev. John Winebrenner, and in the building of the latter gentleman, we saw a large number of his worms spinning, having come to maturity and spun their cocoons in three weeks, notwithstanding they are called four weeks' worms. In regard to the durability of Pennsylvania silk, we can speak from experience. The writer of this article has worn a figured satin vest for two seasons and has it on now for the third, and the service it has gone through has not been of the ordinary kind; yet it is neither worn through at the pockets nor frayed at the arm holes. We sincerely hope that the business may go on and prosper until we are able to manufacture all silk goods worn in this country.—*Keystone. (Harrisburg, Pa.)*

Protection Against Drought.

In tillage, the best protection against drought that can be conveniently practiced to a great extent, is frequently stirring the earth, so as to keep it light and loose. In this way, the earth at the surface is in many small particles, which serve as a non-conductor of moisture, and returns it below, where the roots obtain a supply.

On the contrary, when the earth is hard and compact, the moisture is readily conducted off through it, even to a great depth in a very dry time. As an illustration, if one end of a long bar of iron be put into a fire, the heat will readily pass to the other end; but if that bar be cut into pieces of one inch or less in length, and laid along in the manner of a bar, the pieces would touch in some places, and in others there would be a small space between them; and on heating one end, the other would not be affected, as the heat would not pass but a small space through the pieces.

Again, we will suppose that a fire of intense heat be made on a block of iron, that is four feet square, and ten feet high, the body of iron would fast become heated downward, even to the bottom. Now, if that iron should be cut or broken into fine pieces, and a body of iron formed of these pieces, of the same size as the block, and a fire of like degree of heat made thereon, the fire would work down slowly, after penetrating a small distance through the many particles, and the air intervening between them. We give this as the theory. It is the practice, as in all other things, that we rely on as the foundation of true science.

There is in a dry time, a great quantity of moisture in the earth, that is continually rising and passing off in evaporation; and if this evaporation can be prevent-

ed, in a great measure by a non-conductor, of moisture at the surface, the plants will suffer comparatively but little. This is abundantly shown in practice.

Those who have not witnessed from experiments and observations the advantages of fine loose earth on the surface, as a protection of plants against the drought, would not be likely to suppose its effects so great as it is, though the theory is plausible and reasonable. Corn and other vegetables that have been well hoed in extremely dry times, have flourished well, while some parts left for experiment, were nearly destroyed by drought.

We noticed the powerful effects of this protection last season. We cultivated a few acres, mostly dry land, and the drought was severe indeed. Where the soil was frequently stirred and kept light and loose on the top, there was a constant moisture a short distance from the top; but where the earth remained unmoved it dried to a great depth.

A narrow strip, running across the piece, was left for turnips, and remained unploughed. On this the soil became dry below the usual depth of ploughing, and the weeds were almost dead for want of moisture, while at the side, weeds of the same kind in the edge of the ploughed ground, were fresh and vigorous, and the soil was dry only a few inches on the surface.

Where some grain was sowed, the earth was dry down six or seven inches; while by the side of it, where the soil was often stirred, it was dried off only three or four inches. And in this latter case, the moist earth had a good degree of moisture, while the former contained but little.

On this subject an intelligent cultivator observed that he would rather have six men among lands, stirring the earth to keep it loose and fine, in a severe drought, than to have the same number of men engaged in watering the plants.—*Vankee Farmer.*

The Duty to Labor.

"The world owes me a good living, and I'll have it," says some blackleg, as he finishes a luxuriant repast; "here, landlord, another bottle of your prim Madeira!" Half a dozen empty-headed fops, who sit gazing on him, by stentch, in silent admiration, ha the sentiment with a shout of applause: "That's it! The world owes us a good living and we'll have it!—landlord, more wine here! 'we won't go home to-morrow.' Let's go it while we are young. We care for the expense!" The consequence of this is the pilfering of money drawers, the ignominious lot of employment gented loafers, and so on, until or of these enterprising gentlemen, in eager pursuit of the 'good living' the world owes him, puts the wrong man's name to a check, or in some kindred way gets a ticket for the marble palace at Sing-Sing, when the State provides a 'living' for those it considers deserving; but not just such a one as consists with the own estimate of their exalted merits.

The great error in this case is in the original man. It is false and detestable. "The world owe you a living?" How owes? Have you earned by good service? If you have, whether on the avil, or in the pulpit, as a toiler or a teacher, you have acquired a just right to a livelihood. But if you have eaten as much as you have earned, or—worse still—have done little or no good in the world, the world owes you nothing. You may be worth millions, an able to enjoy every imaginary luxury without care or effort; but if you have done nothing to increase the sum of human comforts, instead of the world owing you a living, as fools have bubbled, you are morally bankrupt and a beggar.

Mankind are just awaking to a consciousness of the duty resting on every man to be active and useful in his day and in his sphere. All are not called to dig or hew—to plough or plane—but every man has a sphere of usefulness allotted him by Providence, and is unfaithful to his high trust if he deserts it for idleness or heedless luxury. One man may be fitted by nature and inclination for an artisan, another for sailor, and a third for a merchant; but no man is ever born, fitted only to be an idler and a drone.—Those who become such are the victims of pervers circumstances, and a deplorably false education.

"But has not a rich man a right to enjoy his wealth?" Most certainly: We would be the last to deprive him of it. He has a natural and legal right to possess and enjoy it in any manner not injurious to others, but he has no moral right to be useless because he has superior means of being useful. Let him surround himself with all the comforts and true luxuries of life; let the masterpieces of art smile on him in his galleries, and the mighty minds of all ages speak to him from his library. Let Plenty deck his board, an

he faces of those he loves gather joyously around it. Let him possess in abundance, the means of satisfying every pure and just desire of his nature, and become wiser, nobler, larger in soul than his less fortunate neighbor; but let him never forget—as if properly trained he never can—that it is his solemn duty to be useful to his fellow creatures, especially to the depressed and suffering—to labor for their benefit, and, unless, if need be, for their elevation.

The servile idolatry with which Ignorance and Vulgarity have looked up to Power and Wealth—the osannas which the trampled millions have sung before the cars of conquerors and other scourges of the earth, are fading and flitting forever. In the twilight which succeeds this gross darkness there comes a season of anarchy when men having lost faith in the juggles which once blinded and bound them, resolve to believe nothing, to deery and prostrate all who rise below the lowest level. Now the laborer with his sinews returns hatred for the contempt once cast upon him, and says, 'What good is there in any thing but manual labor? Away with all else! Those whose labor is chiefly mental are deceivers and moths!' But this is a transitory ebullition. The world soon learns to respect its benefactors in whatever sphere, and to realize that he who truly and honestly exerts himself in some department of useful effort may justly claim a brotherhood with all who toil, make and earn. Let the rich cease to look down on the poor—the merchant on the porter; let each respect the dignity of Man, whether in his own person or in that of his less fortunate brother. Let haughtiness and pride on one side, and envy, jealousy and hatred, with their train of fearful consequences, will vanish from the other, and all animated by a common kindness, will move forward in concord to the attainment of the highest good. — *Selected.*

The Flower Garden Cultivated by the Ladies.

A neat Flower garden in front of the farm house, is proof that the farmer's wife and daughters are industrious and refined. It is proof that the work within doors is well performed; for it is never the case that disorder and thriftlessness reside within, while the garden—tended by female hands—is neat and flourishing. This out-door labor gives bloom to the cheeks, vigor to the whole frame, cheerfulness to the disposition, and general efficiency.

Fair and gentle woman is never in a better school than when busying her fingers and twining her affections around the fair daughters of Flora. There she tangles with beauties whose tongues never utter envy or malice, and whose ears are deaf to every idle or unkind word. There the lovely and innocent speak to her of the more lovely and innocent One who delineates their graceful forms and paints their rich and varied colors. Purer, richer, better, are the teachings of the shooting blade and opening flower, than come from the musings of a listless mind, the pages of romance, or the gossip of corrupted society. The seeds of health, and purity, are in the soil on which the ink and primrose grow, and those who labor to procure the fragrance of the latter, will taste the delicious fruit which the former bear.

Fear not, ye busy wives and daughters, that the care of a small flower garden will be a burthen, rendering more arduous the labors of the kitchen, the airy room and the needle. For the invigorating exhalations of the freshly turned soil, the draughts of pure oxygen which will be found among your plants when the warm sun is expanding their foliage, the variety of exercise which the garden gives to body and mind, together with the pleasure derived from the beauty and fragrance of your flowers, will furnish more strength than the labors of the garden will exhaust. — *New England Farmer.*

Leisure Days.

By these we mean days in which the care of the crop does not require attention—days when the farmer can look about him and turn his hand to some odd job. Usually there are several such days in June, and the manner they are spent is no small moment.

Of course it is not in our power to tell you what is to be done on your particular place—for on one farm a few rods of stone fence is to be built; on another an underdrain is to be completed; on a third the ditches require attention, &c. &c. But at these times keep a sharp look out for manure making. The swine must have frequent supplies of the raw material, and leaves, oil, muck, &c. must be deposited near the hog yard now, so that in the busy days of haying, something may be thrown in, and your hogs not left without means of doing their proper work. These days for white washing, for cleaning up around the house and

barn, for seasonable repairs, and the like, are among the most profitable of the season. We class them under the head of leisure days, but they should be far from days of idleness: more of the profits of husbandry is obtained from the good judgment and perseverance with which improvements and plans are executed; (we mean the gradual implements which the good farmer will have an eye to, and will carry on at times when the cost will be but little)—more of the real profits of farming turns upon these than upon the ordinary crops of the farm. Where soil and manure are alike, one man can obtain as good a crop as another, or nearly so; the skill required is not so much that of planting and hoeing, as of increasing the manure heap, increasing the depth of the soil; protecting the dry lands from drought, and draining those that are too wet; the mixing of soils and sowing the manures to the soils and crops to which they are applied. These are the important matters; and many of them deserve attention at this season of the year. — *Id.*

What should Parents do with their Boys?

Many parents have sons, whom, when they arrive at years of discretion, they are uncertain what to do with. For instance, a respectable mechanic has a good, stout, hearty, well disposed son, whom he wishes to bring up respectfully. If he is in easy circumstances, he some how or other seems to think that his son must be brought up to some higher business than a mechanic. He therefore concludes that he must send him to college, and make him a lawyer, a doctor, or a clergyman, and the honest well meaning parent labors hard to earn money to pay the expenses of a collegiate education, for the purpose of making him respectable, to make him take a higher rank in the world than that of a mechanic. Here is a great mistake. When the boy leaves college, what is he to do? He is then just qualified for nothing. He turns pedagogue for awhile. He beats learning into the youthful progeny; but few, very few, think of pursuing the business of a school master as a permanent profession. After continuing it for a year or two, he quits it, and commences the study of one of the learned professions. Here are three or four years spent in preparing to become a professional man, and at much additional expense to his father. He at last is admitted to the bar, or receives a degree of M. D., or is licensed to preach. The next thing is to get a living by the profession he has chosen, and this is not so easy a matter. All the learned professions are full to overflowing, and there seems to be no room for new beginners. The consequence is, that the young aspirant for eminence, drags along, without getting business enough to pay the rent of an office. Year after year he toils, or would toil, if he had any thing to do, without making half enough to pay his own expenses. To be sure, there are some, whose superior intellect and commanding talents will enable them to rise at once to eminence, and to command a business which will render them independent; but these cases are few and far between.

When such do occur, the superiority of mental power will shine out beforehand, and should be fostered. But the propensity which some mechanics have of bringing their sons up at college to make them more respectable, we think to be a great error. It is injuring a son more than it is benefiting him, unless some extraordinary mental energy displays itself in the youth. He goes through college, and thence,

"Proceeding down a graduated dunce,"

he is just fitted for—what? He has spent the best part of his youthful days, in qualifying himself for a profession from which he cannot gain a living, or at least a very scanty one.

In our humble opinion, as the professions now are, we should say to mechanics, and indeed to professional men, in ninety-nine cases out of a hundred, give your sons a good education, and then put them as apprentices to some respectable mechanical business. They will then as soon as their time of apprenticeship is expired, be independent, capable of earning an honest living at once. The profession of a mechanic is daily becoming more and more respectable, thanks to the good sense and good judgment of the present age, and it can no longer be thrown out as a mark of reproach, you are a mechanic, or the son of a mechanic. It is on the contrary an honor.

As the question has been recently discussed among a few mechanics, what they should do with their sons, we would repeat, give them a good education and then bring them up as mechanics or farmers, if you wish to ensure them a comfortable, honorable, and independent living and station in society. — *Boston Transcript.*

A G.M.—"Carbonic acid, water, and ammonia, contain the elements necessary for the support of animals and vegetables. The same substance are the ultimate products of the chemical processes of decay and putrefaction. All the innumerable products of vitality resume, after death, the original form from which they sprung. And thus death—the complete dissolution of an existing generation—becomes the source of life for a new one." — *Liebig.*

Culture of Buckwheat.

Dry light land is most suitable for buckwheat; but when that has been swarded for a number of years and then ploughed but once, a great crop cannot be expected. Something may be obtained this year and a greater harvest will follow in the second year. Any ground that bore beans, potatoes, or corn last year, and for which you have no manure to spare this season will yield a good harvest. We sow the seed from the twenty-fifth of June to the fourth of July—sometimes the earliest sown produces best and sometimes the latest sown—it depends on the season, which no one can foretell. A neighbor of ours, Mr. E. Freeman, keeps one of his lightest fields on purpose for buckwheat. In the spring he sows rye on the field, and in the last part of June he ploughs in his rye with his horse plough and sows his buckwheat on the furrow. By this practice he is bringing a thin soil gradually to fertility at trifling expense. He took off a fine crop of buckwheat last season, and he uses the straw for fodder for his cattle. — *Boston Cultivator.*

Pity is a passion proceeding from the misfortune of another. Envy is a passion proceeding from another's success. — *Addison.*

Go Forth into the Fields.

Go forth into the fields,
Ye denizens of the pent city's mart;
Go forth, and know the gladness nature yields
To the care-wearied heart.

Leave ye the feverish strife,
The jostling, eager, self-devoted throng;
Ten thousand voices, waked anew to life,
Call you with sweetest song.

Hark! from each fresh-clad bough,
Or blissful soaring in the golden air,
Bright birds with joyous music, bid you now
To spring's loved haunts repair.

The silvery gleaming rills,
Lure with soft murmurs from the grassy lea;
Or gaily dancing down the sunny hills,
Call loudly in their glee!

And the young wannon breeze,
With breath all odours from her blossomy chace,
In voice low whispering, 'mong the embowering trees,
Woo's you to her embrace.

Go breathe the air of heaven,
Where violets neckly smile upon your way;
Or on some pine-crown'd summit, tempest driven,
Your wandering footsteps stray.

Seek ye the solemn wood,
Whose giant trunks a verdant roof uprear,
And listen, while the roar of some far flood
Thrills the young leaves with fear!

Stand by the tranquil lake,
Sleeping 'mid willowy banks of emerald dye,
Save when the wild bird's wings its surface break,
Chequering the mirror'd sky—

And if within your breast,
Hallow'd by nature's touch, one chord remain;
If aught save worldly honors find you blest,
Or hope of solid gain—

A strange delight shall thrill,
A quiet joy brood o'er you like a dove;
Earth's placid beauty shall your bosom fill,
Stirring its depths with love.

Oh, in the calm still hours,
The holy Sabbath hours, when sleeps the air,
And heaven and earth deck'd with her beautiful flowers,
Lie hush'd in breathless prayer.

Pass ye the proud fane by,
The vaulted aisles, by flouting folly trod,
And 'neath the temple of uplifted sky,
Go forth and worship God

[*Selected.*]

Waterloo Woolen Factory.

Messrs. Editors—This factory cost and capital (\$50,000) makes over 6,000 yards of dressed woolen cloth per month. Its annual consumption of wool is about 250,000 lbs.; the greater part of which is purchased from the farmers wagons at the factory.

On Saturday last, between 10 o'clock and 4, there was received there over 7,000 lbs. of wool, the greater part of which was paid for in cloth. It was comprised of eighty different lots, and came from five of our neighboring counties, including Seneca. For the time being, the sales room was crowded with an intelligent, well dressed, rural population of men and women, many of the latter supporting in their arms those jewels, which the mother of the Gracchi did boast of. Some half a dozen clerks had constant employment in measuring and cutting cloth, to say nothing of the brisk and busy duties of the wool sorters, or the more wordy, though the not less laborious task of the superintendent or of that very active director, friend Richard himself.

The cloth which this factory sells in New York, Philadelphia, and Baltimore, affords but little profit at this time owing to the depressed state of the market. But the home trade was perhaps never more profitable; and, what is better, it is daily increasing and extending. The interests of the wool grower and manufacturer, are fast becoming identical. Our shrewd, intelligent farmers find it better, far better, to give a liberal price to the manufacturer, who in return pays them well for their wool, than to buy the imported article at a lower price, when that very article strikes at their occupation, by destroying the market for their wool.

It is supposed by some woolen manufacturers that the maximum duty under the compromise law of 20 per cent. on imported woollens, is not protection enough for their cloth against the imported article. But when we reflect that this duty is to be paid in cash down, argent comptant, and that the taxes and extra expense of living to the English manufacturer, is more than another 20 per cent. in favor of our manufacturers, we think, with some self denial and ordinary economy, they will not have to shut up shop.

It is true that capital is cheaper in England, and that their operatives do not get wages sufficient to enable them, like ours, to monopolize all the shirton stocks of the market; but the countless number and enormous weight of their taxes, is more than an offset to our better living. S. W.

Waterloo, June 15th, 1841.

Devon Cattle.

Messrs. Editors—I believe it is not generally known to our farmers that Mr. S. Vernon, of Rombeck, in the town of Stafford, Genesee Co., imported a fine Devonshire Bull in the summer of 1839. He was bred by Mr. Davy, the celebrated breeder of North Downs, in Devonshire, England, and selected by Mr. Hiley, of Stafford, (when on a visit to England,) a good judge of stock, and an intimate friend of Mr. Davy. Mr. Vernon holds him at the moderate price of \$3 per cow, and I think he will prove a valuable acquisition to the graziers in Western New York.

Yours &c. W. GARBUTT.

Wheatland, June 18, 1841.

Monroe Co. Agricultural Society.

At a meeting of the Executive Committee, held June 2d., the following persons were appointed town committees for the present season.

Wheatland—John McVean, Jirah Blackmar, Ira Wood.

Chili—Jacob Strawn, Wm. Tone, John Tuller. Riga—Dennis Cautch, Alfred Patch, Charles Tenney.

Ogden—Wm. B. Brown, Jesse Harroun, John Gait.

Sueden—George Allen, Humphrey Farmer, Frederick P. Root.

Clarkson—John Bowman, David Forsyth, David Allen.

Parra—Ahner Darling, L. W. Metcalf, Roswell Atchinson.

Greece—John Maxon, Nicholas Reed, Asa Rowe.

* Her children—these are my jewels said the mother of the Gracchi.

Gates—Mathias Garrett, Moses Dyer, Caleb Corson.

Brighton—Gideon Cobb, Nathaniel Hayward, Hiram D. Calvin.

Harrletta—Hiram Smith, Joseph Williams, M. L. Ankle.

Rush—Martin Smith, Jacob Clapp, Charles Chamberlain.

Mendon—Ahner Cole, Thomas Wilcox, Henry Quimby.

Pittsford—Edward Wilbur, Alexander Vorhees, H. S. Potter.

Perrinton—Gideon Rameidel, Zera Burr, A. Goodell.

Penfield—Henry Fellows, Daniel Fuller, Samuel Miller.

Webster—Byram Woodhull, Wm. Holt, Alpheus Crocker.

Irondequoit—S. Shepard, Allen T. Hooker, H. N. Langworthy.

Rochester—Lewis Brooks, Wm. Pitkin, A. Chamberlain, George Whitney, Alexander Kelsey, E. Darwin Smith, Henry O'Reilly.

The duties of the town committees are, to obtain the names and collect the fees of members; examine crops offered for premiums and obtain certificates of the same; and attend to the general interests of the Society in the town. (Printed Circulars have been sent them.)

The Annual Fair and Exhibition of the Society will be held at Rochester, on Friday and Saturday the 15th and 16th days of October, 1841. The list of premiums, &c. will be printed immediately and sent to each of the officers and committee-men, and may be obtained at the Rochester Seed Store.

J. B. LANGWORTHY, President.

H. M. WARD, Secretaries.

M. B. BATHAM, } Rochester, June, 1841.

Rochester, Monday, } July 1, 1841.

MONEY MARKET.

Table with columns for specie, Eastern Drafts, Pennsylvania, Ohio, Michigan, Maryland, and New England Bank Notes, with prices in dollars and cents.

There is no alteration in the rate of uncurrent money.—The money market is at a standstill, and is rather tight.

NEW YORK MARKET—JUNE 29.

The Flour dealers have still further advanced their pretensions. Sales yesterday of common brands Genesee at 53 1/2 to 55; Ohio round hoop, 52 1/2 to 53 1/2; do. flat hoop, 53 1/2 to 53 3/4; Michigan 5 1/2 to 5 3/4; Georgetown and Howard st. 53 1/2 to 55. The arrivals are light, and of many kinds the market is bare. The purchasers are confined to immediate wants. Corn has arrived more freely, and sales of Southern have been made to the extent of 12,000 bushels, at 50 a 60 measure, and 6 1/2 weight, delivered; 1000 do. Northern at 6 1/2 weight. The stock of Wheat is reduced, and 125 is generally demanded for Ohio. A parcel of 2000 bushels Long Island sold at 1 1/2 for milling. For Rye 6 1/2 was asked, but we heard of no sales. Small sales of Southern Oats at 4 1/2. No Southern Oats at Market.

REVOLVING HORSE RAKES.

Of the best construction, are manufactured by P. D. Wright, State street, Rochester.—Price \$5. Also, Cultivators.—Price, \$8.50 to \$9. July 1.

THE THOROUGH BRED HORSE, FLORIZEL.

FOR the information of those who may wish the stock of this celebrated horse, notice is hereby given, that he will stand for mares the ensuing season, at the stable of H. V. Werl, Genesee; and also at the stable of the subscriber, in Goveland, where pasturage will be provided, and attention paid to mares from a distance. July 13, 1841.

C. H. CARROLL.

RUTA BAGA AND TURNIP SEEDS.

A Full and choice assortment of Ruta Baga and other Turnip Seeds, lately received from England, for sale at the Rochester Seed Store.

BATEHAM & CROSMAN.

June 1, 1841.

THE THOROUGH BRED HORSE YOUNG HENRY.

THE PUBLIC are informed that the above thorough bred Horse, raised by H. Wooley, Long Island, and now owned by the subscriber, will stand at O. Culver's, Brighton, Monroe Co., and will be let to mares at fifteen dollars the season. Enclosed and good pasture will be provided, and all possible care and attention will be paid to mares brought from a distance and left with the horse; but no responsibility for accidents or escapes, should any occur.

Pedigree.

Young Henry was got by Henry, the competitor of Eclipse, out of Sandhill, by Eclipse. Young Henry is now 7 years old on the 4th of June next; he is a splendid figure, with his points finely developed, he is a dark sorrel, and somewhat over 16 hands high. For further particulars, apply to OLIVER CULVER.

Brighton, Monroe Co., N. Y., May 20, 1841.

ROCHESTER SEED STORE--1841.

BATEHAM & CROSMAN, the proprietors of this well known establishment, respectfully inform the public that they have now on hand a general assortment of superior English and American SEEDS of the growth of 1840, and other articles in their line of business.

For the FARM—choice varieties of Corn, Grain, Grass, Clover, &c., and seeds for Root Crops, such as Mangel Wurtzel, Sugar Beet, Carrot, Ruta Baga, English Turnip, &c.

For the GARDEN—all the most valuable and approved kinds of esculent Vegetable SEEDS. Those which grow in greater perfection in Europe, are annually imported from England;—such as the different varieties of Cabbage, Cauliflower, Broccoli, Radish, Turnip &c. Onion seed is obtained from Weibersfeld, and other articles are raised for this establishment with great care.

FLOWER SEEDS—about 200 varieties of the most beautiful and interesting kinds.—(Price 30 cents per doz. papers.) ROOTS AND PLANTS—Choice kinds of Potatoes, Asparagus and Pie-plant roots, Cabbage, Cauliflower and other plants in their season.

TOOLS AND IMPLEMENTS, of various kinds, for the Farm and Garden. And a large collection of valuable BOOKS on subjects connected with farming and gardening, silk culture, &c.

SILK WORM EGGS—of different kinds, on hand in their season.

CATALOGUES gratis on application. Merchants supplied with Seeds at wholesale, on liberal terms. Orders from a distance containing a remittance, or gold city reference, will receive attention.

BATEHAM & CROSMAN.

Arceide Hall, Rochester, April 1, 1841.

ROCHESTER PRICES CURRENT.

CORRECTED FOR

THE NEW GENESEE FARMER, JULY 1, 1841.

Table listing prices for various commodities: WHEAT, CORN, OATS, BARLEY, RYE, BEANS, POTATOES, APPLES, FLOUR, SALT, PORK, BEEF, POULTRY, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, PEARL ASHES, POT, WOOL, HAY, GRASS SEED, CLOVER, FLAX, PLASTER.

The market is very musty. The various reports in relation to the crops, have a tendency to render the prices very fluctuating. Wheat has advanced to quoted prices, and we have heard some lots being sold at prices still higher. The supply is small, and demand great. Flour for shipment, is up to 4.85 and 5.00, and is very brisk at the L. Corn has advanced since our last. Oats have rather fallen off, if any thing. The Wool market is very lively, and great quantities are coming in. Hay has rather dropped off from what it was at one time since our last, but is now in demand at quoted prices.

THE NEW GENESEE FARMER AND GARDENER'S JOURNAL

Still another Call.

We are now incurring large expenses, and greatly need the numerous small sums—amounting in all to some hundreds of dollars, still due us from Postmasters and others. If not remitted soon we shall have to send, what we hate to give or receive—*special* Diss. We fear we shall have to adopt stricter rules next year.

To Correspondents.

Several communications, letters of inquiry, &c., have not received attention this month, owing to our absence. We will endeavor to give a description of a stump machine in our next. *HELEX* shall receive attention next month—Is *Our Valley* near *Maple Grove*? Then where are both?

The Harvest.

The Wheat crop of Western New York, like that of Ohio, will fall below an average in quantity, although fine in quality. In several towns in this county the insect has done some injury, but we believe not very extensive. The weather has been fine for harvesting, and the crop is mostly secured in good order.

In Michigan, the Detroit Advertiser of July 26th says, the Wheat crop is very abundant and secured in fine order; but the corn and potatoes were suffering from drouth—there, on the 9th in the shade. The Alton (Illinois) Telegraph of July 31 speaks of excessive drouth, and potatoes being actually roasted in the hill! A correspondent in St. Louis Co., Missouri, says the Wheat Harvest never was better in Canada we are informed the crop is fair, though not very abundant. The same is reported of Pennsylvania.

The Weather of June and July.

The month of May left us cold and dry, and the drought continued till the 11th of June. The crops, especially grass, clover and wheat, suffered severely, and were saved by the rain before and after the middle of June. In this vicinity, the grass crop is below the average, and the same remark is true respecting wheat.

Over the country it is gratifying to hear that the harvest will be fully adequate for the wants of the people. Indeed, the fine weather, after the rain in June, filled out the berry of wheat to uncommon fullness, and thus the crop is larger than many had anticipated.

It is now obvious that the cold weather of May was highly beneficial; for with hot weather, the drought would have destroyed grass and wheat, and much misery must have followed in this part of the land. The rain of June, however, did not much exceed an inch. The 7th and 8th and 10th June were very warm—temperature 90° or more at 2 P. M.

July has been favorable for ripening grain, as well as for haying and harvesting; as it has abounded with fine weather. Considerable rain has fallen in pleasant and short showers; weather warm, and a week from the 2nd very hot. On the 2nd the heat was 93°, and almost as high on the 23rd; and on holidays, above 90° for more than three hours; 23rd, very little less heat; and 21st for some time 97°, and above 93° several hours. This was the hottest day for some years in this vicinity—hot indeed over the country. The earth became parched, and occasional showers seemed to have little influence. On the 31st fell a great rain; in showers; in the morning and long before sunrise, till nine o'clock, there was much thunder, and more than one inch of rain fell in an hour. The earth seemed to drink in the successive and abundant showers, and to be greatly refreshed. "Thou visitest the earth, and waterest it: thou greatly enrichest it with the river of God that is full of water."

During the continuance of the drought, the horns of the moon have been so turned as to indicate a wet moon, though it proved dry.

Mean temperature of June.	80.53
do do of July.	65.51

The Barometer has varied but little from 29.5 inches, indicating regular weather. C. DEWEY.
 Rochester, July 31st, 1-11.

Hints for the Month.

Farmers should remember that weeds continue to grow throughout the season, and that efforts to destroy them should not be now relaxed. Corn and potatoes should still be kept clear of them. It will not only be of essential benefit to the present crop, but save a vast amount of labor in future seasons. Ruta bagas, carrots, and mangel wurtzels, need constant attention in this particular.

But perhaps the greatest evil from suffering weeds to grow, is the bad habit it leads to. Good order and neatness should be studied and carried out on all occasions; and every cultivator should become alarmed whenever he finds himself growing easy under careless management.

Care should be taken not to sow weeds. Seed wheat should be thoroughly cleaned, and nothing left but the pure grain; chaff and cockle may be removed from it by a good fanning mill, and by washing in brine.

It should be a standing practice to improve all kinds of farm crops by selecting the best seed. The best portions of the field should be chosen, and of prac-

ticable, the finest heads picked singly from the sheaves for the growth of future seed. The same course should be pursued with corn and other crops. Every one knows that animals are improved on a similar principle, and vegetable productions may doubtless be equally so.

Weeds growing in pastures need care to prevent their spreading by seed. Their rapid increase in Western New York shows a wretched neglect. Fields in which, five years ago, the Canada thistle, Johnswort, and ox-eye daisy, had just obtained an entrance, are now completely overrun with these weeds. A tenth part of the expense they have indirectly occasioned, would have extirpated the whole of them long ago. When the worst comes to the worst, farmers must attend to this subject, though a hundred times the labor may be then needed that would do the business now.

Those who cannot afford to destroy spreading weeds, should remember the miller who would not pay a dollar to fill the musk-rat hole in his dam; the second day the current had enlarged it, and he would then have gladly paid that sum, but it would cost five dollars; and the third day he was compelled to pay fifty, or lose all.

Garden seeds require collecting as fast as they become ripe. The best way is to cut off the stems, which hold the ripened seeds, and tie them in bundles, until they can be conveniently cleaned. Where seeds are not fully ripe, a large portion of stems attached, will often afford nourishment enough to complete the process.

This is the best season of the year to bud peaches. Apples and pears may be easily budded, if done early in the month. Success in the adhering of the bud, depends chiefly on the thriftiness of the stock, so that the bark may separate very freely. Peach buds which adhere well are often destroyed by the succeeding winter and perish the following spring. To avoid this, select buds from the oldest part of the shoot whence they are taken, and be especially careful to procure the strongest and thickest shoots.

Before concluding, we wish to direct enterprising farmers to what we have already published, in late numbers, on subsoil ploughing. The season for sowing wheat will soon be at hand, and we are confident a great improvement will be made in our crops by this practice. One fact in confirmation:—A neighbor had dug a ditch through his field, several feet in width and depth; the subsoil, thus removed, was spread to the depth of about two feet on the adjoining ground. This season, when the drought was such that the wheat in the rest of that field, did not promise five bushels to the acre, that portion on each side of the ditch on which the subsoil was deposited in a deep bed, indicated a product of more than twenty bushels to the acre. The soil was a loam, not so heavy as ever to become cloddy or bake from temporary drouth.

Cherries.

Last season we took some notice of our cherries, (vol. 1, page 114) and we now resume the subject.

Some fine sorts are found in this county; but we doubt if one treeholder in ten ever eat a fine cherry of his own cultivating; and we believe it might be asserted without much risk, that many grown people in this land have never eaten a ripe one. This suggestion may seem rather startling; but when we consider that this fruit is generally taken to market in a half ripe state, we may comprehend how the owner fares with a few trees in the most public part of his grounds, who keeps off the boys and the birds with one hand—as it were—while he plucks his scanty portion with the other.

It is enough to sadden the heart of a pomologist to behold the old "English cherry," and the upright sour cherry, casting their shadows over the highway; for it tells of a deplorable neglect to take advantage of the fine climate of the Genesee country; why such fruits are not worth the trouble of guarding against the birds—not worth even the labor of gathering.

Now according to our experience—and we have had a reasonable share—the best cherries grow on trees quite as hardy, and quite as easily cultivated as the worst. How then comes it that such apologies for fruit are tolerated? We leave this question for our readers to answer; but we can inform them that trees of first rate kinds may be had for fifty cents a piece; and that the annual interest on the outlay would be three or three and a half cents—just the price of a small paper of tobacco. In two or three years, such trees, with the treatment that we have recommended, would come into bearing; and we are strangely deceived if the proprietor would take less than many times that sum for the crop.

Two causes have conspired to make most of the cherries on our old trees this season inferior in quality. The steady cold in the spring, kept the blossoms back, and none of the young fruit was injured by the frost, so that there was a superabundance; while the severest drought in the early part of summer, that has occurred in many years, withheld the usual nourishment. On several trees that were hung with fruit, like onions on a string, the leaves withered in the latter part of the day, and some thought they were dying; however there was no disease but that of starvation—too much fruit and too many leaves. The fruit gave way first, and the leaves are now recovering.

It has satisfied us however, that old cherry trees should be pruned when we want the finest fruit; and that to adopt the old English custom of breaking off the twigs with the cherries on them is no great proof of Vandalsm. On such trees as are in danger of overbearing, like the White Tartarian, or Transparent Guigne, it is a positive improvement.

All the "white" cherries of England that we have seen, become red under the glowing skies of this land. Well, an old White Heart (so called) which had borne abundantly, was unproductive for several years; but by cutting off a few of the leading branches, it was roused from its torpor—vigorous shoots sprung forth, and again it has become fruitful.

We have never known the cedar birds so scarce as they are this season. Young cherry trees have been mostly allowed to ripen their fruit in peace; and whether we ought to say with the poet

—Joy to the tempest that whelm'd them beneath

And made their destruction its sport;

or ascribe their diminished numbers to some other

cause, we know not; but we should estimate them at not more than one-tenth of what usually appear in other seasons. We have not had opportunities to shoot half a dozen.

The crow however, made some predatory demonstrations; but on our stretching aloft two pieces of twine between some of the trees, they suddenly discovered they had no further business in that quarter.

The manner in which ornithologists occasionally speak of the characters of different birds, is amusing. According to Nuttall, the crow is "troublesome," "gormandizing," "voracious," "audacious," "piratical," "pillaging," "guilty," "injurious," and "formidable;" while to the cedar bird is ascribed "gentleness of disposition," and "innocence of character," besides being entitled to the adjectives, "friendly, useful, and innocent." Now all the charges that we have selected against the crow, apply as well to the cedar bird, with the exception of two; and "innocent" as he is made to appear, the same acts committed by some other bipeds (without feathers however) would entitle them to a lodging in the county jail.

It is often extremely difficult to determine the true name from the books, when two varieties are much alike. The time of ripening is an important characteristic; but as this will vary with the climate as well as with the season, the most exact way to fix this point, would be to compare the ripening of the variety under examination, with that of some well known sort.—Unfortunately, pomologists have generally chosen the May Duke for this purpose—the most unfit of all the cherry tribe that we have ever seen; for it goes on ripening and to ripen for several weeks in succession. All such references are but of little value.

Our young trees have made us acquainted this season with three more fine varieties of the cherry. The first is the Elton which Lindley calls "very excellent," and which ripens with the Black Coronet. Niel says "it is distinguished by the extraordinary length of the fruit-stalks;" and so we have found it, after comparing it with seven or eight other varieties, all of which have shorter stalks. The fruit is large, a waxen yellow, mottled or dashed with red next the sun. We think it will become a general favorite.

Another kind has been called the Black Eagle; but Lindley represents the genuine sort as ripening at "the end of July or beginning of August" in England, while ours ripens with the Elton, "the beginning or middle of July" in that country. He continues: "the spurs of the Black Eagle produce bunches of ten or twelve cherries each;" but ours were mostly single. Again: "juice very rich and high flavored;" but ours, though sweet and rich, and much admired, could scarcely be entitled to that epithet. Another year however, may throw more light on the subject.

The third sort is the Elkhorn—a very remarkable variety. We agree with Prince that it is one of the largest black cherries that we have ever seen, and when fully ripe a superior fruit, as it then loses most of its bitterness. It is very firm, and must be fine for transportation or culinary purposes.

For the New Genesee Farmer.

My own Experience.

Messrs. EDITORS—Last year was my first attempt at farming. I commenced by subscribing for the New Genesee Farmer, and Albany Cultivator. By these valuable papers, every number of which is worth three times its cost, I learned that Canada Thistles, of which I had a very promising crop, could be effectually subdued, by repeated ploughings. Accordingly I commenced about the first of June, and

ploughed them about once a month, and harrowed them as often, alternately, (with Wilber's improved harrow,) till about the first of October. The result is their entire destruction, except a few places where the ploughing could not be well done.

I planted one bushel of Bohan potatoes, and raised seventy bushels; four acres of corn, and harvested two hundred; sowed ten bushels of wheat, and shall not harvest any. So much for the first year.

Yours truly, V. YEOMANS.

Watworth, July 9, 1841.

From the Farmer's Gazette.

Under-Draining.

The past month has been very unfavorable for outdoor business, in consequence of the almost continuous rains. It has, however, afforded me an excellent opportunity to witness the benefits derived from under-draining. This branch of agricultural improvement is wholly neglected by most of our farmers, while there are no twenty-five acres of ridge-land lying contiguous to any holding of low or swampy ground, but what some parts of it at least would be materially improved by draining.

With many persons, the discovery is, yet to be made, that a super-abundance of water is as detrimental to the growth of most plants, as a stinted supply of this fluid. They admire that elevated lands should be wet; the reason is, they do not look deep enough,—if they did, they would discover that the soil of most of our ridges rests upon a sub soil which is very tenacious, and as impervious to water, as a dish; consequently there is no way by which the water falling upon the surface can escape, except by the slow process of wending its way through the soil to some less elevated place, or by evaporation, except it is by ditches, either covered or open. My remarks regard the former. After recommending a system, the inference will be that I have devised some benefit from it. I answer in the affirmative, and will state briefly my experiments.

I have an orchard, one side of which is wet, stiff land; rarely any water stands upon the surface, but for several months in a year the soil is completely saturated,—so much so, that a hole dug a few inches deep will immediately fill. The trees did not flourish as well as on the more elevated parts; it occurred to me that it might be owing to the roots being so immersed in water. Accordingly, two years ago I caused thirty rods of ditch to be made, in different directions, all in the compass of half an acre, and terminating in one, and that in a low place, where I could witness the discharge, and the quantity surprised me. The favorable influence of the drains upon the land lying some distance off, as well as that in their immediate neighborhood, also exceeded my expectation. The effect upon the trees is decidedly favorable, and the grass is much sweeter and more abundant.

Again, I have a field of ten acres, in which I have made one hundred and fifty rods. This lot had always been occupied for grazing; some part of it was so wet (made so from springs) as to produce but little, and by far the greater part of a kind of knot grass, which indicates the coldest of land; will only keep animals, but not fatten them. The ditches had so favorable an effect that I determined to put the lot under the plough,—that being my intention from the beginning, provided I could drain it. I have had two crops from it, and my experience is, that those parts of the lot, which were the most wet, have become by means of the drains the driest, and the soonest fit to plough after a rain, and producing the best crop. It would surprise any one to witness the quantity of water discharged, and that it is not interrupted in the coldest weather.

Now as to the size and expense of making. That will vary according to circumstances. I have made mine two feet wide, from eighteen to twenty-four inches deep. The depth, however, is to be determined by the nature of the ground, and the kind of water to be drawn off. If surface water, when you meet the obstruction, (hard pan,) that is sufficient; if spring, deeper cutting may be necessary. The most expeditious way of filling the ditches is to dump the stones in; but the best way, and the one which I have practiced, is to lay them in by hand, leaving an aperture or four or five inches square, just as the stones seem to favor. As to cost, I calculated twenty-five cents a rod; this is what I pay for digging and stoning. The drawing the stones I count nothing, as they can be disposed of in that way at a less expense than to draw them into the highways, or to some distant ledge or broken

* We allude to Lydgate's account of the London cries (about the year 1400) where he mentions "cherries in the rye." "Rye," says the New Edinburgh Encyclopedist, "is a word not yet obsolete in Scotland, signifying spray or twigs."

piece of ground. The drawing the dirt on after placing the stones, is to quicken it, that it need not cumber into the expense.

The ditch should not be filled nearer than within six inches in the surface. Stone or snow should be laid on the stones previous to replacing it out. The quantity of water to be discharged, and the stops upon the land, will influence as to water and depth of the ditch.

I have made my article longer than I had intended when I began to write. I am not ambitious to make a display of my farming, but to attract attention to, and promote agricultural interests. R. H.

Dunbury, May 3, 1841.

From the London Bath Lane Express. On Making Ponds.

SIR—Observing one of your correspondents to be making an inquiry as to a method of making ponds, I take the liberty of sending you, for his information, the method practised some time ago by Mr. Robert Gardiner, of Kilmam, in the East Riding of Yorkshire.

Let a circle be marked on the ground sixty feet in diameter—more or less as the person chooses, or the size of the pasture may require, and a dy of water—and if of that diameter, let it be hollowed out into the shape of a basin, or bowl, to the depth of seven feet in the centre; when the surface of this hollow has been raked smooth, let it be well beaten over, so as to reduce it into as even, uniform and firm a surface, as the nature of the ground will admit of; on this, will slacked and screened lime must be uniformly spread with a riddle, to the thickness of two or three inches; the more porous or open the ground, the greater will be the quantity of lime required; this lime then must be slightly watered, to make it adhere firmly to the place, and great care must be taken to spread it equally, so that no place may remain uncovered—as on the lime depends, more than any thing else, the success of the work. On this lime must be laid a bed of clay, to about the thickness of six inches, which being moistened sufficiently to render it ductile, is to be beaten with mallets or beaters, into a compact solid body, capable of being trodden upon without impression or injury. Great care is to be taken in laying on this mass of clay uniformly, and beating it into a compact body; for this purpose no more must be spread at a time upon the lime than can undergo the beating, while it retains a proper temper or consistency for the purpose; after the whole is thus finished, it is gone over several times with the beaters, and sprinkled each time with water, and care is taken to prevent any cracks being formed, which might entirely destroy the power of retention.

Pure brick clay is not required in particular, but any tenacious earth; that by beating will become a solid compact body, will answer the purpose. As soon as this operation has been duly performed, the whole surface of the clay is covered, to about the thickness of a foot, with broken stone, fine gravel, or the chippings of mauling stone, or limestone to prevent any injury being done by the treading of cattle.—It is necessary to observe, that coarse stones ought not to be made use of, as they are liable to be displaced by the treading of cattle. They are also liable to be pressed into or through the clay, or to be rolled down to the bottom of the pond; under all which circumstances, the beds of lime and clay are liable to be broken, and the water consequently let out of the pond. Sometimes the clay is covered with sods, the grass side being laid downward as a support to the ground, by which some saving of the covering may be made; or a covering of earth may be used, where gravel and such like are scarce. After the clay has been well beaten, some workmen water the surface of it, and bid sheep or pigs for a considerable time upon it—the treading of which is found, to be serviceable in rendering it more compact.

The best season for making these ponds, is thought to be in autumn, as they are then likely to be filled the soonest, and the least liable to crack before they are filled. Should the weather prove dry at the time they are finished, it is well to cover the surface with straw, or litter, to hinder them from cracking.

These ponds are usually made at the foot of some declivity where, after heavy rains, water may run into them from the road, but many are placed without any such assistance, it being found that the rain which falls upon the surface is in general sufficient for a supply, after they have been once filled; for this purpose snow is sometimes collected and heaped upon them the first winter after they are finished. One of the size above given, he says, may be executed for

about £15, and will contain about 1000 barrels of water. One of forty five feet in diameter, by five or six feet in the centre, will contain about 1000 barrels, and may be executed for about £12. Thus you may supply in a small expense. The water thus preserved is of an excellent quality, when not injured by the cattle.

Much might be said upon the excellence of the plan, but I will refrain from being upon your valuable columns, by giving any observations of my own, thinking they may be unavailing.

I am, Sir, your obedient servant,

YEOMAN OF KENT.

Keep your Land Dry.

The importance of draining is not duly appreciated, nor its practice well understood, among us. Although water is indispensable to vegetation, too much of it is as hurtful as too little. It is necessary to the germination of the seed, to the development of the vegetable matter in the soil, to the transmission of the food from the soil to the plant, to its circulation there, and to the maturity of the product. All these useful purposes are defeated, where water remains in the soil to take up—the soil rests, the vegetable matter which should serve as the food of the crop, remains undecomposed, in consequence of the absence of heat and air, which the water excludes; or, if the seed grows, the plant is sickly, for want of its proper food, and there is consequently a virtual failure in the harvest.—It is not from the surface only we are to determine whether land is sufficiently dry to sustain a healthy vegetation; but we are to examine the surface stratum, into which the roots of the plants penetrate, and from which they draw their food. It is this stratum which is to be made dry, and water will collect in a hole sunk fifteen inches below the surface—the best site to wet for cultivated crops, and means should be adopted to render it more dry. From my painful acquaintance with this country, I feel assured that much of your best land is rendered unfit for tillage, or the growth of the finer grasses, by reason of the excess of water, which passes or reposes upon the subsoil unremoved by the cultivator. These lands are denominated cold and sour, and they truly are so.—Cold sour lands are invariably wet lands below, if not upon the surface. But if the superfluous water were judiciously conducted off by efficient under-drains, (for the construction of which, you possess the best materials in abundance,) these lands would be rendered warm and sweet, and highly productive, and the only would be repaid by the increased value of two or three of the first crops. Wet lands are generally rich lands, abounding in vegetable matter, which water has preserved from decomposition, but which readily become the food of plants, when the water is drawn off. Let me imagine a case, which I am sure will be found to exist in many parts of your country. There is a slope of a little hill, half a mile in extent, terminating in a flat forty rods wide, through which a brook meanders. The soil on this slope, and in this flat is of a light porous quality, six to twelve inches deep, resting on a subsoil impervious to water, as clay, rock or limestone. By soil, I mean the upper stratum, in which vegetable matters are blended with earthy matters, and which constitute the true pasture of plants. Near the top of this slope, all along in a horizontal level, or perhaps lower down, spouts or springs burst through the subsoil, a thing very common in hilly districts, the waters from which finding an easy passage through the loose soil, spread and run down the slope, and upon the subsoil and through the flat, till they find their level in the brook. A thermometer plunged down to the subsoil, will indicate, at undimmed, a temperature probably not greater than 60° whereas to grow and mature many of our best farm crops, we require a heat in the soil of 70° or 80°.

How shall we remedy this evil, and render this land profitable to the occupant? Simply by making an under drain or drains, in a gently inclining direction; a little below these spouts or springs, and, if practicable, somewhat into the subsoil. The water will catch and conduct off the spouting waters, and by laying the lower plane dry and permeable to heat air, develop all its natural powers of fertility.

I will suppose another case—that of a flat surface, underlain by an impervious subsoil. This is rendered unproductive, or difficult to manage, by stagnant waters. The rain and snow waters, penetrating the soil, are arrested in their downward passage, by the subsoil, which not having slope to pass them off, they here remain and stagnate, and putrify, while prejudicial to vegetable and animal health. The mode of draining such grounds, and of rendering them productive and of easy management, is first to surround

the field with a good underdrain and to construct a sufficient open drain from the outlay to carry off the surplus. Then with the plough, throw the land into ridges of twenty to thirty feet in breadth, according to the quantity of the soil, in the direction of the slope, and sink an underdrain in each of the furrows between the ridges, terminating them in the lower cross drain. The materials of the under-drains, which are generally stone, should be laid so low as to admit of the free passage of the plough over them. The superfluous water, by the laws of gravitation, settle into these drains, and pass off and the soil becomes dry, manageable and productive. An acquaintance called upon a Scotch farmer whose tract had been underdrained in this way, and being informed that the improvement cost sixteen dollars an acre, the having been used, remarked that it was a costly improvement. "Yes," was the farmer's reply, "but it cost a deal more *not to do it*," which he illustrated by pointing to an adjoining farm, like situated, which had not been drained, and was overgrown with rushes and with sedge grass, and then to his own fields teeming with luxuriance and rich in the indications of an abundant harvest.

I have dwelt upon the subject of draining with more detail, because I have personally realized its benefits, and am sure it may be extensively gone into with certain prospect of reward.—Judge Bell.

For the New Genesee Farmer.

Receipts of Information.

LIVER COMPLAINT.

MISSIS. EDITORS—Barley is an old medicine for the cure of liver complaints. In the countries west of the Allegany mountains, animals are particularly subject to such complaints, especially hogs. Repeated experiments have shown, that if they are fed with a proportion of barley while fattening—say one-third or one-half barley—their livers, when they are killed, will be found free of any defect or unsoundness: Whereas, if they are fattened upon corn or other articles, such as are generally used, a sound liver can rarely be found. In order to produce this effect, it is best to feed the barley without cooking it;—boiling it will lessen its medicinal properties.

DEAD SHEEP.

If the wool of dead sheep is not wanted for stockings, it should be sheared off from them instead of being picked off. If sheared off, it can be sorted by the manufacturers, and will be purchased by them at its fair value. It is also a great saving of labor.

STITCHES, OR COSTIVENESS OF BOWELS.

This complaint frequently arises from dry hay becoming consolidated in their stomachs.

CURE.—To half a pint of yeast add half a pint of lukewarm water, and from a bottle, turn it down the sheep's throat. Dose it in this manner once in two or three hours, until relieved.

This medicine operates by dissolving the contents of the bowels by fermentation, and will generally operate when all other medicines fail—is a cooling and safe remedy. Doses of two or three quarts should be given to oxen and cows afflicted with dry murrain, which is similar to the complaint among sheep.

Potatoes.—Sheep are not fond of Potato tops, especially when they are full grown, or getting old—therefore, if your potato patch becomes too grassy or weedy, either before or after being, turn in your sheep, and they will shortly cut down the grass and weeds—only be careful to turn them out as soon as they have finished the grass and weeds.

HOGS IN PASTURES.

I have conversed with many farmers upon the subject of letting hogs in upon pasture ground, and I find upon inquiry that a majority are in favor of letting old hogs in upon pasture ground, and think that they add to the quantity of pasture without injuring the quality. My own impression is the reverse of this, but I find so many large farmers who are of opinion that it should be pleased if you

subject and notice it in your issue of Albany has sold a Berkshire

Porc, July, 1841, the former for \$200, and the latter V. P. Curo of Kentucky. The weighed 890 lbs.

The Flowers of Summer.

Since our last article on flowers was written, we have seen the *Mahoe rose* in its glory; and when its tall stems are properly supported by a trellis, its dark flowers make a fine display. The *Caroline rose* is well adapted to the same treatment.

The *Grindle rose* stands on the south side of a board fence; and with no other protection, it has endured the winter without damage. The flowers varying from pure white to almost red purple, even in the same panicle, present a pleasing contrast of colors.

At different times, we had procured trees of *Magnolia glauca* but they could not endure the sun in the open border, though the soil had been enriched for the purpose. Accident, rather than judgment however, induced us to try one on the north side of a board fence; and it has grown finely, producing this season, for the first time, two of its white fragrant flowers. Sand with a large portion of muck from the woods, constitutes the soil.

Our purple *Chinese Magnolia*, mentioned at page 84, (where its specific name should have been printed *odorata*) two or three years ago shewed in its yellow leaves that it was suffering from an ungenial soil; and we procured *sour earth*—such as corn would grow in, from the northern part of Seneca county. This material was applied three or four inches thick to the bare roots, and covered up with the soil that had been removed to give it place. In a few weeks the leaves assumed a deeper green; and two of these shrubs, which have been treated in this way, might now be chosen as samples of a healthy vegetation.

Verbascum speciosum grows six or seven feet high, and appears to be perennial. The stem supports more than fifty lateral branches, crowded with flowers of a golden yellow which in the morning beam are uncommonly brilliant. In the afternoon it seems to fade, the flowers contracting or falling off; and in the evening it is nearly bereft of beauty. In the morning it is again renewed; and continues to bloom in this manner for a long time.

The double white *Campanula persicifolia* has blossomed with us for the first time, and equals our expectation. This species in its foliage as well as its flowers, is among the most elegant of that wide spreading genus.

Yucca flaccida was mentioned last year; and remains to be a favorite. Its large white flowers continue long in bloom; and its leaves which are abundant and more than a foot in length, are as green in winter as in summer.

Severe as the drought has been, *Bocconia cordata* disregards it; and from a deep fecund soil, sends up stems seven or eight feet high. The light bluish of its petals before they open, which though small, are exceedingly numerous, is very conspicuous and pleasing.

Macrotys racemosa, degraded in some districts under the name of Black Snake Root, is much admired for its delicate white flowers. Where it is rare, and no prejudice exists, it appears to great advantage.

Hydrangea quercifolia, from the far south, has endured another winter, and retained enough of vitality to come finely into bloom. The branches even above the snow, were not destroyed, though impaired in their vigor; but under the snow it is secure from all injury by frost.

The dwarf Horsechestnut (*Aesculus macrostachya*) we find high, but flat topped and spreading wide, has numerous panicles resembling spikes, projecting above the leaves, each nearly a foot in length, crowded with yellow flowers, and reddish anthers on long stamens. It is a wood not yet obsolete in our country, and with splendor.

A year ago we grafted the rose-flowering Locust (*Robinia hispida*) on the common kind, because the former was not adapted to our soil. It flowered the first season, this year it has grown finely, and is now in bloom. Some have spoken discouragingly of its duration, but so far it has done well.

The Fruit Garden.

The general introduction of fruit gardens among the freeholders of this district, would go far towards revolutionizing public sentiment on the subject of petty theft—at least of one kind. People who have grown up in the practice of taking whatever they could lay their hands on in the shape of fruit when the country was new, have in too many instances trained up their children in the same licentious habits. Steal? no, not they—out of a neighbor's desk or cupboard; but they would plunder him of the just reward of his toil (melons, plums, or peaches,) and glory in their wickedness. They would not rob a hen-roost—that would be too mean; but they would rob the tree where the hens roosted, of every thing else that was valuable.

A sprinkling of depravity has fallen on every neighborhood—on some heavier than on others; but we think there are depredators who would alter their course, if the case could be clearly presented to their view; especially those who have any thing of their own. The boy who owns a melon patch and has to guard it, will be not much disposed to plunder his neighbors. A fellow feeling strengthens his virtue. His mind, in grasping the arguments that show his own rights, perceives that they apply with equal force to his neighbors, and he learns to respect them.

By way of illustration let us suppose a case. *B* and *C* owning village lots devote them to different crops. *B* plants no trees—trees cost money, and years may pass away before they come into full bearing. He is satisfied with the kitchen garden, and its cabbages, onions and potatoes; while *C* looking further ahead without neglecting his immediate wants, is preparing to have the cherry, apricot, plum, peach, pear and apple, and in process of time he is rewarded for his expenditure, toil, and care. Now the whole subject of begging or plundering fruit, turns on one question: Has *B* any more right to *C*'s peaches than *C* has to *B*'s cabbages? Let them barter, or let them buy; but the honest and honorable who have duly considered the subject, can put in no other claim, and apply on no other condition.

It has long been a general custom throughout the country with them that have fruit, to share it with their neighbors; and in many instances to keep the smallest share for themselves. It has not been because the proprietor wished to have it so, but because he was not prepared to assert his rights in opposition to a public sentiment generally expressed. He did not wish to be called *stingy*, and therefore calmly, though reluctantly, submitted to be plundered.

Before we planted our fruit garden, but while we were contemplating the subject, we became satisfied that a new stand must be taken—that we must assert and stand by the assertion, that the fruit was exclusively ours—to use it, to sell it, or to give it away, to whom we pleased, and to nobody else; and as we knew that some singularities may be indulged in, without impairing a person's character, we determined to try the experiment. We therefore laid down the rule *Not to give fruit to them that ask for it*, subject to such exceptions however, as might be right and proper; and we have found it to work well. It is the only way to make a fruit garden worth having; and we would strongly recommend it to every proprietor who wishes to enjoy the fruit of his own labor.

A Basket of Cherries.

Every body has eaten cherries; the common red, "sour enough to make a pig squeal," is the companion of every farm house. What a pity that we should rest satisfied with this miserable apology for a very superior class of fruits!

I have just had the privilege of tasting several kinds received from the garden of our friend D. Thomas, and beg leave to communicate somewhat of my enjoyments and conclusions, to those readers of the "Farmer," who are as uninformed as I have hitherto been, on this subject.

First, I was introduced to the "Early Richmond;" pretty fair thought I, as I drew down the corners of my eyes—sugar enough added to its rich, though not high flavored pulp, would give us good pies before we had any thing else. "Transparent Guigre" rich and high flavored, not quite sweet enough to suit my taste. "White Tartarian" a very fine delicious cherry, no one would say "hold, enough," with a dish of this fruit before him. By this time, I began to think "D. T." must have a very fine collection, and felt a good deal like stopping by the way in company with the good friends mentioned above, but finally concluded to join hands with the "Carnation;" for size and beauty of appearance this cherry has few rivals; its skin is sufficiently capacious to hold half a dozen of the common red (if snugly stowed) and then its complexion so beautifully mottled! who could refuse eating it? I did not try; and although some charge it with having a bitterish taste, I did not hesitate to say, that no prudent man would refuse it a place in his garden. There was a bunch on my right hand, which in my eagerness I had almost overlooked, it was the "Black Tartarian," for many years considered as standing without a rival, and when I state that it is thought very small unless three fourths of an inch in diameter, and that its juice, pulp, flavor, and bearing qualities are in proportion to its size; perhaps my readers will say as the boys do, "N. C." (nuff ced.) Animated with my success, I now determined to push my discoveries further, and seized upon a long, black, rakish looking fellow called "Elkborn," and by making "two bites," succeeded in dividing it; not that it was tough, by any means, but it justified Prince's description in "being sufficiently hard to carry to market." This quality was not very pleasant at first, but after repeated trials we found that a most delicate sweetness was left in the mouth, which even the remembrance of the one previously described could not extinguish. In this opinion, my wife (who in my estimation at least, is no mean judge of these matters) entirely concurs.

One more, the "Elton"—and lest I should tax the patience and credulity of those who have read thus far I will briefly say that it is a new cherry, a cross between the Yellow Spanish and the White Heart, and taking all things together "we ne'er shall see its like again." In this opinion I am borne out by those best qualified to judge. It is not to be understood that all the kinds spoken of ripen at the same time, but with a few of them there is much inequality, some being ready for the table, while others on the same tree are quite green. W. R. SMITH.

Macedon, 7th mo. 23, 1841.

The Curculio shut out.

A cultivator of fruit informs us, that soon after the flowering season, wishing to preserve some fine specimens of a fine plum, he made bags, "of that thin stuff, you know," said he, "that women make caps of," and inclosed portions of the bearing branches. The result is, that those portions are thickly covered with fair untouched fruit, while it has entirely fallen, in consequence of the attacks of the Curculio, from the rest of the tree.

A Visit to Mr. Sheffer's Farm (in Wheatland.)

It affords us much pleasure to publish the following account of the operations of our friend Sheffer. Farmers would find it greatly to their advantage to visit each other more frequently; and we wish our friends would oftener send us their observations on the management and success of their neighbors. Mr. Sheffer is a plain hardworking every-day farmer, enjoying no greater advantages than are possessed by thousands of others in our land.—Eus.

—
For the *New Genesee Farmer*.

Messrs. Editors—In making a visit to our townsmen, George Sheffer, last week, I was so well pleased with what I saw of his management, that I am induced to send you a short sketch of my observations.

Mr. Sheffer's farm consists of 360 acres, and has been in the possession of the family 51 years. It is situated a little below the mouth of Allen Creek, and is part of the farm that was purchased of Indian Allen, so called. About two-thirds of the land is Genesee Flats, the remainder undulating oak land.

In stock, Mr. S. is doing a fair business, with cattle, sheep and hogs. His cows, (of the native mixed breeds,) cannot probably be excelled in Western New-York; and his other cattle are also fine. He has a thorough bred Durham bull, pure white; and a full blood Devon bull. He is this year breeding from the latter. In his pasture I saw a pair of young horses, of the St. Isaac stock, very large and fine. Of sheep, he has some of the improved Leicester and some of the Merino breed; both kept distinct. He gives the Leicesters the preference, and says the greater quantity of wool they afford, will more than make up for the lesser price; besides, they are one-third better for mutton. He said nothing of the difference in feed; and if that was taken into the account, I think the balance might be in favor of the Merinos. His hogs are of the Leicestershire breed, with a small cross of the Byfield. He has 63 one-year-old store hogs, wintered mostly on cooked roots. (Potatoes and Mangle Wurtzels we presume. Eus.) They are now running in the clover pasture, with about the same number of pigs, all in fine condition. He kept his hogs in close pens through the winter, and thus made 100 loads of first rate manure which he applied to the land for his root crops. (I am of the opinion that he might improve on his pig management, by feeding boiled corn with his roots; and if he had it ground and slightly fermented it would be still better.)

In wheat growing, Mr. S. is not behind his neighbors. He has 110 acres, mostly extra-fine, for this season. Some on the flat was injured by the winter and the high water this spring, and is consequently quite thin; but it is not filled with cockle or ches, as some of the readers and correspondents of the Farmer might suppose; on the contrary, not a stalk of cockle could be seen, and in going more than 200 rods around and through his wheat, I only found one solitary root of ches, and that he said was chargeable to me, for I furnished him the seed. If the advocates of transmutation would take a walk through his wheat, I think their faith would be somewhat shaken; for here, if any where, is the place for wheat to turn to ches; when it has been severely frozen, and covered with water.

Of Corn, he has 17 acres, planted on sward land, turned over and well harrowed, (after being covered with manure.) This crop looks remarkably well, and if the weather proves favorable will afford a great yield. In passing through it, I could not discover any pumpkin vines, and was informed by Mr. S. they would not grow in the shade, where the corn was so thick.

He has 27 acres of Oats, a part of which are on the land where his root crops were raised last year, and are very heavy. The remainder are on sward land turned over, rolled and harrowed in; these bid fair to afford a good yield. He observed that if oats did not fetch three shillings a bushel, he fed them out.

Of Barley, he has about 10 acres, half of the six-rowed, and half of the two-rowed kind. He gives the latter the preference.

In Root Culture Mr. Sheffer is quite at home, and is operating with a masterly hand. His long, straight rows of Beets, Carrots, Potatoes, and Ruta Bagas, are a sight worth seeing. He has nine acres of potatoes planted in drills, manured in the rows, of the Roban, Mercer, and Ox-Noble or large pink-eye varieties. He expects they will average four hundred bushels per acre. Next are two acres of Mangel Wurtzel, in rows twenty-seven inches apart, and the plants from six to nine inches apart in the row. Then two acres of Sugar Beets, three acres of Carrots, and four acres of Ruta Bagas, all in similar rows and all looking very even and thrifty. With ruta bagas he is very successful. He is very liberal with seed, using three pounds to the acre. The amount of labor expended upon the root crops, including preparing the land, seeding, thinning, and twice dressing has averaged about ten days work per acre.

In taking a peep into his garden I found another sight that but few farmers can exhibit. A good assortment of vegetable luxuries, all thriving in their proper places, and free from weeds. His melon vines were so fine that I enquired his mode of culture; and was informed that he first opened a trench about two feet wide and one deep; this is filled two-thirds full of hog manure and the other third a little rounding with river sand, on which the seed is planted.

The cider mill is but little used. With his large orchard, Mr. Sheffer only made three or four barrels of cider the past year, and that was used for vinegar and apple-sauces. No spiritous liquors are used on his farm. The apples are mostly fed to stock.

Last, though not least, I took great pleasure in viewing the Apiary. Mr. S. has 16 swarms of bees in Week's Vermont hives; with the boxes or drawers filled or nearly filled with fine white honey, and the little workers busily stowing away their treasures for the owner, who says, Go on, industrious bee; I will only take what you can well spare from your store. With these hives the honey can be taken at any time without destroying or disturbing the bees.

Respectfully, yours,

RAWSON HARMON, JR.

Wheatland, Monroe Co. July 17, 1841.

Berkshire Hogs.

A. C. Blackwell, of Round Grove, Mo., requests "a full description of the never-varying flesh marks of Berkshire hogs," adding that there are a great many imported into that State as Berkshires, some white with black spots, others black with white feet, face, and the tip of their tails. He wishes the necessary information to prevent imposition on himself and many other subscribers. We hope some one, properly informed in this particular, will give the necessary information in our next number; just observing at present, that a very large portion of the Berkshires now in this country are of the color our correspondent speaks of,—black, with white face, feet, and tail tip, (not exactly nine white hairs in the tail, as some have humorously and sarcastically said;) some others are spotted; and some are even noticed on the most respectable authority, as being white. We consider the shape, not the color, as the distinguishing feature, and as this cannot be easily described by words, we must either refer our correspondent to some well executed portraits, which we have rarely seen ourselves, or to

what is far better, to the living specimen, obtained from some honest and competent importer and raiser of the breed. We hope to see something more satisfactory from some of our correspondents under this head next month.

For the *New Genesee Farmer*.

Sugar Beets Plough Late and Plant Early.

Messrs. Editors—Finding that some of our best Farmers had abandoned root culture, I inquired the reasons: "A puttering business—bired men won't work at it," "increase don't pay the maling," &c.

Now if the time employed in digging, and picking up small potatoes in the fall was spent in boiling long manure on to a single acre of ground and ploughing it under, this acre would be ready early in the spring for sugar beets with harrowing only. Plant as early as the ground is dry enough, thin out and transplant as soon as the beets are three or four inches high, and by the first July some of the beets will measure five or six inches in circumference. I admit that if a piece of ground is half ploughed in the spring and planted just before the droughts of summer commence, that the culture of beets will prove a puttering business, and the increase will not pay the maling.

SENECA.

Waterloo, July 18, 1841.

P. S.—I have now sugar beets in my garden, self-sown and transplanted in May, that will now measure four inches in diameter above the ground—heavy clay soil. S.

Wheat Culture.

Messrs. Editors—Having been a reader of the Old and of the New Genesee Farmer from their first establishment, I have observed that some branches of agriculture have been much neglected, while others of minor importance have received their full share of attention. I refer to our great staple wheat, as one of the much neglected, yet one that interests us more in this vicinity than all others. Now why it is so after so many repeated calls, I leave for others to say, and propose to break the ice on this subject by briefly giving you the results of my experiments.

The field contained six acres of land, principally occupied with Canada thistles, and on which a Florida war had been waged for twenty-five years or more, with little prospect of success or termination, easting, as is always the case, all that was obtained.

In 1837, in the latter part of May, I broke it up, and drew on it about one hundred and eighty loads of manure. I ploughed the ground deep four times, and harrowed it as often, in the heat of summer. From the tenth to the fifteenth of September, I spread the manure on the ground, sowed the wheat at the rate of one bushel and a peck per acre, and ploughed it in, and then passed over it lengthwise with a light harrow. The result was, that I killed three instead of two birds with one stone, for I harvested three hundred and forty one dozen sheaves, a part of which being thrashed by itself, gave one bushel to eleven and a half sheaves. The wheat was the red chaff bald, and the soil was a black loam with a subsoil of clay. Proof of the above can be furnished if needed.

In the above piece it cost me but little more than other fields of similar size, I received about twice as many bushels of wheat, killed the Canada thistles, and my ground is in good condition for sfer-cropping.

AUGUSTUS D. AYERS.

Romulus, June 26, 1841.

Pig Sale.—J. Lossing of Albany has sold a Berkshire boar and sow, the former for \$200, and the latter for \$300, to W. P. Curd of Kentucky. The boar with his cage weighed 890 lbs.

For the New Genesee Farmer.

Inflammable Gas exhaled by Flowers.

Messrs. Editors—Having recently made some experiments on the Dictamnus rubra, or Red Fennel, I have thought it desirable to communicate the result of the same through the medium of the Farmer.

The Dictamnus rubra (and alba) is one of our most hardy herbaceous perennial plants, and is universally admired, not only for its great beauty, but also for its peculiar fragrance. Its bright leaves, its erect position, its long spikes of fine flowers, cannot fail to attract the attention of the most casual observer.

In some nursery catalogues it is stated that this plant exhales an inflammable gas; yet probably but few persons have tried any experiments to test this peculiar property of this plant. A few days since, having several of these plants in full bloom, (and it is only when in full bloom that they appear to emit the strongest odour,) I repaired to the garden in the evening to try the experiment. On applying a lighted candle to the base of the spike of flowers, it instantly exploded, and in a moment the whole flower was enveloped in a blaze. On applying the candle to the top of the flower, it had no effect. When applied half way down, the gas only above that point would explode, but none below; and thus the explosion was only complete when the torch was applied to the base of the stem or flower.

I also tried the same experiment on the Dictamnus alba, which produced similar results, only that the quantity of gas emitted from this plant appeared to be much less than that emitted from the rubra. The explosion is something like that produced from the ignition of a small quantity of gunpowder; yet it produces no injury to the flowers.

B. HODGE.

Buffalo Nursery, June, 1841.

For the New Genesee Farmer.

Best Time for Cutting Timber.

Messrs. Editors—Your article in a recent number of the Farmer, under the above caption, is on an important subject, and contains some valuable suggestions. I coincide with you in opinion that the summer is the best time for cutting timber; but not that every period of the summer is equally good. In the early part of the season the flow of sap is so abundant, that the retention of the juices in the pores of the timber is liable to produce fermentation, and consequently, premature decay. If there be a period when the circulation is almost inactive—when the sap nearly ceases to flow and the bark to run—it appears to me that reason would designate that as the most proper time to perform the work. The qualities of the sap, instead of being watery and abundant, as is the case early in the summer, will have become concentrated and viscid; and instead of hastening decay, will no doubt contribute to durability.

That there is such a period, is a well known fact. It occurs in the month of August, a few days earlier or later, according to circumstances, but generally from the 15th to the 20th, and continues only for a very limited time. If the weather is dry, its continuance will be somewhat longer. Persons who are in the habit of measuring fruit trees, select the period of the autumnal flow of sap, which is from the 1st to the 10th of September, as the most eligible for propagating cane species.

I have frequently had timber cut in August, and I can certify that the wood is very compact and solid. It has a different appearance from that cut in winter—looking and feeling as if it had been oiled. My own experience does not extend further back than ten or twelve years; but I have known, and could cite, a number of cases of remarkable durability, when the

timber has been cut according to the old Dutch rule, in the dark of the moon in August,—which is as near the exact time, as any person, relying on lunar influence, could approximate to; and every third year the rule's might very nearly correspond.

The period mentioned, appears to constitute something of a crisis in almost all vegetation of a ligneous character. The simple boring of a tree, will effectually destroy vitality, that not a sprout will ever shoot up from the roots or stump. It is the only time at which I have ever even partially succeeded in substituting the "round top" (Cephalanthus occidentalis) which infests our meadows and bog grounds, and which grows from the smallest section of a root. I succeeded in entirely, by a single operation, so that there was scarcely a vestige of it for several years afterwards.

Close observation is necessary, to enable one to designate the precise time when the work should be performed. The moment to begin, is when the bark is found to adhere closely to the wood. T. S. P.

Virginia, 6 mo. 30, 1841.

The Hessian Fly.

Extract from remarks on the Hessian Fly, read before the Calthoun County (Michigan) Agricultural Society, by the president, Judge Hickox.

GENTLEMEN—We have a fine climate, less subject to high winds, to sudden changes from cold to hot, from too much wetness to drought, from deep snow to bare ground, than is enjoyed at the east. The soil of this country is for the most part a sandy or gravelly loam; and soon subsides in the earth, while the great protection of lime it contains, secures the crop against the dangers of excessive dryness. It is a fully cultivated, and its ingredients are exactly adapted for the production of wheat and for grazing; two branches of business which should always enter into our system of Agriculture.

But we labor under two evil circumstances; the one which is of paramount importance to all others, because it is the nursing mother of all of them, is the want of such a market for our produce as will induce us, by its profitability, to cultivate our farms as to have at least one bud or two thirds of our bits in grass while the others are under the operation of the plough. In practice, this will be found unobtainable, especially where the price of Agricultural produce is low, and the wages of our labor are high.

The second embarrassment arises from the prevalence of the Hessian Fly, which has the last season destroyed, it is believed, more than two-thirds of the wheat crop in this country. This formidable insect was first discovered in Long Island, about sixty years ago, and was supposed to have been brought from Germany in a ship which transported the Hessian Army to Long Island during the Revolutionary War. It has, however, been well ascertained that the insect is indigenous in the United States.

From the best accounts we have been able to obtain of the Hessian Fly, it chooses for its prey the weakest plant. In this respect it resembles most other insect depredators, who prefer to make their repairs on the delicate swarder to pieces of plants of a stunted growth. It is voracious, and usually deposits its eggs in the gutter on the upper leaves, and in some instances on the under as well as the upper sides. In four or five days the eggs hatch, and the caterpillars crawl down the leaf to its intersection with the stalk, where they may be found beneath the sheath, so minute as scarcely to be seen by the naked eye. This insect has two generations in a year, distinctly marked, although in scattered instances it may be found in all its various states of existence, from April to October. First generation. In spring, the eggs are laid in the latter end of April or beginning of May, and are hatched, and the caterpillars appear in May. In the latter end of May, or the first of June, they change to the chrysalis or flux seed state; at harvest part of the chrysalis are cut off the field with the grain, but most of them remain in the stubble in their original nest at the intersection of the leaf with the stalk. The latter end of July or first of August, they take wings and deposit their eggs the latter end of August and in September. Second generation. In a few days after the eggs are laid, they are hatched, and the caterpillars pass into the chrysalis or flux seed state in October, and in this state they remain during winter, and appear with wings and lay their eggs the latter end of April or beginning of May.

The fly is not found, at least rarely, on lands that are subject to early and late frosts, such as our prairies, or the high lands on the head waters of our streams. But it would seem that the outer parts of the State must be particularly subject to its ravages, and that there is no variety of wheat that can long resist this formidable enemy.

Prevention.—The preventives which are most likely to be efficient, are, not to sow until October; in the spring of the year, soon after the fly has deposited its eggs, while the plants are wet with rain or dew, sow the wheat field with manure, or feed down the wheat close to the ground, by a drove of cattle, or what is better, by a flock of sheep, sufficiently large to perform the operation in a few days—not to sow a field of wheat adjoining one from which a crop has been recently taken—plough under wheat stubble in autumn—destroy all the voluntary wheat plants that may appear on a farm in the spring and before October, by the use of a drag or in some other way, and cultivate land in the best manner, so as to have no weak or stunted plants.

Rotation of crops a preventive.—But all this trouble to guard against the Hessian Fly may be saved by the introduction of a proper system of rotation of crops. A strict adherence to the true principles of husbandry admits, nevertheless, of a considerable variation.—Western Farmer.

Important Discovery—Destroying Insects.

We embrace the earliest moment, after the receipt of the following letter, to lay it before our readers. The season is not yet so far advanced that the process may not be beneficial to those who put it in operation: M. P. WILSON, Esq., President of the Massachusetts Horticultural Society:

SIR—Having discovered a cheap and effectual mode of destroying the Rose Slug, I wish to become a contributor for the premium offered by the Massachusetts Horticultural Society. After very many satisfactory experiments with the following substance, I am convinced it will destroy the above insect, in either of the states in which it appears on the plant, as the fly, when it is laying its eggs, or the slug when it is committing its depredations on the foliage.

WHALE OIL SOAP, dissolved at the rate of two pounds to fifteen gallons of water. I have used it stronger without injury to the plants, but find the above mixture effectual in the destruction of the insect. As I find, from experiments, there is a difference in the strength of the soap, it will be better for persons using it to try it diluted as above, and if it does not kill the insect, add a little more soap, with caution. In corresponding with Messrs. Downer, Austin & Co., on the difference in its appearance, they say—"Whale Oil Soap varies much in its relative strength, the article not being made as Soap, but being formed in our process of bleaching oil. When it is of very sharp taste, and dark appearance, the alkali predominates, and when light colored and flat taste, the grease predominates." The former I have generally used, but have tried the light colored, and find it equally effectual, but requiring a little more soap—say two pounds to thirteen gallons of water.

Mode of preparation. Take whatever quantity of soap you wish to prepare, and dissolve it in boiling water, about one quart to a pound; in this way strain it through a fine wire or hair sieve, which takes out the dirt, and prevent its stopping the valves of the engine or the nozzle of the syringe; then add cold water to make it the proper strength; apply it to the rose-bush with a hand engine or syringe, with as much force as practicable, and be sure that every part of the leaves is well saturated with the liquid. What falls to the ground in application, will do good in destroying the worms and enriching the soil, and from its killing cost, it can be used with profusion. A hog-head of 130 gallons costs forty-five cents—not quite four mills per gallon. Early in the morning, or in the evening, is the proper time to apply it to the plants.

As there are many other troublesome and destructive insects the above preparation will destroy as effectually as the Rose Slug, it may be of benefit to the community to know the different kinds upon which I have tried it with success.

The Thrips, of a red and the Vine Pruner, a small, light colored or spotted fly, in motion, which in some places are making the rose bushes nearly as bad an appearance as the effects of the slug. Aphid, or Plant Louse, under the name of green or brown fly, an insect not quick in motion, very abundant on, and destructive to, the young shoots of the Rose, the

Peach tree, and many other plants. The *Black Fly*, a very troublesome and destructive insect, that infest the young shoots of the Cherry and the Snow Ball tree. I have never known any positive cure for the effects of this insect until this time. Two varieties of insects that are destructive to, and very much disfigure Evergreens, the Balsam or Balm of Gilead Fir in particular, one an Aphid, the other very much like the rose slug. The *Acarus*, or red spider, that will known pest to gardeners.

The Disease Mellow on the Gooseberry, Peach, Grape Vine, &c., &c., is checked and entirely destroyed by a weak dressing of the solution.

The above insects are generally all destroyed by one application, if properly applied to all parts of the foliage. The eggs of most insects continue to hatch in position, during their season. To keep the plants perfectly clean, it will be necessary to dress them two or three times.

The Canker Worm. As the trees on this place are not troubled with this worm, I have not had an opportunity of trying experiments by dressing the trees, but have collected the worms, which are killed by being touched with the liquid. The expense of labor and engines for dressing large trees, to be effective, may be more than the application of it will warrant; but I think by saturating the ground under the trees with the liquid, about the time the insect changes from the chrysalis state and ascends the trees, will destroy them; or, when the moth is on the tree, before laying its eggs, they may be destroyed without much labor; in either case, the mixture may be applied much stronger than when it comes in contact with the foliage. Laying it on the trunk and branches of the tree, at the consistency of thick paint, destroys the brown, scaly insect on the bark, and gives the tree a smooth, glossy, and healthy appearance.—N. E. Farmer.

DAVID HADGISTON.

Watertown, June 19th, 1841.

From the American Farmer.

The Rose-Bug.

This little insect wherever it is known at all, is known to be extremely destructive to some other flowers as well as the rose, and is sometimes so numerous as to destroy all the early cherries, the hawthorns, the grapes, and sometimes the more delicate varieties of the peach. Many years ago I have often lost all these fruits except some of the varieties of the peach by these insects. Of late years they have done me little or no injury, and they are nearly exterminated from my premises—they are only to be seen at the places of their destruction—these are *Linden trees when in blossom*. When these trees first begin to blossom about my yard and garden, at one of them or a hard naked wall, I was surprised to find the rose-bug, which had been vastly numerous and destructive for many years before, dead in great quantities under it—as many as a pint or quart might be swept up under it at a time dead. My first impression was, that the bugs died about the linden tree after depositing their eggs and terminating their natural career, but such is not the fact, and I now speak with confidence after several years observation and experience when I say, the blossom of this tree destroys them, and will extirpate, or nearly so, the race from its immediate vicinity, on the farm on which they grow. This fact seems to be out of the ordinary course of nature, for we are taught to believe that all animals in a natural state are led by the wise instinct of nature to avoid that which will poison or destroy them. In rushing into the enjoyment of the delicious fragrance and honey of this flower, they precipitate themselves on their own destruction.

I state this fact, for the information of florists and fruiters, and hope that those better skilled in philosophy and natural history, may solve the seeming heterodoxy. T. E.

No End to Improvement.

He that believes agriculture is perfect, and that we have nothing to do but pursue the old and beaten track, as blind animals move round the tread mill, deserves our compassion. Nature proclaims that neither agriculture, nor any other branch of natural science, can ever become perfect. The mind of man is capable of indefinite improvement, so are all the productions of nature. For examples, look at the valuable plants in the condition in which they were first found in their native woods. The various kinds of corn, potatoes, cabbages, fruits, &c., were all, before they were touched by the finger of culture, as unlike what they now are, as different species are unlike. They are all susceptible of continual improvement, all ever running into new varieties. It is not long ago, that

the potato was a useless, unhealthy vegetable in the woods of South America, where it was first found, but it has been so changed by the hand of care and industry, as to become large and healthy, and now supplies food for more human beings throughout the earth, than any plant, save corn and rice, and is no doubt destined to as much future improvement as it has received in the past. Compare the maize or Indian corn, as first seen in the feeble stalk and slender roasting ear round the wigwag, with its hundred varieties in its present maturity, yielding in value its countless thousands to national wealth. And we are just now beginning to see the improvement of which this valuable plant is still susceptible.

The succession of the seasons—the calm—the storm—the course of the winds—the revolution of the heavenly bodies—the nature of the earth—the food of plants—the influence of water, light, heat and air on the growth of vegetation—the proper composition of the various soils to furnish the greatest amount of production, will ever be subjects too broad for the full grasp of the most profound philosophers, and in the untathomable profundities of which, new discoveries will be made as long as the frame of nature shall endure.—Mo. Farmer.

Humbugs.

Almost every year gives birth to some new word, or some new and peculiar meaning to the old word, in the English, or rather American, language,—so that there will be a need of dictionary makers and new lexicons as long as the Anglo Saxon race exists. In the political vocabulary, the introduction and permanent use of new terms, has become very common. Take, for instance, the word "germyander"—an entirely original one, which was invented in the days of Gov. Gerry, or the words "twaddler," "loco-foco," and the like, which have obtained a political significance, that until lately, were unknown in the English language; are not such terms evidence of the lexicographical genius of our political fever citizens? The word "humbug," is another term which, of late years, has assumed a new significance; and for the harmless insect that hums its merry music in the nocturnal atmosphere, has come, rather, to signify whatever in politics, religion, science, agriculture or the arts, deceives the people by promising much and performing little. And so now, whatever does not come fully up to what was promised, or rather what was expected by a misinstruction of the pretension, is familiarly stigmatized as a humbug. There is danger that we may go too far in this unceremoniously bestowing opprobrious terms upon every thing that does not meet our expectations. By such a premature course, we may often do real injustice to men who are engaged in great improvements. Their inventions and improvements may at first not fulfill all the expectations which were raised; still they may be of some value and ultimately prove of great service when the full design is completed; at least their motives and intentions are good, and should receive the charity, rather than the unmeasured censure of the public.

Take, for instance, the experiments that are made and the suggestions which are offered, relating to Agriculture. No improvements can be had without experiments. It is not to be expected that all should succeed. But what then? shall more be made? Some may be partially successful—leaving room for still further improvement; others may be perfect at once. If now a person who thinks he has made, and actually has made some improvement, publishes the results of his experiments, under the influence of that partiality which is always bestowed on one's own offspring, and an expectation is therefore raised, in less partial minds which is not fully sustained—though there may be improvement—is it fair or generous, to denounce the whole as a "humbug," and as author as a base man and deceiver? We think not. Some how or other, whatever gets in print, some readers are apt to look upon as having a consequence—that authorizes higher expectations than if the same thing had come to them in precisely the same words, from the lips of a neighbor. Exorbitant expectations, in this case, are the fault of the reader, rather than the writer; and if disappointment follows, the blame is not altogether on one side.

We make these remarks now in relation to two articles in agriculture, which we notice many persons are disposed, off hand, to denounce as "humbugs," because expectations have been raised, either through the faults of readers, who ascribe an undue importance to what appears in print, or to the writers who under the influence of a parental partiality have described them. We allude to the Rohan potatoes and the China Tree Corn.

For ourselves, individually, there was always something from the first and earliest descriptions which we saw, that led us to doubt whether the Rohans were much better potatoes or greater yielders than the long rods; and so we never recommended or said much about them—not choosing to make any experiments, or to give the results of them to the public. But these are called a "humbug." Wherefore? Do they not yield largely? They do. Very largely? They do. So much then is gained. Are they not better than many other potatoes for cooking? It was never pretended that they were. On the contrary, it was always said, they were not very good for culinary uses, and were more appropriate for stock. In this, then, there was no deception. Call them "humbug" if you will; nevertheless they are great yielders; and if it so happened that we in Maine have another sort, not thus made conspicuous before the public by accounts of them, which yield so much—the good luck is ours—no one is injured by the Rohans. Why then should such terrible judgments be decreed against the New Yorkers who produced and complimented a new kind that yields so well in that state. People here were anxious to try them. The seed stores were called upon to procure them. They did so to oblige customers. Purchasers bought one or two each and tried them. If they did not find them the best potato in Maine, and the greatest yielders ever seen, why should the seed stores be blamed for enabling them to try the experiment?

And now of the China Tree Corn. We can speak more experimentally of this. We tried the experiment on a liberal scale, not for our own, but for the public benefit, and gave the result of our operations to the world—just as they were. So that others had the knowledge at our cost. We never said that the China Tree Corn was adapted to our latitude. That was a point to be ascertained. We found out that it is not, and we told the public so.

It should be recollected that Thorburn from whom the seed was obtained, resides in the city of New York. His crop was raised on Long Island. His descriptions of its capacities related to that latitude. He never said it would flourish and ripen in Maine; and if we choose to try the experiment here we must do it at our risk, and if it failed, not blame the corn for what it could do in the Middle States, but could not do in Maine or in Canada. We have no doubt that it is a very early corn for that latitude; and that what Thorburn said of it is mainly true, so far as relates to the region where he raised it, which was the place of his descriptions. He never said that it grew like trees bearing ears on branches. This was an emendation made by the conjecture of some secular editor, for whose description Thorburn was not responsible. The truth is, it is a tremendous great corn. It grows like a forest, and will yield, in climates suited to it, beyond any corn we ever saw. This we proved by actual experiment. The year we planted it, as we did on a large scale, the season was dark, cold and wet. It did not have a fair chance with us. But still fearful as the odds were against us,—the seed having been raised three or four hundred miles south of us, the most of it did ripen. Last year, we planted some from our own seed, and that was fully ripe long and long before any frosts. We are not sure yet, that it may not be acclimated and become a fine corn for us in Maine—bating its exhausting properties—for it will exhaust the land at a great rate, as is natural where a great crop is yielded.

People may call it a "humbug," if they choose, but it is no humbug in New York and Pennsylvania, for we very frequently see accounts in the agricultural journals of those states, setting forth examples in various places of its successful culture, and of its enormous yield. We ought not, in Maine, to expect a corn to flourish here, which is adapted to the Middle States.

People brought it here from curiosity, to plant. To gratify this curiosity our seed stores obtained some of it on sale. But who was really injured by it? Not one in an hundred bought even a single ear, which cost the capital sum of twenty five cents; and most procured but a few kernels at a price of a glass of rum. This expense, therefore, could not have been a great injury to any one, and certainly not much land was lost by its occupancy with the plants. People had the opportunity to try the experiment, and this they did without injury to themselves. If they were satisfied—well; if they were not, let them not grieve as if they had been imposed upon and robbed of a whole summer's work, and their farm to boot. It is well to try experiments, though they fail sometimes.—Maine Cultivator.

ROCHESTER, AUGUST, 1811.

Apologies and Promise.

The absence of the managing editor during the past month, must serve as an excuse for any defects that may appear in this number of our paper. For the same reason we have not yet completed the new arrangements alluded to in our last. We can assure our readers, however, that such measures are in progress as cannot fail to give them increased satisfaction. A new Power Press will be procured expressly for this work, and a better quality of paper will be obtained, so as to improve its appearance and secure punctuality. More attention will be paid to the editorial department than heretofore, and more aid is expected from valuable correspondents—so much for this time. Now have patience with us readers; and see if we do not perform all that we have promised, and more too, before many months.

The Fair at Syracuse.

Our readers will not forget the State Agricultural Fair to be held at Syracuse on the 29th and 30th of next month (Sept.) The place selected is a good one, and articles for exhibition can be transported there with little risk or expense. We trust the farmers of Western New York will do themselves credit on the occasion. For list of premiums, &c. see last month—further particulars hereafter.

Monroe County Agricultural Society Notice.

The Officers and Town Committees of this Society will please remember the meeting on the 2-th August. The Town Committees are expected to make their reports at that time, and arrangements are to be made for the coming exhibition.

COUNTY AGRICULTURAL SOCIETIES.

Notices of the formation of a goodly number of county societies have appeared during the past month, but having been absent till almost our day of publication we are unable to give them that attention we could wish, and some must be deferred entirely till next month. We intend to publish a complete list of the societies in the State, and give the names of the officers and time of holding the fairs, in the western and central counties.

Cayuga County.

This society was organized at Auburn, July 22, 1811. A constitution was adopted and the following persons appointed officers of the society:

PRESIDENT—Humphrey Howland, Ledyard.
VICE PRESIDENTS—John M. Sherwood, Auburn; Loring Willard, Aurelius; Isaac Bell, Brutus; L. M. Hollister, Cay; Levi Colvin, Conquest; D. O. Durkee, Ira; Wm. F. Tompkins, Fleming; Matthias Butcherson, Genoa; Wing Tabor, Moravia; Samuel Bell, Menz; Isaac Sisson, Locke; Geo. R. Brankerhoff, Owego; Jonathan Richmond, Ledyard; Mr. Fuller, Seneca; John W. McAllen, Sterling; E. A. Howland, Venice; Matthias Vanderheyden, Victory; John Sizer, Sennett; U. P. Doubleday, Scipio; Luther Fuller, Niles; Henry Gane, Springport; Martin Butler, Summerhill.
RECORDING SECRETARY—Wm. Richardson, Auburn.
CORRESPONDING SECRETARY—Wm. C. Beardsley, Auburn.
TREASURER—John B. Dill, Auburn.
EXECUTIVE COMMITTEE—Ira Hopkins, Auburn; Thomas Bell, Aurelius; Moses Davon, Brutus; Silas Dudley, Cay; Enos Wilberill, Conquest; Samuel Phelps, Ira; Elijah Sheldon, Fleming; William Wilton, Genoa; Isaac Cady, Moravia; Joseph Osburn, Menz; M. Sherman, Locke; John Austin, Owego; David White, Ledyard; Josiah Wilcox, Seneca; George Cooper, Sterling; William Bennett, Venice; Peter Bogart, Victory; Wm. Webster, Sennett; Joseph Pettit, Scipio; John Rooks, Niles; Peter Yawger, Springport; A. J. Vanarsdale, Summerhill.

Extracts from the Constitution.

§ 2 Every person desirous of connecting himself with this Society, shall pay to the Treasurer fifty cents at the time of his becoming a member, and one dollar annually thereafter on the second Wednesday and Thursday following in October, during his continuance as a member. Any person paying five dollars on admission may become a member for five years. Any member wishing to withdraw from the Society must pay all dues and give a written notice to the Recording Secretary of his intention.

§ 5 There shall be an annual meeting of the Society on the 2d Wednesday and Thursday following in October, at Auburn, (or at such place as the Board of Managers shall direct) for the purpose of holding the regular fair and exhibition of domestic animals, manufactures, and articles, the produce of the farm.

The officers of the Society are requested to meet at the American Hotel, at Auburn, on the 12th day of August, at 11 o'clock, A.M.

Seneca County.

An Agricultural Society for this county was formed at Fayette on the 29th of June, 1811. The following persons were appointed officers:

PRESIDENT—G. V. Sackett, Seneca Falls.
VICE PRESIDENTS—Dr. John L. Eastman, Lodi; George Woodworth, Covert; Andrew Daulton, jr. Ovid; Elijah Denton, Romulus; Thomas Burroughs, Varick; Dr. Oakley, Fayette; Joel W. Bacon, Waterloo; Silas Vandermark, Junius; Jason Smith, Tyre; Benjamin Boardman, Seneca Falls.

RECORDING SECRETARY—A. B. Dudley, Ovid.
CORRESPONDING SECRETARY—Samuel Williams, Waterloo.
TREASURER—John D. Coe, Romulus.

TOWN COMMITTEES—Dr. Folwell, G. Miller, John Lefferts, Lodi; Judge Woodworth, Truman Boardman, Jeremiah Rappleye, Covert; Wm. R. Saylor, Benson; William Woodworth, James Barrett, Ovid; C. J. Sutton, John Kinne, Col. Folwell, Romulus; Tams Day, John A. Christopher, Orange W. Wilkinson, Varick; John King, Augustus Reading, Jacob Pearson, Fayette; William S. Dell, Shepard Gage, James Stevenson, jr., Waterloo; Clinton Perry, George Van Cleef, Henry Powers, Seneca Falls; Thomas M. Gee, Ebenezer Munson, Alexander H. Nicholls, Tyre; Israel Lisk, Aaron Southwick, Abel Birdsey, Junius.

Art. II. (of the Constitution.) Any person may become a member of this society, by paying into its treasury fifty cents on admission, and fifty cents annually thereafter, on or before the annual meeting, during his continuance as a member. Any person paying five dollars on admission may become a member for five years.

The list of premiums, &c., will be published in the "Ovid Bee."

Erie County.

A meeting was held at Buffalo, on the 22d of July, to organize an Agricultural Society—Henry Johnson of Lancaster, in the chair, and Aaron Riley, of Aurora, Secretary. Horace S. Turner, Benj. Hodge, jr. Alex. Hitchcock, John Webster, and Palmer Bowen, were appointed a Committee to report a Constitution and Bye-Laws, at the next meeting, to be held at the Court House in Buffalo, on Saturday, August 12th. **Attend, Farmers!**

Niagara County.

This society was organized at Lockport, June—. The officers are—

William Parsons, *President*.
 John Gould, jr., C. H. Skeels, *Vice Presidents*.
 D. S. Crandall, *Recording Secretary*.
 Joel McCollum, *Corresponding Secretary*.
 Wm. C. Brown, *Treasurer*.
 Other particulars not at hand.

Livingston County.

A meeting was held at Geneseo, and a Society formed about a month since, but the particulars have been mislaid in our absence—will give them next month. We again repeat our request that the Secretaries will send us accounts of the formation and proceedings of Societies.

What is doing in Wayne, Orleans, Chataugue, and several other counties in Western New York, not heard from?

To the Officers of the Cayuga County Agricultural Society.

GENTLEMEN—It will be seen by reference to the proceedings of the meeting held on the 22d inst., for the purpose of organizing an Agricultural Society for the county of Cayuga, that by Resolution, notice was given that a meeting of the Officers of the Society will be held on the 13th day of August next, to carry out the objects of the Society.

At this meeting all necessary Bye-Laws, Rules and Regulations will be framed and adopted to carry into full effect the design of the Association. It will be the imperative duty of every Officer, President, Vice President and Committee man, to be punctually present at this meeting. Too much pains cannot be taken in laying the foundation of the Society, for on this depend the durability and usefulness of the superstructure.

All the officers residing in the several towns in the county, should immediately make individual efforts to obtain members of the society, and if any such should be obtained, their names should be handed to the Recording Secretary, and the amount of their subscriptions should be deposited in the hands of the Treasurer, at the above mentioned meeting of the Officers.

From the spirit manifested at the meeting on the 22d inst., and the high character of the persons interested (myself out of the question,) I have not the least doubt that this cause will be eminently successful. Let no man be discouraged on the ground that a former

experiment of the kind, some 20 years since, has been tried and proved a failure; because the present circumstances under much more favorable auspices. The liberal bounty of the State, the increased wealth and enterprise of the agriculturists of the County at the present time are sure guarantees of its success.

The advantages to be derived from this Society, will be increased wealth, multiplied produce of the soil, a vast improvement to all kinds of stock, enhanced beauty and comfort from fruit yards and ornamental shrubbery, and a new impulse to moral and intellectual improvement, and the meetings of the Society, the addresses delivered on such occasions, the awarding of premiums, and the novelty and bustle of the annual fairs will be sources of rational amusement, happily calculated to take the place of other amusements of a more dangerous character.

WM. RICHARDSON,

Auburn, July 26, 1811. Rec. Sec'y of C. A. S.

New York State Agricultural Society.

The regular meeting of the Executive Committee of the New York State Agricultural Society for June, was held at the Troy House, in Troy, on the 16th,—the President in the Chair.

Letters were read from Messrs. H. S. Randall, H. Munson, John H. Beach, Charles F. Johnson, A. Bergen and Jabez Burrows.

New members were admitted to the Society.

Mr. Tucker introduced the following resolutions, which were unanimously adopted:

1. *Resolved*, That the Corresponding Secretary be authorized and requested to open correspondences with such individuals as he may deem proper, in the several counties of our State, for the purpose of eliciting information on the following points:

The present condition of Agriculture in each County, with such changes as have already taken place since the period of their first settlement—Aspect of the county—Nature of the soil—What are the principal products?—Where are the products marketed?—What kinds of cultivation are in use?—What are the favorite breeds of horses, cattle, sheep, swine, &c.? How are the stock generally fattened for market? What ploughs, harrows, and other agricultural implements are in general use? What is the general value of the land? What kind of timber generally prevails? What agricultural changes are requisite to advance the prosperity of the county?

2. *Resolved*, That the Corresponding Secretary be authorized and requested to open correspondences with such individuals as he may deem proper, for the purpose of eliciting information on

The most profitable breeds of cattle, sheep, horses, swine, &c., for our county—the best and most economical method of rearing them—Their diseases and the method of treating them—The most profitable varieties and the best method of cultivating the several varieties of grains and roots—The best and most profitable method of making butter and cheese—the most economical method of fattening domestic animals—the best and most economical method of wintering domestic animals—the Cultivation of fruits—Horticulture—the most profitable Grasses—Draining—Rotation in crops—Manures—Diseases of plants, and the remedies—Destruction of noxious weeds, &c.—Construction and management of farm out buildings, yards, &c.—Fences.

3. *Resolved*, That the Corresponding Secretary be authorized and requested to open correspondences with such individuals as he may deem proper, in the United States and Europe, for the purpose of eliciting information on such agricultural subjects as may be of value to the farmers of our State.

4. *Resolved*, That the Finance Committee be requested to address a Circular to the friends of Agriculture in this State, setting forth the importance of the objects for which the New York State Agricultural Society was formed—its inability to accomplish those objects or any useful purpose, without the aid and co-operation of the farmers and the friends of agricultural improvements generally, and the consequent necessity of an appeal to them to extend their aid to the Society by connecting themselves with it, either as annual or life members, or by contributions in aid of its funds.

Mr. B. Bement laid before the Committee a communication from Solon Robinson, Esq., in relation to a convention to be held at Washington, to form a National Agricultural Society; whereupon,

Resolved, That the object is one of paramount importance, and the executive committee earnestly recommend it to the friendly consideration of the members of the New York State Agricultural Society.

Slugs on Fruit Trees.

ESSRS. EDITORS—

About the first of July there appeared on the leaves of pear trees in this vicinity, a small dark brown worm or slug, from one quarter of an inch to an inch in length, with head much larger than any other part of the body, and in each number as to threaten the trees with immediate destruction. Half a dozen of them might often be seen feeding on a single leaf, eating out the tender part like young silk worms. They increased in numbers for about two weeks, and extended their ravages to the cherry trees, but I have no other kinds were injured by them. After continuing their work of destruction for about three weeks, and stripping many trees entirely of their foliage, they began to die, and have now mostly disappeared. Now as I am entirely ignorant of the name, origin and history of these insects, I write this communication in hopes that you or some of your correspondents will throw some light on the subject.

A. B. C.

Bloomfield, July 25th, 1841.

REMARKS.—These slugs, as they are commonly called, have been quite too well known in this vicinity for three or four years past. We are not sure that their operations are confined to Western New York, although we do not recollect having seen or heard of them in other parts. It is evident, however, that they are every year extending the field of their operations, and they will probably continue to do so, unless some natural calamity destroys, or enemy devours them; however simple may be the artificial means for their destruction, it seems that people are generally too illiberal to put them in requisition. We last year published several articles on the subject, and suggested some means for their destruction (Vol. 1.)

This insect appears to be a *worm*: or at any rate we have been unable to find out its true name, or any account of its history. We have discovered, however, that in its first state it is a fly, about as long and half as large as the common house fly, but of slower motion. It deposits its eggs in the month of June, which appear like small glutinous spots or scales on the upper surface of the leaves. These hatch and produce the slugs, which feed for about two weeks—then curl up and appear to die and fall to the ground. But instead of dying as most people suppose, they change into the chrysalis state and escape into the ground, where they remain till the next summer, and then issue forth again in the form of flies—multiply their species, and renew their mischief.

The most common and simple mode of destroying them is, therefore, to have thrown dry ashes or lime over the trees for several successive mornings. It adheres to their body and kills them. If any of our readers have discovered any more easy or effectual method we should be pleased to publish it.—Eds.

Downing's Landscape Gardening and Rural Architecture.

The appearance of this work at the present time, and the confidence which it has excited in the intelligence and good taste of our countrymen, inhabiting a region but recently made subject to the benefits of civilization, it is a matter of course that our thoughts should be chiefly occupied with what pertains to the necessities rather than the elegancies of life. We were, consequently, not without fears, that our author had mistaken his own zeal for a high estimate of rural improvement, for a somewhat corresponding feeling in the community, and therefore, like many other writers of merit, his labors would remain unappreciated, until a more refined public sentiment should do them justice.

But we are mistaken; and if the plea of ignorance does more credit to our honesty than information, all we can say is, that it is very gratifying to find the prevailing taste in advance of our anticipations.

We knew indeed that huge piles of brick and stone had been erected in the vicinity of our cities and large towns, with some pretensions at least, to care and labor, in planting about them; but we were not aware how much had been done remote from these, in the busy haunts of commercial life, to catch the inspiration of Nature, and make her beauties subservient to our comfort and elevated enjoyment.

We had often fested upon the works of foreign authors as they described the magnificent country

seats of the old world; but we knew not that the noble Hudson reflected from its silvery waters the light and graceful tracery, the pointed arch and the lofty pinnacle of the Gothic style; or that the warm and rich Italian, transported from its sunny home, had found an appropriate resting place on the quiet banks of the Delaware. But what has given us more satisfaction than all, and for which we think our author deserves much credit, is, his attempt to bring this species of enjoyment within the reach of every landholder, however humble. Republicans, as we are by feeling and education, we hope never to see the day when lordly castles, extensive parks, snatched from cultivation, and highly artificial and costly gardens, shall take the place of the elegant, but unostentatious villa, the well kept farm house, or the neat and comfortable cottage. The former how beautiful soever in appearance, constantly force the reflection upon us, that toil and privation are wrung from the many, for the gratification of the few. It is partly on this account, that an impression seems to prevail, unfavorable to ornamental planting, as being attended with heavy expense: hence also, when a wealthy individual, wishes to improve his grounds, he thinks his object secured by the application of large sums of money; he changes a gentle slope into huge terraces, lays out his approach road in a regular curve, racks his invention to produce a fence of the most showy description; and if, behind these, rises a naked, staring front of composite columns, his success is complete. After all this he looks for enjoyment, and wonders why it does not come; never reflecting that the mind derives its chief satisfaction from the contemplation of Nature in her varied, ever-changing forms. Let him then who seeks enjoyment in this particular, keep his purse strings undrawn, except to the calls of the poor and the needy; but let him with his own hands smooth and enrich the verdant turf: let him in this low corner, plant the bending willow; on that knoll, the graceful, towering elm; lead the circuitous path through this close planted grove, the dark maple and the shelving beech invite

us by their refreshing coolness; here, open to view the distant prospect; there, shut out by thick undergrowth an unsightly object; here, in an irregular plant, suited perhaps to the bend of the walk, plant a few choice flowers; and near by if possible divert the neighboring rivulet to gladden and complete the whole: Then our word for it, there will be no complaint of sameness. This would be a world within itself which would afford more of variety than all the architectural display of the city. But some of our readers are ready to say, perhaps, "all this is very well for the wealthy, but when shall we find time to accomplish a work so extensive? We reply, in the first place, we should be glad if there was a little more attention given to the comforts of life, and not quite so much exclusive thought, in relation to getting rich. And in the second place, let every man strictly conform to his circumstances, and if his front and back yards occupy but a few rods of ground, why let him improve them in the best manner. Is it absolutely necessary that the lawn gate opens precisely in front of the principal door? May we not have some reference to convenience? and must the straight walk be bordered with flowers in a straight line, and the whole area occupied with parallel rows of trees? In fact it is common to find places arranged in this manner which have required quite as much labor, as to have laid out the grounds in a simple and effective form.

We copy below as illustrating our meaning in part, an engraving, representing a plantation of the simplest description: let our readers observe the close planting near the house, the wide spread lawn and the graceful curve of the approach road, then let them in imagination cover the whole with straight rows of fruit trees, shut out the best prospects, if accident decide, and lead the approach in a direct line to the house, and then mark the difference.

We hope in future numbers to give our readers a synopsis of the work, as we conceive the information contained therein to be intimately connected with the real happiness of the community. S.

ITEMS

CONDENSED FROM EXCHANGE PAPERS, &c.

New Pasture for Cows—*Morus Malticaulis*.—The American Farmer says "In a recent conversation with a friend from Virginia, he informed us that he had tried the experiment of turning his cows into the field where his mulberries were growing, and found that they ate the leaves with great relish, and that the increase in the quantity and quality of the milk was perceptible in a day or two." Should like to know how many cows an acre would pasture.

Silk Culture.—Edmund Morris of Burlington, N. J. announces the entire success of his experiments the present season in the culture of silk, by means of his newly invented silk frames. His experiments were performed in the presence of crowds of visitors, and several testimonials are given of the complete success of his frames in other places. Those wishing further information may have it by reading his "Silk Record," a small monthly, sent to all without charge, who are personally interested in the silk business.

Hen's Eggs.—A correspondent of the Cultivator says he obtains fresh eggs the year through, by regularly feeding his hens as much Indian corn as they will eat.

A *Berkshire Hog* in the possession of E. Marks, Onondaga county, gained, while fattening, three pounds five ounces daily.

Working soil, according to Skinner of the American Farmer, is "the sovereignest thing" to prevent plants burning from drought.

Two Rules of Jefferson are very applicable to the times:—"Never spend your money before you get it;" and "Never buy what you do not want because it is cheap."

Large Yearlings.—S. Hecox of Lyons, writes, in the Cultivator, that he has two bull calves, raised from Thomas Weddle's stock of Darhams, the one a three-quarter blood, which weighed at one year old 1015 lbs., the other a half-blood, which at the same age weighed 915 lbs. Their feed during the past winter was hay and roots only.

I of as high a grade in blood as the nature of your land and the climate will permit. The admissions made before the close of this paragraph, of the enormous weights of the Durham ox with good keeping, admit to the fullest extent all that we claim, when abundance of food is given to the animal.

In the 6th and last paragraph, Mr. C. doubts whether the Durhams are, after all, not the best of all oxen to have, and candidly admitted that his mind is open to conviction. Now this, after making the admissions and denials that are above exhibited, is not exactly what we should expect from one of his servation and astuteness. It is indeed too much in vein of the old adage: "Hang him first, and try an afterwards." In this last paragraph all is admitted that the advocates of Short Horns desire. We never asserted that they would produce great quantities of beef, or of milk, without sufficient food; nor would they thrive under continual ill-treatment, neglect and abuse; nor indeed, will they bear so much privation and ill-treatment as some of our native oxen; but we do firmly assert that either thoroughbred or grade Short Horns will produce more beef, or more milk, each in their own proper time, with the same quantities of grass, hay, or other proper feed, in any breed of cattle ever introduced into this country; and so have they thus far done in England.

My own cattle have never been highly kept. On the contrary, owing to my farm being at some few miles distance from my residence, and therefore not receiving my daily attention, my herd always received ordinary care, and sometimes, I regret to say, not so much. But I do say, that so far as my experience is proved, they have from the highest bred Herd book leader, down to the lowest grade, (never less than half blood,) been as healthy and as hardy as the common stock of the country, kept side by side with them. The opinion, therefore, that Durhams are to be rejected for want of hardihood or constitution, is a prejudice that deserves to be exploded.

I am no enthusiast in this matter. I would not recommend every farmer to introduce into his farm the Durham cow. On the contrary, on very fine and light soils, I would not introduce them; nor any thing else that ever lived on a luxuriant one, if I do say so, on lands natural to grass, which afford an air yield of pasture and of hay, where either the rearing or the fattening of beef, or even the rearing of calves for sale, be the object, judging from my own experience, and corroborated by that of others who have tried a single cross upon our native, or any other breed of cattle, no matter what, even up to high grades, the Durhams are altogether the most desirable, both for appearance and for profit; with the exception, perhaps, of the Devonshire, if the climate be very mild; and they are no milkers. Were I a dairyman, I desired to grow up a race of the best and most profitable milkers, I would select the best native cows within my reach, then obtain a thorough bred Short Horn bull of a good milking family, and raise my cows to as high grades as in their natural course could be produced, always using a thorough bred bull, in no other way can the excellence and the true characteristics of the race be perpetuated. Did I however, admit of any other foreign admixture, it should be a cross of the Devon to give additional sweetness to the milk; and then but a single cross, for more than that would degrade the milking qualities of the herd. These animals, bred as they would be from native cows, would inherit their constitutions and habits; and become identical, as much as the most ordinary stock, with our soils and our habits of keeping. In any way should we at once gain all we desire, without sudden or prejudicial change."

Sugar Beet for Spring Feeding.

Sir—I have for a long time been falling between two opinions, as to the value of the sugar beet as winter food for stock, and really have been puzzled with a conflicting testimony of parties. I had recently a visit to a friend in an adjoining county, where I have been induced to take at the same time, your rejoinder at p. 205 of the *Calendar* for January, in which I can bear out in the remark, that such a mode of expending a small sum is the cheapest and the best way in which a man can study the science of agriculture, has, however, brought me short about, a strong advocate for its cultivation, and I will tell you by.

Before I left home, I was wondering within myself, how my poor stock were to subsist another month without a supply of fresh provender: my hay-barn on the other hand began to show signs of stoniness, the ribs of the latter rattling in the wind like a dried skeleton;

with scarcely a blade of grass left to be put to pasture, into which however, I had been a fortnight turning the poor creatures, in the hope that they might be able to pick up a little to put out. Knowing of the whole, that what they could extract from the stubble and soil must be at the expense of the covering crop of hay. In this state of mind and feeling, I called on my friend's house, and was indignantly surprised to find him heading all his credit and sheep, and indeed I might add dogs, which also came in for a share, to the full hock, as he termed it, with sugar beet, which he had reserved for this particular season, and which between the winter and summer crops, the value for which purpose, to use his own words, was "quite above all price." Said he—"While many are debating about the quality of the beet, and not able to determine whether its cultivation be the greatest good or the most considerable evil, I have gone quietly on, sowing regularly, and quantity no less, my winter consumption, being enabled to procure a full supply for the whole month of April, without regard to the stories that are told about its different and very dissimilar properties; and now you see me with plenty of food for every living thing about me for a month to come, obtained at a most trifling cost of production; for, from about an acre of land, I have produced a mountain of green food, to mix with my hay and straw, which has now become dry and hard from keeping; and by these means I am able to keep all my stock from the meadows and pasture until May—a perfectly inestimable advantage; for thus I am not only doing them *this year*, but adding astonishingly to my means for the next winter, as I almost fancy that by so doing I am able to increase the quantity of hay that I need to do. And this is not all; for the large quantity and excellent quality of the manure which I thereby obtain, is of far more value to me than all the labor and expense of cultivating the beets, twice told. You see that my stock are in good condition, contented and happy, and that their winter quarters, and not permitted to roam abroad, to the destruction of the fences, the loss of their dung, and the late mutilation of the future crops of hay; and if these are not advantages sufficient to induce us to go forward with the cultivation of the beet, I shall be glad to be told what more we have a right to expect. Let others argue what is the value of such a crop for winter food, and especially for spring use, while I am too happy to be able to create a *summer* amongst my stock during the most dreary winter, and procure my spring crop of grass; by the very trifling devotion of about a single acre of land to their cultivation. I repeat, my extra manure pays me for all my extra expense; and my peace of mind is above all price." I thought of my poor starving animals at home, and shortened my visit, but I might return and be prepared to practice the doctrine which my friend had been preaching.—*Par. Cabinet.*

Schuyllkill County, April 1, 1841.

The following remarks, from the N. E. Farmer, should be read in connection with the article on Hay Making in our last number.—

Drinking in Hot Weather.

Mr. Editor—In your number for June 23d, is an excellent article on Hay making. I rejoice to see so many of the simple, practical articles in your paper; and hope they will be read extensively, and be as extensively useful.

There are one or two thoughts, however, in the concluding paragraphs of the article to which I allude, which do not seem to me so much in accordance with general experience as I wish they were. You say—and I know others have also said—"None but the intemperate are injured by drinking cold water."

Now, unless you mean that the excessive drinking of cold water is itself intemperate, I am confident the statement cannot be true. That intemperance is injured most readily by cold water, I have no doubt; but that any man, who is at once over heated and over fatigued, may be injured by drinking cold water in large quantities, is at least equally certain. Indeed, it is certain that he who is either over heated or over-fatigued, may be injured in this way. Cases of injury from the former cause are of almost every day occurrence.

I know what is the main thing intended by the writer of the article in question, in the remarks to which I have here alluded; and I rejoice at the effort. To put down the use of food or even doubtless food, and put up cold water, is noble—and may God speed him who does it, or assists in doing it. Nevertheless,

we must have a doing even if we can't have our best of both. And his end of saying, "There is no danger from frequent drinking, in the horse," was far from taking cold water as often as has freely as you please—over a man's stomach, if you have not been too long without drink." And in proof of the matter, I wish with all my heart you had said something like the following—it is, had you liked it: "There is no special danger from frequent drinking, in the hottest weather, provided you use the following cautions: 1. To drink very slowly. 2. To drink but little at a time. 3. To have your drink, though cool, not excessively cold. 4. To use but little drink, with or nearly with meals. 5. To drink but little, very little, when over-heated and over-fatigued.

With these restrictions, you might have said, as you have—"Cold water is the best of all drinks for sick or hot; there is no danger from it (with the restrictions above,) if you have not been too long without drink." &c.

You say, "The lay implet must have a full supply of drink; perspiration will be free, and he must have something to support it." Yet I can point you to a laborer now over 80, and healthy and strong, who has drank almost nothing at all between his meals all his life long, though he has perspired very freely, and no man has enjoyed his life more. Yet observe, his meals are better than those of the average of men. I can tell you of another individual, whose employments are partly agricultural, and whose habits are very severe—calculated to exhaust them, in the common way of thinking, who has labor through the summer and drink nothing at all, and who for nearly ten months, beginning with August 6, 1840, did so. And not only so, but he suffered less from thirst during the time, than he ever did before in any of the months of his life. But then he lived right otherwise.

These facts are not mentioned, Mr. Editor, to induce your readers to go without drinking at all, for I cannot advise a person in the world to do that—at least as long as he retains his present habits in other respects. My object was simply to show that we need far less drink than is usually supposed, if we only exercise, eat, sleep and think as we ought.

But I am extending these remarks too far perhaps. Excuse the freedom—well meant, I am sure—which I have taken. I was brought up a farmer—and, thank God, an intelligent one for the time—and I still love farming and the farming interest, and the welfare and happiness of the farmer. Would that I had the means of being a New England farmer now, on a small, but truly rational scale and system.

Yours, &c. WM. A. ALCOTT.

Bedham, June 25th, 1841.

We thank Dr. Alcott for his strictures upon the remarks we made last week. His long continued attention to matters pertaining to health, entitles his opinions to much weight. We most cheerfully make them public. But at the same time we are far from receding an inch from the ground we took last week. Will the over-heat and over-fatigue occur, if cold water is taken with sufficient frequency? It is possible that the over-fatigue may, but if it should, we question whether cold water, to any extent which the appetite craved, would be instantly and excessively injurious; (for the injury done in these cases is the violent pain which often precedes death in a short time.) Our belief is, that if cold water is taken so frequently as to prevent the over-heat, there is no danger from its frequent use. We take, of course, to danger of severe attacks of pain. Whether it would not be permanently better for our laboring people generally, to use less drink, is a question to which we had no reference.

From the London Farmers' Magazine

Destructive Rafts.

Sir—The following is a reply to your correspondence, as to the best mode of destroying rats. Some of the methods of these methods exceed, I will be very ready through your paper.

1st—Corks, cut as thin as possible, or sawed, or sawed in grease, and placed in their tracks.

or—Dried sponge in small pieces, fried or soaked in honey, with a little oil or rosin.

or—Lard-line, in a wooden box, with a hole in the top, and cut as thin as possible.

If a rat be seen, it may be killed by putting it over with the rat and trapping it, or by putting it in a trap in the holes of the rat, they will be caught.

Reasoning is a very dangerous and objectionable mode.

The proudest man on earth is but a pauper, fed and clothed by the bounty of Heaven.

Mr. Neff's Stock of Short Horned Cattle,
TO BE SOLD ON THE SIXTH AND SEVENTH OF SEPTEMBER NEXT, NEAR CINCINNATI, OHIO.

The attention of the readers of this paper, in the West and South, is invited to the notice of a sale of cattle inserted in another column. Mr. Neff has for a number of years given his particular attention to the raising of improved cattle, and has spared no expense in procuring the very finest animals to breed from. His herd has now become so numerous that he has determined to sell off the whole or the greater part, in order that he may begin anew. The writer of this had the pleasure of viewing these cattle a few days since, and he does not hesitate to pronounce them the finest collection to be found at any one place in the United States. If any of the cattle-loving readers of the Farmer chance to be in that part of the country previous to the sale, they must not fail to **Go and see.**

On arriving at the Queen City of the West, first call on Mr. Ailck, the editor of the Western Farmer & Gardener, and if you are not already a reader of his excellent paper, subscribe for it at once, and in it you will find a complete list with pedigrees of Mr. Neff's cattle, and numerous fine portraits of animals, engraved by Mr. Foster. Mr. Ailck is a good judge of stock, and if not too busy he will offer to accompany you to Mr. Neff's farm. If so, happy are you; and with old Kentucky in the harness, you start off right cheerily down Western Row, and on a good turnpike road over the Cheviot Hills till you come to the Seven Mile House; then turning in at a gateway you enter the premises of Mr. Neff, and the first object that arrests your attention is a number of splendid two-year old heifers in a small pasture in front of the house. That very large and handsome red and white one is Louisiana; that beautiful white creature of smaller size is Clifford; the other, red and white, is Virginia, and the roan is Georgia. These four are all too perfect and beautiful for description. Then go into another field, and there you see Rosalia, Indiana, Belle-Creole, and some half a dozen other thorough bred heifers about two years old; and he must be a meek judge who discovers defects in any of them.

But pass on to the yearlings, and there you will find a dozen or so more, 'Gems' of the first water. Then follow your *Cicerone* to the stables, and you see Cincinnati, a beautiful large white two year old bull; and Young Prince, a promising son of Prince William and Lady Catherine, with a number of other two-year old and yearling bulls. Now take a look at that long row of beautiful calves. Are they not "Buds of Promise?" But hark! Is that thunder? Oh no; it is only the voice of old Brutus. Pass out that door; see here comes, with all the pride and dignity imaginable. What an enormous size, and yet how beautiful he is! Brutus is 7 years old, roan; was purchased at Mr. Whitaker's sale of imported cattle at Philadelphia in 1838. He is in rather high flesh and weighs about 2700 pounds. See how kind and gentle he is! Feel of his soft sleek sides; observe his fine limbs, noble head and neck; his splendid brisket and broad straight back! Taking him all in all, did you ever see a more perfect animal of his kind? But here comes another, who disputes the palm of excellence with him. This is Prince William, 4 years old, roan; also imported by Mr. Whitaker. He is not in so high flesh, nor so large, but some consider him superior to Brutus. If he had on more flesh he would nearly equal him in weight, and probably excel him in activity. See with what a stately majestic step he marches back to his apartment!

Here comes the boy with the cows. Walk this way and stand by the gate, so as to view them as they pass. Do not laugh at that old-fashioned looking

dame in the lead; it is true she is not handsome, but she is an imported cow of the finest pedigree, and, as is often the case, is a very superior breeder. Her name is Ruth, she is 10 years old, and the mother of some of the most beautiful animals in the herd; for instance Victoria, Louisiana, Sibella and Great Western. That fine large fat looking red and white cow, is also imported; she is properly named Beauty; and the only objection to her is, the difficulty of keeping her *poor enough* for usefulness. There are four other fine imported cows, Blossom, Profitable, Strawberry and Lady Catherine—six in all, from which the rest of the herd were mostly produced, and some of the younger ones are more beautiful than their parents. See that smallish roan cow; that is Ruth's eldest daughter, and one of which she may well be proud. She is aptly named Victoria, for like her Royal namesake her greatest defect is, that there is no more of her—both are rather too short!

Now look at those 'Swill Boys' in the barnyard. That long thrifty looking Porker is an Irish Grazer. Youder are more of them; how thin their coats are! They look as though they would freeze to death in winter; but if you ask Mr. Ailck he will probably inform you that they are a hardy and valuable breed of hogs, although not more profitable than some others. These black and spotted ones you at once know are Berkshires. They are generally considered the perfection of the swine family now-a-days. Here, under this shed, is a fine Berkshire sow, hung in a sling, so that her feet cannot touch the ground. See; her hind leg is bound up with splinters; it was broken by being run over with a wagon a few days since, and being a valuable animal, Mr. Neff determined to make an effort to save her—hope he may succeed.

I fear I shall detain you too long, and yet I cannot leave without taking you through this thrifty vineyard. Look at these Catawba, Isabella and Schuylkill grape vines: how abundantly they bear, and with very little attention. They are more sure to ripen and less liable to mildew or blight than in New York State. There, in that inclosure is a pair of Deer, but they appear to be out of their proper element. This small building at the bottom of the garden is the boys' Rabbit house, and it is well stocked with furry quadrupeds. Walk up this way through the garden, and pick some of these Ohio ever-bearing Raspberries. They are of good size and pleasant flavor, but not so delicious as the Antwerp. Their great advantage is their habit of bearing plentifully all through the season.

I find I must close this gossiping epistle, and have not time to speak of Mr. Mahard's splendid lot of Berkshire pigs, but you must go and see them nevertheless, and perhaps I may notice them hereafter, together with some other sights seen in Ohio.

Cincinnati, July 20, 1841.

M. B. B.

The Crops in Ohio.

Columbus, July 26, 1841.

Ohio claims the honor of producing the greatest quantity of Wheat, and may perhaps justly be considered the most important agricultural State in the Union. When we meet a friend, therefore, from this State, the first question that arises is usually in relation to the crops. And as this is a topic particularly interesting to the readers of an agricultural paper, I will give it my first attention. I have now spent two weeks in traveling over the State, during the height of harvest, and having taken particular pains to inform myself on the subject, I feel confident that my views will not be found erroneous, although they may differ from some of the published statements.

The *Wheat Crop* is very uneven: in some places, as along the lake countries, it is generally fair, although

not heavy; in others, as in the southern counties, it is very poor—some fields not worth harvesting. In the central parts, fields of all qualities may be seen—some being very good, others of medium quality, and others scarcely worth cutting. The difference being mainly attributable to the soil, and the cultivation. Taking the whole State together, I was disappointed in the wheat crop, and am confident the yield will not be as great as the papers have of late represented. My opinion is that Ohio cannot be set down for more than *two-thirds* of an average crop.

Indian Corn is the next staple crop of Ohio, and almost the *only* crop of some parts of the State. It has suffered materially this season from the cutworm and the drouth in some parts; but in other parts it looks very fine, and the whole state must yield an immense crop; although perhaps not quite as large as that of the past year. The immense corn fields in the valley of the Scioto, and along other streams in central and southern Ohio present to the eye of the traveler a very beautiful and luxuriant appearance, and afford striking evidence of the wonderful fertility of the soil. While sitting at an elevated window in the "Ned House" in this city, (the thermometer at 90 in the shade) I was shown a field of 160 acres, in the valley below, that had been planted with corn 40 years in succession, without any apparent diminution of its productiveness. I should judge the stalks now stand 10 or 12 feet high, and as thick as they can grow giving the whole valley the appearance of a dense young forest.

Grass, on dry lands was very light; but on moist lands it is pretty fair. Much of the hay in this state is not cut till after the wheat. Clover is much used in some of the best wheat counties, but not as generally throughout the state as I should think it might be with advantage. The *Clover Seed* crop is not very promising—owing to the drouth having checked the second growth.

Oats are much raised, and are generally fair, though not uniformly so.

Barley is but little raised, and is very light.

Potatoes, in some parts, have suffered from drouth but I think the crop generally will not fall much below an average.

In conclusion, it is evident that the *Buckeye State* will sustain her high rank for producing the necessaries of life, although the aggregate yield of *wheat* must be considerably less than for the past two years.

Canada Thistles, &c.

"AID TO AGRICULTURE."—The Legislature lately passed a law appropriating \$8,000 to promote Agriculture, by encouraging the formation of County Societies, and enabling those societies to excite emulation among the Farmers by distributing premiums. This is all well enough; but we can point out a way in which the State authorities might still more effectually promote the welfare of the agriculturists.

Let immediate orders be issued by the Canal Commissioners, for destroying the *Canada Thistle* and other noxious weeds that abound along the Canals, on the ground controlled by the State. Even within the limits of the city of Rochester, there are thistles enough on the Canal and feeder, to seed all Western New York. Every man who has farm or garden, or who really wishes to "promote Agriculture," should aid in calling attention to the correction of this nuisance, which annually causes more injury to land by sowing them with foul weeds, than can be compensated by ten times the \$8000 now annually appropriated for "promoting agriculture."

ROCHESTER.

For the *New Genesee Farmer*.

Reply to S. R. W. on the Corn Laws.

MISS. EDITORS—Your correspondent S. R. W. decided that the lessons of patience and self-denial which S. W. attempts to "read to farmers" are years behind the age. It is hardly necessary to say that he has not gone back far enough by nearly eighteen hundred years—such lessons are coeval with the Gospel Dispensation—they were the lesson which Christ taught and Paul preached.

In my former articles on the national tariff, on the English Corn Laws, &c., I endeavored to impress farmers with the necessity of depending on the products of their own industry, and living within their own domestic resources, without looking too much to legislation, or to aid from without. If I have, by the statistics I have given, succeeded in convincing a single individual reader of the Farmer, that the years of high prices were years of unnatural inflation, extravagance, debt and ruin; and that the subsequent period of low prices has been one of liquidation, rearing industry, economy and consequent pecuniary health, then I am well paid for my labors. But as nations of political and domestic economy have some instances given dissatisfaction to the readers of the Farmer, I had resolved to abandon the subject, and should not now have adverted to it, but to defend some of my articles from the strictures of S. R. W.

S. R. W. felicitates himself on the progress of free trade in England, and its spread in the United States. He speaks of the landed interest of England as "selfish, and regardless of suffering humanity" and he predicts a much better market for our wheat when the English Corn Laws are repealed.

I should, as one of the readers of the Farmer, be allowed to learn from S. R. W. how England is to get along with her stupendous debt, without the landed interest. Who pays the great bulk of the taxes on the landed interest; who most supports the enormous home trade of £400,000,000 sterling, but the landed interest; who feeds the people but the landed interest. Selfish as they are, their selfishness appears wonderfully adapted to the wants of the nation. About feeding England from the United States I twenty-five years previous to 1825 all the foreign grain imported into England did not amount to more than one week's supply. Since that time in 1831, a year of very short crops, all the grain imported amounted to but twenty-five days' consumption, and in one-seventh part, or three and a half days' supply, received from the United States of America.

When the corn laws were repealed, Europe would supply Great Britain with corn at as low prices as it is selling in N. Y., adding the Atlantic freight, if lower; and the present prices in N. Y. are below the average, and certainly lower than S. R. W. with his improved modern notions, thinks they ought to be. In 1837 we imported nearly a million of bushels of wheat and Rye from German and Russian ports, and about for the duty of 25 cents per bushel (an American, not an English, corn law) wheat would often be imported into the United States for our own consumption.

S. R. W. says that the English corn laws are the cause of incalculable misery. There are thousands of people in England with wise heads and pure benevolent hearts, who differ with S. R. W. in opinion. It is true that even the time-serving Lord John Russell is altogether sincere in his eulogy of free trade, for it is only one thing but free trade that has made England what she is.

The introduction of foreign corn should cause the immense capital now employed in British agriculture to be only in part withdrawn, what would be the state of a great home trade, which is now the only trade

that remunerates the manufacturer and enables him to feed his operatives. Would not the laboring classes of England then resemble the Irish peasantry, *starving in the midst of plenty, for the want of that employment which alone can furnish the means to buy?*

S. R. W. says that "the interest of millions at the north are neglected by our Government," "while a few hundred thousand at the south have an accredited representative at St. James, watching every movement which may affect their favorite exports." It is somewhat illiberal, if not invidious, in S. R. W. to accuse the South with any thing more than their due quantum of social and political sins. The facts in the case are simply these: Corn is indigenous in England, but Cotton is not, and besides cotton is an indispensable article in her manufactures, hence the duty on our flour there, and the free admission of our cotton. The South is no more to blame for this discrimination on the part of England in favor of their great staple, than they are that the Compromise Law imposes no duty on imported silks and wines. The South was willing to have these articles taxed, but Mr. Clay preferred placing the duty on such correspondent articles as were manufactured in the United States. Yet by admitting silks free, the exports of the south are increased to the manifest prejudice of the nation at large.

I might extend this communication by dwelling on the importance, not of encouraging a free trade with the old over populated and cheap producing nations of Europe, but of diversifying our agricultural and manufacturing productions in order to build up a home trade, which alone can guarantee to the farmer and manufacturer a remuneration for their labor, secure from without. But I am aware that there are many readers of your paper, who still "sigh for the leeks and onions of Egypt." I therefore conclude with the Scriptural quotation, "Ephraim has joined himself to idols, let him alone." S. W.

Waterloo, July 10, 1841.

Remarks.—It is agreeable to our feelings (and we believe it is in accordance with the wishes of the majority of our readers,) that a small space in the Farmer should be devoted to the discussion of important subjects not strictly agricultural, (nor party political) but we hope our correspondents who write on these subjects will study brevity and perspicuity; and always aim at the elucidation of truth—remembering that discussion does not mean controversy.—Eds.

Practical Remarks on the Silk Culture.

To the Editors of the *New Genesee Farmer*:

It was with pleasure I noticed in your last publication your determination to devote more space in your valuable paper to communications on the subject of the Silk culture. I hope the day is not distant when a paper devoted exclusively to that subject will find ample support in this western section of the State. I have no desire to occupy any portion of your paper unprofitably; but the interest I feel in the success and permanent establishment of that business, has induced me to trouble you with a few remarks addressed to the Farmers of this section of the State, with a view of inducing them to make a fair trial—beginning small, and increasing as their knowledge and stock increases.

I have no desire to effect that purpose by exaggerated statements, and shall state nothing but what is founded on facts, in my own experience, or that of others within my knowledge. I make my statement of what can be done by what I know has been done.

I know that any farmer can commence at a very trifling expence. He can procure 500 *Morus Multi-calis* trees for little or nothing. He can plant them, root and branch, in a small spot of good land, in the

latter part of April or 1st of May; from the leaves of these his wife or children can feed 10,000 worms. The eggs may be purchased for ten shillings, 110 can in a few minutes erect shelves in a room of his house, barn, or any out house, to feed his worms on; if well attended, they will produce three bushels of cocoons, or 3 lbs. of reeled silk. He can in the fall take up his trees, preserve them through the winter, and plant half an acre in the spring. By doing this for three successive years, in the spring of the fourth year, he will have trees to plant five acres, and 20,000 to dispose of. Five acres of trees, with proper management, will feed 500,000 worms. Thenceforward he will have little or no trouble with his trees; he may leave them in the ground all winter, and the next year he may feed half as many more worms, say 750,000, the year following, double the quantity of the first year, or 1,000,000.

The following calculations may appear at first eight extravagant, but as it is well known one acre of trees will feed 100,000 worms, with proper management, five acres, with the same management, will feed 500,000.

I would here observe that these calculations are made without reference to casualties that may happen—such as accidents, mismanagement, unfavorable weather, diseases amongst the worms, &c. &c., though I have no doubt of complete success following constant attention, careful, good management, proper feeding, sufficient room for the worms, and a free circulation of pure air. From my own experience and observation I am perfectly satisfied it is a business worthy the attention of farmers, provided they can get their wives and children interested in it. If so, there can be no reasonable doubt of its complete success.

I have in the following statement valued the cocoons at an average of \$3.50 per bushel. The State bounty of 15 cents per lb. will make them worth \$5. By reeling the silk, which will not cost more than \$1 per bushel, the value will be yet more increased, and by adding the State bounty on reeled silk, fifty cents per pound, the silk, if well handled, will be worth \$3 per lb.

Statement of the produce of 500 trees planted the

FIRST YEAR.	
10,000 worms producing 3 bush. cocoons at \$5 per bush.....	\$15 00
Expence of 10,000 eggs.....	1 25
Profit.....	\$13 75
SECOND YEAR.	
50,000 worms, 15 bush. cocoons, at \$5....	\$75 00
THIRD YEAR.	
200,000 worms, 60 bush. cocoons, at \$5....	\$300 00
Expences, say.....	50 00
Profit.....	\$250 00
FOURTH YEAR.	
500,000 worms, 150 bush. cocoons, at \$5..	\$750 00
20,000 trees for sale, at \$1 per 100.....	200 00
(The State bounty ends this year.)	\$950 00
Expences, say.....	150 00
Profit.....	\$800 00
FIFTH YEAR.	
5 acres, the second year in the ground, 750,000 worms, 225 bush. cocoons, at \$3 50,	\$785 50
Expences, say.....	200 00
Profit.....	\$585 50
SIXTH YEAR.	
5 acres, the 3rd year, 1,000,000 worms, 300 bush. cocoons at \$3 50.....	\$1050 00
Expences, say.....	250 00
Profit.....	\$800 00

The floss and cocoons which have been spoiled for reeling to produce each year's stock of eggs, may be manufactured into cloth, which will contribute no small portion of clothing for the family. J. B.

Alabama, Genesee Co., July, 1841.

For the New Genesee Farmer.
Natural Philosophy.

Why is it that so little attention is bestowed in studying the Works of God by which we are surrounded? How can the Power and Goodness of the Almighty be more gloriously exemplified than by reference to the Skill and Design manifested throughout all Nature?

From the minutest to the mightiest, the works of the Creator are every where characterized by the wise adaptation of means to end—by traits of Wisdom and Benevolence which proclaim with "silent eloquence" the glory of the Eternal God.

The Farmer is less excusable than any other man for neglecting the wide field of Practical Wisdom furnished for his contemplation by the objects constantly spread before his eyes. The Earth and the Heavens—from the soil and the dews of which his harvests are blessed—are everywhere replete with wonders. The millions of worlds which glisten around him, are scarcely more wonderful than the animalcules which sport in thousands through a drop of water!

The study of Natural Philosophy is replete with interest and instruction—it cheers the heart, elevates the mind, and promotes the love of God and man in the human heart. It should be one of the prominent studies in our schools, for nothing could more effectually enlist the interests and affections of the young—it should be a frequent theme in the sacred desk, for what more powerful auxiliary could Religion have in securing the attention and dignifying the character of manhood?

Let the Farmer consider well this matter—consult some of the writers celebrated in Natural Science—exercise his own powers of observation and reflection—and he will never regret that he has read this article, if what we write shall have the slightest tendency to encourage him in "looking through Nature to Nature's God."

ROCHESTER.

For the New Genesee Farmer.

Education—Agriculture—Correct feeling well expressed.

Messrs. Editors—Much has been said and written on the subject of the education of the young of our country: and I am happy in the belief that a change has been wrought upon the public mind, on this important subject. So much has been said by persons capable of doing the subject justice, that it seems almost needless for me to say anything: But I consider it of so much importance, that I am anxious that it should be kept before the public mind.

A few years since, a large portion of our citizens seemed to think it worthy and mean to labor in any capacity—and especially as a farmer or mechanic. Our young men seemed to be bent upon getting a living "without work." And our young women, when any thing happened to be said about "work," seemed very careful, if perchance they had been guilty of such a crime, not to let it be known. This, I believe, was more generally the case among a certain class—a sort of "would be somebody."

I am in the belief that the public mind has changed on this subject. Young ladies seem not so fearful that it shall be known that they attend to household duties: And young men, instead of begging a situation behind a counter or in some dusty office, seem willing to employ themselves in that more noble and useful avocation—the cultivation of the soil. I say "more noble,"—because what is more noble than for man to cultivate those plants and animals that God has given him to exist and luxuriate upon? and in doing which he may more forcibly see the divine goodness and mercy exemplified in its bestowments upon man.

Besides, it is expressly declared that "man shall earn his bread by the sweat of his brow." Now it is perfectly plain that bread cannot be obtained except by the "sweat of the brow." Some of us must work, or we all starve: And who does not know that the powers and faculties of both body and mind are much more vigorous when we subject ourselves to manual labor? The idea that hard labor cannot be endured by us, is all imaginary. A sound healthy person can work, and he cannot enjoy all the blessings of health without working to some extent.

Let the idea that all healthy persons cannot labor according to their strength, vanish—and let all idlers "cease to do evil and learn to do well." I understand that the doctrine, "man shall earn his bread," &c. includes all men: and that all men are in duty bound to supply themselves with the staff of life, as far as is possible. I do not say that all shall be farmers, or mechanics, or of any particular calling: but that each should earn his own living honorably: And I am quite sure that there can be no more honorable or sure way of getting a coin, hence, than by cultivating the soil.

But, gentlemen, as I am a new-comer, I will not trespass upon your patience longer. It has been said of some of our most eminent men, they were always brief, and spoke to the point. Would it not be well for us all, and especially our legislators, to think of this?

With my best wishes for your success and the advancement of agriculture, I am, yours,

A FARMER.

Orleans Co., July, 1841.

For the New Genesee Farmer.

More Large Pigs.

Messrs. Editors—I am a new subscriber to your valuable paper, and have just received the back numbers of the current volume. On looking over the March number I observed on account of some very dumpy pigs raised by Mr. Shelton Cook of Genesee county, who asks if any person has raised larger, of no greater age. Also, one by Mr. Samuel Lundy of Waterloo, who challenges the Berkshires to beat his.

I say, I hope these gentlemen will pardon me if I say I think I have outdone them. I slaughtered four pigs, January 1st, that weighed, when dressed, 1279 lbs., being an average of 319 1/2 lbs. each, or separately as follows: 396, 324, 363, 386. They were only ten months and eight days old, and were a cross of the Berkshire and common large breed. I think such a cross is a great improvement, and goes ahead of the full bloods.

I am only a young farmer, but I have had considerable experience in fattening hogs: and I have one word of advice to give to my brother farmers on the subject. Get fat more spring pigs, and not so many old hogs. Try the experiment, as I have, and you will become satisfied that more and better pork can be made, with far less expense, from young than from old hogs. Attention to this point is particularly necessary with those persons who feed but a small number, and where the trouble and expense of wintering store hogs is an important consideration.

Very respectfully,

JOHN STRATUCK.

Oxford, Chenango co., N. Y., Jan., 1841.

How to Ascertain the Age of Horses.

An esteemed correspondent requests us to publish directions for discovering the age of horses. The following answer must suffice for this month—when we find a better we will give it:—

In purchasing a horse, not the least important matter is to be able to tell his age. In transfers of ordinary farm and saddle horses, great impositions are often practised upon the credulous and uninitiated

farmer. The event, then, is of great extent, as possible for the future, is the object of this communication to the public. The most certain method of ascertaining the age of a horse is to examine the changes which take place with the teeth. The twelve front teeth begin to show in the first two weeks after the colt is foaled. These are called cut teeth and are shed in different periods and replaced by others. When the colt is about two years and a half old, the four middle ones come out; in about another year, four others are lost—and in another year, or when the horse is four and a half years old, the four last are shed. These last are replaced by what are called corner teeth. They are hollow, and have a black mark in their cavity. They are scarcely visible, and the cavity deepens when the horse is four and a half years old, they begin to fill when he is six and a half, and the mark continually diminishes and contracts, till the horse is seven or eight years old, when the cavity fills up and the black mark is obliterated. The horse acquires his canine teeth or tusks about his fifth year. The two in the lower jaw begin to appear when he is between 3 or 4 years old, and those in the upper jaw five or six months after. They continue very sharp pointed till six. At ten, the upper seem blunted worn out and long, the gum leaving them gradual; the lower they are the older the horse. From ten to fourteen, it is difficult to tell the horse's age—it is sufficient then to know that he is old, and under the hard treatment which is given to horses generally, the copiousness will be a safe one that he is worth but little.—So Colt. EQUESTRIAN.

An Address on American Agriculture.

Before the American Institute, in New York, April 14, 1841, by Henry Colman, is an able and interesting production, in the peculiarly pleasant style of the author. We make the following extract:

American Agriculture starts in the race of improvement in the enjoyment of singular advantages, having the benefit of all the improvements and discoveries of the philosophers and practical agriculturists of the old world. The Agriculture of Europe differs from that of this country on account of differences of climate and soils, and by various circumstances in the social condition, character and wants of the people.—But the great principles of vegetation and cultivation are every where the same. Their remarkable improvements in the redemption of unproductive, waste and wet soils, in the irrigation of lands, in draining and sub-soil ploughing, in the composting and compounding of manures, in the use of mineral manures and more especially in the improvement of their livestock, amounting almost to the creation of new races of cattle, sheep and swine, will not only stimulate our exertions, but serve as examples for our guidance under the qualifications, which the peculiarities of our situation require.

The French and Germans, if their progress has not been as great as that of Great Britain, are now advancing, in a course of improvement in Agriculture with an equal step. In the application of Chemistry to Agriculture, in comparative anatomy and botany in exact experiments, in the institution of model farms, where the most important agricultural experiments are carefully going on under the supervision of some of the most enlightened men of the age, and the expense of the state, and in efforts and provisions to create a interest in the art and to extend any information, which is acquired; and especially, by a systematic arrangement and organization throughout the kingdom, by which agricultural information is collected from every source, and again sent on through the itineraries into every part of the political body, the French nation is at this time in advance of all others.

American Agriculture, though comparatively in its infancy, having always had to struggle with the difficulties of a general and high price of labor, may nevertheless be abundantly supplied with a good deal of satisfaction. The early publication of American Agriculture was made in 1760; and Elliot's Essays on Field Husbandry will be read with interest and instruction for ages to come. Massachusetts, Pennsylvania, and New York early established Agricultural societies, offered liberal premiums for successful experiments in agriculture, and held cattle shows and ploughing matches, which have awakened a strong interest and created a most salutary competition. These three states, in the reports and memoirs of their agricultural societies, have given to the public more than twenty-three volumes of instructive and useful matter. Deane, Lowell and Pickering, in Massachusetts, Livingston, L'Hommedieu and Lock in New York, Peters, Mease, Lorain and Powell in Pennsylvania, Stiles and Humphreys

Connecticut, a e names which are bestowed, with-
t prejudice to any of the distinguished contemp-
ories or successors, to occupy the highest niches of
honor in the records of American Agriculture.

Physical Education.

Fast the daughters? Have a care of their body.

ECCLESIASTICUS.

The inhabitants along the shore in the old Bay
ate, are becoming less robust and hardy than their
thers were. The present generation has less vigor
d health than the last possessed. The causes are
able many—and not a few of them are hidden.
A hasty glance at society will disclose some de-
cay of the present generation from the habits of
e past age, which obviously tend to debilitate. The
ness of our dwellings, rendered desirable by the
gh prices of fuel, causes us to breathe a less pure at-
osphere than pervaded the dwellings of the yeoman-
in the times when the chimney corner would hold
lf a score of children; the extensive substitution of
ice and tea for milk, bean porridge and the like,
ve brought on a degree of feebleness;—the general
e of fine wheat in flour instead of the coarse rye and
lin of former days has over loaded and weakened
the gastric organs in many cases;—the fashion which
cludes the thick shoe and boot, and expels the foot
cold and wet, has helped to bring on many mal-
adies;—the abandonment of wrestling and other games
quiring great muscular efforts, (though perhaps the
indolence in wise) may be a cause of the increase
feebleness. In short, less of hard-ship and more
ary in modes of living, have excited their en-
rging influence upon our community for the last quar-
of a century. And though we are still a vigor-
 energetic and enterprising people; yet, as these
aracteristics are becoming less prominent, it is pro-
for us to inquire into the causes and help to stay
ir operations. We feel the duty incumbent, be-
cause we think that the intellectual, moral and relig-
ious character of individuals and nations, has a close
d intimate connection with the health and strength
of the body. The public good, (not its prosperity in
ney making merely)—the public good—in the
broadest, deep, extensive of the times—a slow-
interwoven with the general health and strength
of the people. Therefore necessity is laid upon those
o will be faithful and e teachers, to discommen-
ate all customs which tend to bring on general
bleness.

We commenced with a quotation from a wise man
olden times.—“Has thy son brought forth a
robust body; and it was our purpose to say dis-
tly, that the physical education of those who are
the mothers of the next generation, is the first
y of parents: yes, we do steadily put this branch of
ention first; for while we would have habits of
th and obedience early formed, we are persua-
ed that these and other good habits are of much less
rth to the world when found in one of feeble con-
tition, than when connected with a healthy frame,
has power to set out the promptings of the soul.
ke the child hardy; and to do this, the food must
simple, the clothing loose and comfortable, and ex-
ure to the weather in all its states, must be bal-
al. The dirt, and wet and cold into which the
ld will rush with delight, are all contribut-
s to its health and energy of character. There is much im-
udent profligence in keeping children with doors—
ch cruel kindness in keeping them from exposure
such weakening prison in the healthful delicacies
ashed for their feeble digestive organs. Let kind-
s to your offspring be far-sighted. Let it remem-
ber that health is promoted by vigorous exercise and
fresh air. Let not forget that winter's snows and
summer's suns help to harden and strengthen the
living body.

“Reserve the child from immoral habits and exer-
ce little more restraint than is necessary for this,
the foundation of firm health is apparently well
l. There has been a tendency for a few years past
to force the growth of the intellect in advance of phys-
ical growth; but this is a contravention of the
rse of nature, and must in many instances bring
er death or debility. He who formed the myster-
ous connection between the body and soul, has ob-
viously designed that the growth of the former shall
cede that of the latter; and any course which shall
maturely develop the mind and call it into high-
vigor exercise in early childhood, is necessarily
nded with danger of destroying the body.
But we designed to speak particularly of the phys-
ical education of daughters. Let them be accustom-
ed to regular and vigorous exercise, and that too in
open air. It is becoming almost barbarous to

send the girls to the milking stool and to the field-
work in the field. We are not violent at a sham of
the feeling on this subject which prevails in the vicinity;
and yet looking at the future and reasoning from
well known facts, the conclusion is irresistible that it
would be better—far better—better for them and bet-
ter for the next generation, that our daughters should
engage in the out-door labors which their grandmo-
thers performed. Then a fresher bloom would spread
over their cheeks, and more healthful blood would
flow in all their veins. They would discharge their
household duties with more despatch and less fatigue.
Their spirits, graduated by the fresh health, would dif-
fuse more life into the family circle—and the mind,
sympathizing with the body, would be clearer in its
perceptions, more prompt in its decisions, more effi-
cient in all its operations.

Looking forward to the future, we see not how it
is possible for any other than a feeble race to be pro-
duced from the pale faced girls, of compressed forms,
that are growing up in both city and country. The
subject is one of delicacy, but it is so closely connect-
ed with human welfare, that some obvious truths
connected with it should not be suppressed. We say
that the same laws by which, in brutes, the offspring
partake of the characteristics of the parents, operate in
the human species; and no female can expect to be
the mother of a healthy family of children, who has
not a firm robust constitution. The weaknesses pro-
duced by stimulants, by unwholesome food, inactiv-
ity, impure air, tight lacing, thin shoes, or avoidance
of vigorous exercise, will be transmitted to their
children. The sins of the parents are visited upon
the children for generations. These truths teach a
lesson that should be heeded. Could the young of
either sex, but be made acquainted with the facts
which we have witnessed, they would learn that the
marriage relation often—very often rests in a family
of feeble and infirm children, and this too in con-
sequence of such weaknesses in the parents that should
have departed them from entering into the married
state. For we hold it to be wrong for any intelligent
being to be voluntarily instrumental in bringing others
into existence, when the probability is strong that
the children will inherit such weaknesses as will ren-
der them unhappy or burdensome to society.

This subject of physical education is more closely
connected with human welfare than almost any other
that can be agitated. We have not diseased it; but
the hints here given may cause some of our readers to
make it a matter of serious and useful reflection.
Should we not feel it a duty to disclose all our con-
victions relative to this subject; and could our advice
be better, many of the young of each sex would go
down to their graves unwedded and childless, and this
too not often from any fault of their own, but from
the faults of parents and of persons, which have ren-
dered them prematurely feeble.—N. B. Turner.

The Working-Man's Dwelling.

“When we mean to build,

We first survey the plot, then draw the model;

And when we see the figure of the house,

Then must we vote the cost of the erection.”

King Henry IV. part 2.

There is such a satisfaction in having a house of
one's own, that most Americans begin to think of
building as soon as they are rich enough. It is pro-
verbial that this becomes a mania, even in the coun-
try, with men of wealth. In quantity, therefore, we
have no lack; the defects are in the quality of our ar-
chitecture. For want of observing the plain dictate
of reason contained in my motto, many great houses
are finished less splendidly than they were begun. As
I seldom take a walk without seeing the dwelling of
some mechanic going forward, I am anxious to make
a few suggestions on this point.

A good site is almost every thing; in such a land as
ours, few are compelled to build in bad situations. Yet
half the houses we see in the country are disad-
vantageously placed. How little advantage is taken of na-
tive groves! I have in my eye a very easily edified
just near enough to a beautiful cove to tempt the belief
that the proprietor wished to avoid its shades,
while he is making a strenuous effort to bring forward
some starveling trees in a miserable clay bluff his
door! The general design is next in importance;
this is what strikes the distant beholder. The eye is
shocked when, in a clever building, the door has three
windows on one side and five on the other. The pro-
portions of length and height, the pitch of roof, the
number, and size, and arrangement of lights, are all
matters which demand careful study, in order to pro-
duce a good effect; but in most cases they are left to

chance or whim. Symmetry is given in a dispropor-
tion, and rich men should not imagine all corners
and tastes. A good plan gives liberty to the painter
materials, while no expense can render a false propor-
tion elegant. A well-designed cottage, of the hum-
bled dimensions and simple architecture, fills the eye, and
gives repose to the mind. But finely executed hide bad
taste; it often betrays it. We may here apply Crabbe's
couplet—

“Faults that in dusty pictures rest unknown,
Are in an instant through the varnish shown.”

Men who come suddenly to wealth are greatly in dan-
ger of falling into this trap. The showy in architec-
ture is usually coupled with the vulgar; just as in
dress the finest are not the truly well bred. Pope has
parodied this abuse of ornament:

“Lest some vain church with old theatre state,
Turn arcs of triumph to a garden gate;
Reserve your ornaments, and hang them all
On some patched dog-hole creaked with wall

“Then clap four slices of pilaster on't,
That base l with legs of rustie makes a front,
Shall call the win through long arcades to roer,
Proud to eat their euld at a Venetian door.”

Some of our builders, I hope, will read these es-
says: their influence is of great moment. If well in-
structed, they will tell such as apply to them, that the
word Architecture is not confined to the massy piles of
public edifices, but that the very same principles which
dought the Birmingham Town Hall, or the Made-
laine, can descend to plan the cottage or the rustic
bridge. These principles ought to be studied, not only
in our colleges, but our lyceums, and other institu-
tions for the instruction of our well-to-do men. Books
of architectural plans should be compiled and abstracted
from the more costly European publications. I am
sure any one who is familiar with the Tailor's Maga-
zine, will grant that there is no insuperable obstacle
in the way of a builder's periodical. And not architec-
ts alone, but all planners and proprietors should fa-
miliarize their eye to the contemplation of good models.

The day it is to be hoped will come, when even the
day laborer will not think it necessary to be slovenly
because he is poor, and when the most incessant
struggles shall begin to see that there are some good
things to be seen and bank-rows. The practical
man whose eyes are enlarged, will not fail to see that
pleasures of imagination and taste have also their price.
Decorum naturally comes after use; we build our
houses before we decorate them. But in the advance-
ment of society, there is a stage at which men always
set a value upon ornament; and though these circum-
stances may breed luxury, they have fruits which are
desirable, such as increased contentment, pleasured
refined taste, cheerful domestic life, and the love of home.

Along the bank of a river, where, under a low, the
elderly, are taken out, which, in a morning's distance,
showed the origin of its elements. The opposite as-
sents, borne, carried, ya, there, without, borne's, windows
without glass, and a daughter at the entrance; these
afforded the symptoms of a hard. There was no deco-
ration, and I enquire concerning this settlement, that
there are no music and pleasures, no taste, no gentle-
ness, no lives of happiness.

Let me change the scene. Here was a family of Eng-
lish people, not richer than those who were at, who lived
in a dwelling no larger than one of these—but how
different! I see it yet in memory, its white iron pa-
nings and beaten walk, not a stain, not a gut side and
close roof, and especially the edge of summer flowers
around a plot of the clearest grass, and its roses and
woodbine creeping over every work. They were
poor, but they were tidy—tidier than this; they were
full of natural beauty, and kind of home, and there-
fore always anxious to make home lovely.

Every reader has in my mind seen the same thing,
and some have also learned the connection between
single direction and domestic virtue and peace.—
Why does an English cottage strike an American
with surprise? Why does he look, as at a strange
thing, upon the French peasantry taking their even-
ing repast beneath their trees and vines? Because
we Americans are so peculiarly practical, and so pos-
sessed of the demon of trade, that nothing is valuable
which cannot be sold. Value is becoming equivalent
to vendibility. Valuable means salable; worth means
money. If a flower, or a hedge row, or a cascade, or
a bust, or a prospect, add to the price under the ham-
mer, these things are valuable, and are straightway in-
serted in the lithographic view of the auctioneer. They
are useful. Usefulness is that quality of things where
by they bring money.—Working-Man.

The Orchardist's Companion.

Will the Farmer's Cabinet, or some one who knows, please inform us of the "Terms" of this publication? It is of course a splendid work, but is it not too costly for our republican economy?

The Ruta Baga Hook.

In accordance with the request of Mr. Ernestus Skinner, we give a description of his ruta baga hook, as published in the Cultivator.

The implement is made with a strong eye and a handle like a common hoe; the blade is a piece of a hand-saw plate, 4 inches by 6, riveted on to the eye, the hooks or prongs are six inches long, and of the same piece with the eye.

In using it, the man walks along the row, and by a light blow with the edge cuts off the top; then turns it and with the hook side pulls up the root. Any good common hand can top and pull from 600 to 800 bushels with it in a day.

Blight in Pear Trees.

There has been much complaint in this section of country, about blight in pear trees. The bark upon the pear tree is thinner than upon almost any other tree, and as the sap flows, the hot rays of the sun against the stock of the tree, stop the circulation; and the consequence is, that a space two or three inches wide on the sun side dies, leaving the stock dead. I would recommend to take the bark from a chestnut, something larger than the pear tree, place it sap side up exposed to the sun, until it rolls up, place it around the trunk of the pear tree, and let it remain during the hot weather.

Yours,
JONA. J. WATSON.

Bucks Co., Pa., 1841.

Wonderful Precocity.

FRIEND BATHAM—My beautiful half blood Durham Heifer "Nelly" aged ONE year and ten days, was this day safely delivered of a fine heifer calf, sired by "WELHAM." So far as my knowledge extends this case has not a parallel, and I am happy to say that the young mother and her offspring are apparently doing well. Respectfully,

J. C. HATHAWAY.

Farmington, 7 mo 3, 1841.

We have never known an instance of precocity quite equal to the above. Alexander Keley, Esq. of this city owned a heifer last year which calved at the age, we believe, of 11 months.—Eds.

"Gullibility" Gallinippers!

In our June number we copied from an exchange paper a short paragraph headed wonderful discovery, announcing the very important fact that Mosquitoes might be substituted for Leeches, in medical practice. But "one of our agricultural contemporaries" is so fearful, lest his readers will be humbugged, that he takes special pains to advise them "not to forsake their harvests to enter into this Mosquito Speculation!"

Now we are quite sure that our brother scribe would not treat this subject with so much indignity, were he not ignorant of its importance. If he had ever traveled in the Great West, he would have been aware that these animals form the principal part of the live stock of many parts of that country. Along the borders of the Maninee and Wabash rivers, they have an improved breed of Mosquitoes, called Gallinippers, which in size and action greatly excel the kind known in this state. They are easier raised than Berkshire pigs, and are in much more common use than hogs, for the purpose of depletion. We see but one reason why they should not become quite an article of speculation; and that is, the necessity of eging them in the spring of the year, to prevent their pulling up the Corn!

Does the Curculio fly up into the Trees!

A correspondent informs us that the Curculio can fly (!) and consequently any contrivance fixed around the body of the trees will prove of no avail. Now we readily admit the premise but the inference does not necessarily follow. We have not, as he imagines, "fallen into the common error of supposing that this insect cannot fly." But does it fly up into the trees?—that is the question. Who will answer from positive knowledge?

The Silk Bounty Law was passed as reported by the Assembly and published in the June number of this paper. It was not altered or amended.

Late English News.

The Steam-Ship Great Western arrived at New York, July 29, with London dates to the 14th.

The whole country was in a great state of excitement on account of the elections, which were nearly over. The returns were not quite all in, but it was certain that the Tory party would have a majority in the new parliament, and consequently an entire change would take place in the Ministerial Cabinet. This revolution renders it pretty certain that no modification of the Corn Laws will take place at present. This subject was made a test question in most parts of the kingdom, but a powerful influence of the landed interest that it controls the majority of voters. It is predicted that the triumph of the Tories will be short lived.—We think it likely.

The appearance of the crops is said to be promising, but the weather had been rather unfavorable of late. The prices of Wheat and Flour had advanced somewhat. American Flour in bond was selling at 24s to 25s. per bbl.

NEW YORK MARKET.

WEDNESDAY, JULY 29.—The receipts of Flour to-day are trifling—the demand is moderate. We quote Genesee-1 \$5.50 a 5.56; Ohio \$5.25 a 5.37; Michigan 5.12 1/2 a 5.25—Southern \$5.50. In consequence of a temporary light supply of Ohio and Michigan, sales of these descriptions have been made at higher rates than we have quoted. The market is bare of Corn of all descriptions—sales 800 bushels Southern at 61c, small lots Northern at 67 a 68c measure. No sales Rye. Northern Oats are plenty and dull at 13 a 14c. Pot ashes are in fair demand at 5.50. Pearls dull at the same rate.

The following is from the Commercial Advertiser of Wednesday evening, July 29th.

Flour—Canal Flour is scarce and the demand better today. Sales were made of about 1500 barrels from store this morning at \$5.75.

Thursday, July 29—Flour—is better again to-day—good brands of fresh canal are sold at \$5.75, and Rye from store that is state, brings \$5.75. For Ohio, the rates are \$5.62 1/2 a 5.75. In Southern flour there is no change.

OSWEGO.

OSWEGO, JULY 25.—Flour has declined during the past week, and is now worth at our mills from \$5 to 5.25. A fall in the New York and Canadian markets, and improved prospects of the new crop about coming in, has given a downward tendency to prices. Five hundred bags changed hands on Saturday, at one of our mills, at \$5; while \$5.12 1/2 was refused at another mill.

MONTREAL.

MONTREAL, JULY 23.—Flour—The market is extremely dull, but prices are not altered. Genesee at \$5.50 a 5.36; Ohio \$5.25 a 5.34; and Michigan \$5.30 a 5.37. Ashes—Pot ashes \$3.50. Pearls, no sales.

CINCINNATI.

CINCINNATI, JULY 25.—Flour—Since yesterday noon, 591 bbls. have been received by canal, about two-thirds of which were sold at \$1.15, one small lot at 1.25, and 99 bbls. a choice brand, at \$1.31. A sale of about 150 bbls. City Mills yesterday evening, at \$1.37—still selling by dry load at \$1.50.

CLEVELAND.

CLEVELAND, JULY 27.—The supplies of wheat by wagons, are very trifling, and \$1 per bushel is readily paid. Sales from boats have ranged from \$1 a \$1.06, according to quality. The quantity offered is small.

Flour has been offering more freely, than the demand required, and prices have given way, sales having been made at \$1.90 a \$5 from boats: the latter price is not accepted by some of the holders.

NO ADVERTISEMENTS will be inserted in this paper except such as relate to Agriculture, Horticulture or rural affairs; and none will be inserted more than three times in succession. Terms of Advertising—For 12 lines, or less, \$1, for the first insertion, and 50 cents for each subsequent insertion.

ENGLISH IMPORTED SEED WHEAT.

SEVENTEEN or Twenty kinds of the finest varieties of ENGLISH WHEAT are for sale at the Seed Store. Amateur farmers are invited to call and examine it. Aug. 2. BATHAM & CROSMAN.

FALL SEASON.

THE IMPORTED ENGLISH HORSE ALFRED

is now at my Stable in Greece, 6 miles west of Rochester, near the Canal—and will continue there until the first day of September.

All mares which may be sent shall receive the best attendance, accidents and escapes being at the risk of the owner. THOMAS WEDDLE.

Greece, July 30th, 1841.

Great Sale of Durham Cattle.

THE sale of cattle, advertised by the subscriber to take place at his farm, on West's L. V. 21st of July, has a consideration of circumstances, been postponed till MONDAY and TUESDAY, the 6th and 7th days of SEPT., next. On those days he will offer at public sale, a good reserve at his farm near Cheviot, seven milch Friesian Cattle (perhaps the GREATEST NUMBER of REALLY CHOICE INDIVIDUALS of the IMPROVED SHORT-HORN DURHAMS, to be found in any one place in America.

There will be sold at the same time and place, a LARGE NUMBER of FINE BULLS, OF THE GRAZER and BERKSHIRE BREED, a variety of SHEEP, consisting of Southdowns, Bakewell, Cotswolds, &c.—the property of many of the best breeders of this region.

Also, a very fine farm of 115 acres, with good brick house and other improvements.

The terms of sale for the cattle, will be one year's credit, and for all sums over \$1000 the privilege of a further year time, by paying six per cent. interest—approved personal realty security.

The terms for the farm will be one fourth in hand, and its balance in three annual payments, with annual interest at six per cent.—with mortgage on the premises for the unpaid part. WILLIAM NEFF, Carriotti, O. July 15th, 1841.

FRUIT TREES.

THE subscribers have for sale, at their Nursery, near Macedonville on the Erie canal,

3000 Peach trees, of thrifty growth, at 25 cts. each, \$20 per 100.

500 Peach trees, (seedling stocks,) from 3 to 5 ft. high 37 1/2 cts. each.

700 Apple trees, 3 to 7 ft. high, 25 cents each, \$18 per 100.

And a large number, a few hundred pear, apricot, and nectarine trees, of smaller size and of the best varieties.

The Peach trees consist chiefly of the following varieties: Early Ann, Tallottson's Early, Large Red Rarering, Early York, White Imperial, Royal Kensington, Sealott's (large red), Yellow Alberg, Red Cheek Malawaton, Late York and Heath, forming a succession of fine fruit for more than two months.

The varieties of the apple are, Woolman's Early, Yellow Harvest, Bough, Sine Qua Non, Buffington's Early, Strawberry, Rambo, Bellflower, Swaar, &c.

The Cherries include the May Duke, Early Richmond, Black Tartarian, White Tartarian, Black Carone, Transperre, and Gignie, Carnation, &c.

All of which have been propagated from bearing trees and their genuineness or excellence fully tested by rigid examinations of the fruit.

This practice will be invariably adhered to, however limited in consequence may be the supply. In propagating, fre use has been made at all times of the fine collection of private fruit in the possession of David Thomas of Cayuga county, and no pains have been spared by the subscribers in extending their list of varieties for examination, selection from which, in addition to the above, will be offered to the public next year.

Orders from a distance, directed "Thomas & Smith, Macedon, Wayne county, N. Y." accompanied with remittance will be faithfully and promptly attended to. Orders may also be left with David Thomas, near Au Ora, Cayuga county. Purchasers will please state when any discretion is given the subscribers as to selection.

W. R. SMITH, Macedon, 8 mo. 1, 1841. J. J. THOMAS.

ROCHESTER PRICES CURRENT.

CORRECTED FOR THE NEW GENESEE FARMER, AUGUST 2, 1841

Table with 2 columns: Commodity and Price. Includes items like WHEAT, CORN, OATS, BARLEY, RYE, BEANS, POTATOES, APPLES, FLOUR, SALT, PORK, BEEF, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, PEARL ASHES, POT., WOOL, HAY, GRASS SEED, FLAX, and PLASTER.

The weather is fine, and farmers are busily engaged harvesting their wheat. But little business is doing in market; some small lots of new wheat have been brought in mostly for retail trade. The price of wheat is rather unsettled at present, and has declined a trifle, but we do not think the late accounts from England and New York calculated to depress the market's. Considerable quantities of flour have lately been shipped from this place for Montreal—canal trade dull.

To Readers and Correspondents.
 We are compelled to omit several communications, written in Canada, and various other matters intended for this number. Our friends must wait till the month to ensure their articles an insertion. Mr. Bateham has been absent most of the past month.

Hints for the Month.
Ploughing wheat is the most important operation to farmers during this month. It is a matter of consequence whether the cultivator obtains ten, or thirty bushels at next harvest. Let the business then be done right. Above all, do not sow after wheat of this year. Many of the mis-crops this season resulted from this practice. Plough deep at least once, where the soil will allow of it. If subsoil ploughing cannot be practised, plough as near to it as you can. A large portion of the soil of Western New York, as well as of other places, contains a portion of mail lime, and mixing with the rest of the soil, is one of the very best ways of applying this manure. Independently of this, ploughing is very useful. Plough evenly and run narrow furrows. This is the only way to do the thing right. Buy the best seed you can find in all the country, if it does cost a little more. The land we recommended on page 111 of last volume of this paper, sustains the character there given of it. Let the seed be as clean as possible, as it is exceedingly difficult to take such pains to plough and prepare your land for wheat, and then to sow cow-cake, &c., and such wretched stuff for a crop.

Lastly, plough in your wheat with a light plough, leaving it rough just as the plough leaves it. At last try the practice. We have known it to succeed admirably. And do not forget the well cleaned surface furrows for draining, where they are wanted.

Cut up corn this month as soon as it becomes hard, that the fodder may be well saved. The ripening process will be fully complete by the month's end afterwards derived from the stalks. Never mutilate corn by topping it.

Let your logs begin to have the dropping apples from the orchard, and they will fatten rapidly. Never feed unground grain of any kind, to hogs. Let your swill or hog-pomage be fermented if you cannot boil it—to do which, you must have two small tubs or barrels, feeding from one while the other is fermenting. But extensive hog-farmers should always boil the food.

Keep every thing in first-rate order—cattle in good keeping and fine condition—horses lively, and not over worked nor under fed—calves fat and growing, so that they may winter well—and every thing else in equal style—and finally, pursue the maxim of the distinguished classical American statesman,—"Be sure you're right, then GO AHEAD!"

Wheat and Canada Thistles.
 If the Canada Thistle should generally induce our farmers to cultivate their land better, its evil aspect would be greatly softened, though we should not dare to call it a blessing in disguise.

In years past we have frequently endeavored to call the attention of cultivators to this subject; and have given some details of the facility with which this weed could be destroyed; but our last number contains two communications, which we think deserve some farther notice; and we would hold them up for the encouragement of others.

"I commenced about the first of June," says our friend V. Y. on page 114, "and ploughed them about once a month, and harrowed them as often—till about the first of October. The result is, their entire destruction, except a few places where the ploughing could not be well done."

Not less favorable is the report of our correspondent, Mr. Ayers at page 117. "The soil contained six acres, principally occupied with Canada thistles, on which a Florida war had been waged for twenty-five years, or more, with little prospect of success or termination.—In the latter part of May, I broke it up—ploughed the ground deep four times, and harrowed as often in the heat of summer.—The result was [it] killed the Canada thistles, and my ground is in good condition for after cropping." In consequence of this superior culture, and high manuring, the crop of wheat which followed was very fine; and we are left to infer that nearly sixty bushels to the acre were obtained.

Two causes have conspired to make farmers slovenly, and to spread the Canada thistle: One is, the strong desire to raise all the wheat they can, by putting in as much of their land as possible; and the other is, the very short time they have to prepare the ground in business in the growing season of this climate, hurried by the farmer at every step. The getting in of spring crops is often greatly retarded by unfavorable

weather, and sheep-shearing, road mending, and sometimes continued rains, interfere with breaking up the fallow. Then comes the hoeing of corn, potatoes, and field-beets; and unless the farmer bestirs himself, hay-making will be on his heels. Harvesting the barley, wheat, and oats, is usually finished before the middle of the last month of summer, when many are beginning to sow their wheat—so near do's of time and harvest approach in this district. How then is manuring and ploughing the fallow once a month to be accomplished? Go over less ground—apply the same amount of labor to half the quantity of land—raise double crops to the acre (in weeds)—and reserve the remainder of the farm for pasture and meadow.

Sometimes however, slovenly management succeeds well with wheat; and to succeed once, like gaining a prize in a lottery, encourages the farmer to try it again, though there are ten chances against him. Success is always sure to be remembered. "Corn stubble," or potato ground is often sowed too late for the wheat to fill, for it rarely if ever tillers well in this district if sowed more than a week after the sun crosses the line; and then between freezing out in the winter and spring, and the rust or blight in summer, the crop stands but a poor chance. From lotteries of all kinds farmers ought to keep clear.

We now revert to another branch of our subject. Deep ploughing, or pulling up the thistles by hand, is not more destructive than to cut them off near the surface. In the latter case, the horizontal root with the upright stem attached to it, remains undisturbed; and the plant prepares to recover its foliage without delay. But when the plough breaks up the horizontal runner, or the harrow draws its fragments to the surface it soon perishes in dry weather. There is a profit in taking the most thorough course.

The Flowers of Summer.
 Very few annual flowers have succeeded this season, so severe has been the drought. We have not seen a Balsamine, except some that were watered by a small rill. *Carabidus tricolor* and *Zinnia coccinea* attempt to display their beauties, but they often droop in the parching air. Some species of *Ipomoea* (besides the following) are also in flower, but less vigorous than usual.

The Cypress Vine, one of the most delicate forms of the Vegetable Kingdom, requires a rich soil, and seems to enjoy a great of soap-suds. It is a morning flower, not intended for late rains.

The Tiger Lily, though shortened in its stem, has lost none of its richness: the *Galardia* continues to unfold its purple disk and yellow rays; and *Echinops sphaerocephalus* appears not to suffer from any lack of moisture.

The same remark will extend to the *Rust colored Fox Glove*, so erect in its stem, and so neat in its leaves; to *Hibiscus Carolinensis*; with its fine rosy flowers; and to *Cleome latifolia* with blue rays so perfectly fringed. Yet this plant is generally an officious because it is an intruder, hard to be restrained within reasonable limits, and then pertinaciously adhering to the spot it has chosen.

Silene Regina displays its brilliant scarlet; and the old Monthly Honey-suckle, like all other sweet flowers is less fragrant in dry air, but always interesting on account of its beauty, and of our early recollections.

The White Argemone, an old favorite—and the modest *Lychnis laevifolia*—blow, though feebly; while *Periphaca græca*, as if recollecting the hot dry air of its native land, seems to rejoice, and puts forth its long polished leaves of dark green, in abundance. Last year we mentioned a *Phlox* of sober purple in the morning, which changed to a rosy hue in the afternoon. The same phenomenon continues. *Buck's Seeping* is beautiful.

Machinery applied to Agriculture.

Masrns Editors.—I herewith send you a notice in the New York Tribune, of a work which promises great a saving in the manual labor pertaining to rural economy, as the power spent has effected in the production of cotton cloth.

I have often thought that if a portion of the great labor-saving improvement, which have in late years been applied to marine, canal and river navigation, could be so applied to agriculture as to enable the North to accomplish more, with less bodily exertion and expense of muscle, and the South to dispense with *slave labor*; that a greater social revolution would be produced by it, than our eyes have yet seen, or our hearts have yet felt. It may be said that man, to live well, must "live by the sweat of his brow;" figuratively speaking, that man does so live, who lives by artificial production; the high civilization which labor-saving machinery induces, only creates the renewed wants, which vary, improve, and stimulate production. The simple comforts which in past ages could only be indulged in by the rich, are now attainable by all; and if the time which Henry the Fourth wished for, when "every poor man could have his fowl in the pot," has not arrived, it is alone the poor man's fault.

It may be said that the cultivation of the potato in Ireland, by the introduction of a more cheaply raised necessary of life, has produced the same effect as labor-saving in agriculture, and that the result has trebled the population of Ireland without adding any thing to their social comforts. But may not the wretchedness of the Irish be attributed to other causes, than to an increased population? Is it not rather to a lack of a well directed manufacturing industry; to the want of that home trade which the *absentism* of the aristocracy produces, by leaving the workers of the soil to the grindings of the middle man and the tithing proctor: "Thou shalt not muzzle the ox that treadeth out the corn," is one of those scriptural injunctions which is never read understandingly by the land holders of Ireland. If her aristocracy would stay at home and expend their incomes there, in properly encouraging and directing the industry of the people, there is no doubt but that the condition of Ireland would at least compare with either of the other United Kingdoms.

When reading Humboldt's description of the scanty and widely scattered cultivation in some of the most fertile sections of equinoctial America, I have felt that nothing short of the discovery of labor-saving machinery to be applied to agriculture, could ever bring all the usable land of those hot and debilitating regions into cultivation. What a stupendous revolution in the production of the edible things of the earth, may not be produced by the application of machinery to a soil where organic Nature is enlarged to such a gigantic scale, that not only the earth produces its semi-terrestrial vegetation, but trees their parasitic families, but even the air itself is filled to darkness by the pendant drooping of the *banans*, which hang in festoons from tree to tree at the height of more than a hundred feet.

S. W.

Washington, July 25th, 1841.

From the New York Tribune.

THE NEW WORLD, OR MECHANICAL SYSTEM, to perform the Labor of Man and beast by inanimate Powers that cost nothing, for producing and preserving the necessities of life, by J. A. FETTER. Published by C. E. Stollinger, Philadelphia, 75 pages.

The object of this little work is, as the author informs us, to show how to cultivate in a single manner 10,000 acres of land by one machine and three or four men, with a capital less than one dollar per acre,—how to clear land from trees and stumps, roots and stones,—fill and drain swamps,—make canals, con-

als, ditches, roads and perform any kind of work on the ground,—build houses, and furnish as much inanimate power for any place or stationary machine as is wanted,—all by the same system.

The author of this work is certainly a bold, an original thinker,—a man of a high order of talent. Men heretofore have only applied machinery to certain general purposes,—to manufactures, mechanics, navigation, &c., but FETTER has conceived the gigantic plan of applying it to the daily works of society,—to cultivating our lands, building our houses, roads, canals, &c. To do all this he does not make use of costly powers, like heat of barthen and steam, but of powers that cost nothing, such as the heat of the sun, the wind, tides, &c. He has invented machinery adapted to those powers, and so contrived it as to make use of them at all times. We of course can give no idea of his machinery or invention; the book itself must be studied; it contains plates and full explanations.

FETTER has foreseen and explained the immense ultimate results which would follow, if machinery could be applied to agriculture and to the various daily Labors of Man; he sees that it would do away with poverty, elevate the condition of the human race, fertilize and cultivate the tropical climates, which are now neglected and which are the fairest portion of the earth, and lead to a great and fundamental Reform in society.

We particularly recommend his work to attention, and we trust that he may find the means of making a practical experiment of his plan. The views of the most celebrated mechanists have been very limited; they have not conceived the possibility of applying machinery further than to a few specialties. Is it not pitiful to see our large canals dug out by single spadefuls, blocks of granite hewed by human hands; bricks carried to the tops of houses on human shoulders! It seems so to us, and no one has felt it more keenly than FETTER, and no one has undertaken before him to invent a general system of machinery for obviating it.

For the New Genesee Farmer.

ITEMS.

Corn-cob Feed.—The best way to dispose of cobs is of course to grind them with the corn. But we observe two substitutes which have been successfully made use of. One is to soak the cobs in a half hogs-head of brine, when the cattle eagerly thrust in their noses and devour them. The other, or better way, is to boil them. One farmer says he would as soon throw away his fodder as his cobs.

Preserving Cheeses.—S. Don Robinson says a neighbor has practised for several years the method of preserving his cheeses by placing them within a hay stack, where they are kept from freezing through winter.

Foot rot in Sheep.

An intelligent and successful wool grower informs us of the method by which he entirely prevents the inroads of this disease.

It is known that the sheep, when removed from its native mountains and rocks, to the soft and luxuriant pastures, no longer has its hoofs worn away as in a state of nature, by which as they grow they are preserved fresh and sound,—but the outer part, which is naturally intended to support the weight of the animal, grows out of all bounds, until it laps more or less over the sole, and retains the accumulated earth and filth which collects within. From this the disease originates.

According to our informant, by repeatedly and carefully paring off this crest of the hoof, as often as necessary, the disease is effectually prevented. Where it has already made progress, something more is necessary, as the application of turpentine, or tar with caution, the disease being very similar in nature to the "foul in the foot" in cattle, which is successfully treated by rubbing a hot iron rod with tar, between the hoofs. Although it had made such progress in the hoofs of our informant, as to cause indirectly the loss of several hundred sheep, yet he has

succeeded after a year or two of careful attention, in removing it entirely.

He thinks it rarely reaches that degree of malignancy described by European writers, by whom it is represented to become contagious, and occasion directly the destruction of the animal; or at least that several years would be required to produce such a result; death appearing here to be caused by the severity of winter operating on weakened and emaciated animals affected by the disease.

Resources of the West—Agricultural Riches.

How can we better promote the objects for which the Genesee Farmer was established, than by publishing some articles calculated to expand the thoughts of our Farmers by reference to the growing greatness and glorious destinies of the Mighty West? The dignity and importance of Agriculture can only be properly estimated by contemplating such views as are here presented in the annexed statements from Mr. Penfield—formerly resident in Rochester—a man whose talents and observation enable him to speak confidently on the vast topics which he discusses. Were Mr. Penfield unknown to us personally, we have an endorser in his behalf, whose testimony would alone secure an insertion for his statements. That endorser is JESSE HAWLEY—well known as one of the earliest and steadiest friends of INTERNAL IMPROVEMENT in the State of New York. Mr. Penfield was formerly under the instruction of Mr. Hawley; and doubtless profited considerably by the practical knowledge and enlarged views of his friendly instructor. The article has not suffered in value by the delay in publication—though we must apologize for omitting it till this time—having had it in possession for some months. Let it be read carefully—let its statements be maturely considered—and let other statements bearing on the great questions, be attentively examined with a view to more thorough knowledge of the vast regions watered by our Inland Seas.

From the Cleveland Herald.

Wheat and Flour Trade of the West.

NEW YORK AND OHIO COMPARED.

MR. EDITOR—In making up some accounts on this subject for a private communication, I have since thought the figures would not be uninteresting to some of your readers; and hope I shall not be considered too tedious for your columns or their patience, in the closing remarks.

There arrived at Cleveland by the Canal in 1840, 504,900 barrels of Flour, and 2,151,450 bushels of Wheat. We compute the flour as in wheat, allowing as in other instances that follow, 5 bushels to each barrel of flour, making the aggregate 4,675,350 bush. There was bought from wagons besides 80,000 bush. of wheat and considerable flour; the exact quantity not to be ascertained, sufficient, however, for the consumption of the city. The exportation from this place then was equal to 4,755,350 bushels. Several other points on the Lake within this state also ship large quantities; at Huron for instance, equivalent to 472,878 bushels during the past season. The export of Ohio on Lake Erie we estimate from 5½ to 6,000,000 of bushels. That on the Ohio river we have not the means of stating with so much accuracy. Some portion of the 132,637 barrels of flour shipped east from Pittsburgh; the past season, was doubtless from Ohio wheat. There are several points on the river that send off more or less, besides those of Portsmouth, where the receipts by canal were 31,131 barrels of flour, and Cincinnati, by the Miami canal 165,762 barrels of flour, and 97,200 bushels of wheat. We put the river export equal to 2,009,000 of bushels, making that of the State, not less than 7,500,000 bushels.*

Governor Seward states in his message at the opening of the New York Legislature, in January last, that there was delivered in 1840, at the eastern termination of the Erie Canal, 1,805,135 barrels of flour, and 1,235,195 bushels of wheat, equal to 10,420,870 bushels. Deducting from this quantity, that part which went from the Western States, as will hereaf-

* A recent statement, purporting to be from the Cincinnati Chronicle, makes the export of the State from Cleveland, Huron, Portsmouth and Cincinnati, 8,000,000 bushels

re noted, and there remains as grown in the State New York, 4,729,487 bushels, giving to Ohio an export trade of wheat over Western New York of ore than 2½ millions of bushels, or nearly 50 per cent. If any flour has been sent from Rochester to Canada, this result will be so far affected, but we apprehend little if any has been sent.

There entered at Buffalo and Black Rock per statement of Custom House at Buffalo, 1,582,888 bushels of wheat, and cleared from Buffalo, per Canal collector's statement 689,635 barrels of flour. The assumption of Buffalo and vicinity of western flour several thousand barrels more; besides small supplies sold to ports between Ohio and Buffalo.

There entered the Welland Canal 203,916 barrels flour, and 1,833,765 bushels of wheat, which added to the figures at Buffalo and Black Rock, makes a entire export from Lake Erie 7,889,998 bushels.

The growth of the Western States—a staple we prebend not illy comparing, the relative extent of age and population being also considered, with that which was garnered by Joseph for Pharaoh, in years ten Egypt yielded even more than her usually amount harvests. We observe here, that in one county bordering on Lake Michigan, the harvest of wheat a summer was diminished by blight from what was expected as calculated by a committee, of 509,000 shels. This quantity, so large, has not been brought to by high prices, for the very opposite has ruled. Of the quantity passing the Welland canal there filed at Oswego 707,157 bushels of wheat, and 165 barrels of flour; and of this 83,830 bushels of wheat, 116,000 barrels of flour were shipped east on canal from Oswego, and 35,579 barrels of flour to Canada.

The quantity as before stated by Governor Seward, 10,420,879
 Product shipments from Buffalo and Oswego, 4,691,402

town in New York as before, 4,729,487
 shipped from Cleveland as before noted, 4,755,950

The average annual export of wheat and flour from the United States for an indefinite period past is not equalled that of Cleveland the past season. Next to New York, Baltimore has the largest flour de on the sea board; but the inspections there never reached 600,000 barrels till the past season by the person which the tide-water canal has effected, the inspections exceeded 700,000 barrels, or say 4,000,000 shels of wheat. New York receives flour from all its of the west and south, yet her inspections had never been so large as the receipt at Cleveland this season till 1833. Again, if we compare the receipts at New Orleans and the quantity sold on the river above at 500,000 barrels, the west, besides supplying a large emigrant population furnishes more wheat than the rest of the Union. We may remark here that the crop of corn the past season in Indiana and Illinois, cannot be estimated much less 100,000,000 bushels.

It would appear that the quantity of western wheat to Canada, including the flour from Oswego and small quantity of wheat to Ogdensburgh, was equal to 2,000,143 bushels.

The Canal Commissioners of New York in their annual report state the business of the Welland at 600 tons, whereas the wheat alone exceeds that amount; and if the produce of the west going through Welland had entered at Buffalo it would have effected the whole amount of tolls of the Erie Canal upwards of \$2,000,000. Less than one-third, it seen, of western wheat went to Canada to twenty different points above Montreal; and so did even this season fill these ports with an avalanche rush, that farmers, waking up to the threatened destruction their interests as they conceived, immediately petitioned the Home Government to lay duties on the portion of flour and wheat from the United States to the provinces, virtually shutting out the unwelcome flood. We heard also how the accumulation increased at one point of the transit, (Kingston,) a complete glut, choking up the St. Lawrence, and occupying not only all the facilities of transport a line of navigation traversed for nearly two centuries, but had so taken up all the means of storage at large quantities lay out of doors for some time, and finally, many vessels awaiting to be discharged formed long quarantine for that purpose. We see what effect this has on the exports of Montreal and Quebec, and how it tends to augment British commerce. The quantity exported from these places a past season was 72,725 bushels of wheat, and 3,094 barrels of flour; equal to 1,658,195 bushels, of which saving about 7,000 bushels was sent to

Great Britain. But it would seem that Canada has not raised her *own bread* for, deducting

For western money sent her, 2,309,411
 Her exports above, 1,688,195

The deficiency is, 621,216

But let us follow this flour to the ports of Great Britain, admitted as it is by a very singular and favorably constructed tariff for Colonial Commerce. There have been for several months shipments of flour, not to a large extent it is true, making from New York to England, and if the same amount of exportation of Montreal and Quebec above had been made from New York and the price in England equal to 62s. sterling per quarter, the duties would have been, \$1,075,558
 But being from Canada they were only, .. 420,398

The difference being the benefit to colonial commerce, \$-64,867
 or about 51 cents per bushel.

But to return—such is the West; the "garden" and the granary of America, sending her products from the interior of a continent in every possible direction, taxed as they are by the charges of an inland transportation of 1,000 miles before they can reach the open markets of the world; giving the staff of life to the languishing factories of New England, to Old England, to Canada, and the Cotton and Sugar plantations of the South.

We have stated the export trade of Lake Erie in 1840 at 7,869,938

The shipments of wheat and flour from Buffalo in 1836, the first year after the Erie Canal was completed—the Welland not opened, were "453 tons," or 11,945

Such has been the growth of this one item, of the commerce of Lake Erie in the short space of fourteen years, since the departure of the first canal boat from her waters was announced by the splendid and unrivalled telegraphic enterprise; marking an era in the commercial history of America, second only to that of its discovery by Columbus. Such is the past—of the future; imagination returns from the contemplation with fatigued wing and proclains, "tap Lake Erie" at as many points as you will, and with such dimensions as you will, the avenues shall all be filled. Here is a commerce suddenly washed into life, not diverted from other channels, but *not created*; yet more important than that which for centuries had traversed interior Asia, borne by the slow and weary caravan, halting at the gates of magnificent Palmyra on its way to renowned and commercial Tyre and other Phœnician ports of the Mediterranean, or that subsequently, by another route, for 1800 years deposited its wares in the ampler store houses and more splendid shops of more popular Alexandria and Venice; or which at a later period, without re-shipment, rewarded Portuguese enterprise in the success of a Vasco da Gama. If

"Westward the star of empire takes its way"
 westward too, moves the star of commerce.

The mind looking at this great change seeks to find what it is, that with such rapidity is transforming a vast wilderness into cultivated fields; where man had first to cut his path into that wilderness, build his cabin, and clear away the forest before this stream of commerce could begin to flow. The construction of lake harbors and the use of steam navigation have had a great influence in this matter; but towering high above all other agencies stands that of the Erie Canal. That was the key that unlocked treasures of ever increasing value and ever augmented growth. Truly fortunate among the sons of men was he whose mind was instrumental in effecting such a sales in his country's glorious career. Yet this individual, who more than a third of a century since, grasped the mighty thought and gave through the press publicity to the grand design in his "Declaration of the Erie Canal," has never had the slightest recognition from his own state that receives the yearly increasing revenue from its tolls. Not less has the National Treasury overflowed from the sales of the public domain to which the influence of that canal has so much contributed.

We mingled in the throng that in last summer's solstice congregated on the green spot of Maumee's banks, the story of whose defence had impressed itself so indelibly upon the memory of our boyhood days. Heard we not, mingling with the war blast of the brave, other bugle notes that came from the still gliding canal boat on the opposite side of the river.

* See essays, over the signature of "Hercules," republished in the appendix to Dr. Henshaw's "Memoirs of De Witt Clinton" in 1829

pursuing "the even tenor of its way" be on where the battle field of "Tippecanoe" echoes with thrilling tones—where the Wabash rolls its tide toward Mississippi's flood—see that boat bearing on its return the rich harvests from that celebrated field of song.— That canal is one of the daughters of the Erie canal, with others of a numerous sisterhood, bringing its tribute to the national improvement. But ere the clash of arms was heard on that field, there had been developed in another quarter the project, that laid the foundation of this northern line of commerce which has already encircled this interior spot with the arms of its mighty influence, and is fast pervading every part of the illimitable west.

But however unmindful of his eminent services rendered, the generation to which he belongs may be, posterity may do him justice. Indeed the enlarged canal itself and its increasing business will be a monument, raised still higher, and the record more indelibly made, of the merits of Jesse Hawley. It is quite beyond the limits of a closing article to even hint at the benefits which the West has derived from his labors. But while we survey with him the vivid panorama of human industry and happiness, which he was instrumental in producing, we would for a moment, point him to that part of the picture where, on a western prairie, he could see "one field of 20,000 acres of wheat" waving its golden head to the passing breeze; and putting with him who would not forget, that his hand touched the spring that set in motion a many thousand wheeled machinery, growing more complex and extended, the hum of whose noise shall be heard far down the vale of time.— It he is worthy of the gratitude of mankind who makes two blades of grass to grow where but one grew before, what shall be the measure of praise awarded to him, who had such an agency in the production of so great harvests as we have considered.

A. FENFIELD.

On Bran as a Manure.

Sir—As this is the season for preparing the turnip crops, I am desirous of calling the attention of your readers and the scientific agriculturists, to the consideration of bran (the husk of wheat) as a manure, not only for turnips, but also for wheat and grass. The great facility that every farmer has of obtaining it from his neighboring miller, and its exceeding cheapness, (now about £1 10s. per ton,) warrants their trying a series of experiments in drilling it with the turnips and wheat, and putting it over their grass lands as a top-dressing; substituting it for bone and other manures, which are costing two or three times as much as the bran would.

Experiments have been tried but not extensively enough to warrant its being said how much is saved in expence, and what quantities per acre ought to be used to render the best return.

It is to this point that I wish attention to be directed, and as Sir Humphrey Davy in his "Elements of Agricultural Chemistry" writes—"Nothing is more wanting in agriculture than experiments in which all the circumstances are minutely and scientifically detailed"—would some of your readers assist in this object, and drill a small portion in each of their fields of wheat and turnips, with bran in quantities from 3 to 6 cwt. per acre, and report the result in your paper; that is, the quality of the other manure used, the respective cost for manuring an acre, the yield, and the quality of the ground experimentalized upon.

The following extracts from Liebig, would leave, in theory, bran to be at once the cheapest and best manure that could be employed:

"Phosphate of magnesia, in combination with ammonia, is an invariable constituent of the seeds in all grasses. The bran of flour contains the greatest quantity of it.

"The perfect development of a plant according to this view, is dependent on the presence of alkalies or alkaline earths; for when these substances are wholly wanting, its growth will be arrested, and when they are only deficient, it must be impeded.

"So likewise none of our corn plants can bear perfect seeds, that is, seeds yielding flour, without a large supply of phosphate of magnesia and ammonia; substances which they require for their maturity.

"It is the greatest possible mistake to suppose that the temporary diminution of fertility in a soil is owing to the loss of humus—it is the mere consequence of the exhaustion of the alkalies."—*Mark-lane Express.*

Agriculture is the nursery of patriotism and virtue—aided by science makes a great man. All the energy of the hero and all the science of the philosopher may find scope in the cultivation of one single farm

New York State Agricultural Society.

CATTLESHOW AND FAIR AT SYRACUSE.

At a meeting of the Executive Committee of the N. Y. State Agricultural Society held at Syracuse, Aug. 17, 1881—Present, Messrs. Nott, Johnson, (of Oneida), Carter, H. Randolph, T. Tucker, &c. the following Viewing Committees were appointed to award the Premiums offered by the Society at their Cattle Show and Fair to be held at Syracuse on the 29th and 30th days of September:

ON CATTLE

- Class I—Bulls—Of any breed, 3 years old and upwards.
Class II—Bulls—Of any breed, under 3 years old.
Class III—Cows—Of any breed, under 3 years old.
Class IV—Cows—Of any breed, 3 years old and upwards.
Class V and VI—Heifers—A improved breed, under 3 years old.

ON HORSES

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON SHEEP

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON SWINE

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON PLOUGHS

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON CULTIVATORS, HILL, BARROWS, AND HARRIOWS

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON THRASHING MACHINES

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON HORSE RAKES AND STRAW CUTTERS

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON FARM IMPLEMENTS

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON SAMPLES OF GRAIN

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON SAMPLES OF WOOL

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

ON HORTICULTURAL PRODUCTS

- Class I—Long Wooled.
Class II—Middle Wooled.
Class III—Fine Wooled.
Class IV—Cows—Not recorded.
Class V—Cows—Not recorded.

COMMITTEE OF ARRANGEMENTS

- 1st Secy., H. S. Rusk, Jr.
2d Secy., Harvey Baldwin, Jr.
Treas., J. P. Ketchum.
W. S. Frazer, Jr.
M. B. Bateman.
Comptroller, C. W. Keedy.
P. N. Rust.
J. S. Savage.
M. D. Burnett.
L. J. Williams.
J. M. Dyer.

The following gentlemen were appointed a committee to solicit members and funds for the Society at Syracuse:

- M. D. Burnett, Esq.
H. Baldwin, Esq.
J. R. Lawrence, Esq.
P. D. Norton.
P. N. Rust.
J. Sanford.

Additional Premiums TO BREEDERS.

F. Retch, Esq. having given the Society \$50 for that purpose, Premiums will be awarded to breeders as follows: To the breeder of the best thoroughbred Bull, \$10 00 To the breeder of the best thoroughbred Cow, 10 00 To the breeder of the best thoroughbred Heifer, 10 00

FOR WORKING OXEN.

Will's Gaylor, Esq. having contributed \$20, for that purpose, a premium will be given For the best set of working Oxen, \$20 00

In awarding this Premium, particular reference will be had to the close matching, excellent training, and docility of the animals, as well as to their general good appearance. Committee—Abel Baldwin, David Bundy, and Dan Hubbard.

FAT CATTLE.

Mr. Rust offers a sweepstake, twenty dollars entry, for the best yoke of fat cattle. Committee—B. P. Johnson, B. D. Noyon, and M. D. Burnett. A PLOUGHING MATCH, under the direction of the Onondaga County Agricultural Society, will take place immediately after the Trial of Ploughs, on the second day of the Fair.

REGULATIONS FOR THE FAIR.

- I. A Committee of Arrangements, consisting of five members, will in conjunction with a committee consisting of the same number, appointed by the Onondaga County Agricultural Society, exercise a general supervision and control on the day of the Fair.
II. Clerks shall be appointed by the committee of arrangements, who shall occupy a convenient stand near the place of exhibition, who shall give to every one entering animals, cards, with the number of the pens which such animals shall occupy, and the premiums for which such animals are entered, written thereon—and such cards shall be conspicuously placed upon the pens containing the animals. A list of all such entries shall be kept by such clerk.
III. No animals shall be removed from the pens until the close of each day's exhibition without permission of a member of the Committee of Arrangements.
IV. Applicants for premiums on animals will be prepared with written statements accurately detailing the age and method of feeding such animals; and those drawing premiums will be required to make oath to the correctness of said statements. Such written statements will be delivered to the clerks on entering the animals.
V. All animals will be examined and premiums awarded on the first day of the Fair, and the viewing committees will commence their inspection at 10 o'clock, A. M. No spectators will be admitted to the yard until after the viewing committees have performed their duties.
VI. Implements, products, &c. will be examined on the second day of the Fair. Implements, particularly ploughs, will be put to a full and fair trial.
VII. Any exhibitor of any article will be suffered to compete for premiums on articles and products, and any exhibitor of the United States for premiums on implements, on the payment of one dollar, if not already a member of the Society.
VIII. Viewing Committees shall in all cases have power to examine if applicant for premiums personally, when more particular or satisfactory information is desired.
IX. No premium shall be awarded without a competition, unless the viewing committee shall deem the amount of product or implement exhibited, highly meritorious—in a case where there is competition, unless they shall consider such product or implement worthy of the award.
X. All reports of viewing committees shall be made in writing and signed by the members entering thereon.

NL. All persons intending to compete for the premiums on animals, should give notice to take effect on or before the 20th Sept. to LEVIN TUCKER, Albany; H. S. RANDALL, Cortland Village; M. B. BATEMAN, Rochester; or P. N. RUST, Syracuse—in order that the necessary accommodations may be made for them. It is desirable also that those who intend to compete for the prizes on Implements should give notice as above by the 20th September.

Owners of stock throughout the State and manufacturers and agencies of agricultural and horticultural implements, throughout the United States, are invited to present their animals and implements. Samples of farm and garden products, silk, cocoons, domestic manufactures, &c. &c., are also solicited.

Discretionary Premiums will be awarded on articles not enumerated in the Prize List.

The Society will dine at Rust's, at 3 o'clock, P. M. on each day of the Fair.

The officers of the Society and the Committee of Arrangements are requested to meet at the Syracuse House on Tuesday evening, Sept. 25.

Monroe County Agricultural Society.

At a meeting of the Society held at Rochester on the 25th day of August the following persons were appointed inspecting committees to award the premiums at the exhibition of the Society to be held on the 15th and 16th of October next.

ON HORSES—Theron Brown, Wheatland; Steph. Charles, Rochester; Henry Olmsted, Greece.

ON CATTLE—George Steifer, Wheatland; Samuel H. Davis, Sweden; Jacob Strawn, Chili; Alonzo Frost, Rochester; J. Allen Frost, Brighton.

ON SWINE—Stephen Merry, Wheatland; Thomas Wilcox, Mendon; Arthur Clark, Rochester.

ON PLOUGHS—Edward Chapman, Rochester; John Fuller, Chili; Gibson Ramsbell, Perrinton.

ON FARM IMPLEMENTS—Lawson Harmon, jr., Wheatland; John Ayrault, Perrinton; Nathan Lusk, Sweden.

ON FINE WOOL—Lewis Brooks, Rochester; Nicholas Reed, Greece; Eliza Harmon, Wheatland.

ON MIDDLE WOOL—Henry E. Rochester, Gates; Caleb K. Robbie, Irondequoit; Hiram Nash, Rochester.

ON LONG WOOL—Joseph Allyn, Rochester; Henry S. Potter, Pittsford; Melvin P. Parker, Ogden.

ON IMPLEMENTS—Mathias L. Angle, Henrietta; Jereh Brockmar, Wheatland; H. N. Langworthy, Irondequoit.

ON HORSE RAKES—Mathias Corral, Gates; Alexander Kelsey, Rochester; Henry O'Reilly, Rochester.

The Executive Committee sincerely hope that all the gentlemen named will consent to serve on the Committees specified; but if any of them cannot consistently do so, they are requested to notify one of the Secretaries as soon as convenient. The gentlemen composing the committees, and the officers of the Society are requested to meet at the Arcade House at 9 o'clock on the morning of the first day of the Exhibition.

The Rules and Regulations are published with the list of premiums, in leaflet form, and circulated through the county. Lists of the day will be published hereafter.

The Town Committees and officers of the Society generally, are requested to make special efforts to obtain members and funds previous to the time of exhibition.

L. B. LANGWORTHY, President

H. M. WARD, Secys. M. B. BATEMAN,

Jefferson County Agricultural Society. (Organized June 19th, 1811.)

LIST OF OFFICERS.

President—Graville Hunzicker.

Vice Presidents—W. C. Porport, Eliza Camp, Robert Dasher, George White, D. B. Clarke, Wm. Carls, Geo. Brown, Abner Johnson, Geo. Woodruff.

Executive Committee—Edward Kirby, John L. Gottwald, A. M. Woodruff, Abner Dasher, Jr., John A. Sherman, Cyrus Goodrich, Samuel C. Allen, Sterling, Watertown, T. W. A. B. Brayton.

Resolving Secretaries—Abiel Fry

Eric County.

At an adjourned meeting held in the city of Buffalo, on the 14th of August, for the purpose of organizing an Agricultural Society for Eric County, a constitution was reported and adopted, and the following named persons were elected officers:

PRESIDENT—Lewis P. Allen.

VIC. PRESIDENTS—Cushing Smith, of Hamburg; Horace S. Turner, of Aurora; Jesse Vaughan, of Cheeky; Henry B. Ransom, of Clarence; Calvin Bishop, of Allen; John Foster, of Bolton; Isaac Allen, of Collins; Timothy P. Hopkins, of Andover.

CORRESPONDING SECRETARY—Warren Dwyer, of Buffalo.

TREASURER—Benjamin Hodge, of Black Rock.
EXECUTIVE COMMITTEE—Moses Case, Alben Robert Person, Aurora; John Beslow, Andover; Reuben R. Hancock, Buffalo; Benjamin H. Keston, Boston; Job Haswell, Brant; Amos Bryant, Black Rock; Orestes Warren, Chateaufort; G. Adner J. Kipp, Chertokowaga; Richard Sweet, Colton; Samuel Peck, Collins; Emory S. Fry, Canandaigua; Levi Bunting, Ellettsville; Aaron Salisbury, Keeseville; David P. White, Hamburgh; Isaac Humphrey, Holland; Clement Walker, Lancaster; William Miller, Newstead; Bela H. Colegrove, Sardinia; Uriel Briggs, Tonawanda; Henry B. Stevens, Wales.

Niagara County Agricultural Society.

(Organized June 23d, 1841.)

LIST OF OFFICERS.

PRESIDENT—William Parsons.
VIC. PRESIDENTS—J. S. Stebbins, John Gould.
CORRESPONDING SECRETARIES—J. M. McCollum.
SECRETARIES—David S. Campbell.
TREASURERS—William C. Brown.
RESOLVED, That the following compose the Executive committee:—Timothy Earhart, Dr. Townsend, Richard Snell, Joseph W. Walden, Freeman, Alanson T. O'Neil, Lewis B. Horton, Royallton, Martin S. Douglas, Samuel Coleman, W. Babcock, Somerset; Samuel Deveau, Theodore Whitney, Gen. P. Whitney, Niagara; Stephen Baker, W. Wheeler, Harry Harrington, Hartland; James Wisner, Peter McCollum, Thomas W. Morrill, New Fane; Daniel Dwight, Daniel H. Jones, Morgan Johnson, Wilson; N. M. Ford, John Sweeney, Henry Miller, Wheatland; John Tappan, Ebenezer Bristol, Jacob Moot, Porter; Rufus Phillips, Abner H. Peterson, Eli Thayer, Leviston; Hiram McNeil, Daniel W. Craggy, David Gould, Candaria, Aaron Parsons, John Baker, Alfred Post, Pendleton, (Annual fee of membership fifty cents.)

Livingston County Agricultural Society.

The Fair of this society will be held at Genesee on the 15th of October. Owing to the lateness of the season, it is deemed inexpedient to offer premiums on crops this year; but a liberal amount will be awarded for all kinds of live stock, implements, domestic manufactured goods, &c.

LIST OF OFFICERS.

PRESIDENT—William S. Mills.
VIC. PRESIDENTS—H. Clowry Long, James S. Waldron, Daniel H. Fitzhugh.
RESOLVED SECRETARIES—C. H. Bryan.
CORRESPONDING SECRETARIES—C. R. Bond.
TREASURER—Allen Ayraud.
MANAGERS—M. Brool, Mount Morris; S. W. Smith, Hart; R. H. Carroll, Groveland; W. H. Spencer, York; W. W. Wadsworth, Genesee; W. W. Webster, Leicester; H. Peter Brecheed, Genesee; Edward A. Le Roy, Candaria; Ashael Warner, James H. S. Tyler, Springwater; man Gibbs, Livonia; John E. Thompson, Avon.
POWERS COMMITTEE—Gurman Shepard, Jan. Reuben Jones and Charles Velt, Genesee; Alfred Hubbard, Wm. Morgan, Moses Barren, Mount Morris; Charles Shepard, M. Scott, M. S. Fullerton, Morgan Hammond, Sparta; W. M. Nair, John White, Wm. Ewart, Groveland; Abel H. Warner, Jasper Marvin, Samuel Stevens, Linn; James Campbell, John Adams, Rufus E. Lake, Livonia; Lee H. Pease, Hiram Pease, Zeas; A. J. Day, Springwater; John Henderson, James DeGraw, John Clark, Tonawanda; John Cutler, Jeremiah Bondard, Allen Cragg, Leicester; John Haddock, James Day, Wm. Cragg, John S. W. S. Cragg, James B. Harris and A. McLean, York; Lucy T. H. Newbold, John McKay, Candaria; John Key, Asa Nowlen, LaMott.

Wayne County Agricultural Society.

The Annual Fair of this society is advertised to be held at Newark on the 15th day of October. We have not seen a list of the officers but they have published a respectable list remains, and ought to have the co-operation and support of the farmers of Wayne. They can get up a good exhibition if they try; and now that aid is given by the State, surely will try.

The Drought.

According to our recollections, no drought as severe as the present one, has occurred in this district within the last thirty-six years. Periods of longer duration without rain to saturate the soil, perhaps happened, but they have been later in the season when the heat was less intense; and the greater length of the nights afforded some refreshment to the fields and pastures. The following statement may serve to show how seasons of similar character often cluster together: In the fall of the year 1829, having been short of water four cattle, not only in that year but in several that preceded it, we dug a well nearly fifty feet deep, at once found an abundant supply. So wet have been the summers since that time, however, that we have never drawn a gallon, having kept it closed as one of our wells; but it will in a very probable soon be opened. Other wells have been in a very low state. The effects of the drought are not only visible in the streams, and the dusty surface of the soil, but

some trees are absolutely dying of thirst, and a few others dropping their leaves as in autumn. Where the leaves simply fall, the branch will retain its vitality; but when they dry on the tree, it is dead.

Yet notwithstanding these appearances on land uncultivated soil, wherever the ground has been made mellow to a good depth, we have never seen young grow faster, or seem to suffer less with drought. Some peach trees in particular, have made great growth; and even now while the meadows and pastures are parched, their vegetation is in the height of its vigour.

Not less encouraging is the appearance of some field beets that were not forgotten. It has been well said that a man can produce more moisture by his hoe than by his pit; in other words, it requires less labor to keep up a healthy vegetation by making the ground mellow, than by carrying water. We think the truth of this proposition may be easily shown. If rich ground be well hoed once a month, it becomes a fountain of itself, to the plants that stand on it. Turn it up in the driest and hottest weather, it will be found moist; while a hard heavy soil will require watering every day.

A hard heavy soil cracks open in time of drought; exposes the roots to the sun and air; and allows the moisture from the depth of the fracture to evaporate. It possesses very little absorbent power. A light shower can hardly penetrate it from above, or the moisture rise up into it from below. On the reverse, a deep mellow soil never cracks open, exposes no roots, and the moisture that rises from below enters the whole mass of loose earth, and supplies the plants as they require it. But such a soil also imbibes moisture from the atmosphere; and, like a sponge, yields it to the roots while it imbibes more. It is a perpetual though an invisible fountain.

Another cause however, should be taken into view. Every weed or blade of grass, operates like a pump to draw out and dissipate its moisture; and from this heavy loss well cultivated ground is exempt. Further when decaying weeds are mixed with the soil, they increase its absorbent power, so that instead of diminishing, they add to its nutriment.

Perhaps some qualification to these remarks should be made on account of some plants requiring more moisture than others. While we were writing the above we have had fruit trees chiefly in view, round which the soil may be well cultivated without cutting the roots; but some other objects of culture, even with the best hoeing, would scarcely produce good crops in a severe drought. We think indeed that all the soap-suds from the wash-tub may be profitably applied to many plants in the kitchen garden at such a time as this; and that the cucumber, potato, and cabbage, would pay well both for culture and for drink.

Facts and Illustrations, in Opposition to Speculative Opinions on the Culture of Silk.

MRS. S. FLETCHER—I last week promised you some communication on the subject of Mulberry and Silk Culture, but incessant occupation has hindered me from fulfilling my engagement. You are aware of my reluctance to write for publication. I am unaccustomed to it; and have felt a reluctance to add to the mass of speculative and inconclusive matter which has been thrown upon the public during the present year. I ask therefore your indulgence while I now proceed to comply with your engagement, with all consistent brevity.

My farm of 35 acres lies within the corporate limits of Brockport, bounded upon the north by the Erie Canal, and situated in the southern part of the village. It is a rich and fertile plain, once covered with forest trees and a strong wind-swept plain, the surface of the

two species of Mulberry, best known viz: *Morus Alba* and *Morus Multicaulis*—commenced with both kinds in my garden in 1833 and upon my farm in 1836—adjacent to the plantation I have this year fitted up in a barn erected last season, partly with a view to this object—a cocoonery, &c., embracing a loft and garret 42 by 22, a proprietary room on the first floor, and basement for leaves, in which is a furnace for keeping up a proper temperature in the feeding department.

The cocoonery is fitted up with the feeding and spinning frames and apparatus, invented and patented last season, by Edmund Morris, Esq. of Burlington, N. J. The establishment altogether, furnishes pretty conclusive facts in illustration of the following propositions, viz:

That in Western New York, the culture of Silk, is a perfectly practical and profitable business.

That in order to render it so, reliance must be placed upon an equal proportion of the *Morus alba*, or some other hardy variety, and the *Morus multicaulis*.

That the *Morus alba* may be transplanted at any age not exceeding 7 years, (my experience,) and that at any age after the 3d year, its foliage may be used with benefit to the tree—that by the best method of detaching the leaf, (pruning shoots,) it may be fed without injury, the tree and rendered unfit for food.

That the *Multicaulis* on suitable soil and aspect, needs no protection from winter.

That its adaptation to the worm depends upon its management.

That it succeeds admirably by being grafted upon the root of the *Morus alba*, upon soil; and locations unsuited, where standing upon its own root.

That it may be transplanted, (roots one year old—) I have 11,000 plants done this season (between the 25 and 30 of June, when in full leaf, and now, 25th Aug. be used extensively for feeding.

That Morris' frames combine decidedly more advantages for insuring success, in the important operations of ventilation, (applied to each individual worm,) feeding and spinning, or winding, than any other system now known.

I have now feeding several hundred thousand worms in various stages from hatching (5 oz., say 10,000 now in chry.) to spinning, and of course, they will continue through most of September or later. I invite attention and investigation—and will be at all times happy to exhibit and explain to respectable strangers desirous seeking information, and to citizens, on Thursdays and Fridays, between 7 and 11, A. M. and 3 and 6, P. M. His curiosity must seek its resources of gratification elsewhere.

I am joint proprietor with Mr. Morris, for the sale of his right for all the District of Western New York, being west of Genesee River, and repaired to furnish frames immediately. Apply to E. Morris, Burlington, N. J. or to me at Brockport—Letters must be post paid. Yours truly, GEO. ALLEN.

Brockport, May 1st, 1841.

P. S. AWARE of the extent of the reaction which followed the speculation in *Morus multicaulis* plants a few years since, I am prepared to meet with liberality and opposition, and therefore refer to further facts to support my position, to the operation of Mr. John Adams, at Adams' Basin, on the Erie Canal, 15 miles west from Rochester, and 5 miles east of the present. Mr. Adams has made 100,000 cocoons this season, at an expense of less than two dollars per bushel; and is confident that he could have obtained suitably eggs for hatching, (my own were received from Burlington, per mail 17th inst.) he could have materially increased his present crop. Mr. Adams has already made 100,000 eggs, which I desire to and can sell, will satisfy all who are competent to judge of its value.

Mr. Adams has published a list of 11,000 eggs, and Morris' frame is superior to all others. It is a new and interesting article, every farmer who has a child of 10 or 12 years old, should have one. G. A.

"A Report on the Herbaceous Plants of Massachusetts."

PUBLISHED agreeable to an order of the Legislature by the Commissioners of the Zoological and Botanical Survey of the State. Cambridge, 1841.

The Botanical Survey of the State of Massachusetts was assigned to two individuals. The trees and shrubs to E. B. Emerson, Esq., and the Herbaceous Plants to our esteemed fellow citizen, Rev. Chester Dewey, Professor of Chemistry, Botany, and Natural Philosophy in the Berkshire Medical Institution of Pittsfield. (Now Principal of the Collegiate Institute at Rochester, N. Y.)

In making his report, Prof. Dewey has avoided the objection commonly made against Scientific reports; namely, that they are too technical and abstruse to be useful or interesting to common readers. He has adopted a systematic and scientific arrangement, and at the same time made the descriptions popular and easy to be understood; and taken notice of facts of interest or importance to cultivators and others. So that the work is highly useful and interesting, not only to Botanists but to common readers.

The following notice of Indian Corn will serve as an example:

Zea. L. 19. 3. Indian Corn.

The Greek name of some kind of corn, from the Greek word *lice*, on account of its nutriment.

Z. mays. L. Maze Cultivated, but indigenous to America. It is more abundant at the South, larger, and more productive, and its flour is whiter and more excellent. The necessity of hot weather to ripen this grain in this latitude, is well known and verified by the heat of the last summer, (1839) when the corn was, to a considerable extent, ripened at an early day in September, even in Berkshire County. It is probable that seed which would ripen earlier, or had become better adapted to the climate, was planted, and the favorable season early matured it.

There are many varieties of Indian Corn, of which *Maze* is the South American name; all of which may be reduced to one species. Some are far more hardy than the others. One of this kind is mentioned by Nuttall as cultivated by the western and northern Indians, and called "Early Mandan Corn." Same grow and ripen in England. The value of this grass is immense. Its stalks and leaves are excellent fodder for cattle.

Indian corn was introduced into England in 1562. The species *Z. Carroga*, W. Cross Corn, from Valparaiso, and which parries into a cross-like form, is probably cultivated in some parts of the State.

As our corn is liable to be affected and sometimes cut off by a too early frost, it is important to obtain seed from a more northern section, which will be firmer likely to ripen here. Though it may bear a smaller ear, the advantage is obvious. But, when the crop is injured by the frost, it was clearly ascertained a few years since, that more corn was ripened by cutting it up from the roots and placing it upright in small collections, than by leaving it to stand. In the latter case, the juice of the plant seems to be drawn to the root, in the former to be carried into the kernels on the ear, and to bring more of them to maturity.

The *smut* of *Maize* is *Uredo zea*, Schw., a fungus of dangerous properties. Only a little is produced in our country, and it is avoided by animals. It is said to have a deleterious effect on those who eat it.

In reply to the objection that many of the plants noticed are nothing but weeds, the Professor makes the following interesting remarks:

Of the Useless Plants.

A large number of the plants which are considered useless, because they have yet no known application, are particularly described in this Report. They occupy space; they aid in covering the earth with vegetable life. They are, indeed, weeds, and often considered as mere nuisances. What is the advantage derived from them? What object is designed by them? Can any one be in truth, useless? Certainly not, is the reply to the last question. The others may receive the following answers:

1. The vegetable kingdom is the great means of purifying the atmosphere, so that it may sustain the animal kingdom. Respiration of animals and various operations in nature, produce such a change as tends to make the atmosphere unfit for its great office. It

oxygen has become combined with carbon, or the essence of charcoal, and cannot be separated by the lungs so as to support life. This separation is effected by vegetables. They take up the carbon and restore the oxygen to the atmosphere. They do this as they grow in the air, and also as they grow in and under water. Provision is made for the absorption of carbonic acid by water, and thus food is supplied to plants, and life to animals. This is one of the most beautiful provisions in the economy of Divine Providence. It has sometimes been doubted whether vegetables were able completely to accomplish the object. None have maintained, however, that they did not operate largely and chiefly to this end. Even the general opinion seems to be strongly in favor of their perfectly effecting this purpose. To accomplish this object, vegetables must be spread widely over the earth. It might not be sufficient to depend upon the results of cultivation. Besides, the vegetables must be formed for growth through all the warm season of the year, and in all the variety of soil, situation, climate, condition. Plants that are directly useful would not be more likely to effect this end in all this variety; it is doubtful, indeed, whether the useful plants would be so well adapted to this state of things, as they generally require a more favorable combination of circumstances.

To secure this end, too, it is important that a host of plants should have no natural attractions for animals, that they may grow without molestation, and exert their influence upon the atmosphere without interruption.

This end is secured by the foliage of forests, which is chiefly removed from all access of destructive agencies.

It is a general fact that animals multiply nearly in proportion to the supply of food. If all vegetables were food for animals, the entire action of a great multitude could not be employed, as it now is, in purifying the atmosphere.

In this grand respect, all plants are performing a work of the highest utility. Unseen and silent, they renovate the very pabulum of life.

2. Another end of the vegetable kingdom is food for the animal. All animal life is ultimately supported from the vegetable world. But animal life abounds; tens of thousands of smaller animals, and especially of the insect tribe, must be dependent, as well as the larger animals and man, upon vegetables. By their foliage and seeds, the plants now considered as useless by many, may give far more support in the article of food, than is commonly imagined. We know that many small birds derive much food from seeds, as also a host of insects; and yet we may be in relative ignorance on this subject. Even the animals of the seas must have no inconsiderable dependence upon vegetable substances for their support. A great amount of decorated vegetables must be annually poured into the great reservoir by all the rivers.

3. Plants enrich the soil, and fit it for the production of vegetables in greater quantity. This is true of vegetables generally, when they live and die and decay on their place of growth. Cultivation often exhausts land, because no adequate return is made for the vegetable matter removed from the fields. The vegetables, often considered useless, will, by their decay perform another important service, in enriching the earth, and improving the soil. It has long been remarked, that this effect follows, because the atmosphere contains the elements of vegetable matter, and plants derive their support from the air as well as from the earth. Experiment has proved that a plant will grow and flourish without any food except that obtained from water and the atmosphere. The reason for giving up exhausted fields to the growth of any vegetables for a few years, is philosophical and conclusive. Without the great fact of vegetables enriching the earth, the reason could not exist.

4. Many important properties and applications of these plants may yet be discovered and made, so that they may be seen to be more directly useful. Great discoveries have been made in this respect within the last fifty years. It cannot be doubted that the progress of discovery is only just commenced. The beautiful colors for painting, called *lakes*, are many of them obtained from vegetables and many more may yet be procured. Combinations too of vegetable matter may develop important powers. Without this, indeed, important uses have already been seen.

5. The beauty and variety of vegetable life are in them a great and useful end. In this way are displayed the wisdom, power, and contrivance of the Creator, the illimitable means at his control, the effecting of the same ends by objects so diverse; the adaptation of means to ends; the constant supervision of his

agency; the countless variety amidst surprising uniformity.

These are reasons amply adequate to produce an interest in respect to all parts of vegetables. The purification of the atmosphere alone, and preserving it in the due proportion of oxygen in a state to support life, invests the world of vegetables with new attractions.

On the Importance of Systematic Cultivation

"Hate not laborious work, nor the husbandry which thy Master Hith has created."—BIBLE.

Agriculture is the oldest art of which we have an account. It was the occupation chosen by God for the first man, Adam. By it, nations and communities are kept together. It is the bond of union that unites all society. It is an art more conducive to health, and more strictly united with religious and moral virtue than any other. It is important, that it should be well understood. It requires laborious work, and constant application. Inquiries in the principles of agriculture are like the key of knowledge, that will open unto us an extensive field for inquiry. Intelligent and patient observation will disclose vast riches for the mind to delight in, and no vast resources for physical happiness. As nothing comes by chance, as there is a cause, a law for everything that occurs in the universe, the inquiring cultivator of the soil may trace those laws, and ascertain correctly the theory of nature in the production and re-production of plants; and when he prosecutes the interesting inquiry, he will obtain the most profitable results for his labor, both mentally and in the increased product of his lands. He will be a *scientific or natural farmer*.

Why not? Let every man understand thorough the fundamental principles of his own business. With a fund of knowledge may agriculturalists acquire.

Many farmers are contented to abandon their practice to their own taste and prejudices, without attempting to make serious investigation into the science or principle of their business, or of trying experiments, that they may be led to adopt improved modes of practice. Such farmers, though they may succeed in obtaining a living by their labor, will never advance in knowledge or wealth, or experience the true happiness, dignity and independence, which the calling, under intelligent and systematic direction, so well calculated to produce.

Practice, to be beneficial to the land, and profitable to the cultivator, must be in accordance with natural laws; and so far as any success attend the labors of the most ignorant and careless, it is only because these laws have been partially observed. It is not enough that a man was born and bred a farmer, to enable him to secure the most desirable results, for, may be, that his breeding has not been of the best order, or, that he has been brought up on a good farm and his mode of culture produce him better crop keep his land in better tillth, and yield him more profit than his neighbor receives, yet the experienced others will be highly useful, for the field of enquiry large; the knowledge obtained from good books, being the record of scientific and systematic experiment conducted by farmers, as good, not to say better than himself, will be found highly serviceable to him.

When a man of superior genius applies himself to the arts, experience shows us that he does it with greater ability, force of mind, industry, taste, and with more inventions, new discoveries, and various experiments; whereas a common man confines himself severely within the common road, and to his ancient custom. Nothing opens his eyes, nothing raises him above his old habits, and after many years of patient labor, he still continues the same, without making any progress in the profession he follows.

One reason of the small produce of farms, and the small return to the industrious farmer, is, that agriculture is not generally regarded as an art, that requires *rules, reflection and study*. It has too long been regarded as a mere manual occupation. A man is called a farmer, and is thought to have performed his part, when all that he does is to plough, plant an harvest, without regard to rules or system. It is strange, indeed, that farmers, who, above all others ought to understand the theory of soils, and the production of plants, and to observe the phenomenon of nature in these particulars, as a means not only of adding to their knowledge, but to their ease and profit should neglect them most.

Experience is above all precepts, and makes even the faults we have committed conduce to our advantage, for from doing wrong, we often learn to reform. The experience, then, of the thousands of intelligent minds, who have elucidated and brought out truths

n subjects directly and indirectly bearing upon agriculture, is to be regarded.

In continuation of this subject, we shall endeavor to point out a good method to pursue, to enable us to adopt a natural system of cultivation. We must lay our foundation well, commence with primary principles, and the results must be successful.

The Working-Man's Home Pleasures.

"I crown thee king of intimate delights,
Fireside enjoyments, home-born happiness,
And all the comforts that the lowly roof
Of undisturb'd retirement and the hours
Of long uninterrupted evening know."
Cowper.

Cowper.

The family relation implies community of interest; as there is a common stock, so there are common sorrows and common joys. Put a dozen of people together in a house, and let each lead the life of a hermit: this would be no family, even though they might be blood relations. There is more of domestic life even in the stowage of a packet-ship, where like seeks like, and little congenial groups are formed before the voyage is over. The true glory of home is in the middle region of civilization: it is absent alike from the highest and the lowest. What can be more cheerless than the sullen selfishness of the Indian wigwag; where the relentless savage wraps himself up in indolent dignity, while the squaw and children are spurned, as unworthy of a look—unless it be the elegant and fashionable household of the prince or noble, where each is independent of the other, and has his separate equipage and peculiar friends. Compare with his the cottage of the poor laborer, who returns at twilight to be welcomed by every human being, and every domestic animal; who tells over, or hears, all the occurrences of the day, and who feels that there is no interest which he does not share with every one round him.

There is more value than all believe, in the simple maxim, *let family enjoyments be common to all*. If here are few who deny this, there are still fewer who act upon it in its full extent. Something of it, as I have said, there must be, to make a family at all. We occupy the same house, sit around the same fire, and eat at the same table. It would seem churlish, and almost inhuman, to do otherwise. But I am for carrying the matter much farther, and for knitting more closely together those who cluster around the same hearth; believing that every influence is evil which severs father from child, and brother from brother. The morsel that is eaten alone becomes sooner or later a bitter morsel.

Members of the same household should feel that they are dependent on one another, and should be as ready to ask, as ready to give, assistance. Each should rise in the morning with the impression, that no duty of the day is more urgent than to make every individual happy, with whom he is brought into contact. And this contact should be sought not shunned. It is a bad sign, when members of the same household are shy of one another. I do not, of course, allude here to those horrid instances of unnatural, brutal temper, where persons of the same blood, daily gathered around the same board, refuse to speak to one another; malice and envy must rankle deeply where this can be the case. I refer to a more common fault, which sometimes exists where there is a degree of real affection, but where the members of a family have separate pursuits and separate pleasures. The hasty morning meal is swallowed with little intercourse. When it is done, each hurries to his or her peculiar line of employment. The mother is busy in the kitchen, the father in the shop, the sons go their several ways. This might do well enough, if it were confined to business, but it becomes the habit of the hours of leisure. The father has his evenings abroad: the sons are seldom within doors till a late hour, and too often, she who most needs the cheering influences of the family circle, the mother, is left to patch or darn by a dim candle, with the cradle moving at her feet, during those hours in which her daughters are laughing or singing among their young company. All this is highly undesirable. The evenings of the industrious family may be, and ought to be, delightful seasons of joint satisfactions. If we must have evening parties of friends, let there be a proper mingling of sexes and ages. The presence of the old may to a degree moderate the mirth of the young, but in the same proportion the aged will be enlivened. This parceling and assorting society, like labelled packages in a shop, is becoming too common and in my judgment injurious. The young folks must be all together; and the children must be all together; and if matters go on thus, we may live to see parties of greybeards and parties of sucklings. Not

wherever it is possible, let the family chain be kept bright and whole. In the houses of the industrious, it is surely broken often enough by separation at work during the day.

Instead of thus living apart, which engenders selfishness and moroseness, I love to see the members of families flowing together, like congenial drops. There are some houses in which no one makes a confidant of another: if one would learn the secret of his brother, he must go abroad for it. This is unnatural, and wholly evil; incompatible with the frankness of simple love. Show me the father often walking with his sons, and these sons often with one another, not in business merely, but in sports; and I shall think I see a virtuous and happy household.

There is one particular in which the principle I have laid down may have a very important application. I mean the cause of mental improvement. The rule should here be, so far as possible, let the pursuit of knowledge in every family be a joint pursuit. For many reasons this is desirable in every house, but it is almost indispensable in the house of the working-man. It wakes up the spirit of improvement; it saves time and expense, and it gives tenfold zest to the refreshments of leisure. To take one of the simplest instances, I would, in two words, say to every working-man, *Read aloud*. If the book is borrowed, this is often the only way in which every one can get his share. If the family is very busy—and the female members of all industrious families are as much so in the evening as in the day—the reading of one will be as good as the reading of all, and while one reads, a dozen may knit or sew. There are many persons who enjoy much more and retain much better what is read to them than what they read themselves; to the reader himself, there is a great difference in favor of reading aloud, as it regards the impression on his own mind. The members of the circle may take turns, and thus each will have a chance of learning, what so few really attain, the art of correct and agreeable reading. Occasion is thus offered for questions, remarks, and general discourse; and it is almost impossible for conversation to flag, where this practice is pursued. With this method, the younger members of a family may be saved in a good degree from the perusal of frivolous and hurtful books; and, if a little forethought be used, a regular course of solid or elegant instruction might thus be constantly going forward, even in the humblest family.

But the moral and social effects of such a practice are not less to be regarded. Evenings thus spent will never be forgotten. Their influence will be daily felt in making every member of the circle more necessary to all the rest. There will be an attractive charm in these little fireside associations which will hold the sons and daughters back from much of the wandering which is common. It will be a cheap, wholesome, safe enjoyment, and it will be all this, *at home*.

The gains of an affectionate family ought to be shared and equalized; the remark is true of all degrees and kinds of learning. Study has a tendency to drive men to solitude, and solitude begets selfishness, whim, and moroseness. There are some households in which only one person is learned; this one, however amiable, has, perhaps, never thought of sharing his acquisitions with a brother or a sister. How seldom do men communicate what they have learned to their female relations; or, as a man once said in my hearing, "Who tells news to his wife?" And yet how easy would it be, by dropping a word here and a word there, for even a philosopher to convey the chief result of his inquiries to those whom he meet at every meal. I have been sometimes surprised to see fathers, who had made great attainments, and who, therefore, knew the value of knowledge, abstaining from all intercourse with their sons, upon the points which were nearest their own hearts. In families where the reverse of this is true, that is, where the pursuits of the house have been a joint business, it is common to see a succession of persons eminent in the same line. Thus, among linguists, the Baytells; among painters the Vernets and the Pellers; among musicians, the Garcias; in literature, the Edgeworths, the Taylors, and the Wirts.

There are some pleasures which, in their very nature, are social; these may be used to give a charm to the working-man's home. This is more true of nothing than music. Harmony implies a concurrence of parts, I have seen families so trained that every individual had his allotted part or instrument. Let the thing, however, be conducted by some rule. Let proper pains be taken with children, while they are yet young, they may all be taught to sing. Where circumstances favor it, instrumental music may be ad-

ded. It is somewhat unfortunate that American women practice almost entirely upon the more expensive instruments; and it is not every man who can or ought to give two hundred and fifty dollars for a piano-forte. In countries where the guitar is a common accompaniment, it is within the reach of the poorest. There may be lovely music, however, without any instrument. The most exquisite music in the world, I mean that of the pop's *Sistine Chapel*, is known to be such. There is great room for selection, however, both as to music and words. It is the height of folly to buy every new thing which comes from the music-sellers. So far as words are concerned, a full half of what they publish is nonsense, or worse; and I have blushed to see a young lady turning over what she very properly called her "loose music." These persons, therefore, deserve our thanks who from time to time are publishing in a cheap form such secular music as is proper for families. I here refer chiefly to such works as Kingsley's *Social Chor*, Mason's *Odion*, and the *Boston Glee Book*.

But, after all, and without any reference to religion, the best music is sacred music. It is on this that the greatest masters have laid out their strength; it is this which most suits the chorus of many voices. Secular pieces, as commonly published, are intended to be sung by few, or by a single voice; but sacred compositions admit of the strength of a whole company. And it is truly delightful to drop into one of those families where the evenings are sometimes spent in this way. There is the eldest daughter at the piano-forte, accompanied by the eldest son upon the violin. Another son and two daughters lead off vocally, with the principal melody, while a neighboring youth plays the tenor, and sings the same part. The old gentleman in spectacles labors at his violoncello, and two or three thus come in modestly to complete the orchestra; while nieces, nephews, cousins, friends, and, perhaps, suitors, fill up the sounding chorus with right good will. This is, indeed, something more than a mere family meeting, but it is what grows out of it; and when the evening ends, and some little refreshments have gone around, the transition is not abrupt from this to the social worship, when all voices join once more in a happy evening hymn.—*The Workingman*.

For the New-Genesee Farmer.

MOB.

BY D. W. C. ROBERTS.

Whistling far through ether, springs
The early ark on soaring wings;
The sombre mists of midnight flee
With the dew of grass and tree;
As Morn, all decked, and smiling led,
Peers o'er the mountain's distant head.
Lo! her chariot's joyous train
Sweeps the heavens' cerulean plain!
Flowers, gemmed with diamond dew,
All the crystal pavements strew;
Airs of richest fragrance blow
Floods of rarest music low;
The merry song of chanticleer,
And loo of kine, fill on the ear;
The milkmaid, singing, seeks her cow;
The Farmer listens to the plough,
'Tis his life and joy, on every hand,
Prevail when Morn comes o'er the land!

Black-thorn Hedge.

Many gentlemen wish to see a beautiful black-thorn hedge, they are gratified by stopping at the residence of the editor, in Cambridge. We are satisfied, from our own experience, that farmers might adopt this mode of fencing enclosures with success. It would be a perfect protection against all animals that usually trespass on their grounds. The plant is not only useful for this purpose, but is highly ornamental. No worm or beetle attacks the root of the stem; no insect preys upon the foliage. It is also of rapid growth; and in six years it may be raised from the seed to a state of maturity sufficient to afford the protection required. And the best recommendation of all is, perhaps, that it will live as long as its owner or his heirs may need it. Our plants were procured six years ago, from Mr. Derby, of Salem, who it is well known, has a specimen of the hedge which surpasses any thing of the kind in Massachusetts.—*Boston Courier*.

ROCHESTER, SEPTEMBER, 1841.

Grand Agricultural Fair at Syracuse, ON THE 29TH AND 30TH OF SEPTEMBER.

The arrangements and regulations for the N. Y. State Fair will be found on page 132 of this paper. (The list of premiums was published in our July number.) Judging from the preparations which are making, and the general interest which is manifested in this respect, we are confident that this exhibition will be a grand affair—worthy of the farmers of the Empire State. We will not merit the good name of our readers by flinging any arguments to convince them that they will derive both benefit and pleasure from attending this Fair, for we believe every intelligent farmer is aware of it; and we trust every such one who can, will be there. Those who cannot or will not go are more to be pitied than blamed; for their's will be the loss. But we wish to remind our readers that if they intend to go, and expect to be benefited thereby, it is their duty, to contribute something to the common stock. They ought to join the Society, and pay at least their dollar, and if possible carry something for exhibition. The Executive Committee have placed much reliance on the farmers of the Western Counties for aid in getting up this Fair, and if they are disappointed the reputation of Western New York will suffer. Those who live near the line of the canal can easily transport animals to Syracuse from almost any distance; and those who cannot send animals should send something else, so as to help to give interest and variety to the show.

Two Packet Boats and two trains of Rail Road cars leave Rochester daily for Syracuse—both pleasant, cheap, and expeditious modes of travelling. Quite a number of farmers in this county have already expressed their determination to attend—we expect to see at least a cart load from Monroe.

Mr. B. Barnum, of the Rochester Seed Store, it will be seen is appointed one of the Committee of Arrangements. He will be happy to receive the names of members for the Society, and those in this region who intend to exhibit animals or implements, are requested to notify him thereof, previous to the 24th inst.

Devastative Hail Storm.

A most destructive storm of hail occurred in this vicinity Sunday afternoon, Aug. 29th. It commenced at three miles south of the city, and passed off in a North-Easterly direction, over a space about seven miles in length and one in breadth. The hail stones were very large; many of them measuring from 1 to five inches in circumference; and being accompanied with a gale of wind their force was very destructive to windows, orchards, and crops.

The first point where it commenced near the County Poor House, in which building it destroyed 250 lights of glass. The fine new green house of Edwinger & Barry, near Mt. Hope, had almost every light of glass broken, amounting to nearly 2,000 feet of lead, which great damage was done to their choice stock of plants, and young fruit trees. Their building was partly destroyed by fire the following day! The loss sustained by these enterprises may only be very severely, and much to be regretted. Passing over the eastern part of the city, the hail broke the windows of numerous dwellings, including the Seward Seminary, Alexander's Tavern &c., and greatly injured the fine garden and orchards which abound in that vicinity. Several market Gardeners have lost nearly all their crops—the produce of a whole season's labor. Mr. Skeneel of Bingham, had about \$1,000 worth of peaches and apples destroyed. Messrs. Pitkin,

Woodman, Hayward, Colver, Lockwood and others, have also suffered great loss of choice fruit. Mr. C. Crozman has lost a large portion of his crop of garden seeds &c. It is said that birds, and even some were killed by the hail; and some cattle in an open field, which were slaughtered in the evening, were covered with the marks of bruises, when their sides were taken off. Watermelons were brought in

to town the day following, some cut entirely open with the hail, and others with holes in them, showing where the stones had entered. The crops of corn and potatoes were mostly too far advanced to be destroyed, although late pieces are much injured—the leaves being literally cut into shreds. Such a storm was never known before in this region, and we hope may never be again.

STUMP PULLING MACHINE.

Having been repeatedly requested to publish a description of a Machine for extracting Stumps from land, we have, at considerable expense obtained a description and engraving of the most efficient one for the purpose within our knowledge. The above representation, admirably drawn and engraved by two young artists of this city, will convey so accurate an idea of the machine that but little explanation is necessary.

A, the sills on which the frame work is erected; the side ones 7½, and the cross ones 4 feet long, made of 5 inch square timber. Under these sills are three more cross sills under which planks are fixed with the front end turned up like the front of a sled or stone boat, to facilitate the removal of the machine by dragging over the ground. *BBB*, the upright posts, three on each side 4 feet high, 3 by 4 inch stuff, the middle one standing 2 feet from the front and 4 feet from the rear of the machine. *C*, girths 12 inches wide, 2½ thick, framed into the posts. Several short girths of this description are framed across the machine and contain iron boxes for the shafts to turn in. *D*, the roof or cover, with 1 foot slope to protect the machine from wet. *E*, a large cast iron shaft 4 feet long, 5½ inches in diameter at the ends and swelled to 6½ in the middle, on one end of which is a strong cast iron spur wheel (*F*) 3½ feet in diameter, with 51 cogs. *G*, a pinion wheel 7½ inches in diameter, with 9 cogs to mesh into the spur wheel, and placed on a wrought iron shaft (*H*) passing through the whole length of the machine, 2½ inches square near the pinion wheel, but tapering towards each end. *I*, the crank, outside, in front of the machine, on the end of the wrought iron shaft, by which to wind up the slack of the rope, and at the same time around the drum. *K*, a wooden drum, 3½ feet in diameter, and 1½ wide, attached to the shaft by iron arms, around which winds a strong rope 1½ inch in diam-

eter, 150 feet long, to the end of which the power is applied. *LL*, two rollers to prevent the friction of the rope against the sides of the machine.

The chain, *M*, is attached to each end of the iron shaft, by a strong belt and screw, and extends about 4 feet double, where it converges together and is united by a triangular link and then extends single 4 feet further and terminates with a hook and swivel as shown in the engraving. The chain must be very strong, made of the best of iron, the single part of 1½ and the double 1½ inch wire, the links small end short like ship cable. Another strong chain 10 or 12 feet long, with a hook one end and a ring the other, is placed around the top of the stump intended to be extracted, and this is connected with the chain attached to the machine by a number of connecting rods (*N*) made of 1½ inch iron, 10 feet long, with a strong hook one end and an eye the other, as represented above. There should be a sufficient number of these rods to extend 100 feet or more. These rods cost less, and are much easier handled than heavy chains.

Now go on the other side of the machine, and on the upright posts, level with the large shaft you see two strong rings attached to heavy plates of iron reaching to and forming boxes around the ends of the shaft. To these rings two strong chains are attached by which the machine is anchored to a stump or some other immovable object. It will readily be seen that the power acts as much on one side of the machine as

the other, and consequently it must be firmly secured to prevent its being displaced or turned over. By placing the chain around the top of the stump to be extracted, and anchoring the machine to the bottom of the one on the other side, the former will give way first although it may be larger than the latter. The usual plan is, to commence operating near the outside of the lot, and after fastening the machine to a firm stump, extract all within reach of the chains, leaving only one good one within reach to which it may next be fastened in order to extract the former one. If it be desired to extract a stump where there is no other one to which to fasten the machine, a hole must be dug in the ground and a strong post set in it, well braced to the top on the side towards the machine; place the chain around it close to the ground, and if the stump is not very strongly rooted it will come out without much trouble.

The manner in which the machine operates must now appear obvious to all. A yoke of oxen draw on the rope; this turns the drum and the small wheel, and that turns the large wheel and shafts so as to wind up the chain very slowly but with immense power. A single yoke of oxen drawing on the rope gives a power equal to thirty-five or forty yoke on the chain; so that something must inevitably give way. It will readily be seen that the machine must be well made, and the chain very strong, especially if large and firmly rooted stumps are to be pulled.

This machine was a good deal used in this State 10 or 12 years ago, but we have not seen or heard much of it of late. It was called "Pratt's Patent Stump Extractor." A Mr. Drake, we believe, was proprietor of the right in this State; but whether the patent or the patentee, is alive now, we have not been able to ascertain. We will endeavor to give information on this point next month. One of the machines can be seen on the farm of Mr. Whitney near this city, from which the above drawing was taken. If any person within a few miles of this place desires to see it, it can doubtless be hired on reasonable terms.

It weighs about 1500 pounds and is hung on wagon wheels so as to be conveniently transported.

In an old paper handed us by Mr. Whitney, an engineer on the Chemung Canal certifies that one of these machines extracted 65 stumps between 2 o'clock and sundown, and on another section 230 were extracted in one day. Another certificate, signed by eight persons, states that they saw this machine with a yoke of oxen, extract 17 white pine stumps of no size in 52 minutes, without any of the roots being previously cut; and remove a barn 22 feet square containing about 2 tons of hay and grain, with only the power of five men applied to the rope. Another certificate that a large green pine tree, measuring 12 feet circumference and 150 feet in height was drawn down by this machine, the chain being applied 22 feet on the ground. The depth of soil broken up by the machine was between five and six feet, and the width 22 by 25 feet.

Autumnal Planting.

A friend has requested us to caution our readers against planting out trees in the fall of the year in some clays. When the hole is dug, it holds water like a tub—the tree is put in and there amongst loose stuff it has to soak till spring. Hardly indeed, must be the one that can bear it. In our last volume, page 8, we mentioned a remarkable case of this kind, with the complete success that followed under the same; and we can now state another. Last fall, the present Corresponding Secretary of the Cayuga County Agricultural Society planted sandal trees in front of his new mansion in Auburn, part in a sandy loam and part in a heavy clay. All the latter died, and all the former lived.

A trench sufficiently deep may be made with the plough, by turning out the earth from the same line several times in succession. When the bottom of the furrow is made smooth, straw, corn stalks, potato tops, chips, brush or old rails, may be laid in, the

trees planted, and the earth returned to its place. With a proper descent, all the soakings of the ground will pass off, and the trees will be fully established in the soil before those substances decay; but even then, there will be a seam through which the water can percolate.

THE SUBTENDED BEE-HIVE.

We some time since acknowledged the receipt of a little work entitled, "Bee Breeding in the West," by Thomas Adcock, Editor of the Western Farmer & Gardener; and having given it a careful examination we find it so interesting and instructive that we make some extracts from it. The main points at which the author aims, are, 1st, Preventing the depredations of the moth or worm, and, 2d, Obtaining the surplus honey without destroying the bees. These advantages he contends can best be secured by the use of the *Subtended Bee-Hive*; and his arguments are the more convincing from the circumstance that his object is not to favor any patent right, or maker of bee-hives; for the invention he describes is not patented, and he gives directions by which any common joiner can construct the hives. He points out several objections to the different "improved hives" now in use; the principal one of which is, that they compel the bees to work upwards, while their natural habits always lead them to work downwards. This point he requires should be kept constantly in mind, and contends that no apiculturist can long prove successful who practically disregards it; as by repeatedly robbing the bees of the new comb and compelling them to breed successive swarms in the old, the progeny will inevitably deteriorate in size. We should like to hear the opinions of those who have long used the Vermont and similar hives, on this subject. But to the work:—

When the bee is left to itself to seek a home in the woods, it seeks for a hollow tree or a crevice in the cliffs, and commences at the extreme top, there forming its first comb. As the cells are formed, the Queen Mother deposits her eggs in them, regularly using the new ones for this purpose, and that only once; she rarely places an egg in the same cell a second time, so long as there is space for the formation of new ones. So soon as the young bee leaves the cell, the workers clean it out, removing everything but the nymphal robe, or white covering within which the larva underwent its transformation, which is pressed down to the bottom and covered over with a thin coat of wax. Thus, of course, it diminishes the size of the cell, which is then used for the reception of honey; while the succession of eggs, as before remarked, the Queen's instinct teaches her to deposit in the newly formed, full sized cells. So long as their supply of food is abundant, and sufficient space is allowed them below, they go on increasing; but to what extent has not yet been determined. It seems probable that there must be a limit to the procreative powers of the Queen; and as no two queens can exist in a state of freedom, in the same hive, all plans which are intended to prevent their following their natural mode of increase—by swarming—must end in failure.

engaged in the lower part of the hollow or crevice, and do not even perceive the theft; nor do they suffer by being deprived of these upper combs, which have become superfluous, by the new sack of provisions, which they go on, inactively accumulating, in their uninterrupted descending operations. Here the whole secret of nature is laid open—how to rob them without doing them the least injury!"

They thus go on, as is their habit both in a wild and domesticated state, working always downward, leaving their winter's store of honey at the top of the hive, and congregating with their Queen, round those cells which contain their eggs and larvae.

Those who have adopted the plan of adding an empty box on the top of the permanent hive, think they have made the same discovery, and that they are acting up to it. But they overlook, in their method several most important facts—that it compels the bees to breed, year after year, in the same box; and of course they must use the same cells for the repeated broodings, which thus become continually diminished in size, by the addition of two or three nymphal robes in a season; until the difference between the bees from such a hive and from a thriving young one, is apparent to the most careless observer. Then, when so managed, they breed but little; the swarms occasionally thrown out are weak and inefficient, and rarely exist through the first winter unmolested.

It was his observation of this fact, that such was their invariable practice, that led the French writer, to whom I am indebted for the first idea of the subtended hive, and who originated the two-storied hive, to adopt the plan of adding his boxes below, and allowing the bees to follow their natural course. In his treatise he remarks, that "it is evident, if we intend to rob bees, thus lodged in a hollow tree or cleft of a rock, without injuring them, we must attack the store at the top. There the combs are easily removed, because the bees have left them, and are busily

By a careful comparison of the young bees from an old hive, the cells in which have become much diminished in size, with those from fresh hives, the difference in their size and thrifty appearance will be at once perceived. New honey, or that which has been made the same season, though both winter and later to the eye, is neither so fine flavored nor so wholesome as that which has undergone, as it were, a fermentation in the hive. In a good, thrifty hive, there is just that degree of heat kept up, that is necessary to prevent the honey becoming candied in the cells—if once allowed to get into that state, age does not improve nor affect.

If the farmers of the west will think of these things, and bestow a few of the many hints which they may throw away in idleness, on the care of a few stands of bees—acquire a knowledge of their nature and habits, and apply that knowledge judiciously, in their management of them—sowing and putting in each

plants as in clover and white clover, to yield them pasturage—they would improve their condition as men, add greatly to their own wealth, and save annually to the country some millions of dollars that are now lost.

The certain destruction occasioned by the moth, if it effects a lodgement, is the principal and most serious barrier to successful bee-breeding in this region at the present day.

Numerous plans have been published for their prevention, some of which were good—others worthless. The only ones that have been successful, are those that have had for their object the entire exclusion of the moth; and the keeping each hive in a strong, healthy condition, in a box or hive proportioned to their strength, so that they were enabled to defend themselves from all invaders.

In adopting a plan for the keeping and management of bees, several important points must be considered. It must combine simplicity with convenience; and cheapness with durability. It must allow of the inmates proceeding in their own natural way; of the proprietor removing honey when it can be spared, without disturbing or injuring the bees. It must afford them, during winter, a warm and dry habitation; and in summer a cool and airy one. Its entrances must be so arranged, as to allow the bees a free passage, and yet enable them to defend themselves from enemies. It must afford, with a reasonable degree of care, complete protection against the moth; and facilities for putting two or more weak swarms together, where they come off late in the season. And it ought to give the proprietor control over his bees, as perfect as the nature of the insect will admit of.

All this and more can be attained by the use of the

SUBSIDED HIVE.

It is a simple and economical plan; of easy management; and one within the means of any farmer who can handle a saw, a plane and a hammer.

The boxes of which it is composed, are formed of good, well-seasoned pine planks—if possible, free from knots and wind-blakes. It ought to be at least one inch thick. The boxes may be ten, eleven or twelve inches square, in the clear. Let the plank be dressed on each side, and jointed on the edges, so as to fit close, without being tongued and grooved. Before nailing them together at the sides, lay a thin strip of thick white lead paint on the edge to be nailed, which will render it impervious to the ovipositor of the moth. In the top cut two semicircular holes at the front, and two at the back, of one inch and a half in diameter—the straight side being in a line with the back and front of the box, so that the bees may have a straight road in their way from one story to the other. Put the top on without any layer of paint, using eight stout screw nails, that it may be taken off to facilitate the removal of the honey. Give the outside of the box two coats of white lead paint, all except the top; and let it be done so long before it is necessary to use it, as that the smell may be dissipated, as it is very offensive to the bees. Pour a little melted bees-wax, while pretty hot, over the inside of the top, which will enable the bees to attach their comb much more firmly. Let three-quarters of an inch of the thickness of the lower edges of the box in the inside be beveled off, so as to leave but about one-fourth of an inch of surface to rest upon the stand—this will afford less shelter for the eggs of the moth.

We will suppose the boxes thus made, to be a cube of twelve inches inside. In that case, the tunnel stand will be made thus: Take a piece of two inch plank, free from knots and splikes—a carpenter's term *clear stuff*; length 25, and breadth 18 inches. Ten inches from one end, and two from the other and from each side, is marked a square of fifteen inches. From the outside of this square, the board is dressed off, with an even slope, until its thickness at the front edge is reduced to half an inch, and at the other three edges to about an inch. The square is then reduced to twelve inches, in the centre of which is bored an inch square hole. In this hole, the inner square is also gradually sloped to the depth of an inch; thus securing the bees from any possibility of wet lodging about their hive, and affording them free ventilation. There will then be a level, smooth top of one inch in width, surrounding the square of 12 inches, so that to set the box or hive. Two inches from the front edge of the stand, commence cutting a channel two inches in width, and of such a depth as to carry it out, on an even slope, half way between the inner edge of the hive, and the ventilating hole in the centre. Over this, fit a strip of wood as neatly as possible, dressing it down even with the slope of the stand, so as to leave a tunnel two inches

in width by a quarter of an inch in depth. Under the centre hole, and over the outlet of the tunnel, hang small wire grates, the one to prevent the entrance of other insects; and the other to be thrown back to permit a current of air to pass, or rained down to keep them at home in clear, sun-shining days in winter. For fast to the stand, use four or five inch screws, screwed in, from below, far enough to be firm. The lower side ought also to be planed smooth; and the whole should have two coats of white paint some time before it is wanted.

Rotation of Crops.

This is a subject of great interest to the Farmer: And yet few points in Agriculture are less understood. The importance of the systematic rotation in crops is nowhere set forth in briefer or clearer terms, than in one of the Agricultural lectures of Dr. Daubeny, Professor of Rural Economy in the University of Oxford. (By the bye, why are our American Colleges so destitute of instruction in that branch of knowledge?) Annexed is an extract from that discourse; an extract which, if properly appreciated by our farming readers, will alone be worth more than the cost of the New Genessee Farmer for an ordinary lifetime.—Read it, my friend—reflect on it—and guide your operations by the important principles which it develops:

"Those plants ought to succeed each other which contain different chemical ingredients," says the intelligent Professor, "so that the quantities of each which the soil at any given time contains may be absorbed in an equal ratio. Thus a productive crop of corn could not be obtained without the phosphates of lime and magnesia, which are present in the grain, nor without the silicate of potash, which gives stability to the stalks. It would be injudicious therefore, to sow any plant that required much of any of the above ingredients, immediately after having diminished the amount of them present in the soil by a crop of wheat or of any other kind of corn. But on the other hand, leguminous plants, such as beans, are well calculated to succeed to crops of corn, because they contain no free alkalis, and less than one per cent. of the phosphates. They thrive, therefore, even where these ingredients have been withdrawn, and during their growth afford time for the ground to obtain a fresh supply of them by a further disintegration of the subjacent rock. For the same reason, wheat and tobacco may sometimes be reared in succession in a soil rich in potash, because the latter plant requires none of these phosphoric salts which are present in wheat. In order, however, to proceed upon certain data, it would be requisite that an analysis of the plants most useful to man should be accomplished at the different stages of their growth, a labor which has hitherto been only partially undertaken. It is a curious fact that the same plant differs in constitution when grown in different climates. Thus, in the beet root, nitre takes the place of sugar when this plant is cultivated in the warmer parts of France.—The explanation of this difference is probably as follows: Beet root contains, as an essential ingredient, not only saccharine matter but also nitrogen; and it is probable that the two are mutually so connected together in the vegetable tissue that the one cannot exist without the other. The nitrogen being derived from the decomposition of ammonia, must be effected by any cause which diminishes the supply of the latter; and in proportion as this ingredient is wanting, the secretion of sugar will likewise fail off. Now it has been shown by Liebig that the formation of nitric acid is owing to the decomposition of ammonia; and it is concluded by him that the last products of the decomposition of animal bodies present themselves in the form of ammonia in cold climates, and in that of nitric acid in warm ones. Hence in proportion to the amount of nitric acid formed, and of nitre absorbed by the plant, that of the nitrogen, and consequently that of the saccharine matter present in it may be diminished.

By order of Government, the roads in Prussia are lined on each side with fruit trees. Noting that some of them had a wisp of straw attached to them, I enquired of the coachman what it meant. He replied that the straw was intended as a notice to the public not to take fruit from these trees without special permission. "I fear," said I, "that such a notice in any country, would but be an invitation to attack them."

"*Habens sic hinc erholen.*" (Have you no schools? was his significant rejoinder.—Prof. Stoeck.

From the New England Farmer.

Early Suppers.

By late suppers I do not mean a fourth meal, such as is often taken in fashionable life, for I have seldom known our plain agricultural families addicted to this practice. They leave it chiefly to the inhabitants of large towns and cities, to go to the closet at 9 or 10 o'clock in the evening, when they ought to go to bed and take a meal of cold ham or tongue, and bread and butter, or something else quite as difficult of digestion.

But by late suppers among our farmers, I mean the usual third meal, deferred to an unreasonable hour—to 7 or 8 o'clock, or even later. I have known many a farmer who made it his constant practice at all seasons, to work as long as he could see, and not to take supper till his work was finished; consequently his hour of supper, during a part of the season, would be from 8 to 9 o'clock—never earlier than 8, and often when the fields were but a little distance from the house, as late as nine.

The best and most thriving farmers I have ever known, however, take supper at precisely 6 o'clock, even in haying and harvesting. I know that a thousand objections may be brought to each early hour, especially in the month of June, July and August; but I know too, they can be met.

Some years since, having finished our haying, (I resided then in New Coventry, Conn.) I took my scythe and went into the employ, for a short time, of David H. Warner, in Litchfield county, whose grass was rather later than ours, and consequently was not yet all cut. At that time I had not known of any other way than to work till dark and eat supper when we could.

But Mr. Warner had supper uniformly, at six o'clock. Whatever the weather might be, and however pressing the work might seem to be, he required us all, at six, to suspend work and "come to tea," as it was called. This consisted of a light repast; wholesome and perhaps rather too solid, or I might say heavy, but not luxurious. When this meal was finished, which occupied, including a little conversation, about half an hour, we were permitted to go to work again if we choose. In general, however, all we did was to grind our scythes and get ready for the next day.

I do not say that when, by some unforeseen occurrence—an accident or a shower—a very pressing necessity seemed to exist of deferring supper half an hour to get in a load of hay or oats, it was never done; for I believe it was so; though I saw nothing of the kind while I was there. It takes no longer to grind scythes at evening than it does in the morning; and Mr. W.'s workmen were ready to go to mowing in the morning, in the cool of the day, and while the grass cuts easily, instead of being compelled to spend a part of the best of the morning in making preparations which ought to have been made the night before. And having begun betimes and got ahead of their day's work, they were not obliged to mow so late in the forenoon in the great heat. As soon as the ground and swath were dry enough to spread, their mowing was finished for the day, and they were ready to attend to it. And thus by being an hour or two earlier in the morning, and by keeping *before* their work, they found it as easy to get through at six, as others at eight.

But there are other and numerous advantages which are enjoyed by those who take supper at six.

1. They are not quite so apt as others are to over-eat. Our farmers—especially those who do not take any luncheon in the afternoon—and there are some who do not—and who do not get ready to sit down to supper till 8 or 9 o'clock, are very apt to eat too much. Some, it is true, lose their appetite, instead of having it increased, but these cases are not very numerous, and are diminished somewhat by the custom of taking something to give an appetite. My old friend, Levi Atkins, used to defend the practice of taking a little spirit before supper, to give an appetite—but *this is a before the temperance reform commenced.*

2. They do not so often go to bed with a load on their stomachs. He who eats at six, has not eaten less in quantity, is not so apt to go to bed till nine, by which hour the digestion is partly through. Whereas he who takes his supper at eight or nine, and goes immediately to bed, is apt to have a mass of food in his stomach either undigested or but half digested, for a considerable time; and is apt to toss in bed and dream a good deal, or else sleep *too soundly.*

3. And what is a natural consequence of this over-loading the stomach, he who *supers* late, gets up with a

bad taste in the mouth, bad feelings in the head and stomach, if not with diseased eyes; out of which feelings, or rather upon them, comes in no small degree the habit of taking a morning dram. How much clearer the head is, and how much better the feelings are, generally, after taking an early, light supper at six o'clock, they best know who have tried it.

3. There is one more advantage which I must not pass over, which is worthy of consideration, and which is highly in favor of early suppers. It is, that by taking our repast at six o'clock, we may have the society of the female portion of the family. They will not wait for their supper till eight or nine o'clock, or at least many will not, and none of them ought. But they will wait till six. Need I say that such a custom would be as favorable to good manners as it would be to true enjoyment? Besides, we are apt to reproach them now-a-days, with retaining their tea, to excite their nerves—while they demand of us to surrender our cider; but how do we know that they would not, for the sake of our society at six, dispense with the tea? Is not the experiment worth trying?

I have not exhausted the subject, Mr. Editor, but my sheet is full, and I may have exhausted the patience of your readers. Yours, &c.

Dedham, July 12, 1841. W. A. ALCOTT.

For the New Genesee Farmer.

Corn Laws.

I am a plain man, and have controversy,—but one or two things of "S. W." I think I ought to object to, as I cannot, being a reader of the Farmer, silently admit them. I was indeed greatly surprised to find a citizen of Western New York, the advocate of a hereditary aristocracy; and attributing the payment of the great bulk of the English taxes, and even the support of "THE PEOPLE" to them. The "landed interest" be it remembered, is nothing else than the interest of a number of petty monarchs, whose ancestors obtained their possessions by conquest or force, and from whom they have descended to the present occupants. They "pay the taxes?" We might as well say the British Government itself pays the taxes which it exacts from the people. They "feed the people?" No! the people, by whose toil and sweat those domains are rendered productive, support the aristocracy; and without the labor of the people, they would starve in the midst of their own plantations.

It is a narrow policy, which must fall away before the light of civilization and Christianity, for notions to exclude one another's products from their people, because they can be furnished cheaper from other sources. Let the immense wheat country of the northwest throw its supplies into England, and she in return pour her manufactured articles through our country; who would be the worse off among the whole, because the necessaries of life were cheaper there, and the comforts cheaper here? But I must not enlarge, but respectfully beg S. W. to read *through and attentively* Leavitt's wheat memorial, published in the Farmer two or three months ago; only observing in conclusion, that his objection to the repeal of the British corn laws, on the ground of the little foreign wheat ever carried there is very much such a one as this:—"Why make a canal across the Isthmus of Darien? No ship has ever, since the beginning of the world, been across there—why then make a canal where there never will be any navigation?"

A READER.

A Public Benefactor.

Among the enlightened friends of Agricultural Improvement, the name of COLMAN of Massachusetts is emblazoned with the living lustre of a Public Benefactor. His services to Massachusetts—a State which honored herself by making him her Agricultural Commissioner—are invaluable; not merely for promoting agriculture, but for rendering farmers contented with, and proud of, their employment. If he could be spared from Massachusetts, we doubt not that thousands would rejoice to see him appointed a Commissioner for making an agricultural survey of the State of New York—a enterprise which should

follow the Geological Survey that has proved so advantageous to the interests and credit of the state.

The Product of Labor the only Real Wealth.

Agriculture is the foundation of wealth. The sea renders her tribute; but the earth presents to skill and industry richer and infinitely varied contributions. Money is not wealth. It is only the representative of wealth. Money is coveted because it can command labor; but of what use would it be, if labor would not be commanded. What would it avail to possess all the riches of Potosi, if thereby we could not acquire the products of agriculture? What are manufacturers concerned in but these products? What freights do the banks of commerce in their liquid flight, threading every channel and whitening every post, but the products of agriculture? Whence does the government derive its revenues but from the fruits of agriculture? What constitutes the wealth of the country but her cotton, hemp, sugar, rice, tobacco, wool, wheat, beef and pork? Agriculture only can be considered as the creator of wealth. The merchant, the manufacturer, the sailor, the various artisans and tradesmen perform their part in making the products of agriculture more valuable; in transporting them so that the advantages of climate are equalized, and in putting them in a condition for use; but agriculture alone produces. Like the leader of Israel, she strikes the rock, the waters flow, and a famished people are satisfied. She supplies, she feeds, she quickens all. Agriculture is the commanding interest of the country, which with no singular interest of a secular nature combined, can be brought into competition.

HENRY COLMAN.

Michigan.

This noble State, though sadly cursed with wild-cat banking, is steadily improving in her Agricultural character. Readers in various quarters may be interested by the following letter—which embodies many interesting matters respecting the Agricultural wealth of the Peninsula State.

MARSHALL, JULY 8, 1841.

"J. D. BEMIS, ESQ.—"DEAR SIR—I see much in the papers relating to the wheat, and other crops, in Western New York; from all which, there can be no doubt, they have suffered greatly from drought. The wheat, in this region, undoubtedly, was seriously injured, in the early part of the season, from the same cause, and somewhat, also, by the fly; but I am happy to say that timely showers in the early days of June, operated so effectually, that although there will not be a great crop, there will be a fair supply of wheat. The miserable low price of flour, for the two last years, added to the great expense for transportation, had discouraged the farmers from extending their fields, and indeed from sowing all which were broken up; so that the *acres* in cultivation are scarce equal to some former years. Yet, after all deductions are made, there will be a much larger crop than has heretofore been harvested. I have no doubt that Michigan will have from 2,000,000 to 2,500,000 bushels, at least, of surplus for market. With a steady demand, at 75 cents per bushel, the present population would at once furnish 5,000,000 bushels for export, with ease, for it is cultivated with far less labor than in New York.

The other crops about here, without exception, present the most animating and delightful aspect. The Indian corn surpasses any thing I have ever seen, in vigor, richness and luxuriance. But it will all be needed, for the "swinish multitude" has waxed amazingly prolific. There are, I think, over 600,000 of these animals now in the State; and if so, the surplus of pork the coming fall and winter, will come up to near or quite 300,000 barrels.

The people of this State—(although lying under a curse, resulting, in a great measure, from early legislative mismanagement; in unwisely, if not dishonestly, incurring and squandering a \$5,000,000 loan in that breeding a litter of wild cat banks, and then commencing a senseless hostility to all banks)—are enterprising, industrious and economical, in an eminent degree; and with their rigid habits of privation and self-denial, the surplus products of the present year, at fair prices, will pay up all individual foreign debt, and leave a very handsome balance of capital, for useful and profitable investment at home.

But the most profitable staple article for exportation by the Wolverine, will, hereafter, be wool. With-out deducting at all from the present produce of the State, 5,000,000 sheep may easily be kept. It is only necessary for a farmer to purchase 500 or 600 acres of

these oak openings, which he may get for \$5 per acre, enclose the whole, cultivate 100 acres, or enough to sustain his stock through our generally short and mild winters, and he is prepared, off hand, to keep 2,000 head of sheep. There is no doubt that all cattle, and sheep especially, thrive better upon the native grasses and shrubs, found in the openings of this State, than they do upon the best cultivated grasses of New York. I have no doubt it is the best State for sheep-husbandry in the Union; and the great ease and cheapness with which wool can be marketed, at Boston or New York, renders it admirably fitted for the staple of our interior country. Our farmers are becoming convinced of this, for every one is trying to commence or increase his flock. The numbers now coming in from Ohio and other States, are immense, and I have no doubt the sheep now in the State doubles the last year's return. Money to buy them, alone is wanting, and that number would be ten-fold in twelve months to come.

I know that a serious prejudice prevails abroad, against this State, on account of the onerous taxes imposed upon real estate. Four fifths of these taxes, however, have been imposed by school and highway districts. In many cases they have been justly condemned as unequal and oppressive. Doubtless a more correct public sentiment is pervading the State; for the most intelligent men have become convinced that the prosperity of a new country is never promoted by the imposition of unnecessary taxes, so exorbitant as to drive its own citizens away, and attract all immigration from abroad. Such appears to have been the consequence of the high taxation in this State. But, as I said, a more correct feeling exists. Indeed the taxes are now much lower than in former years.

I ought to add, that for near nine months in which I have resided here, I never knew a healthier land—the green hills of New England, thus far, do not surpass it.

With great respect, yours,

HENRY W. TAYLOR."

Evaporation.

A correspondent inquires "if water or maple sap, when heated to a given degree, evaporates according to bulk, or surface."

Water (of which maple sap almost wholly consists) when heated to 212° Fah. evaporates rapidly, and this heat cannot be exceeded (unless it is confined) so long as it remains in the vessel in a liquid state. The evaporation only becomes more rapid, as the fire is increased. And the rapidity of evaporation depends wholly on the quantity of heat which passes from the fire to the boiling water. Of course the larger the surface, the greater will be the quantity of heat passing, the intensity of the fire being the same. If a kettle has one square foot of surface exposed to the fire, the evaporation will be the same whether one foot or ten in surface, of the water, be exposed to the air above. And the evaporation will be the same, whether the vessel be high, and contain a barrel in measure, or flat and contain only a gallon. Consequently it depends on the *extent of surface exposed to the fire*, the intensity of the heat of that fire being the same.

Domestic Economy.

MORE LIGHT!—Lamps may be easily arranged for burning Lard, instead of oil. Many of them are now in use in Rochester. Ordinary lamps may be fixed for this purpose—with a thick wire so arranged as to be kept hot by the flame, and thus secure the lard in a fluid state. There is but little smoke and the light is pleasant. It is certainly far preferable to making candles of tallow; and will be a great convenience to thrifty housewives, on the score of neatness as well as economy. This mode of burning lard was devised by Mr. B. W. Oakley, of Tecumseh, Michigan. Oil is extracted from corn, by distillation, to some extent, at the west. The Niles (Michigan) Republican says:

"We have been burning in a common lamp, for the last few weeks, oil extracted from corn, in quantity of which we received from Mr. R. A. Ward, of Niles, who manufactures the article. It gives a clear, beautiful light, and burns longer than the common white oil, and emits no offensive smell. On the whole we should think it better and cheaper than any other kind of oil for lamps."

By the New Genesee Farmer.

Crops of 1841 in East Bloomfield.

MISERABLE HARVEST.—It is getting so fashionable to write of the crops and harvest, that we can scarcely take up a paper, either practical, religious or agricultural, but we find a column headed the "Crops;" and sure are the contradictory and extravagant statements given, that it is coming to be almost as necessary to inquire whether the writer be not a consumer, interested in representing the crops as superabundant in order to lower the price, or a producer wishing a round price for his surplus commodities—as in reading a political article to enquire to which party the writer belongs. As the public feeling has become somewhat calmed, now that the harvest is past, and the true state of the case is becoming more and more apparent, I may be less liable to the imputation of an interested writer, if I continue the record of the crops in this town. In the *Old Genesee Farmer*, the record is continued from 1831 up to last year. Last year our crops were so uniformly good, and so much was said of the crops everywhere, that it seemed irksome to repeat the story.

Wheat, our staple crop, is decidedly a failure.—Whatever may be said of other sections of the country, wheat has not been so universally poor for many years. The cause I believe to be the same throughout the country. Our farmers were very forward with their sowing last fall—much of it being done in August, under the impression that early sowed wheat is much the surest. The fall growth was good, although a few pieces of very early sowed showed the ravages of insects. The winter was as favorable as usual. The latter part of April and the month of May were trying months. Freezing nights and thawing days with dry and cold winds, continued for so long a time as we had them, last spring, would seem sufficient to destroy every vestige of winter grain, and almost preclude the possibility of sowing any spring crops.

As we are liable to such seasons, and have our wheat more or less injured every spring, it becomes a matter of interesting inquiry in what manner we can best guard against them. Protection, whether by hills, forests, orchards, or even fences, is the most efficient guarantee against cold chilly winds, which dry up the life of the wheat and prevent that thrown out by frosts from taking root again. Early sowing on land under thorough cultivation, thereby giving the roots firm hold of the soil, is next in order to protection, and more under the control of the farmer.—Draining all surface water is of the utmost importance. A regular rotation of crops, inasmuch as the land is thereby supplied with the requisite nourishment for the crop, is of more consequence than usually imagined. The skimming system of cropping with wheat every other year, so very generally pursued among us, is the best calculated to culture such seasons, and has in the present crop received a most favorable rebuke.

Of the kinds of wheat, little discrimination can be made in such unpropitious seasons. The quality is good, and the yield will be greater in proportion to the straw. There has been much complaint of a scab in many fields that were injured by the spring—but I have seen no appearance of the wheat worm which could be found so plentiful three or four years since. Smut and rust we have generally escaped this season—but scab cannot be made no rapid advances upon us. The darkening path may be traced through the length and breadth of the town, and some fields have this year appropriated exclusively to it.

Beside the power of the scab, we have a new enemy to contend with, which, from its rapid strides, we have reason to fear will outstrip all others in de-

stroying our wheat crops. I mean couch or quack grass. If this is the worst weed the English farmer has to contend with, it must be still worse for us, as we have no cheap laborers to spare for hand weeding.

Spring wheat promises to be a fair crop. The season was so backward that but little was sown.

Barley was also unfortunate in its seedling time.—What little I have seen promises an ordinary yield.

Oats.—It used to be an old proverb, sow flax in the fire and oats in the mire. If therefore the proverb is good for any thing, we ought to have good oats as the ground was moist enough surely. It is generally supposed that seasons like the present are not good for oats, yet the crop is with us more than ordinarily we get. During the month of June, they looked as if going to head out before half grown. The straw is indeed short, but the heads are of good length and well filled. What is remarkable they all stood up well, there scarcely having been a severe rain storm since they were sown.

Corn.—On some accounts this has been a good season for corn, and some fields of early planted will come off very fine. In general the drought has injured the growth and will prevent its being well filled.—The prospect is that it will be early ripe. The stalks being now much shrivelled and dried up. The amount raised will I think be less than usual.

Grass.—This is our poorest crop. Less has been cut and less pasture for our stock than we have had for many years. The prospect is now that fall feeds will be scarce and we shall have to feed our cattle from our barns unless we have rains soon.

Potatoes and all root crops have suffered severely by the drought, and if we get any it will be from early planting. Potatoes I think will lose in reputation, and if the order is not reversed, one peck from twenty bushels planting, instead of twenty and thirty bushels from a peck of seed, it will be because they are better than they look to be.

R. clover.—I have seen none growing.

Peas are generally said to be good, although I think they will not be found to yield well.

Wool.—The quantity of wool grown in town is constantly increasing, and is second to no crop except wheat. It has this year been freely sold at fair prices.

Fruits of all kinds are in more than usual abundance; and although we are short in a few important crops we have abundant reasons for gratitude for the prosperity which hath attended the tail of the luncheon.

Yours, &c.

ADAMS.

E. Bloomfield, Ont. Co., Aug. 25, 1841.

Twelve Varieties of Wheat.

Gen. R. Harmon, Jr. of Wheatland, has for several years past cultivated many different varieties of wheat, with a view to test their relative value, of a adaptedness to our soil and climate. At our request he has left at the Rochester Seed Store, samples, in straw and grain of twelve distinct kinds raised by him the past season. The seed of several of these varieties was imported from England last year by Mr. Bateham; but the past winter and spring being unusually severe for wheat, several of these kinds were a good deal injured by frost. This, however, should not be considered decisive proof that they will not endure our ordinary winters; for many cases might be found where common varieties were almost entirely destroyed the past season. The experiments of Gen. H. are valuable, however, and he will much accept our thanks for the samples and the following paper which accompanied them.

By the New Genesee Farmer.

Mr. M. B. BATEHAM.—The following is a list of the names and a short description of the twelve vari-

eties of wheat, samples of which I have left at the Seed Store:

No. 1, **TUSCAN.** This variety was introduced into this town four or five years ago, by Abram Hanford. The seed I believe was imported. It has large straw, chaff white, bald; grain large and white, ripens a little later than the common Flint. I have tried it on different soils, but it appears too liable to injury by frost for profitable cultivation in this climate; still it may possibly become acclimated so as to be a valuable variety.

No. 2, **TUSCAN BEARDED.** This variety was found mixed with No. 1, but is very different from it in appearance. The straw is very large, with long heads; chaff white, with a long stiff beard; grain large and handsome. It appears to be less hardy than the preceding; more than two-thirds of it being destroyed by frost with me the past two seasons.

No. 3, **VIRGINIA WHITE FLINT.** This variety was introduced from Virginia, and is said to be the kind of which the Virginia flour is made, which stands so high in the markets. The straw resembles that of the White Flint, but is rather lighter. Chaff white, bald; grain very short and round, of a reddish cast, somewhat flinty. It weighed last season sixty six pounds to the bushel; ripens about a week earlier than the White Flint; endures the winters well, but has suffered more from the drouth this year than most other varieties.

No. 4, **VIRGINIA BEARDED.** This variety I obtained from No. 3, by sowing it in the spring. Head large and heavy, chaff white, with very stiff beard which I consider an objection to it.

No. 5, **WHEATLAND RED,** obtained in the same manner as No. 4. Straw large, heads rather short but heavy; chaff red, bald; grain reddish; has the appearance of yielding well, and is very hardy.

No. 6, **COMMON WHITE FLINT.** This name was probably given from its white straw and white flinty grain. Heads short; chaff white, bald; grain very white and flinty with thin bran, and yields flour of superior quality. It is more generally cultivated than any other kind in this county, but the seed can seldom be obtained pure. It is a very hardy variety, being more seldom injured by frost than any other kind I am acquainted with.

No. 7, **IMPROVED WHITE FLINT.** Selected from among No. 6, and resembles that kind, but the heads are larger and the grain not so flinty; makes very superior flour and a greater quantity per bushel than any other kind within my knowledge. (Gen. H. has left seed of this variety at the Seed Store for sale.—Eps.)

No. 8, **WHITE PROVENCE.** This was imported from France. I obtained it at the Rochester Seed Store, and have raised it two years. The straw is smaller than any of the varieties I have cultivated, grows thick and is apt to lodge. Heads large; chaff brown, bald or with short beards near the upper end; grain white, very large and fine, and has the appearance of yielding flour well.

No. 9, **PIGOT STRAW.** This is an English variety imported last year for the Rochester Seed Store. Straw short and bright; heads very close set and heavy; chaff white, bald; grain white and fine. This variety is considerably injured by frost, and I doubt whether it will prove sufficiently hardy to be valuable here.

No. 10, **ELIEST,** from the same source as No. 9. In growth and appearance this variety resembles our Red Chaff Bald, but the grain is a darker red. It does not stand the winters as well as some other varieties.

No. 11, **GOTTEN DRUM.** Imported the same as the last one. Resembles the White Flint in growth and appearance, head larger, grain reddish, large, with

rather coarse appearance and thick bran. Did not stand the winter very well.

No. 12, BELLEVEU TALLAVRA. From the same source as the last three. Straw large and white, bald; grain large and fine. This is the most promising of the four English varieties. It stands the winter well and is as early as the Flint. I believe it will be found valuable.

You will perceive that the grain in most of the samples is a little shrunk, which is owing to the very dry and hot weather just before harvest. Several of the imported varieties were so much injured by the winter, that the straw was very thin, which made them several days later in ripening. I shall continue my experiments with them till better situated of their character. Yours, &c., R. HARMON, Jr.

Wheatland, August 26th, 1841.

REMARKS.—Any thing which tends to increase or improve our wheat crop, is of the first importance to this country. And as there can be but little doubt that improvements can be made in the kinds of wheat, we hope some of our readers will unite with Gen. Harmon, to test the matter by experiments. The proprietors of the Seed Store have been at considerable expense this season to import some 15 or 20 of the finest varieties of wheat to be found in England; which will be sold at \$1 per peck—this barely pays the cost and expenses. How many farmers will try them all?—Eps.

Cherries.

4 Supplement to our Last Article on this Subject.

The Early Richmond ripens at the same time with the White Tartarian and the Black Coronet; and may be used for culinary purposes a fortnight sooner than the Kentish, or common red cherry. We value it very, chiefly as a dessert fruit. When it becomes very ripe, it loses with its brightness most of its acidity; and in this state, it is chosen by many in preference to the sweet cherries. The delicacy of its juice surpasses that of the common red cherry.

How long it would retain its excellence on the tree, has not been ascertained to our knowledge. We have kept it there more than six weeks after it was ripe. It is not inclined to rot; but its sweetness at length attracts many insects, including the yellow hornet, the humming bird also comes in for a share; and we have seen it insert its little bill both when it was on the wing, and when it was sitting on the branch.

The Early Richmond is but a shrub, and may be trained very low; and if its fruit was protected by a net, like the currant, it would probably keep as long. In our estimation it is far more desirable.

W. R. Prince says this variety was brought by his father from Richmond in Virginia. It is probably a fine fruit.

The drought of the present season, has been very favorable to cherries that are liable to rot in wet weather; and it has given us an opportunity to observe what happens when the fruit dries up on the tree, it is generally in consequence of the punctures of insects. We remember to have seen many years ago near Philadelphia, one branch of a cherry tree well loaded, a month or two after the usual time of ripening, and when not a fruit remained on any other part of the tree. Its appearance was very singular. On approaching it however, we found it was guarded by wasps and no living thing could go nigh them with impunity.

The Transparent Guigne is a heart cherry; and of those of its class, not generally liable to the charge of worms, though the fruit had a sharpness this season we had not noticed before. Was it occasioned by excessive sunshine? We consider the Transparent Guigne as one of our most delicious cherries.

LATEST NEWS.

From the Liverpool Times.

State and Prospects of Trade—the Harvest in England.

The accounts from the manufacturing districts continue to be very unfavorable, with the exception of those from the woollen districts of Yorkshire, in which there is some slight improvement. The state of trade in Lancashire is truly deplorable, confidence having been excessively shaken by the losses and embarrassments of the last two years, and the demand for goods being at present miserably low. Nothing but a good harvest can restore the cotton manufacturers to prosperity, by increasing the power of the middle and laboring classes, who are the great consumers to purchase clothing, and by restoring confidence generally. At present, unfortunately, the prospect of the country, so far as the harvest is concerned, is far from encouraging, for the weather continues very cold for the season of the year, and the great weight of rain which has fallen must have done some mischief. It is still possible that the harvest may be an average one, but there is no reason to hope that it will be more than that, and without a change of weather it will be much less. Should there be any great deficiency, the consequences will be very serious indeed, for the supply of breaded grain in the country at present does not amount to more than four hundred thousand quarters, and any further supply which may have to be got from the continent of Europe will have to be purchased at very high rates, as the crops are by no means promising abroad, and the foreign markets are unusually late. For the last three weeks the prices both of free and bonded grain have been rising in all the principal markets, and wheat has already reached a price much too high for the comfort of the people or the prosperity of trade. Unless there should be a decided improvement in the weather, a still further and much greater rise will take place, and one which will do more the merchants and manufacturers to another year of gloom and embarrassment, and the poorer classes (those whose wages, as we are told by Lord Sandon and other great political economists, rise with the price of bread) to short work and still lighter earnings for twelve months longer. However willing party politicians may be to deride themselves, and adhere to the maxim of the corn laws, another deficient harvest, unfortunately it should take place, will open the eyes even of the most obstinate. There has been very little change in money matters during the last week. Money continues to be abundant, but there is a great want of confidence in any saving it. We are glad to see that the bulion of the Bank of England is still increasing, though slowly. It now amounts to £5,170,000, which is an increase of £72,000 in the quarter. The weather of the next three weeks will decide whether it shall continue to increase, or again decline much more rapidly than it has advanced. Both the Bank of England and the joint stock banks have increased their issues during the last quarter, though they are still low in comparison with what they usually are. The rise in the price of grain has already begun to affect the averages, and it is believed that some decrease of the duty will take place either this week or next. The average prices of wheat have advanced as follows during the last six weeks:—The week ending the 13th of June, the average was 62s. 5d.; on the 25th June (6s. 5d.); the 2d July, 63s. 11d.; the 9th, 63s. 11d.; the 16th, 64s. 11d.; the 23d, 64s. 11d. These returns do not include the sales of last week, which were at considerably higher rates. The duty at present is 23s. 8d. and the average price of the six weeks, 63s. 6d. An increase of a shilling per quarter in price diminishes the duty one shilling per quarter, until the price reaches sixty-seven shillings, when the duty declines two shillings for every shilling in the increase of price. At the same point the duty on Canadian wheat falls from 6s. to 6l. per quarter, and the duty on the barrel of flour to 35l. As the exports of Canadian wheat and flour are becoming very great, an unusually large quantity would be let into the market if the average of 67s. should be reached.

From the North-Lane Express of Aug. 2.

"In the early part of the week we had two or three days of fine weather, and hopes were beginning to be entertained that the rain had at length left us on Thursday, however, it again became overcast, and since then heavy showers have fallen in various parts of the country. The temperature has, throughout the week, been exceedingly low for the time of year, and the absence of bright sunshine is greatly retarding the maturing of the crops, so that it has now become certain that the harvest must inevitably be late, and

consequently more than usually precarious. With regard to the probable yield of Wheat, the reports are increasingly unfavorable; and unless a decided and total change of weather takes place, it is much to be feared that the produce will prove materially deficient both in quantity and quality, and even under the most auspicious circumstances we much doubt whether an average can be secured.

The high value which Wheat has now attained has induced the Farmers to thresh out rather freely, and the dealers have been somewhat more liberal at a few of the leading markets in the agricultural districts; and the very high price asked by sellers having tended to check the demand, there has, on the whole been rather less life in the trade, notwithstanding which prices have continued to creep up.

Our Scotch letters inform us, that though the weather had rather improved in that country it still continued cold and gloomy, and the want of that general heat so much required at this season to ripen the crops, had caused all species of grain to remain in an unhealthy state; of positive damage, however, we are happy to say there are fewer complaints than might have been expected.

From Ireland we learn that a good deal of rearing was left there respecting the effect of the recent heavy rains on the outstanding crops. Hedges of grain had taken the alarm, and enhanced rates were asked for both wheat and oats at most of the leading markets.

The last London average is 2s. 3d. per qr. higher than for the week previous, being 3,750 qrs. at 72s. 3d. per qr. This is of course not included in Thursday's general weekly return; and as a considerable advance has, so far that was made up, taken place at many of the leading provincial towns, the next average for the Kingdom will probably be about 2s. per qr. higher than the last, and the duty will shortly recede materially."

A Letter of Inquiry on Female Self Education.

Ms. Dutton—The kind regard which you have manifested for the interests of the female readers of your paper, induces me to hope that you will pardon the Liberty Breeze in asking for the use of a small space in its columns. I am one of my youth and ignorance, I do not seek to give, but to obtain instruction; and if some one who possesses the information I desire, will give it through the medium of the Farmer, I think it may prove of great benefit to others besides myself. My father is a farmer in moderate circumstances, and like many others in our land is unable to afford his child in any but the most ordinary means of education than can be found at a common district school. That I have attended as long as appears beneficial, and now, wishing to make higher attainments, I am determined to prosecute a course of private study or self-instruction. I do not in this way expect to obtain a perfect, much less a fashionable education; but I hope to become familiar with the most important and useful branches of knowledge, so as to be able to instruct the younger members of the family, and to employ my life a good blessing to myself and to those around me. My situation at present allows me from four to five hours leisure each day, and I have the means of obtaining a limited supply of books; but I find myself at a loss to decide how to proceed. I write therefore to entreat some person who is qualified for the task, to advise me on this subject. I wish particularly to be informed as to the relative value or importance of the different branches of study; the best order to observe in relation to the time of commencing and the manner of presenting them; the most suitable books, &c. &c., reference being had to my situation and circumstances.

A full and explicit answer to this, will be very much obliged. Your sincere friend, HELEN.

Our Valley, July 1-41.

REMARKS—It gives us a sincere pleasure to publish the foregoing letter of our fair friend; and we have some little of experience and education will assist her in her present worthy efforts. We see no reason why farmers' daughters, even in moderate circumstances, may not elevate themselves, to an intellectual standard far beyond the many of those who boast of personal advantages. We trust Helen will pardon us for making some alterations in her communication.—Eps.

Inquiries about Ashes.

Messrs. Gorton—I wish to ask the following questions respecting the use of wood ashes in agriculture:

- 1st. What quantity of ashes is it proper to apply to an acre of grass land?
2d. What kind of soil is ashes of the most benefit upon?
3d. What time in the year is the best time to apply ashes?
4th. Will ashes be beneficial upon land that has been ploughed, as elsewhere. AGRICOLA

Rhyme and Reason--Political Economy set to Music.

However dry some may consider Political Economy, a rhymester onward shows that rhyme may be readily manufactured from some branches of that useful science. Only think of the statistics of cotton! interwoven with the flowers of rhyme! If people will not study Political Economy more thoroughly in its simple form, some rhymester might render himself a public benefactor by rendering the great truths of that science familiar to our ears through the aid of rhyme.

From the Northern Light.

COTTON STAPLEPLUS.

BY BERRY WHEATING.

Egyptian, Greek, nor Roman ever knew
That such a plant as cotton grows;
Or, if, before known,
'Twas only as a common, useless weed,
Which idly sprang up, flourish'd, went to seed,
By no one sown.
The eastern loom grew it, spun, and wove;
But, wanting "cotton," and from their looms to move,
The trade was small,
Their bales, torn up as rags among mankind,
Would scarcely serve its bleaching works to bind,
Mustans an ill.

A century since 'twas thus. The distaff, and
The shuttle, slowly thro' a from hand to hand,
Exhausted art.
Spindle and power loom their race began
When England brought to light those "Wrights of man,"
Her Lads, and Girls.

What now? Why tak'st the thread, by England spun
In one short year, and to and from the sun,
In course of time,
Trail'd thro' the spheres of plane, bright and star,
'Tis odd strength, soft as flesh, through all those journals far
(The "Wrights of time")

Or, tak'st the world's looms, of giant strength,
In dis-ant times, and but--what is its length?
As girls' hand!

'T would span the earth's enormous waist,
Where fashion left its longest line has trac'd,
The "Wrights of hand!"

As here these vices, which thus could swathe the globe,
Sent out that man alone may be lord'd?
'Tis even so.

It is the age of cotton. Full on fell
Of its smooth texture, 'Tis the young and old,
The high and low.

And whence the "Wrights of hand" which simplify
These countless "Wrights of hand" which face us all,
They give to me?

From the warm South, 'Tis there the genial earth
With cotton brings forth these things, pliant to birth--
'Tis there it blooms.

But 'tis not England only that uplifts
The age with steam. That power with Empire shifts,
New-England long
Has felt the mighty impulse. Soon will be
Weave for the world--old England's rival be,
As rich, as strong.

Then let the North and South in union live,
Nature and art, and thus their sanguine give,
And hand in hand,
Producers not consumers, no bled, claim
A common partnership, a common fate,
A common goal.

Pat. & Publ. by W. R. R. July, 1841.

Agriculture and Education.

These things should go hand in hand everywhere. The Farmer who neglects to improve the minds of his children, gives melancholy proof that he himself is unfitted to rule the business which Heaven has liberally showered upon the land. See to the schools in your neighborhood--visit them frequently--encourage the teachers and the scholars with your presence, even for a few moments in a week--and the

* Sir Richard Arkwright invented the "mule," the Rev. Elihu G. Loring invented the "power loom."
† These are not poetical fictions, but modern facts. See every part of statistical reports, which have been published.

results will soon be manifested by signs that will cheer you onward to greater exertions in the cause of Education. You owe at least this much to your own children--and in discharging the duty to them, you will save the cost of business of incidentally benefiting your whole neighborhood.

Wives, mothers, sisters! Your influence may be made all-powerful in promoting the welfare of society in this way. How can you allow your children or other young relatives to pass through the schools, unhelped by the encouraging visits and influence which you might reasonably be expected to bestow on the schools that exert such powerful influence "for weal or for woe" over the immortal minds of the rising generation.

Let any one person, lady or gentleman, try the experiment--visit the school or schools in the neighborhood--manifest becoming interest in the progress of education--and their exertions, like heaven-born Charity, will be "twice-blessed"--bless to the recipient as well as the benefactor--repaying all toil with hundred-fold gratification to those who benevolently engage in the blessed work.

For the New Genesee Farmer. Scraps.

Messrs. Editors--Having been a reader of the old and New Genesee Farmer, I have taken note of a number of facts that have fallen under my observation as a practical farmer, and am willing to contribute my mite in compliance with your oft repeated request.

SALIVA IN THE HORSE--Can be cured by mixing a table spoonful of flour sulphur in the salt that is given them.

MILK SPREADING--May be remedied by pressing the tit full of milk against a stone and rubbing it sumtly.

GRAFTING--Can be done by any person by cutting the shoots before warm weather, and keeping them in an ice house till the flowers fall, or in other words till the bark peels; then cut off the limb, take a twig three or four inches long and sharpen it by cutting entirely on one side, then one to two inches in length, according to the size of the twig, raise the bark on the stock with your knife and insert the graft--the bark side next the bark. Apply calve enoug to exclude the air, and the process is completed.

Planting grafts on this plan supercedes the necessity of planting the stock, they are much surer to grow, and the labor is much less than the old way. The end of the stock should be painted with common paint; it is better than wax.

YELLOW WATER--The yellow water can be cured by the following process--First bleed the horse; secondly, give him one teaspoonful saltpetre by dissolving it in a pail of water; the horse must be considerably dry before he will drink it; thirdly, give him one table spoonful of resin pounded fine and mixed with bran or meal; let one day intervene between each. A second portion of resin can be given it necessary.

DISORDER IN HORSES--The writer has had a number of hogs that have become lame generally in the hot months of July or August. They were matted in the hind legs and became lammer and lammer, till it was with much difficulty they could move at all--lose flesh rapidly, and if they got better in the fall, fat but poorly; the cause and cure is respectfully called for.

POLITICS--S. W. is treating political economy after the manner of a minister. But is it not dangerous ground for you to tread upon? I doubt your getting a good way without treading on some one's toes.

CANADA TRUSTS--This scourge of all accounts is making rapid progress in our country. Twenty years ago it scarcely ever scolded, but it appears to

have become acclimated and now seeds very heavily. They can be killed by turning the land to pasture, and pulling them as often as they make their appearance.

DRAGLOO.--This instrument can be made the easiest by splitting a log eight feet long and eighteen or twenty inches through, and cutting again across the middle of one half, say four inches wide and three deep; in this put the but end of a pole. It may be made lighter by hollowing out the ends. It is very useful in smoothing newly ploughed sward.

West Niles, April, 1841.

W. R.

Life in the Country Contrasted with City Life.

The discontented farmer, who sighs for city life, may be edified by the picture of crowded towns presented in the annexed sketch, from the pen of Jons A. Dix, late Secretary of the State of New York. The fidelity of the picture is woefully realized by those of us who are surfeited and smothered by the heat and dust and other accompaniments of city life under a roasting temperature of ninety-six to a hundred. There is "more truth than poetry" in the sketch, as the doubting farmer may discover to his cost, if he forsakes the free air of the farm for the glitter of even the best regulated city. The "Northern Light," the valuable paper now edited by General Dix, has never been embellished with a more vivid picture than this from the pen of its gifted editor.

Town and Country.

BY JOHN A. DIX.

At the very moment when cities put on their worst aspect, and the country its fairest and most attractive, it may not seem altogether consistent with impartial justice to set up a comparison between them. And yet it will not be difficult, we apprehend, to hold the balance even. That cities possess some superiorities over the country, particularly at less genial seasons of the year, will not be disputed. When our friends in the interior are blockaded up by mountains of snow, and the intercommunications of pleasure and business among them are difficult, if not impracticable, each man among us shoves off his twenty-five feet front of sidewalk, under an arduous sense of the time for neglect thereof, and we pass them one extremity of the city to the other, with as little obstruction as in the heat of summer. But cities have some superiorities over the country at all seasons. They contain, in a more concentrated slope, the means of intellectual improvement. Extensive libraries, reading-rooms and bookstores are there to be found, furnishing information on almost all subjects, and in almost all languages. The perpetual contact and collision into which mind is brought with mind, quickens the intellect and keeps it in constant preparation for conflict. Men are, as it were, always within pistol-shot of each other, walking the streets and lying down at night with their intellectual weapons sharpened and their harness buckled to their backs. Yet we must concede that the country has some advantage over us in certain departments of mental labor. Its shades, its tranquillity, and his repose are peculiarly adapted to meditation. He, who would penetrate the depths of a subject, will more readily attain his object in its cool and quiet retreats, than in the heart of a city, with all its bustle and its tumult to distract his thoughts and disturb his processes of investigation.

But assuming for the city some superiority in the particulars adverted to, how do we sink in the comparison when we turn to the other views of the subject? Let us look about us, and see what is our condition now. It is midsummer; we are in the very middle of the year; and the "dog-star rages." Let us look at the thermometer--92 degrees in the shade! What a suffocating heat, and no escape from it! The rich man did not long for a drop of water from the fountains of Lazzari more eagerly than we for a mouthful of fresh air from the towering Catskill or the martial Heidelberg, which we see in the distance. We close our windows and blinds and shut out the light of day, under the suggestion of a philosophical friend that light and heat are in some degree inseparable, and if we exclude the one we get rid of a portion of the other. We sit down in this artificial twilight of our dwellings, and find life insupportable. But business calls us out. We must be at our counting-rooms, our offices, and our workshops; we have

a cause to try at the Circuit; some good friend in the interior has sent us money to pay taxes, or a power of attorney to procure a pension for one of the gallant spirits who shed his blood in asserting our independence, and we must see the Controller or the Pension Agent; we have promised to meet our friend Jenkins at his rooms, and assist him in that ugly business with which he is entangled. We are in the street. There is not a cloud in the sky, and the sun shines out with equatorial splendor. He has just reached a point in the heavens, from which he looks straight down the street we are to walk through, leaving not a foot of shade on either side for shelter. There is no choice but to face him in all his fierceness. The pavement and side-walks are heated to the temperature of a furnace. Our soles are none of the lightest; but our feet burn as we tread these pavements of brick, which seem fresh from the baking. We pass along the street. The sun has been shining for hours on the roofs of these houses, which are exhaling, for our discomfort, the heat they have absorbed. Here comes a car heavily laden, dragged painfully over the pavement. The horse is struggling with his load, panting at least twice for every step he takes; and the driver is looking for a dry spot in his red handkerchief, to wipe off the streams that are pouring down his mottled visage. An unhappy cur, with his nose muzzled under the dog-law, has just passed along. Are our Common Council ignorant of the natural history of the animal, or did they invent this torment for the express purpose of making him mad by shutting up his tongue in his mouth, and thus closing the principal outlet for his surplus heat? A half a dozen drovers have gathered under this awning, for want of a better shade. They have just finished their half day's labor, and are breathing a moment before they encounter the fiery ordeal, through which they are to pass to their dinner. What would they not give, of a little they have to give, if they could exchange places with one of the thousand groups of their fellow-laborers in the fields, who, at this very moment, are tending their flocks under a tree of impenetrable shade, and are preparing to lie down for an hour upon a bosom of their mother earth, with the purest air around, and the grass and ground and wild flowers beneath them sending up freshness and fragrance? What a contrast to all this do we present! We have covered up the fair face of our mother with bricks and paving-stones; a few trees scattered along the streets analyze us with conceptions of shade, which we are not to realize; narrow patches of grass of a few feet length, in front or rear of our dwellings, patched down, meet the eye here and there—seldom monuments, as they are, of the broader surfaces, which we have overspread and buried alive under our contrivances to hide the face of nature.

But, the heat of the day is past, and the night is lying like over the face of the country and the town. We begin at length to think we breathe more freely. The streets are no longer blazing with the rays of the sun; but about they have been gathering all the day long, and they are now giving it out, we pass through them, in streams as sensible as the path of a volcano. Those, who keep or can afford hire vehicles, have driven out of town, and are catching the fine air, or snatching hasty glimpses of fields and trees before they are lost in the darkness. These are the favored few. The lot of most of us is to pass the evening and the night where we have used the day—in the heart of the city. And, spite of its heated atmosphere, there is something animating in its aspect at the early hours of night—in its glances of flickering lamps, in the numberless lights streaming from the windows of its dwellings, and in hundreds and thousands that are seen in the streets, lighting at their patches or making the flimsy pavements vocal with their tread.

But the hour of rest has come, bringing new discomforts with it. As the air begins to grow cool and for the renovation of our drooping bodies and spirits we must shut a cat. This is the overruling necessity of every night. The city burghers of the mid-ages was not more vigilant than we to shut up our doors to his fortified dwelling than we to shut up our martial tentement—he against the feudal enemy, and we against the housebreaker and the thief. But there are great occasions which call for fresh precautions. The evening papers tell us that a gang of desperate villains are abroad, and that our property and lives are in danger. What a peering into the conduct of locks and fastenings do these warnings produce! We examine every window, we lock and bar a double-bolt the street door, and shut up every opening through which the breath of night can gain admittance. The dog has his proper station assigned

him. We bring forth our pocket pistols, and that they are loaded, put fresh caps on them, and place them within reach of our bed. Thus prepared for the most desperate extremities, we commit ourselves to the care of a superintending Providence, brooding over apprehended invasions of our domestic altars by our fellow-man, and with a host of bloody resolutions at our hearts.

These, however, are clas in our lives. We are not always thus belligerent. But in our best estate there is no lack of discomfort. We must be down at night in steaming bed-chambers until the summer heats are over, and rise in the morning, unrefreshed, for the repetition of the same scenes, through which we passed yesterday. Nor are we comforted by the frequent suggestions, which spring up within us, as to the condition of him, who, in the calm and quiet retreats of the country, lays his head upon his pillow, with the cool breath of Heaven pouring in at every door and every window, thrown wide open to receive it, and sinks to rest with the assurance that, amid such evidences of the power and beneficence of the Almighty as those which surround him, no rapacious hand will be raised to take from him his property or shed his blood.

Agriculture in Missouri.

We have often remarked that western agriculture must be peculiar in some of its essential features, and are more and more impressed with the importance of discussing such peculiarities in a manner that will awaken attention and embody profitable information. We may say with much propriety that the agricultural science, regarded in its proper construction, as applicable to the west, has yet to be learned.

We cannot find a portion of land in the whole earth like ours; and while we admit that there are certain principles ascertained to be proper in the management of all soils, still there are others only suitable to such as in their nature require their adaptation. We require a somewhat peculiar mode of ploughing, a peculiar character of grains and seeds, and peculiar treatment. This must be admitted, for look at distant removes in any part of the world, and you find local principles and local treatment in tilling soils that are only proper for their own locality. The vast quantities of land amongst us to be had at a small valuation, and their exceeding richness, renders it necessary that our agricultural operations and policy should be peculiar.

With what an ill grace do recommendations reach us through the medium of foreign agricultural works, such as the benefit of a nice system of drill husbandry—a system that would require as many hands to an acre as we appropriate to a dozen, the one acre yielding, perhaps, double one of ours, which is its only argument. Drill husbandry is necessary where practiced, because land is scarce and light, making it important that every inch should be made available in the highest degree. When we take into account the value of labor, the largeness of our plantations, and the productiveness of our soil, such nice measures must be discarded as impolitic.

Then for us to adopt as a general principle, the lavish application of manure, is a doubtful means, and unless an intelligent demand is as practiced, attended with danger. We do not say that we look upon the attempt to increase the richness of our soil as useless, or that it ought to be regarded with indifference, but would recommend, at present, other means than the application of manure.

Such of our soils as are inferior in production may be vastly benefited by deep ploughing, a mode that is easy in its practice, and making it to be additional draft upon our time or force. This, together with a thorough pulverization of sward, will be a sufficient for our lands for many years—at least it will be found better to depend upon this, until other equally vital considerations are acted upon which now plead more strongly for immediate attention. We will not speak negatively longer in reference to our local needs, but say a few words conveying our opinion of what we seem to require in order to advance rapidly our interests by a suitable development and application of our resources.

To this end we are first to learn the nature and extent of these resources. No individual or community can employ means with a good prospect of continued success unless a knowledge is first attained of the character of means in possession; when this is decided, it is easy properly to apply. Are the resources of a State or larger community geographically confined to particular policy, diversified in their nature, or will it be more difficult to fix upon a uniform way of means? But situated as we are in this

respect, the policy best to be adopted is apparently obvious, for we are, in an unrestricted sense, an agricultural community. In keeping our eye upon development and application, we would say that although we might arrive as a community to considerable eminence as a grain raising portion of our country, yet our markets are, and in all probability will be such as to make it suicidal to our interest to make this product a staple.

We say, that having properly ascertained all our relations as an agricultural community, we must, if we would thrive, make our staple productions—Stock, Tobacco and Hemp. These must be made the articles of export. Upon these we must depend for our circulating medium. All of these articles are steadily rising in value and the demand for them growing greater. There is no danger of overstocking the country, for we are importing and shall be for many years, two of them, viz: Stock and Hemp, and there is a substantial market of Tobacco in Europe, and this is growing better.—*M. Tarnor.*

Subsoil Cultivation.

Sir—I am an old man, and an old farmer; but my eyes are not so dim, but I can see that there is much to learn in the way of a profession that has hitherto been considered either too high or too low—*which, I cannot say—to admit of much advantage from observation or reflection; indeed it is plain that we shall be distanced in the race of improvements that is taking place around us, in farming, as well as in every other science.* But the subject that has awakened me to new life and fresh vigor, even in my old age, is, the cultivation of the subsoil, by means of moving it by such an instrument as that, of which you have given us a drawing in your last, the Denston Plough; and for the first time in my life, I regret that I was born so soon, by 20 years. Why, Mr. Editor, I can see with half an eye that the thing will work, and can fully understand how that the operation must be as beneficial for a sandy, as for a clay soil, much of the former, as well as of the latter, having a retentive subsoil, which operates in a two-fold way to the injury of the crop; first, in wet weather, by preventing a glut of water from passing away, until it has become purid and poisonous to vegetation, and next, in a time of drought, preventing the descent of the roots of the plants in search of moisture, which is ever present, even in the driest seasons, within a given distance of the surface of the earth, and where, as you say, they go for water, which by their tap roots is pumped up to the lateral roots, while busily engaged in search of food in the surface soil—a pretty idea that, and worth many times the subscription money of the Cabinet.

To a want of deep ploughing might be attributed, I have no doubt, the weakness of our wheat-crop, which are so liable to be prostrated by any little gust of wind, after it has shot into the ear, and often, indeed, before that period. With a strength, equal in appearance to any vicissitude of climate, we find our crops ready to fall by their own weight, and wonder that with straw of oatmeal like reed, they have the substance only of the common grasses. This is the cause, depend upon it, and it is but natural that it should be so, for I have long considered the tap-root of a plant—and which even wheat is furnished with—to act the part of an anchor, and the lower end deeper this is cast, the greater will be the power of resistance; while the secondary purpose which it serves, that of "pumping from below the moisture that is to serve as drink to the food which is collected by the lateral roots in the surface soil," is new to me, and finishes the picture admirably. I consider therefore, the operation of subsoil-ploughing the "one plus plus," as the old blushing makers say—of successful agriculture, and have great hope that by its adoption, one-half, at least, of the evils attending the cultivation of the wheat-crop will be obviated, possibly the blight and rust, and even the Hessian fly, and especially the *lifting of the crop by frost*.—*Farmers Cabinet.*

Improved Husbandry.

The vast improvements in Agricultural Productions—wheat, roots, grain, fruit, and live stock—show what may be done by judicious cultivation. It should be the aim of every farmer to secure the best that can be used. The comfort of his family, and his pecuniary profits would thus be alike promoted. "A little well cultivated," is in no respect an impracticable great deserts of land overgrown with mullens and thistles. The means of farmers who now can scarce "make both ends meet" on a hundred-acre farm, might realize double the income, and tenfold comfort from fifty well-cultivated acres.

SUMMER ALL THE YEAR.

THE subscriber having obtained the privilege of manufacturing the

MACHINON HOT AIR FURNACE.

Is now prepared to supply all orders for warming dwelling houses, greenhouses, schools and other public buildings.

The furnace is made on the latest and most improved plan, and no expense is spared, to render the whole as perfect as possible.

The testimonials received from gentlemen of the highest respectability leave no room for doubt, that

Health, Comfort, and Economy.

will be greatly promoted by the adoption of the machinon furnace.

The subscriber is pleased to furnish the furnace, put up in the best style, with a fixed and immoveable grate, having full confidence that he will be sustained by the merits of the invention, and the discomfitment of the community.

Customers can post orders, or for more information, or enclosing orders, promptly attended to, at address for Wm. R. Smith, Machinon, Wayne county, or to

DAVID ANTHONY.

Union Springs, Cayuga County.

Testimonials.

Soon after the present year commenced, I had a hot-air furnace erected, under the supervision of Wm. R. Smith's invention.

The hotness, and purity of the air that flowed into the rooms, was all that could be wished; and on my health the effect was equally beneficial. I had been subject to colds (catarrhs) every winter for a long series of years; but from the time of kindling the fire in the furnace until it was discontinued in the spring, I was entirely free from every symptom of the kind.

Three rooms were warmed by this furnace. From either of them when not occupied, the hot air was turned out to the others; and on the reverse system was so fitted, when I was going to my work, or to visit the other for a few minutes, the apartment was made comfortable before a common fire could be kindled.

In regard to the saving of fuel, I am not prepared to state any thing definitely; but I have seen nothing to induce me to question the very favorable statements of others. The consumption of fuel is not only of an extraordinary kind, and the evaporation of wood-burners, and the loss of smoke from the chimney, is not only in proportion to the waste, is one of great value which in many cases doubles or triples its original cost.

In using this furnace, we were also free from the constant care of attending fires in cold weather, because it admits large wood or shavings into a fire, as it is to serve for several hours, if the dampers are well regulated. In this way, the house may be kept comfortable through most of the night without any attention whatever, and perfectly safe from fire.

DAVID THOMAS.

Woodville, Cayuga County, Sept. 24, 1841.

When the last winter of the past winter, and find it more than answer our expectations. Since the 1st of December last, we have used only eight cords of three feet wood, which has warmed four, and part of the time five rooms, eight and ten feet high, and four stoves, as managed by Wm. R. Smith's invention, and I make a great improvement in saving fuel, and free from smoke, and allowing us to pass into the rooms as usual.

I think the reason that we have warmed the last winter, is that we have had a hot air furnace, which is at least five feet of wood, besides a considerable labor in cutting and splitting, is saved by the mode of warming a house. Having no work to do, I am so situated, as to be obliged to be away from it, as I never prepared a winter so comfortably to me, and I think a person in a similar situation, able to take cold on going out, nor with the labor of the furnace, as the furnace is not only a great improvement to have it taken out of our house, and the expense of it, and the benefit to be derived from it. I consider it a great luxury to sleep in a room of even temperature, and as the furnace is a great economy of fuel, and as only pressing into the furnace, the warm air is consequently perfectly healthy and agreeable.

A. HOWLAND.

Woodville, Cayuga County, Sept. 24, 1841.

Having used the Machinon Hot-Air Furnace during the past year, and like pleasure in saying that I consider it indispensable to our comfort, as well as greatly to promote an equal temperature during the day and night. The purity and healthfulness of the air, which the furnace of those countries, and in which, which the fruitfulness of colds and rheumatism, can be valued only by those who have a hot air furnace.

The absence of all danger from fire, and freedom from the dirt, which is so often attendant upon the use of the fireplace, are its most valuable points.

In the past winter, I had a season, we used twelve cords and three quarters of wood.

V. WIDMANS.

Woodville, August 27th, 1841.

MONROE HORTICULTURAL GREENHOUSE AND NURSERY.

GREENSBORO, NEAR ROCHESTER, MONROE CO. N. Y.

AGRICULTURALLY increased, and of Fruit Trees, Ornamental Trees and Shrubs, Herbaceous Plants, and a large assortment of rare Green House Plants and Rare roots and cuttings for sale.

The stock of Peach and Cherry Trees on hand at the present time, is large, of various and thrifty growth, and were mostly cultivated from the best trees in the nursery or vicinity. They will give a guarantee to be true to the kind represented.

Ornamental trees and shrubs, of many kinds, of large size, can be supplied.

Orders will be due reference, as money enclosed, will be carefully attended, and trees and plants packed in a secure manner, so that they may be preserved in any part of the country with safety.

Trees and plants will be delivered on the Erie Canal, one mile from the nursery, or at Rochester, or the Steamboat Landing, at discretion.

Orders can be had at the Rochester, Sept. 28, as can be seen by a application, or if requested.

Address, A. A. ROWE.

Greenboro, N. Y., August 18th, 1841.

MOTT'S PATENT AGRICULTURIST'S FURNACE.

Manufactured by M. C. WOOD, No. 50 Main St., Rochester, N. Y.—This furnace was constructed in consequence of a suggestion from the American Institute—that a simple portable and low priced Furnace was much wanted by Farmers, for boiling or steaming roots, preparing maple or beet root sugar, and for many useful agricultural purposes.

It is six inches high in a space from one to two inches is left between the boiler and the casing that surrounds it, causing the heat to disengage to the pipe, to encircle all parts of the boiler even to its upper edge.

The American Institute awarded a silver medal at the Centennial.

The boiler is an extract from the Cultivator extra for the 26th Nov. '41. A hot air furnace is shown in the illustration. A good cheap, and durable boiler has long been sought for by the farmer. Potato kettles, cauldrons and boxes, with sheep-pans, but not set in brick, have been used, as well as steam boilers of various descriptions; but they all take up considerable room, are clumsy and laborious. For the last seven years, I have tried all the above named articles, and have tried them by, and substituted one of Mott's Patent Agriculturist's Furnace in a Canadian.

It will be readily perceived that it has many advantages over those set in brick. It takes up but little room, is light, and may be placed on the floor, and requires no fire without exception. Besides being portable, it may be removed from place to place, as occasion or convenience require; two men are sufficient to remove it. It can be made to boil full of vegetables in 20 minutes, and the second filling in 20 minutes. In this I was happily disappointed, for I had always supposed that brick kettles had been better than iron, and after being once heated, would require less fuel to keep it boiling. Another very important feature of it, and I will go far to recommend it, is that it requires much less wood than one of the same size in a boiler set in brick, or even the box, with a sheet iron bottom, so I fully recommend in favor of the former boilers of the Cultivator. Although wood may be plenty, it takes time and labor to procure it.

Steam boilers may answer in very large establishments, but I have found them very inconvenient, as every farmer is not engineer enough to manage it, and the consequence is an occasional explosion or collapse, and in either case an expense and considerable trouble was incurred.

Some five or six years ago, I had a copper—Rear—cylinder, within a cylinder, the space in the centre, surrounded by water, very similar in principle to the one figured in the 11th number of the current volume of the New England Farmer, as Doctor Warren's Late of Yankee Vegetable Steamer, but I found it very expensive to keep it in order, and abandoned it.

These Hills Farm, C. N. BEMENT.

Also, for sale at the same place, Wood's celebrated Hot Air Furnace, for which was awarded a silver medal for the best cooking stove, at the last Fair in this city. The public are invited to call and see it.

BUTTERFIRE PIGS.

COLLINS SAWYER, of this city, has a few very fine young Berkshire Pigs which he desires to dispose of to the farmers in this vicinity. Call and see them. Sept. 1.

WHEAT SEED.

Wanted at the Rochester Seed Store. No. 211 N. E. St. will be inserted in this paper except such as relate to Agriculture, Horticulture or rural affairs; and none will be inserted more than three times in succession. Terms of Advertising—For 12 lines, or less, \$1, for the first insertion, and 50 cents for each subsequent insertion.

Mechanics Fair at Rochester.

The third annual Fair of the Mechanics and Artisans of Western New York will be held at Rochester commencing on the 12th day of October. We have no room to insert the Circular this month, and we believe no arguments are necessary to induce the thousands to attend who witnessed the previous exhibitions.

ROCHESTER GARDEN & NURSERIES.

ROCHESTER, NEW YORK.

The Proprietors of this Establishment offer for sale a general assortment of Nursery articles, comprising Fruit and Ornamental Trees, Flowering Shrubs, Herbaceous Plants, Tinias, Hyacinths, and other Bulbous Flower Roots, Double D. Hoses, &c. &c.

They have also on hand a large and fine collection of Green and Hot House plants, including Geraniums, Chinese Monthly Roses, Camellia Japonica, Chinese Azaleas, Cape Jasmine, Caribaea, &c. &c.

Orders for any of the above articles, whether large or small, will be promptly and carefully executed, and charges in transit will be very moderate. Persons ordering from a distance may rely on having their orders securely packed and marked and shipped as their orders may designate.

To such persons as are about forming new establishments or who may wish to dispose of Trees, Shrubs, Plants, &c. in their neighborhood, our terms will be very liberal.

Gardens and Pleasure grounds will be laid out in any part of the country, and skillful gardeners furnished on reasonable notice, and information on any subject connected with the business will be cheerfully and promptly imparted.

It is expected that persons unacquainted with the proprietors will either accompany their orders with a remittance or name a guarantee in the city of Rochester or vicinity.

ELLWANGER & BARRY.

Rochester, Sept. 1, 1841.

N. B. Our Fruit Trees comprise the most desirable early and late varieties and the utmost care has been taken in propagating from such trees only as were in a bearing state and whose qualities have been sufficiently tested.

NEW YORK MARKET—August 28.

Flour.—We noticed an advance in Flour last week to \$6 75, since then the new from Europe has carried it up to \$6 75, and the market is very firm; and even at these prices purchases have been made for export. The market abroad will not have been made for export. The market abroad will not have been made for export. The market abroad will not have been made for export.

Corn.—In the early part of the week the supplies of corn were large, and the demand from the East so great that the market was out of the market East. South-west corn at 7 1/2 a bushel, and Northern and Jersey 7 1/2 a bushel. The market is still very firm, of which but little has a general market, sides of about 5000 barrels superior Ohio and North Carolina at \$1 75, which is a rise of 5 cts. since last week. No. 1 white oats stand at 20 a bushel. Rye has been taken freely at 60 a bushel, which is the same as last week.

Wheat.—The market is perfectly uniform. Both sorts sell at \$3 75. There is a little quieter than perils.

RATES OF UNCURRENT MONEY.

Table with columns for State, par, N. England Bank No. es, and dis. entries for Pennsylvania, Maryland, and Maryland.

ROCHESTER PRICES CURRENT.

Table listing prices for various commodities: WHEAT, CORN, OATS, BARLEY, RYE, BEANS, POTATOES, APPLES, FLOUR, SALT, PORK, BEEF, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, PEARL ASHES, POT., WOOL, HAY, GRASS SEED, FLAX, PLASTER.

Remarks.—The wheat market has been quite active for some time past, and the price has materially advanced—Last week it rose as high as \$ 3- 1/2 a bushel, but that was owing to a little temporary stiff between the millers and forwarders, and it declined to \$1 25 a bushel, which is as high as the flour market will warrant, and as high as farmers can expect, unless arrivals from England should bring accounts of an unfavorable harvest in Europe. The Genesee River is so low that the Rochester Mills are grinding but little; and consequently not much wheat is now wanted for this market.

The Curculio.

Every person who owns a plum tree, ought to feel an interest in the history of the Curculio, for it has been the chief obstacle to raising plums, apricots, and nectarines, where there were trees. We believe it is not known in Europe, though other species of the same genus there, have their peculiar mode of annoyance.

Of the benefit of our circular tin troughs, we can say nothing decisive, because they were not applied till after the Curculio had ascended the trees, and we jarred the trees that had those appendages, as well as the others. To the slaughter that we made of this insect in the early part of summer, we ascribe much of the abundance that our trees have yielded; and in confirmation of this opinion, we may mention that a tree in the fruit garden which had been forgotten, bore three apricots, while another young tree of rather less size bore half a bushel; and we know of no other reason for the difference.

Before this summer we had believed that the young Curculio continued in the fruit till it fell, and only escaped from its habitation after it had lain for some time on the ground. Late observations however, have shown that impression to be incorrect. We found both plums and apricots on the trees, from which the insect had taken its departure through a small orifice cut in the side of the fruit.

We have had some curiosity to ascertain the whereabout of the old Curculio, after it had ceased to deposit its nits in the fruit, (which is said by Judge Darling of New Haven to be early in the seventh month.) We therefore spread a sheet under several plum trees, about the middle of the eighth month; and on jarring them violently, caught several, though in far less number than when we last examined the trees about two months before. Indeed, under some trees where we most expected them, we found none. This failure however, may have been chiefly owing to the hot weather, so favorable to the activity of all insects, and which doubtless enabled them the better to hold on. We hope to repeat the experiment in cooler weather.

Improved Hogs in Ohio.

Nowhere in the course of our travels have we observed greater need of improvement in swine than in the State of Ohio. For while it is the greatest pork raising State in the Union, the common breed of hogs is of the very worst description. Our Western New York farmers with their fine Leicesters, Berkshires, Byfields, &c., would be puzzled to find a suitable cognomen for the animals called hogs in Ohio. We are at a loss to conceive from whence they originated; but imagine their form and character has grown out of their uncivilized mode of life; as they seem to be admirably calculated for wood rangers, or for breaking down the large stalks when employed in the field as corn huskers.

A work of reform has begun, however, and the more intelligent farmers have discovered that a saving of about one-half the amount of food may be effected by adopting improved breeds of hogs, and a more economical mode of feeding. Various crosses of the Leicesters, Byfield, Bedford, &c.; and thorough bred Berkshires are rapidly multiplying in the State. The latter in particular appear to be in great demand.

MR. MAHARD'S BERKSHIRES—(A R CINCINNATI.)

This is the most numerous and (perhaps excepting Mr. Allen's) the most beautiful lot of Swine we have ever seen. Mr. Mahard has been careful to obtain superior animals to breed from, and he displays excellent judgment in their management. He has seven or eight fine breeding sows; several boars, and a large number of pigs of various ages. With his pro-

sent facilities he will soon be able to supply the great demand which exists for these pigs in that region.

Mr. Mahard is the proprietor of one of the large pork slaughtering and packing establishments in Cincinnati, and his experience in that business has given him superior knowledge of the relative value of the different breeds of hogs. The following remarks on this subject were written by him for the Western Farmer & Gardener:—

MR. EDITOR—You are aware that I am now, and have been ever since 1820, extensively engaged in the pork packing in this city; and I feel that I may without presumption, lay claim to not a little experience in the business. It is fully as much to my interest, and that of every one else engaged in curing pork for market, as the interest of the farmer, that the very best breeds of hogs should be scattered over the country.

When I first entered into the business, the pork brought to us was produced from the same miserable race yet to be found through much the greater part of the West. It yielded us little lard, and the sides were unfit for mess or clear pork—too thin, and only fit for bacon. The first improvement we had was the little chunky China hog—a perfect mass of lard—hams light and too fat—though the waste of offal was trifling. The next we had was the large Warren county hog, requiring years to mature, and then coming to us of enormous weight—great waste of offal—the hams too large and badly shaped, as was also the shoulder—and the sides, nevertheless of their great size, were thin in proportion. They were still a great improvement. The crosses of these and the Russia and Byfield, in the hands of some of the more judicious breeders, produced a very excellent hog, and we who were the purchasers, were anxious for any improvement on the unprofitable wood hogs usually raised.

Though, as I have remarked, so long engaged in the business of packing, I had paid but little attention to the breeding of hogs, though always keeping a few of the best I could find, on my farm, and improving them to the best of my ability. It was not until some of the part-bred Berkshires were brought to us from Butler and Warren counties, and I was struck with the great improvement they were, on any thing I had yet seen. The perfect manner in which they were fattened—their extraordinary length of body, and the thickness of the side meat—their small, yet thick, fleshy shoulder—the great weight and handsome form of their hams—the great yield of lard, and the little waste of offal, either of inside waste, or head and bone, proved to me that they were a something entirely different and altogether superior to any other breed within my knowledge. On making further enquiry respecting them, I found them equally advantageous to the farmer and drover, as to the pork packer. Prolific and easily kept; maturing early and fattening kindly to as great weights as were desirable; stamping their own character strongly on any other breed with which they might be crossed; and traveling well to any reasonably distant market.

I had before this, been breeding hogs for sale, and seeing at a glance the great advantage it was going to be to me in my packing business, to have such a hog as the Berkshire in general use, I at once engaged in it largely.

True it is that I cannot give up my farm and my attention and capital, to the breeding of fine stock, without a prospect of making money by it; but that was the secondary object I had in view—my pork-packing business was of the first importance to me. I saw and dreaded the efforts that were made to introduce an extremely large hog into Kentucky, for I had about this time transferred my pork business to that State, and had gone to very great expense in erecting an extensive establishment back of Covington, and intended making my entire purchases in the State. We can make no use in this market, of animals weighing from 400 to 600 pounds, even though they may be well fattened. A hog of the proper form and quality of meat, that matures at ten or twelve months old, so as to fatten properly, and then weighs from 200 to 300 pounds, is the sort for which we will give the highest price, because it yields us the greatest profit. And most assuredly it will also pay the farmer best. We have no population to supply, that will consume large, coarse, indifferently cured meat. Our principal demand is for city and family use, both here and in the cities of the south and east. The ham is with us the most valuable part of the hog, and the celebrity of those cured in Cin-

cinnati is now great. This part must be heavy without being large—round, thick and plump—the flesh, though principally lean, yet mingled with fat. Next to the ham, the lard and side meat yield us the greatest return—the former must be abundant in quantity and fine grained; which never is the case with any hog until he has somewhat matured; the latter must carry its thickness throughout, having no thin flanky parts; and must be fat. And last we rank the shoulder and the jawl.

Many of the Boston and Richmond dealers, and those from the other cities in the East and South, come here annually to have meat packed; they all prefer such a hog as I have described, and will buy no other if they can help it.

For my own part, and for my use for packing, I want neither an extravagantly large hog, nor yet a very small one. A hog that has to be fed two winters, never will pay first cost; if he can be had of sufficient size without wintering at all, so much the more profit. A spring pig killed in the fall at 200 pounds nett, will evidently pay better than if the same hog had been kept over winter, and reached the second fall 500 pounds nett.

I have been speaking now as a pork-packer, not as a breeder; and what I have said, I say in all sincerity. I have no desire to injure the business of any other breeder of improved hogs, nor to prevent their continuing their improvements to as high a point as they please. But I do regret to see gentlemen of science and experience going back to a large course hog, such as the Woburn, Irish Grazer, or Leicester, when they can procure a breed so infinitely superior—the improved Berkshire.

JOHN MAHARD, Jr.

Cincinnati, July 5, 1841.

From the Farmers' Register.

Disputed Questions in Agriculture.

August 2, 1841:

DEAR SIR:—It may perhaps be deemed a very useless, if not presumptuous attempt in any individual to suggest any means of settling for ever even a small portion of those apparently interminable controversies in regard to certain agricultural matters with which our agricultural papers have been and still are often filled. But the very circumstance of their being continued is, I think, a conclusive proof that each disputant believes that they may be brought to a conclusion; provided a proper course was pursued for the purpose. In the hope, therefore, of recommending such a course, I will proceed to notice a few of the controversies, together with the manner in which the questions that give rise to them have been treated. There has been such, in most instances, as to serve scarce any other purpose than to crowd our books of bushy dry with communications, the authors of which appear far more anxious to put each other in the wrong, than to set the agricultural public right, in regard to subjects of controversy. The effect of most of the articles has been to aggravate the unreasonable prejudices against agricultural works, to perplex great all young farmers who read for information; and irreparably to weary old ones, in witnessing such waste of words—uttered, professedly, to give light, but, in reality, often making confusion worse confounded. Instead of giving us accurate details of experiments, most carefully made, together with the results, which alone can satisfactorily settle such matters, we find, in much of what they write, little else than speculative opinions and theoretical arguments, or ill-digested and unsound conclusions from some things which they call experiments, but which are really deficient in all the particulars that it is essential to notice most accurately, before they can be entitled to any weight.

This, I think, may truly be affirmed of nearly that I have read of what has been written on the following controverted subjects:

Whether vegetable manures should be turned under in their freshest state, or left on the surface of the land until it is cultivated?

Which is the most productive variety of Indian Corn in each section of country, where the climate, soil, and situation is nearly the same?

At what distances is it best to plant, and by what modes of culture corn will produce most net profit?

Whether it is injurious or beneficial to cut the root of corn during its growth?

And last, though not least, what is the true opinion in regard to that great "pons asinorum" in agriculture, the convertibility of wheat into cheat grass?

Now, in my humble opinion, all these still undetermined questions might have been settled many—many years ago, if those who were most interested in them had taken the trouble to make a few such perfectly accurate experiments as any cultivator of his own or others' land might very easily make; and to publish the results of the same in our agricultural journals, instead of the numerous vague speculations and inconclusive statements on the foregoing subjects, with which these journals have so often been filled. Whether I am right or wrong in this opinion, let your readers determine, after considering the following queries to which I respectfully invite their attention.

How easy would it have been, in order to settle the first controversy, for all who felt sufficient interest in it to deare that it should be settled, to spread vegetable manure equally over a small determinate quantity of land, and then, alternately to plough it under, and leave it on the surface of exactly equal portions of this land, and to compare by accurate measurement, the produce of each portion?

Would it not have been equally easy to settle the second controversy, by planting a like determinate quantity of land with as many varieties of Indian corn as the experimentalist wished to compare together, giving to each exactly equal portions of the land, the same distances between the hills and rows, the same number of stalks in a hill, and precisely the same culture; and then accurately to measure the produce of each portion? To prevent the produce from being much affected by intermixture, an oblong form might be given to the land on which the experiment was made, and the rows planted across, to the number, say, of 12 or 15. Then, by comparing an equal number of the middle rows only, the experiment would approach sufficiently near absolute accuracy to satisfy even the most skeptical.

To ascertain the best distances at which to plant corn in the richest, the poorest, and the medium quality of land, what difficulty would there be in trying all such as are most approved by practical men, on an ascertained quantity of land of either of the foregoing qualities, giving to each distance exactly the same-sized portion, and then measuring accurately the produce of each portion, as in the other experiments?

With a view to ascertain the best modes of culture, can it possibly be satisfactorily done without comparing them at the same time, on exactly equal portions of land which is the same in soil, fertility, and situation; and can there be any great difficulty, expense, or trouble in making this comparison. Yet who, among our numerous writers on the subject has ever reported any such experiment? This, if it ever had been properly made, would have settled for ever, whether it benefits or injures corn to cut the roots, since *cut they will be*, more or less, by every mode of culture which has ever yet been tried. If the portion of land on which fewest roots had been cut produced the most corn, and that portion yielded the least where the root-cutting had been greatest, then surely the first mode of culture would be preferred by every body, but the obstinate fools who have no better reason for any thing they do, than that they have always done the same.

With respect to the cheat or chess controversy, I am almost afraid to open my lips, for most of our brethren who maintain that cheat is the produce of wheat, seem to have worked themselves up into such a choleric and bellicose humor on the subject, against us who maintain the negative in this matter, that it is quite a perilous thing to offer any argument in support of our opinions. I will therefore content myself with only asking a few simple questions. Is it among the unknowable things of this world to ascertain the truth in regard to this controversy? If it is, why should another word be ever said or written about it? If it is *not*, can any one oblige me so far as to name a single experiment, among all which have been so called and stated as proofs that wheat will turn to cheat, which is not most palpably defective in several essential particulars? I can truly say that I have never seen even a solitary one, but that which was made in 1833 by Messrs. Thomas and William J. Cocks and yourself. This is to be found in the first volume of your Register, on the 83d and 84th pages; and to my mind is most conclusive proof that for wheat to produce cheat, is quite as great an impossibility as for "thorns to yield grapes," or for thistles to produce figs. I will further ask, if any experiment made with less particularity and accuracy than the one just referred to, ought to be regarded, even in the slightest degree, as contributing towards settling this much and long agitated controversy, or indeed, should be entitled to a place in any of our agricultural papers? None, I think, who really desire to come

at the truth in this matter could reasonably object to the editors of these papers requiring equal or even greater accuracy and minuteness in the experiments which they may be required to report for either of the parties concerned. If the zeal of those who maintain the affirmative in this controversy, be not sufficient when stimulated by the hope of victory, to impel them to take the trouble of making such experiments as have just been suggested, I would beg leave hereby to call to their attention to your pledge—made a few months ago, to pay one hundred dollars—not "in rags," but in good lawful money, to any one who can prove by similar experiments, well authenticated in all their particulars, that he has succeeded in converting *wheat into cheat*.

I could mention several other subjects upon which much difference of opinion has been expressed, for many years past, and which still occasionally appear in our agricultural papers. Serving no other purpose than to show the great disproportion in number between the multitude who prefer writing out and publishing their conjectures on these topics, and the few who choose the less easy, but more troublesome road of accurate experiments to solve their doubts. But until this be generally done in regard to all matters which *can* be settled by the experimental process, the readers of our agricultural journals, (good as I admit most of them to be) will have to pay for much that affords them little, if any satisfactory information. It "*action, action, action*," be essential to form the finished orator, I would say that—*experiments, experiments, accurate experiments* are equally, nay, more important, to form the complete farmer. I remain, dear sir, yours very sincerely,

JAMES M. GARNETT.

From the New England Farmer.

Hay Seed upon Inverted Sod.

Many of our moist lands upon our dry uplands and the bog-meadows, though natural to grass, occasionally need renovating. As long as a common top-dressing will call a good crop, nothing more should be done than to apply the manure on the surface. But when the better grasses have run out, and when moss begins to collect upon the surface, it is necessary to plough such land. But where the plough will do its work tolerably well, it is not necessary to plant. These lands which are wet and heavy in the early part of the season, and which bake in the scorching months of July and August, are not profitable for tillage.—They may yield a crop of potatoes, and possibly of corn, but the chances for this are small, and it is usually bad working these wet spots in the early part of the season. The best way to treat them is, to turn the land over as soon as it can conveniently be done after the crop of hay has been removed; to plough in such direction that the dead furrows shall come in suitable places for surface drains, to roll well; and then put on a dressing of compost. When this has been done, sow hay-seed and harrow thoroughly. Then use the roller again, and the next season you may obtain a fair crop of hay, and the following year you probably will get a heavy burthen. Herds grass is better for these moist grounds than clover or red-top. No one who has been accustomed to this process will ever think of tilling any wet lands that can be laid over smooth by the plough.

The process here recommended has been repeatedly urged upon our farmers, by Mr. Buckminster, editor of the Boston Cultivator; and as far as he has influenced them to comply with his advice in this matter, he has rendered them good service.

This is the proper season of the year for working all low lands, and it is by attention to them, that our farmers generally must hope to thrive. They repay the labor and expense bestowed upon them better than most of the high grounds.

Cactus Triangularis.

The Charlestown Courier says, we were among the gratified beholders of the magnificent and numerous bloom of this rare plant, at Mr. L. B. Baker's, on Wednesday night last. The plant is in a state of most luxuriant vegetation, growing in a box containing rocks, superficially covered with sand, and of course deriving its nourishment chiefly from the atmosphere. When we saw it, thirteen magnificent flowers, gigantic in size, yet graceful in form and exquisite in beauty, simultaneously expanded their petals to delight the eye, while at a little distance a pleasant fragrance was diffused. The evening before, seven flowers, on the same plant, had commenced and closed their ephemeral bloom. We carried away one of these rich blossoms of night, kindly pre-

sented to us by their proprietor, and found to our agreeable surprise that, by depositing it in a jar of water, its existence was prolonged, and it bloomed like the rosy morn as well as the curbed night. This bloom of this plant is one of nature's mysteries—floral beauty the most rare and exquisite, destined only to hang on the brow of night, like a rich jewel in the Ethiope's ear, and to close its petals in early and lovely death as midnight tolls its knell—dependent too wholly on human aid to prevent it from being born to blush unseen and waste its sweetness on the desert air.

A fine specimen of this beautiful *Cereus* owned by Mr. Ous Everett, jr., which opened its blossoms on Wednesday last, and was witnessed by many of his friends, all of whom speak in the highest terms of its beauty and fragrance. The flower is very large, of a pure white, with 60 outer and 18 inner petals 6 inches in length. It commenced opening at 4 P. M. was half open at 7, fully expanded at 10, and closed next morning at 7 o'clock. This plant came from the interior of the island of Cuba. Truly is it said that this is one of "nature's mysteries."—*Boston Transcript*.

The Pear Tree.

We are told that many persons are afraid to plant pear trees lest they should die with the *fire-blight*; that they have done their best to save the trees, but all to no purpose; and that they now settle down in despair. In reply to this melancholy account however, we can repeat the assurance that *we have not lost a single tree by the fire-blight in twenty years*. It has been in our fruit garden several times, but always seemed to walk out again as fast as we did; for we cut off the injured branches *without delay* and burnt them *immediately*,—destroying as we believed, the whole colony of insects that had committed the depredation.

As soon as the leaves begin to blacken on the branches, for two feet or more near their extremities, let the owner waken up at once, lay aside all other business, and proceed with as much zeal to the task as he would drive the pigs from his garden. We are satisfied it is the putting off till a more convenient season in such cases, that proves so fatal to the pear tree. The stable door may be locked when the horse is stolen; and the limb may be cut off when the insects are gone to another part of the tree. Did you cut off the limb *below* where it was dead, say a foot or more? "No—we only cut off the dead part"—leaving the insect at work below. Did you burn it when it was cut off? "Why—no—we left it under the tree"—for the insect (if there) to go up again at his leisure.

Culture of Silk.

It is indeed "an ill wind that blows nobody good." The subsidence of the mulberry speculation is followed by cheering attention to the manufacture of silk. The immense quantity of trees lately propagated for speculation, essentially aids those who now embark with a view of pursuing the Silk Culture as a steady business. The vice of speculation is thus rendered tributary to honest industry; and we confidently predict that the crop of silk, in three or four years, will prove that, whatever evils may have deluged the country through the speculating mania, the "mulberry fever" is followed by healthy and efficient action in the great cause of rendering our country independent of foreign nations for an ample supply of Silk.

We congratulate thousands of thrifty farmers upon the pleasant and profitable employment which the silk business affords to the females and children in their families—affording means and inducements for industry that may essentially serve those families throughout life—promoting comfort and independence, and yielding returns that would guard against pecuniary distress, should the ordinary means of support be curtailed by the loss of husband or father, or by other reverses of fortune.

A Visit to Brockport and Clarkson.

In the early part of September, we took a ride to Brockport, in company with L. B. LANGWORTHY, Esq., and Mr. JOSEPH ALLEYS, with the intention of viewing the farm and silk cocoonery of Mr. George Allen, and visiting a number of the good farmers in Sweden and Clarkson. Owing to the excessive warmth of the weather, and some indisposition on our part, we did not accomplish as much as we intended; still, we saw much that was highly interesting to us, and some account of which may gratify our readers.

Mr. Allen's Farm

Is situated on the south east side, and within the corporate limits of the village of Brockport. It consists of 86 acres, embracing a great variety of surface and kinds of soil, now under good cultivation, but originally quite rough and some parts so wet and boggy as to be utterly useless. The improvements which Mr. Allen has effected, are quite surprising, and reflect great credit on his skill and enterprise. His system of

Under-Draining and Stock Watering

is very perfect, and worthy of imitation. He has made about 80 foils of under-drain, by means of which he has not only reclaimed several acres of valuable land and beautified his premises, but by placing reservoirs in the drains, and putting down conducting logs, he has obtained an abundant and never failing supply of pure water, at his yard and buildings. In constructing drains, Mr. Allen has adapted several methods, according to the nature of the soil or other circumstances. Where the soil was firm, and the materials at command, the drain was formed of loose stones, first covered with turf, then with earth. At other places it was formed by nailing two narrow boards together, like a trough, placing it with the angle downwards for the bottom of the drain, then putting small sticks across and covering it with another board, so as to leave a crevice for the water to enter under the cover; the whole surrounded with broken charcoal to facilitate filtration and preserve the boards from decay.—Another method, and to us a novel one, was practiced where the sub-soil was quicksand, and where a board or stone drain would soon fill up: he went to the woods and cut beech brush, consisting of branches one inch or less in diameter, with the spray on, which he tied up in small bundles or faggots, eight or ten inches in diameter; these he placed lapping each other in a row in the bottom of the drain, having first laid down a bed of straw. The faggots are then firmly surrounded and covered with straw, and on this is thrown the turf and rubbish, then earth or sand, the whole firmly pressed down. How long such drains will endure without decaying or filling up with quicksand we cannot tell, but they seem to answer the purpose admirably, and certainly are not very expensive.

Mr. Allen is also largely engaged in

Milk and Mulberry operations,

As our readers are already aware, by his communication which we published last month, and to which we now refer for an account of his cocoonery, &c., in order to prevent repetition. We were somewhat disappointed in the appearance of the cocoonery, having expected to see a better finished building and more expensive fixtures; but as it is, it goes to prove one important fact, namely, that large expenditure of money is not necessary for a commencement. Owing to a want of experience, and some mismanagement, Mr. Allen was not very successful with his early crop of worms; but the later hatchings of which he has an immense number now feeding, appear very promising. Some were beginning to spin when we were there. The cocoonery is fitted up with Morris' Frames, which undoubtedly combine more advantages than any other contrivance for feeding silk worms. Mr. Allen is so well convinced of their utility, that he has

become joint proprietor with Mr. Morris for the right of all the districts of Western New York lying west of the Genesee River.

The mulberry plantations and nurseries of Mr. Allen far exceeded our expectations. He had no estimate of the exact number of trees, but thinks there is over 200,000. They embrace the *M. alba*, *M. multicaulis*, and several other varieties. Mr. Allen has collected a vast fund of information on the subject of silk culture, and appears to take pleasure in communicating it to others.

The Farm of Mr. S. D. Baldwin

Was the next place we visited. It consists of 190 acres of very superior land, only half a mile from the village of Brockport, on the south west side. Mr. Baldwin is very successful in the culture of wheat, Indian corn, and other ordinary crops; but what most attracted our attention was 17 acres of broom corn.—This was of an unusually fine growth, very tall and thick, and being just in full head, it presented a most luxuriant spectacle. Mr. B. has long been in the practice of raising broom corn, and making brooms. It affords profitable employment for the winter months. We found another somewhat unusual crop on this farm, but we doubt whether the owner deserves much credit for it, although it looked very promising, for it was nothing but weeds—yes, and the vilest of all weeds—*Tobacco!* Mr. B. is quite confident that this crop can be raised with advantage on his land; but we shall not be surprised nor sorry if he is disappointed when he brings it to market.

In horticulture, Mr. Baldwin is sadly deficient; but we think he must be something of an amateur in *floriculture*, for we observed many curious if not rare plants in his flower garden in front of the house; such for instance as *Phytolacca decandra*, (Poke weed,) *Rumex sanguinea*, (Dock,) *Chenopodium rhombifolium*, (Pig weed,) &c. &c.

After we had partaken of the hospitalities of his table, Mr. Baldwin conveyed us to Clarkson, where we took a stroll over the large and beautiful

Farm of Dr. Abel Baldwin.

His land extends from the Ridge Road to more than a mile in extent on the plain below. The soil is generally good, though much of it is rather heavy. It formerly produced large crops of wheat, but Doct. B. says it has lost much of its wheat growing properties, and he now intends to try the effects of lime and deep ploughing. If he can obtain a good *subsoil plough*, he promises to give it a trial. He is doing considerable at under-draining, and says he has observed that the heaviest wheat is produced where the earth has been thrown out in making drains; an argument which we have before adduced in favor of deep ploughing on such lands. Dr. B. keeps a large number of cattle, and cuts much grass. On his largest meadows he has adopted a system of

Irrigation

Which he finds of great advantage particularly in dry seasons like the past. A stream formed by a waste-water in the canal, runs through his farm, and when required a portion of the water is conducted on to the meadow in such a manner as to submerge nearly the whole surface; from which it is again conducted when necessary by opening several drains. We wonder that irrigation is not more practiced in this country, especially in places such as we often see, where it could be done with trifling expense. In England notwithstanding the moisture of the climate, irrigation is much practiced and found to be of great advantage.

Dr. Baldwin has a fine collection of cattle consisting both of improved and common breeds. A lot of steer and grade heifers struck us as being very beautiful. His cows are also very fine, both of improved and selected common stock.

Disease Among Calves—Inquiry.

Dr. Baldwin informed us that in the month of August he lost twelve very fine calves about three months old, by a strange kind of epidemic that attacked them; the cause and cure of which neither he nor his neighbors understood. The calves were very large and thrifty; all sucked the cows, and gave no evidence of ill health till they suddenly became dumpy, refused to suck, and in 24 hours died. On removing the skin large black spots were seen on the body; and on examination the second stomach was found to be dry and hard. We presume some of our readers can throw light on this subject, and hope they will do so.

A Large Grape Vine.

In his fruit garden Dr. Baldwin has the largest and most productive grape vine we have ever seen in this country. It is an American variety called Winne, resembling the Isabella. The branches run along a trellis and over the tops of several fruit trees, covering a space we should judge, of at least forty feet square. We tried to make an estimate of the number of clusters of fruit but time and our patience failed us. We guessed there were about 2000; they are not as large as the foreign varieties.

Lime as a Manure.

Lime has been considered the foundation of all good husbandry; for where it is not found naturally in the soil in sufficient abundance, it has generally been the task of the good husbandman to supply the deficiency.

It may be doubted however, whether lime is the only mineral capable of rendering soils perpetually fertile. The black sandy prairies of the Western States seem to furnish an exception. We have formerly stated our views on this subject, and now repeat them in the hope of inducing some able chemist to furnish an accurate analysis.

Much of the prairie on the east side of the Wabash river, which includes the town of Vincennes, was a common when we visited that place in 1816; and had probably been in that condition for more than a century. In many places, it was entirely bare—in others covered by coarse grass or perennial weeds; but wherever it was cultivated, the vegetation was most luxuriant. The soil appears nearly black, but glistening in the sun. This reflection is from the white sand which constitutes a large proportion, while the dark color is derived from the finely divided matter. On treating it with diluted muriatic acid, we discovered no effervescence, and concluded it contained no carbonate of lime. When burnt, it was scarcely diminished in quantity, showing it contained but little carbon or vegetable matter. By this process, however, it was changed from black to a reddish cast; and we inferred that the fertilizing principle was a mineral, and probably a sulphuret, but our examination extended no further.

These tracts however, form but a very small portion of the country; and we recur to lime as the general fertilizer. We intend not indeed to discuss the subject at large, but simply to point to errors that agriculturists have sometimes adopted.

Lime should always be applied in the form of powder; and it matters not whether the reduction of the ore to this state, be performed by *grinding* or *burning*; but the latter method being the easier, has been generally adopted. It is true there is a great difference between the comminuted stone and quick lime, justacked, but the latter when spread out on the ground becomes carbonated so speedily, that both have the same effect, as manures. A solution of quick lime is of no particular use in agriculture; an intimate intermixture with the soil is the principal thing; and to prevent its becoming clotted, a most useful precaution.

The grind magnesian limestone, if practicable, would

be far preferable to burning it; because in that case, neither the lime nor the magnesia would be caustic. When it is burnt, however, the beneficial effects of the caustic magnesia (hot lime) may be avoided by scattering it in powder, over meadows or pastures at least one summer before they are to be broken up. Falling amongst the decaying blades of grass, which omit carbonic acid, the magnesia bubbles it and becomes mild, which it would fail to do on a bare soil, as it attracts that acid more freely than lime, and the latter of course, must be always served first.

Lime loses none of its qualities as a manure by old age or exposure to the weather. Hence the refuse that collects round lime-kilns, is well adapted to the farmer's use, and the value of the mass will be regulated by its freedom from small stones and other impurities. On the same principle, the plaster from old walls and ceilings, should never be thrown into the road; but broken up with a pounder, and applied to the garden, the field, or the meadow. It is a valuable manure, and more especially for heavy soils. †

Blossom Buds perishing in Winter.

A correspondent wishes to know why the blossom buds of the peach and apricot perish in winter? and also, if there is any way to prevent such loss?

A flowing of the sap late in autumn, or in winter, followed by intense cold, has long been considered as the cause of this damage; and we have no doubt of its being the true cause; for these buds can endure a very low temperature, if they are not started by unreasonable warmth. We have no knowledge that they have ever been killed in this condition, by the severest cold of this climate—perhaps ten or fifteen degrees below zero; and in the elevated region between the Susquehanna and the Delaware, they have probably endured a depression of ten degrees more. Our coldest winters, when not interrupted by thaws, have generally, if not always, been succeeded by fruitful seasons.

In the winter of 1831-2, the snow drifted around each tree in our fruit garden, so that one low limb was entirely buried. This rough weather was succeeded by a thaw soon after New Years, and the thaw very intense cold. Peaches were very scarce in the following season. The highest limbs—the very top—which the reflected heat from the ground could scarcely reach—had a few, while the limb which was buried in the snow, was loaded down with fruit.

The same effect was produced on a limb that rested on the roof of a building, and was covered up in a drift. The warm winds that started the other buds, passed over without touching, and left it torpid.

On bleak northern aspects, we believe the peach tree is generally productive in this climate; and we explain the following cases on the same principle:—For many years, we resided in a wide valley bounded on two sides by high hills. In the valley, the peach tree was a certain crop; but on the hills it rarely failed.

A careful observer who lived in a more sheltered valley of the same district, assured us that the peach tree with them was unfruitful as often as six years out seven. In valleys, the temperature is more variable than on the hills—warmer at one time and colder at other; for it has been ascertained that in severe but calm weather, the cold air settles down in the lowest places.

Last winter was milder than usual; and yet we had our shrubs more injured than in seasons of intense cold. It appears that in these shrubs the sap had started, and the sharp frosts that followed were destructive to a part of their branches. Amongst these, were Purple Fringe trees, and the Pyracantha; but *Forsythia pterygoides*, from a Syria, more tender than the other, escaped with out any injury, and is now producing fruit for the first time.

The Antwerp Raspberry may also be mentioned, which with us is generally hardy; but at Marietta, in Ohio, more than three degrees further south, "it requires to be laid down every autumn," says Doctor Hildreth, "and covered with earth or straw to protect it from the freezing and thawing of our variable winters. Plants which stand under the north side of a fence or a building, bear the winter in a manner un-harmful. This is also the case with the Madeira grape vine, and Greville rose, both of which are killed if exposed to the mid-day sun of winter, but live uninjured if grown in a northern shaded exposure."*

Treading down the snow so as to accumulate a compact mass round the tree, and then covering it with straw, has been found useful. We have seen an apple retarded in its vegetation for a fortnight in the spring, by piling wood round it; but the weather here is so variable and uncertain, that what was useful in one season, may be useless in another. †

Importance of Color—Painting Wagons, &c.

The importance of dark and light surfaces, is, we believe, but little appreciated in an economical point of view. The difference between rough or darkened, and polished metallic surfaces, in absorbing and radiating heat, is familiar to every student in chemistry. A housewife would be considered ignorant, who did not know that bread would bake more rapidly on an old or blackened metallic dish, than on a new or bright one; that water boils more slowly in a bright tea-pot, than in any other; that a stove pipe of Russia iron heats a room less than a pipe of common or rough iron; that water can scarcely be made to boil in a new tin vessel, with a charcoal fire, until its bottom becomes blackened with smoke;—all of which plainly show the rapid absorption and radiation of heat by rough and blackened surfaces, and the reverse by bright or reflecting ones.

The influence of color alone, on absorption, is most strikingly exhibited in case of solar heat. Bodies of a black color, are found soon to become heated in the sun, while white ones are scarcely affected. This important fact should be borne in mind, in the preservation, by paint, of all implements or machines of whatever kind, which may be injured by the action of the sun's rays. Wagons and carriages, especially, which during use must necessarily be more or less exposed, should always be of some light color. A carriage of a light yellow or ash color, is almost inconceivably less heated, cracked, and warped, than one of a dark brown or black. And however unfashionable such light colors may be, we have no doubt that if vehicles generally, were painted with such, that many thousands of dollars would be saved annually, by preventing one of the most powerful causes of weakness and decay in these costly appendages to every man's domestic establishment. *

A Visit to Wm. C. Cornell's

We made a visit some days ago to the farm of our friend Cornell in the south part of the town of Henrietta, about seven miles from this city. Mr. C. was formerly a merchant in the city of New-York, but his business not being favorable to his health he left the city and turned his attention to farming. In selecting a location we think he manifested good judgment as well as taste; and in the arrangement and general management of his farm we see good evidence that the systematic mind of the merchant is no disadvantage to the farmer. The dwelling house is in good keeping with the farm; every thing within and around giving an air of comfort and refinement. Mrs. C. although brought up in the city appears to be quite at home, and well contented with a country life. We could discover nothing wanting except a better garden, to

make the place all that any reasonable man could wish.

The farm consists of 100 acres of excellent land, beautifully undulating, and well watered with springs. It is divided off into 8 or 10 small fields, and all well cultivated. Mr. C. is very successful in raising wheat, and his practice is somewhat peculiar. He has promised to furnish our readers an account of his experience in this business, and also in raising Indian corn, of which we saw a remarkably fine field. We advised him to offer his corn crop in competition for the county premium, and if he does so we think he will gain it.

In farm stock Mr. Cornell has a very choice, though not very large collection, embracing the most approved breeds of cattle sheep and swine—Here we see the true system exemplified—a small farm, in small fields highly cultivated, with a limited amount of stock of the best breeds. This is what we call *orthodox farming*. The sheep in particular, struck us as being very superior. He has nearly one hundred head, part pure Cotswold, and the others $\frac{2}{3}$ ths or $\frac{3}{4}$ ths blood, crossed with the Leicester. We regret that Mr. C. did not make arrangements to take his thorough bred sheep to the Fair at Syracuse, but the distance, and the difficulty of procuring a boat to take them prevented. He is fully convinced that the Cotswold sheep are the most profitable breed for our farmers.

By an advertisement on our last page it will be seen that Mr. Cornell offers to dispose of part of his stock, and we advise those in this region who wish to purchase to go and see them.

Crops in South Venice in 1841.

WHEAT.—This crop is not as good as last season. I think it cannot be called more than half of an average yield; the berry is fine however. Many fields of wheat were nearly destroyed by the Stein Crot (Red Rot) which is making ruinous inroads upon us. Spring wheat was but little sown this year, and did not turn out well.

GRASS.—More grass was cut in this town this year, I think, than last. The rain in May gave the meadows such a start as to prevent the subsequent drouth from seriously effecting the crop.

CORN looks very good, considering the season. The dry weather however has so affected it that our farmers will not probably have more than enough for their own consumption; consequently the price must be high.

PEAS.—This crop is very good—better than last season. A larger quantity than usual were sown this year—Many farmers prefer them to corn for fattening pork.

OATS have done well this year—I think they will yield better than last season.

BARLEY is good, what little was sown. BECKWHEAT was but little sown, but looks well—will be a good crop if not injured by frost.

FLAX—The cultivation of this crop is nearly abandoned, owing to the labor required in manufacturing the cloth. What little was sown looks very well.

POTATOES were much injured by the drouth, and will not yield well, however there will be enough for our own consumption.

ROOT CROPS generally will fall much below an average yield; but are not very extensively raised here.

FRUIT is very plenty, save peaches. I think there is more fruit than last year. On the whole I think the crops in this region are as good as in any other part of Western New-York; and we have abundant reason for gratitude to Him who has given us these necessaries and comforts of life.

Respectfully yours,

W. S. TOWN

*Hort. Magazine of Henrietta, p. 7.

On the Moisture of the Soil.--Watering.

We presume that almost every cultivator of the soil in this country, has, during the past season, felt the need of more knowledge respecting the operation and effects of moisture on vegetation. It is a subject which every farmer and gardener should fully understand; we therefore bring it before the minds of our readers while they realize its importance. The following article is from "Lindley's Theory of Horticulture, with notes by A. J. Downing and Dr. Gray"—It is not long—read it carefully.

It has already been shown that water is one of the most important elements in the food of plants, partly from their having the power of decomposing it, and partly because it is the vehicle through which the soluble matters found in the earth are conveyed into the general system of vegetation. Its importance depends however, essentially upon its quantity.

We know, on the one hand, that plants will not live in soil which, without being chemically dry, contains so little moisture as to appear dry; and on the other hand an excess of moisture is, in many cases, equally prejudicial. The great points to determine are, the amount which is most congenial to a given species under given circumstances, and the periods of growth when water should be applied or withheld.

When a plant is at rest, that is to say, in the winter of northern countries and the dry season of the tropics, but a small supply of water is required by the soil, because at that time the stems lose but little by perspiration, and consequently the roots demand but little food; nevertheless, some terrestrial moisture is required by plants with perennial stems, even in their season of rest, because it is necessary that their system should, at that time, be replenished with food against the renewal of active vegetation; hence, when trees are taken out of the earth in autumn, and allowed to remain exposed to a dry air all the winter, they either perish or are greatly enfeebled. If, on the other hand, the soil on which they stand is filled with moisture, their system is distended with aqueous matter at a time when it cannot be decomposed or thrown off, and the plant either becomes unnaturally susceptible of the influence of cold in rigorous climates, or is driven prematurely into growth, when its new parts perish from the unfavorable state of the air in which they are then developed. The most suitable condition of the soil, at the period of vegetable rest, seems to be that in which no more aqueous matter is contained than results from the capillary attraction of the earth particles.

Nevertheless, there are exceptions to this, in the case of aquatic and marsh plants, whose peculiar constitution enables them to bear with impunity, during their winter, an immersion in water; and in that of many kinds of bulbs, which, during their season of rest, are exposed to excessive heat. The latter plants are, however, constructed in a peculiar manner; their roots are annual, and perish at the same time as the leaves, when the absorbent organs are all lost, so that the bulb cannot be supposed to require any supply of moisture, inasmuch as it possesses no means of taking it up, even if it existed in the soil. This will be again adverted to in a future chapter.

It is when plants are in a state of growth that an abundant supply of moisture is required in the earth. As soon as young leaves sprout forth, perspiration commences and a powerful absorption must take place by the roots, the younger the leaves are the more rapid the perspiratory action; their whole epidermis must, at that time, be highly sensible to the stimulating power of light; but as they grow older their cuticle hardens, the stomatae become the only apertures through which vapor can fly off, and by degrees even these apertures are either choked up, or have a diminished irritability. As a general rule, therefore, we are authorized to conclude that the ground should be abundantly supplied with moisture when plants first begin to grow, and that the quantity should be diminished as the organization of a plant becomes completed. There are, however, some especial cases which appear to be exceptional, in consequence of the unnatural state in which we require plants to be preserved for our own peculiar purposes. One of the effects of an extensive supply of moisture is to keep all the newly formed parts of a plant tender and succulent, and therefore such a constant supply is desirable when the leaves of plants are to be sent to table, as in the case of spinach, lettuce, and other oleaceous annuals. Another effect is, to render all parts naturally disposed to be succulent much more so than they otherwise would

be; thus we find market gardeners deluging their strawberry plants with water while the fruit is swelling, in order to assist in that, to them, important operation. While, however, in this case, the size of the fruit is increased by a copious supply of water to the earth, its flavor is, in proportion diminished; for, in consequence of the rapidity with which the strawberry ripens, and perhaps the obstruction of light by its leaves, the excess of aqueous matter taken into the system cannot be decomposed, and formed into those products which give flavor to fruit; it must necessarily remain in an unaltered condition.

It is for the reason just given, that the quantity of water in the soil should be diminished when succulent fruit is ripening; we see this happen in nature, all over the world, and there can be no doubt of its being of great importance. Not only is the quality of such fruit impaired by a wet soil, as has just been shown, but because of its low perspiratory power the fruit will burst from excess of moisture, as occurs to the plum and grape in wet seasons. The melon, although an apparent exception to this rule, is not really so; that fruit acquires its highest excellence in countries where the roots are always immersed in water, as in the floating islands of Castile, the irrigated fields of Persia, and the springy river beds of India. But it is to be remembered that the leaves of this plant have an enormous respiratory power, arising partly from their large surface, and partly from the thinness and consequent permeability of their tissue, so that they require a greater supply of fluid than most others; and, in the next place, the heat and bright light of such countries are capable of decomposing and altering the fluids of the fruit with a degree of rapidity and force to which we here can have no parallel. In this country the melon does not succeed if its roots are immersed in water, as I ascertained some years ago in the garden of the Horticultural Society, by repeated experiments. Melons were planted in earth placed on a tank of water, into which their roots quickly made their way; they grew in a curvilinear iron hot house, and were trained near to the glass, and consequently were exposed to all the light and heat that can be obtained in this country.—They grew vigorously and produced their fruit, but it was not of such good quality as it would have been had the supply of water to the roots been less copious. Thus, in the tropics the quantity of rain that falls in a short time is enormous; and plants are forced by it into a rapid and powerful vegetation, which is acted upon by a light and temperature bright and high in proportion, the result of which is the most perfect organization of which the plants are susceptible; but, if the same quantity of water were given to the same plants at similar periods in this country, a disorganization of their tissue would be the result, in consequence of the absence of solar light in sufficient quantity.

The effect of continuing to make plants grow in a soil more wet than suits them is well known to be not only a production of leaves and ill-formed shoots, instead of flowers and fruit, but if the water is in great excess, of a general yellowness of appearance, owing, as some chemists think, to the destruction by the water, of a blue matter which, by its mixture with yellow, forms the ordinary verdure of vegetation. If this condition is prolonged, the vegetable tissue enters into a state of decomposition, and death ensues. In some cases the joints of the stem separate, in others the plant rots off at the ground, and all such results are increased in proportion to the weakness of light, and the lowness of temperature. De Candolle considers that the collection of stagnant water about the neck of plants prevents the free access of the oxygen of the air to the roots; but it seems to me that much more mischief is produced by the coldness of the soil in which water is allowed to accumulate. It seems also probable that the extrication of carburetted hydrogen gas is one cause of the injury sustained by plants whose roots are surrounded by stagnant water; but upon this point we want much more satisfactory evidence than we yet possess.

It is because of the danger of allowing any accumulation of water about the roots of plants that drainage is so very important. In very bibulous soils this contrivance is unnecessary; but in all those which are tenacious or which, from their low situation, do not permit superfluous water to filter away freely, such a precaution is indispensable. No person has ever seen good fruit produced by trees growing in lands imperfectly drained; and all experienced gardeners must be acquainted with cases where wet unproductive borders have been rendered fruitful by contrivances which are only valuable because of their efficiency in regulating the humidity of the soil. Mr. Hiver (*Gard. Mag.* v.

60) speaks of the utility of mixing stones in great quantities with the soil, "as they prevent the accumulation of water in very wet weather, and retain sufficient moisture for the purpose of the plant in dry seasons;" and, when we hear of such precautions as are detailed in the following good account of preparing a vine border we only learn how important it is to provide effectually for the removal of superfluous water from around the roots, and how useless a waste of money is that which is expended in forming deep rich beds of earth.

"In preparing a vine border," says Mr. Griffin, of Woodhall, a successful grower of grapes, "one foot in depth of the mould from the entrance is cleared out from the whole space; a main drain is then sunk parallel to the house, at the extremity of the border, one foot lower than the bottom of the border; into this, smaller drains are carried diagonally from the house across the border. The drains are filled with stone. The cross drains keep the whole bottom quite dry; but if the soil be gravel, chalk, or stone, they will not be necessary. The drainage being complete, the whole bottom is covered with brick, stone, or lime rubbish, about six inches thick, and on this is laid the compost for the vines." (*Hort. Trans.* iv. 100.)

The practice of placing large quantities of potsherds or broken tiles at the bottom of tubs, or pots or other vessels in which plants are rooted, is only another exemplification of the great necessity of attending to the due humidity of the soil, and the prevention of stagnant water collecting about the roots; and the injury committed by worms, upon the roots of plants in pots, is chiefly produced by these creatures reducing the earth to a plastic state, and dragging it among the potsherds so as to stop up the passage between them and destroy the drainage.

One of the means of guarding the earth against an access on the one hand, and a loss on the other, of too much water, is by paving the ground with tiles or stones; and the advantage of this method has been much insisted upon. But it is certain that, in cold summers at least, such a pavement prevents the soil from acquiring the necessary amount of bottom heat; and it is probable that, what with this effect, and the obstruction of a free communication between the atmosphere and the roots of a plant, the practice is disadvantageous rather than the reverse.

More commonly recourse is had to the operation of simple watering, for the purpose of maintaining the earth at a due state of humidity, and to render plants more vigorous than they otherwise would be; an indispensable operation in hot houses, but of less moment in the open air. It is indeed doubtful whether, in the latter case, it is not often more productive of disadvantage than of real service to plants. When plants are watered naturally, the whole air is saturated with humidity at the same time as the soil is penetrated by the rain; and in this case the aqueous particles mingled with the earth are very gradually introduced into the circulating system; for the moisture of the air prevents a rapid perspiration. This operation is usually performed in hot dry weather, and must necessarily be very limited in its effects; it can have little if any influence upon the atmosphere: then, the parched air robs the leaves rapidly of their moisture, so long as the latter is abundant; the roots are suddenly and violently excited, and after a short time the exciting cause is suddenly withdrawn by the momentary supply of water being cut off by evaporation, and by filtration through the bibulous substances of which soil usually consists. Then again, the rapid evaporation from the soil in dry weather has the effect of lowering the temperature of the earth, and this has been before shown to be injurious (p. 113;) such a lowering, from such a cause, does not take place when plants are refreshed by showers, because at that time the dampness of the air prevents evaporation from the soil, just as it prevents perspiration from the leaves. Moreover, in stiff soils the dashing of water upon the surface has after a little while the effect of "padding" the ground and rendering it impervious, so that the descent of water to the roots is impeded, whither it is communicated artificially or by the fall of rain." It is, therefore, doubtful whether arti-

* Glazed flower-pots are totally unfit for most plants, except with the most careful attention to drainage, and even then they are much inferior to common unglazed ones. The latter permit the excess of water to escape through their porous sides, which is impossible in the glazed pot; in which, if the drainage at the bottom become stopped, the earth is soaked with water, the plant suffers and soon perishes. A. J. D.

† No tree is more common in this country than *unfucul-watering* newly transplanted trees; and we do not hesitate to affirm that full one half the failures, in our dry summers, arise from this injudicious practice. By pouring water daily

ficial watering of plants in the open air is advantageous, unless in particular cases; and most assuredly, if it is done at all, it ought to be much more copious than is usual. It is chiefly in the case of annual crops that watering artificially is really important; and with them, if any means of occasionally deluging ground can be devised, by means of sluices or otherwise, in the same way as we water meadows, it may be expected to be advantageous. Mildew, which is so often produced by a dry air acting upon a delicate surface of vegetable tissue, is completely prevented in annuals by very abundant watering. The ravages of the *botrytis effusa*, which attacks spinach; of *acrosporium moniloides*, which is found on the onion; and the mildew of the pea, caused by the ravages of *crysiphe communis*, may all be stopped, or prevented, by abundant watering in dry weather. Mr. Knight first applied this fact to the securing a late crop of peas for the table in the following manner:—

The ground is dug in the usual way, and the spaces which will be occupied by the future rows are well soaked with water. The mould upon each side is then collected, so as to form ridges seven or eight inches above the previous level of the ground, and these are well watered; after which, the seeds are sowed, in single rows along the tops of the ridges.—The plants very soon appear above the soil, and grow with much vigor, owing to the great depth of soil and abundant moisture. Water is given rather profusely once in every week or nine days, even if the weather proves showery; but, if the ground be thoroughly drenched by the autumnal rains, no further trouble is necessary. Under this mode of management, the plants will remain perfectly green and luxuriant till their blossoms and young seed vessels are destroyed by frost, and their produce will retain its proper flavor, which is always taken away by mildew.

The Flowers of Summer.

The following article was prepared by our friend Dr. ALEXANDER THOMPSON of Aurora, Cayuga Co. (who has one of the neatest gardens in the country); but it was received too late for insertion in our last number. We hope he will continue his contributions to our columns.—Eds.

After the interesting monthly observations on Floriculture, given to the public in your columns, an apology may seem due for introducing to your notice a few

on the top of the ground, under a powerful sun and strong wind, the surface becomes so hard that access of air to the roots is almost precluded; and the water rarely penetrates more than a couple of inches: while the operator imagines he is supplying the thirsty roots with abundant moisture, he is doing them an injury by the application of a very transient stimulus, which is followed by an increased sensibility to the drought. In late spring planting, it is always preferable to water abundantly in the hole, while planting the tree, before filling in the upper layer of soil. This will in most cases suffice, until the tree becomes sufficiently established by the emission of new rootlets to support itself; and also serves to ensure its growth by filling up all the small hollows around the lesser fibres. In seasons of continued drought, when it becomes absolutely necessary to water flagging trees, two or more inches of the surface soil should always be removed, the trees watered copiously, and the earth replaced before the surface dries. This will prevent evaporation and the encrusting of the ground, and the moisture will be retained for a much longer period.—A. J. D.]

*[In the vicinity of Liegen (a town in Nassau) from three to five perfect crops of grass are [annually] obtained from one meadow; and this is effected by covering the fields with river water, which is conducted over the meadow in spring by numerous small canals. This is found to be of such advantage, that supposing a meadow not so treated to yield 1000 lbs. of hay, then from one thus watered 4-5000 lbs. are produced. In respect to the cultivation of meadows, the country around Liegen is considered to be the best in all Germany." Liebig, *Organ. Chem.* p. 105.—A. G.]

*[The mildew which attacks the young fruit of the foreign grape, when reared in the open air, is one of the most troublesome to the cultivator in this country. An effectual remedy is the flowers of sulphur dusted over the bunches with a dredging-box (or the solution applied with a syringe,) when the grapes are of the size of small peas. But the most certain prevention of this, as well as most diseases to which plants are subject, consists in keeping the vines in a thrifty and vigorous condition. The first crop or two of a young and thrifty vine is almost invariably fine and free from mildew; but every subsequent year (if the common mode of pruning is followed,) as the plant grows older, the proportion of fair fruit is smaller, until at last nothing but shrivelled and mildewed bunches are seen. By laying down half of the long shoots of each vine annually, thus forming new plants, and never allowing the same to bear more than two years, a full crop, free from rust or mildew, may be obtained annually. Even the finer sorts, as the Isabella, are sometimes liable to mildew on old vines: when this occurs, they should be headed back, to bring up a supply of young wood, and plentifully manured. The young and thrifty shoots will then have sufficient vigor to withstand the attacks of mildew, to which the enfeebled fruit produced by the old wood is so liable.—A. J. D.]

ants with whose phenomena you may already be familiar. But I trust the "lover of flowers" will never become weary with even a refusal of any thing relating to the successful culture or peculiarities in the structure of rare and beautiful plants.

Calandrinia grandiflora. Having for the first time proved successful in the culture of this interesting plant, for the encouragement of those who have met with like failures I am disposed to offer some observations on the probable cause of my success, the repetition of which, if followed by similar favourable results will introduce to the florist one of the most beautiful ornaments of the garden. Most plants of the genus *Calandrinia* are natives of California, and like many products of warmer regions than our own, this species shows itself ill qualified to endure the influence of our burning suns. So far as relates to the trial made by myself, the whole secret of success seems to have depended upon a rich soil, a sufficiency of moisture, and a shady situation; the first consisting of a compost formed of equal parts of well rotted manure, decomposed vegetable matter from the woods, and coarse sand. Under these circumstances, during the whole of the past month, while other plants were suffering or entirely destroyed by the excessive drought, a succession of these beautiful flowers excited the admiration of every beholder.

Verbena. The introduction into Floriculture of this unique and attractive genus of plants, is daily demonstrating that by this accession to the garden, is added one of its brightest gems. The facility with which new species may be produced from the seed, places in the power of every one, an opportunity for making choice collections, blending in their varied forms every variety of the most brilliant colouring. Few flowers require less pains for their successful treatment. Professor Russell remarks "that a hot sun, poor soil, and open air are the best means of cultivating them,"—three requisites which most gardens are capable of furnishing. Indeed, during the excessive drought of the past month, while most of the occupants of the parterre were struggling for existence, with a burning sun above, and the perched earth beneath, the *Verbena* daily exhibited its dense corymbs of brilliant flowers, in the bright sunshine, almost painfully dazzling to the eye.

DOUBLE FLOWERS. The appellation *monster*, by which botanists have been pleased to designate those flowers, which under peculiar circumstances of soil, cultivation &c. are disposed to undergo transmutations or conversions from one organ to another, and thus to assume new and varied forms,—in some instances would seem to be misapplied, for among flowers of this character we refer for many of the choicest specimens of Flora's kingdom.

From this indiscriminate appellation of the term, I have been the more disposed to dissent since observing a few mornings past a splendid specimen of the Double Tiger Flower (*Tigridia paronia*.)

The characteristics of the original plant, so far as colour, form of petals, &c. were preserved. In other respects every organ of the flower was double, the twelve expanded petals arranged systematically as in the single plant, and presenting a beautiful star shaped flower of almost unequalled magnificence.

I am not aware that this tendency to the multiplication of organs is frequent in plants of this genus. On the contrary, I am inclined to think that the occurrence is very rare, though not an unimportant event in the ARTIFICIAL CLASS to which plants of this genus belong.

Wool in Michigan.—In conversing, this morning, with a friend from Tecumseh, Mich., engaged in the manufacture of Cloth, we were informed that the *Wool-growing* business is more extensive, in the

state, this year, than in former seasons. He says the location and character of Michigan is peculiarly well adapted to successful engagement in that business; and thinks that Wool will soon be a leading and important article of export from that fertile and beautiful state. Wheat-growing and sheep raising work admirably well on the same premises.

We have noticed, in reporting the lake trade, that some fair quantities of wool have been shipped down the lake from the Peninsula state. May her prosperity be commensurate with her industry and economy; and let all be proportioned to her natural advantages and soon no state may say "come ahead."—*Rochester Evening Post.*

Planting Orchards--Peddling Fruit Trees.

The great demand which has existed for fruit trees in newly settled parts of the country, has given rise to a system of imposition, in the shape of peddling, which demands exposure; for it results in loss and disappointment to thousands of unsuspecting persons, who purchase trees in this manner, hoping to improve their premises.

In the spring of the year, particularly, enormous loads of fruit trees may often be seen passing through the country, on a tour of two or three weeks, without even the slightest provision being made to preserve their vitality—tied up like so many bundles of brushwood, their roots exposed to the full action of the sun, winds, or frosts, as though they were completely imperishable; whereas a few hours exposure is often enough to destroy all the *fibrous roots*, so essential to the life and growth of the tree. It is indeed surprising that any man of ordinary intelligence, especially any cultivator of the soil, should be so ignorant of the first principles of vegetable physiology, as to expect trees thus treated, or rather maltreated, to live and thrive.

But a few days ago we were conversing on the subject of planting trees, with a gentleman from Canada, where this peddling system is practised considerably; he said that he and many of his neighbors had planted apple orchards year after year, but with very little success—not more than one third of the trees lived, and they might as well have died, for all the progress they have made. We asked him how he procured his trees; he replied, from a man who was peddling them. This at once explained the cause of his ill success. Partial failures frequently occur from unskilful planting and other adverse circumstances, but in the case we have related, and all similar cases, the trees were in fact dead before they were planted.

The man who digs up trees and sends them about the country in this manner, palming them off upon the community in a ruined condition, is guilty of a willful violation of the laws of common honesty and fair dealing, and should be regarded as little better than a pickpocket.

But there is an argument of a pecuniary character in favor of purchasing from these pedlars:—they usually sell their trees at a lower price than regular nurserymen. Enough has been said to show the fallacy of this economy. But it may be asked why can these pedlars sell lower than regular nurserymen? Because their trees are raised in a cheap and careless manner, without proper regard being paid to the kind or quality of the fruit; cultivating those kinds which come easiest to hand and produce the most rapid growth of wood; while in nurseries where there is a reputation at stake, and responsibility is assumed, the reverse of this is the practice, and in consequence of the extra expense incurred in keeping all correct, and in procuring new and valuable varieties from a great distance, the prices must be somewhat higher.

We may hereafter have occasion to expose the misconduct of some professed regular nurserymen; but, one thing at a time, is our motto. O. P. Q.

ROCHESTER, OCTOBER, 1841.

Agricultural Exhibitions.

This is the month of the Farmers' Holidays—the month in which the producers—the true nobility of our land, will meet together for mutual pleasure and improvement. On these occasions the best productions of the soil, the finest animals, the most approved implements, and the most skilful ploughing may be seen by all. No farmer can witness these exhibitions without learning something by which he can improve his practices of husbandry. Let all therefore, attend—and let all feel it to be their duty to do something to give interest to the occasion. And here we perceive there is apt to be misapprehension in the minds of many. They appear to think that any article to be fit for exhibition must be of great size. But to size the principal thing to be regarded by committees at our Fairs? Is the largest calf, the largest hog, or the largest cabbage invariably the best? By no means. On the contrary those of ordinary size are most frequently the most perfect in form or in quality. Let the committees remember this; and let farmers who have fine animals or productions, bring them forward.

The Fair in this State has opened with a grand *Mas Meeting* at Seneca. We hope the thousands of farmers who were there will repay the right spirit to their friends and neighbors; and that all will unite to give life and interest to the county exhibitions. The whole country—especially the *Empire State*—is now *itching up* on this subject, and we believe the results will be such as will convince every one of the usefulness of agricultural societies and of the wise policy of our Legislature in granting them encouragement.

The officers and town committees of the county societies should consider that the efficiency and usefulness of the society mainly depends upon them. The exhibitions are now close at hand and vigorous efforts should be made to obtain members and funds, and persuade farmers to bring their animals and productions to the Fairs.

We regret that more perfect information respecting the societies in this State and elsewhere, has not been furnished us. We are proud of Western New-York, however—our *Genesee County* has organized nobly—and we are sure the exhibitions will do her honor.

The following is a list of the place and time of holding the Fairs in the counties from which we have definite information:

Ontario County, at Cananahgou, Oct. 12th.
Genee " " " Alexander, Oct. 13th and 14th.
Madison " " " Rochester, Oct. 15th and 16th.
Livingston " " " Cheesee, Oct. 22d.
Orleans " " " Alton, Oct. 14th.
Niagara " " " Lockport, Oct. 22d.
Essex " " " Buffalo, Oct. 6th.
Chautauque " " " Mayville, Oct. 13th and 14th.
Windsor " " " Newark, Oct. 16th.
Cayuga " " " Auburn, Oct. 13th and 14th.
Oswego " " " Oswego, Oct. 6th.
Oneida " " " ————, Oct. 20th.
St. Lawrence " " " Baldwinsville, Oct. 5th.
Putnam " " " Rayson, Oct. 21th and 22th.
Durham, Canada " " " Montreal, Oct. 19th.
Northumberland, Canada " " " Grand, Oct. 20th.

Books and Papers as Premiums.

We are glad to perceive that several Societies propose to award agricultural books and papers, instead of money, for the smaller class of premiums. We believe it will in general be quite as satisfactory and much more beneficial to the recipient. The Genesee county Society offers more than sixty copies of the *New Genesee Farmer*, together with other papers and books, in their list of premiums for their approaching Fair. We appreciate the compliment, Gentlemen Managers, and thank you our thanks.

Our acknowledgments are also due to the officers of the Niagara District Agricultural Society in Canada, or an order lately received for sixty copies. The Treasurer informs us that great good has been done to result from the circulation of our paper among the members of that Society—Thus it will always be.

New Agricultural Papers.

We find on our table quite a number of new 'Exchanges' seeking our acquaintance, some of which we have too long neglected. Almost every day affords us new and gratifying evidence of the increasing demand for agricultural reading; and convinces us that the time is fast approaching when no intelligent farmer in our land will consent to be without at least one paper devoted to his profession.

'*The Canadian Farmer and Mechanic*' is the title of a paper we are indebted to Kingston, August 16, 1841, by Garfield & Guel, proprietors. A. P. E. F. Garfield, Editor; 16 pages monthly, \$1 per annum; (rather smaller than this paper.) A well conducted and a well circulated agricultural paper in Canada, would doubtless exert a very beneficial influence on the prosperity of the province, and we wish this experiment success; at the same time, from our knowledge of the field and experience in the business, we apprehend no gentleman Garfield will find he has undertaken an enterprise of greater difficulty than he imagined.

Another Agricultural paper in Boston! S. W. Colt, formerly editor of the *Yankee Farmer*, has left that paper, and commenced a new one entitled the '*Farmer's Journal*,' a monthly sheet, half the size of this) price 50 cents a year. There are besides this, three weekly agricultural papers and one monthly horticultural, all apparently well sustained. Verily New-England agriculturists are a reading people, and no friend of 'book farming.'

'*The Kentucky Cultivator*' was commenced last winter, but stopped for the want of—subscribers. It has now recommenced and promises to continue—well done Mr. Vinden. It is a neat little monthly of 16 pages; \$1 per year.

'*The Plough Boy*,' is the title of a small semi-monthly sheet, published by Wm. F. Duriso, Edgefield Court House South Carolina, \$1.50 per year.

'*The Union Agriculturist*,' Chicago, Illinois. After a suspension of several months, arising from a difficulty with the printers, this valuable paper has again made its appearance—success to it.

'*The Western Farmer and Gardener's Almanac for 1842*—By Thomas Appleh, Editor of the *Western Farmer and Gardener*, Published by E. Lucas, Cincinnati.

A copy of the above work has been politely forwarded us by the author, and we have examined it with great satisfaction. It is a very neat duodecimo pamphlet of ninety-six pages, and contains, besides the usual calendar, &c., a large amount of very useful and interesting matter relating to agriculture, horticulture, and rural affairs, with numerous spirited engravings by Mr. F. Carter. The chapter on Swine contains 15 pages of excellent words due to the pen of the writer. Every farmer and gardener who has an op-

portunity, should procure this almanac; we presume it may be obtained at most of the booksellers in the west, and we shall advise the publisher to send some this way. The price is \$2 per dozen, or 25 cents single. It can be sent by mail if desired—the postage is 8 cents for less than 100 miles, and ten cents for any distance over 100 miles.

The following glance at the contents will give an idea of the variety and interest of the work:

Times of holding Courts in Ohio, Kentucky, Tennessee, Indiana and Illinois. Rates of postage, list of Agricultural periodicals. January—Life in the country, the garden, re-suscitating gold on cards, saving clover seed, the bee, farm ballads, &c. February—Sugar molasses, culture of corn, farm ballads, &c. March—Duck shooting, the farmer's garden, farm stock. April—The missing potatoes, the fruit garden and orchard, grafting, budding, causes of decay in peach trees, manure. May—The flower garden. June—The Poultry yard. July—Fourth of July frolic, picking, cure for murrain, vermion in cattle. August—Emigration to the west, traps, removing weeds and sprouts, sing-song in swain, horse cattle. September—The vintage. October—Cider making, the perch tree worm. November—A chapter on hogs. December—Wolf hunting on the ice, sowing grass seeds. E. grafting—S. (high) party, suburban lives, sugar corn, duck's coming in the pine swamps, building log houses, grafting, budding, young gardeners, the poultry yard, picnic party in the woods, party of immigrants, the vintage, cider making, peach trees, cut, hog killing, white Chin hog, Warren County, W. Va. do, White Berkshire do, Doctor Martin's braver pigs, and Berkshire barrow, 'Tom,' do, 'Pan of Lumber,' Lakeside cow, 'Marian,' S. Swiss boar, High grinner sow, do, boar, belt barrow, Neapolitan boar, thin lined sow, wolf hunting on the ice, and eleven amusing tail pieces.

P. S. Since writing the above, we have received from the publisher an invoice of the Almanacs and 'Bee-keeping in the West.' So that both of these works will soon be for sale at the Bookstore and Seed Store in this city, at \$2 per dozen, or 25 cents each—orders are solicited.

Our Friends in Canada.

The hearty welcome and genuine old-country hospitality which we usually meet with among the English and Scotch farmers in Canada, always makes us regret that our visits in that country cannot be longer and more frequent. While on a hasty tour in that province last month, we called at a pleasant cottage fronting the lake and surrounded by a beautiful garden, occupied by two English friends, one a bachelor, and the other with a better half from one of the best dairy districts in England. We had, on one or two former occasions been struck with the peculiar excellence and great variety of the table luxuries produced from her dairy. Two of these, 'Junket' and 'Clotted Cream,' are rarely met with in this country, although with some of us they may be associated with the happiest recollections of our childhood. At our request, our friend furnished us directions for preparing these dishes, which we give our readers.

TO PREPARE JUNKET.

Take one quart of milk warm from the cow, and stir in a tea-spoonful of rennet, and let it stand till curdled, which, if the rennet is of proper strength will be in about fifteen minutes; grate over it a little nutmeg, and sweeten with maple molasses or honey. It is an excellent dish for supper.

SCALDED, OR CLOTTED CREAM.

Take a pan of perfectly sweet milk, twelve hours old, with the cream on; stand it on a stove or furnace over a gentle fire till slightly scalded, when a ring will appear in the cream of the size of the bottom of the pan; then take it off and let stand till cold; skim off the cream and it is fit for use. When used as an accompaniment with fruit, nuts, &c., it is sweetened to suit the taste. This cream is esteemed a great luxury in England. It is brought in by dairy men and sold at a high price.

HATCH'S SOWING MACHINE.

We are happy in being able to lengthen to our readers a correct representation of Hatch's Sowing Machine—an invention which we firmly believe will prove of more benefit to the farming community than any other that has appeared of late years. The above drawing is so perfect that but little description is necessary. The machine consists of a pair of wheels of the size of ordinary carriage wheels; an axle 10 feet long, with a pair of shafts or the horse-draw by. Just in front of the wheels, and across the shafts is the hopper (A) feet long and capable of holding 3 or 4 bushels of grain. At the bottom of the hopper is a slide or agitator 1 inch square, lined with iron and having teeth on its sides, by the motion of which the grain is shaken out. The width of the slide, and the raise just in discharge of the seed, can be increased or diminished by means of set screws, as shown at B. When the machine is in operation a rapid rotary motion is given to the agitator by means of a small rod and crank (C) which is attached to one end of a small shaft 15 inches long, on the other end of which is a wheel (D) with cog or teeth meshing into the master wheel (E). The master wheel is bolted on to the inside of the spokes of the high wheel of the machine. It is 2 feet in diameter, and one revolution of it gives eight revolutions to the pinion wheel and shaft. On the top of the back part of the machine is a seat for the driver. A small cord is attached to the end of the pinion shaft, and reaches to the seat of the driver, by means of which he can readily put the machine out of gear, so as to stop the discharge of seed at any time when desired. The machine will sow all kinds of grain, grass seed and plaster, at any desired rate from one to as many bushels per acre. It is easily managed, and not liable to get out of order. A man or a smart boy with a horse, can sow from twenty to twenty-five acres with it in a day.

The inventor and proprietor of this machine has spent several years in testing and improving it, and he now introduces it to the public with the utmost assurance that it will fully meet the wants and expectations of the community. It is well

known that sowing is one of the most difficult and laborious operations of the farmer, and one which but few men can perform properly. Hence arises the need of a machine like this—one that will perform the work correctly, expeditiously, and with ease. All who have used this machine, agree in declaring that it answers the purpose exactly; and if we are not mistaken, it will in a few years be as uncommon to see a farmer sowing grain by hand in this country, as it now is to see one thrashing with a flail.

Mr. Hatch has lately been engaged in manufacturing a few machines in this city, in order to introduce them to the farmers of Western New York, but he cannot, nor does he wish to supply all orders, as his main object is to sell rights for others to manufacture. The price of the machine is \$30. He is willing to send two or three to Ohio and other Western States, if desired, in order to make them known there; and he hopes that all who feel an interest in the subject will examine them and satisfy themselves, before purchasing rights. To enterprising mechanics and others, he will sell County or State rights, on favorable terms. Letters addressed (post paid,) to James Hatch, Rochester, will receive attention.

Aware of the deception which is often practiced by means of Certificates and Recommendations, and being determined that this Machine shall recommend itself, the proprietor begs to refer those wishing information respecting it, to the following highly respectable individuals who possess them:

RAWLEY HARMON, Jr., Wheatland,	MARVIN SMITH, Mendon,
SHAFER HARMON, "	JOHN MOXON, Greece,
LESLIE HARMON, "	ASA RICE, "
H. & D. ROGERS, "	HENRY FLETCHERS-PENFIELD,
ISAAC COX, "	ALVA S. HART, Batavia,
THOMAS H. NEWBOLD, Caledonia,	CHRISTOPHER SCOTT, Ellis,
ISAAC LACY, Chili,	

DYEING.

TO FARMERS.—The following recipes are invaluable to those who wish to improve their wool. The *middle compound, red dye compound, and black compound*, are for sale only by the subscriber, at the street Drug Store, where there are also for sale every description of dye woods and stuffs, at the very lowest cash prices.

Color Malter Red.—Take one pound of Malter for every two pounds of yarn or cloth, soak the malter in a brass copper kettle, one night in warm water, enough to cover yarn you wish to color; in the morning put in two ounces of middle compound for every pound of malter which you soaked. Then wet with yarn or cloth and wring it out in warm water; the water out is the dye. Now place the dye over the fire, and bring it slowly to a boiling heat, which will take about half an hour; keep it at this heat half an hour, if a light red is wanted, and longer if a dark one; color depending upon the time it remains in the dye.

When the color is made, raise the cloth immediately in water, and it will then be made.

Color Scarlet Red.—Take 5 lbs of water, sufficient to cover 10 lbs of yarn you wish to color; bring it to a boiling heat in a copper or brass kettle, then add 1 lb of cream of tartre for every pound of cloth; pour out a quart or two, then add 1 lb of powder of Lead, and 3 oz of Malter for every pound of cloth; it is the same as previously mentioned; glass or earthen bowl, and five minutes; now wet the yarn with water, and wring it out in the dye, and it will be nearly as before; take the cloth out, wring it out, and wring it in clear cold water.

Color Green.—For every pound of yarn or cloth, add 1 lb of Malter; of which 1 lb of powder of Tartre. Soak in the strong liquid, and wring it out; then add 1 lb of powder of Lead, then three or four cups of a 1 lb of

of the compound slowly, until you have the desired shade of Green.

To color Pink.—For every three pounds of yarn or cloth, in 2 quarts of water, or enough to cover it, take one part of the Pink compound. Bring the water containing the cloth nearly to a boiling heat, and add the compound until the shade suits you.

M. B. EDSON,
State Street Drug Store, 39 State St., next door to the City Bank, Rochester, Aug 29

"The Stump Extractor."

Mr. Drake, the owner of the right of this machine informs us that the patent has nearly expired, but he is in hopes of getting it renewed.

Madison Co. Agricultural Society, Organized September 1, 1841.

- JOHNATHAN L. LEBYARD, President.
- LEAH MARR, HORATIO G. WALKER, JAMES H. DUBAR, Vice Presidents.
- ALEXANDER KREMBHAR, Cor. Sec'y.
- A. S. STONE, Recording Secretary.
- URAH LELAND, Treasurer.
- Johnathan Woodward, Cazenovia; Thomas A. Clark, Sullivan; Stephen Cannon, Eden; G. B. Rowe, Leona; O. B. Lind, Hamilton; James C. Alder, Madison; G. A. Leach, Nelson; B. B. Stewart, Sanbford; S. S. Soble, dgo. — D. P. York, — Lebanon, — Blufffield, — Fenner, — Georgetown, were chosen Managers.

Orleans County Agricultural Society.

We have received a circular containing the constitution of this Society, and the list of premiums to be awarded at the Fair to be held at Albion on the 14th day of October. We have not seen the list of officers. CHARLES LEE, is President, and H. CHASE Sec'y.

Mechanics Fair at Rochester.

The third annual Fair of the Mechanics and Artisans of Western New York will be held at Rochester commencing on the 12th day of October. We have no room to insert the Circular this month, and we believe no arrangements are necessary to induce the thousands to attend who witnessed the previous exhibitions.

Wild Rice—Inquiry Again.

We should be glad if some one of our friends in Canada would give us some particular information respecting the Wild Rice, whether it is ever sown or cultivated in any way; what depth of water it usually grows in; what quantity of grain it will yield per acre; and what varieties are obtained, &c. &c.

The Different Breeds of Sheep.

Wool Growing is becoming a very important and profitable branch of agriculture in this State, and many farmers are anxious to inform themselves respecting the character and relative value of the different breeds of sheep. The following article, copied from the *Western Farmer & Gardener*, is the best we have seen on this subject of late. We would advise our readers, who wish information respecting this or any other kind of farm stock, to attend as many *Agricultural Fairs* as they can, where they may see the different breeds, and compare them. We will give some engraved representations hereafter.

In my former communication, I endeavored to lay before your readers some account of the particular application of the different sorts of wool, to their manufacturing purposes; distinguishing them by their well known division of *long and short*. In continuing the subject, I purpose taking a short review of the various breeds of sheep, or such of them as I think will be interesting to your readers; explaining with as much distinctness as lays in my power, the origin of the name held at present by each particular breed; having in view the intent of informing those who may not be acquainted with the subject, what is meant by the *Cotswold, Bakewell, &c.*

The long-wooled sheep shall first occupy our attention; and, as they are more especially before the public mind, we will begin with the *Leicestershire*.

The *Old Leicester*, the *New Leicester*, the *Bakewell*, and the *Disbley*, are one and the same breed of sheep; the *Old Leicester* being the original stock.—About the middle of the last century, Mr. Bakewell, who lived at Disbley, in *Leicestershire*, endeavored to improve the existing sheep of that county; which he did by attention and a careful selection from all the flocks around his neighborhood, without regard to size, but having in view the greatest propensity to fatten, with that shape which he considered would produce the largest proportion of valuable meat, with the smallest quantity of bone and offal.

Having formed his stock from sheep so selected, he carefully attended to the peculiarities of the individuals from which he bred, and (from the best information) did not object to breeding from near relations, when by doing so he put together animals likely to produce a progeny possessing the characteristics he wished to obtain.

Some persons supposed that Mr. Bakewell formed the *New Leicester* variety by crossing different sorts of sheep. There is no reason for believing this; and the contrary appears to be the fact. He next established a system of letting rams for the season, instead of selling them, to those who wished their use—a system not only beneficial to the ram-breeder, but also to the farmer. It enables the ram-breeder to keep a greater number and give his whole attention to this department; and secures to the farmer, any cross he may require for any portion of his flock, without the necessity of in-and-in breeding.

Valuable as this system no doubt was, it was only after 20 years of incessant perseverance, that Mr. Bakewell had the pleasure of seeing his ideas on this subject sustained by the breeders of the country. The first ram Mr. B. let, was for sixteen shillings. Twenty-six years from that time, he let a celebrated ram called the *Two Pounder*, for one season, at four hundred guineas each from two breeders, still reserving one-third for himself; the value of the ram for this season, being thus estimated at twelve hundred guineas, (about six thousand dollars.) Mr. Bakewell's improved breed were called the *New Leicester*, to distinguish them from the parent stock; by some they were designated as the *Bakewell*, and by others the *Disbley*, being the place of his abode: and thus we get at the origin of all these names.

Before closing this account it may be well to describe the peculiarities of the *New Leicester* breed of sheep. The head should be hornless, long, small, tapering towards the muzzle, and projecting horizontally forwards; the eyes prominent but with a quiet expression; the ears thin, rather long, and directed backwards; the neck full and broad at its base, where it proceeds from the chest, but gradually tapering towards the head, and particularly fine at the junction of the head and neck; the neck seeming to project straight from the chest, so that there is, with the slightest possible deviation, one continued horizontal line from the rump to the poll; the breast broad and full; the shoulders also broad and round, and no uneven or angular formation where the shoulders join either the neck or the back; particularly no rising of

the withers; or hollow behind the situation of these bones; the arm fleshy through its woole extent, and even down to the knee; the bones of the legs small, standing wide apart, no looseness of skin about them, and comparatively bare of wool; the chest and barrel at once deep and round; the ribs forming a considerable arch from the spine, so as in some cases, and especially when the animal is in good condition, to make the apparent width of the chest even greater than the depth; the barrel well ribbed home; no irregularity of line on the back or belly, but on the sides the carcass very gradually diminishing in width towards the rump; the quarters long and full, and, as with the forelegs, the muscles extending down to the hock; the thighs also wide and full; the legs of a moderate length; the pelt also moderately thin, but soft and elastic, and covered with a good quantity of white wool, not so long as in some breeds, but considerably finer.

The *New Leicesters* are not however, without their faults; they are by no means prolific breeders. This, it is probable, may be the result of the in-and-in breeding to which Mr. Bakewell no doubt sometimes resorted. They vary much in size, weighing at a year and a half old from twenty-four to thirty six pounds per quarter; though we have instances of their being fed to a considerably greater weight. We have it on record that Mr. Morgan of Loughton, fed a pure bred *New Leicester* sheep, the live weight of which was three hundred and sixty-eight pounds, and that of the carcass two hundred and forty-eight.

The fibre of the wool varies from five to more than twelve inches in length, and the fleece averages from six to seven pounds: it is used mostly in the manufacture of serges and carpets.

The *Cotswold* sheep takes its name from a range of hills on which they are raised in *Gloucestershire*, and known as the *Cotswold hills*—being one of the grand divisions of that county. Camden says "that they derive it from the cots or sheds in which they were housed at night,—or permanently for the winter; and the wolds or open hilly grounds on which they were pastured in the summer." Every person at all conversant with the topography of England knows that the *Cotswold hills* have ever been famous for the pasturage afforded to this particular breed of sheep. In 1437, Don Duarte, King of Portugal, made application to Henry IV. king of England, for liberty to export sixty sacks of *Cotswold* wool, that he might manufacture certain cloths of gold at Florence, for his own use. Stowe says in his *Chronicle*, that in the year 1467, Edward IV. gave license to pass over into Spain, certain *Cotswold* sheep, &c.—The object that I have in making these quotations, is merely to show the antiquity of the breed. Very few pure *Cotswolds* now exist, and these we are given to understand, are fast passing away. The description given of the pure *Cotswold* is that they are taller and longer than the improved breed; comparatively flat sided; deficient in the fore quarter but full in the hind one; not fattening so early, but yielding a longer and a heavier fleece.

The *Cotswold* have been crossed considerably by the *Leicester*, and the prevalent breed may be said to consist of half *Leicester*, half *Cotswold*. Though a distinct breed of sheep, the similarity that presents itself in the *Bakewell* and *Cotswold* sheep of this country, would carry conviction to the mind of any breeder, that the cross has been carried to a very considerable extent, upon most, if not all of the sheep of this name imported into America. In some parts of this country—for instance, in the territory of Iowa, or any other, where wool is the object and not the expense—the pure *Cotswold* is the better sheep; they are more easily kept; are larger, though not so well formed in the body, and produce a heavier fleece. This is speaking comparatively between the *Cotswold* and the *Leicester*.

The improved *Cotswold*, which is the sheep we have here, will weigh from 25 to 40 lbs. per quarter; and yield a fleece of from 7 to 8 pounds on the average.

The pure *Lincolnshire* sheep, like the pure *Cotswold*, is fast disappearing. Culley describes them as having no horns; white faces, long, thin, and weak carcasses; the ewes weighing from 14 to 20 lbs. per quarter, and the wethers from 20 to 30 lbs.; with thick, rough, white legs; large bones; thick pelts, and long wool, from ten to eighteen inches, and weighing from 8 to 14 lbs. per fleece. According to Ellis, they were the longest legged and largest carcassed sheep of all others; and although their legs and bellies were for the most part void of wool—yet they carried more wool on them than any other sheep whatsoever. The contest for supremacy between the

Lincolns and the *Leicesters* was long and acrimonious, and I doubt even now exists in the minds of some, with regard to the relative value of the respective breeds. The cross of the *Leicestershire* ram on the *Lincoln* ewe, displayed to a great extent the excellencies of the male parent, and the wether attained its maturity in a year less time than it was accustomed to, with less comparative expense of food even in that time. The *Lincolnshire* sheep now, is for the most part crossed with the *Leicester*—as indeed is the case with most of the long woolled varieties. The average weight of the fleece of the present sheep, is about 7 lbs., and of the pure *Lincoln*, not more than 9 lbs.—the length of the staple from 8 to 9 inches.

There are other long wool sheep, but from the cross of the *Leicester*, they have generally imbibed so much of the characteristics of that breed that I think it unnecessary to give any lengthened description of them.

In a future number I will take a review of the short wool sheep, and give my opinion as to the adaptation of the particular breeds to western farming purposes.

Yours, &c.

UMBRA.

American Wool Product.

To those who have paid the subject but little attention, the amount of money invested in the production of wool, within the United States, will seem surprising. It is very generally believed that this is quite a secondary branch of our general interest, instead of one of the most fruitful sources of our wealth, and best deserving the cherishing protection of our Government. As shown by the returns of the late census, we have in this country, exclusive of North Carolina, Michigan and Kentucky, 19,075,962 sheep; and taking ten dollars as the average value of land necessary to sustain a sheep and make a fair allowance for the animals themselves, for the labor necessary for their proper superintendance with that required to prepare their product for its first market, which are as much part of the investment as the land which sustained them, the aggregate amount of capital invested in this branch of industry will be at least two hundred millions of dollars. This is certainly an immense sum, and well deserves the attention of the General Government. At present, England supplies us annually with some ten millions worth of broadcloths, and after all chooses to import her wool from the continent, to the entire exclusion of our own. In 1839, her entire import of this article was 57,325,944 pounds, and while we had some 40,000,000 pounds of wool remaining at home, nearly two-fifths of the whole wollen manufactures of Great Britain came to the U. S. And yet we have only \$15,000,000 invested in wollen manufactures.

Of the aggregate amount of wool grown in the United States in 1839, New York produced 4,012,144 pounds; Ohio, 3,650,970; Vermont, 2,257,735; which, in proportion to her population, is much the largest amount grown in any State; Pennsylvania, 3,076,783; Virginia, 2,672,644; Maine, 1,475,351; New Hampshire, 1,240,958; Indiana, 1,202,209; Massachusetts, 1,055,591; Tennessee, 1,029,516; and the other States various amounts between the 893,675 pounds of Connecticut, and the 45,324 of Louisiana.—*N. Y. Tribune.*

Culture of the Tare or Vetch.

A subscriber in Canada inquires whether any farmers in this region are in the practice of growing English Tares; and if so with what success. We should be pleased if some of our readers would give us the results of their experience on this subject. In the meantime, the following, from the *Primer's Cabinet*, may be useful:

"At a late meeting of the Philadelphia Agricultural Society, a member inquired if any one present could speak experimentally on the culture and value of the tare or vetch, which is in such very general use in England, where the summer-soiling system is adopted; remarking, that from all accounts the plant must be astonishingly productive as well as nutritious. Having myself employed it for that purpose very largely, and for many years, I would say, its productiveness has never yet been overstated, or its value overrated, as food for all kinds of cattle. Horses, milk cows, fattening beasts, sheep and hogs, will grow fat while feeding on it, and the older it grows the more valuable it becomes, as the seed when formed in the pod, is far superior to oats or any other grain for the purpose of cattle feed; the seeds are black, and the size of very small peas. The crop is used for soiling, by cutting while green and taking it to the sta-

is; it is sometimes fed off by sheep, confining them to it by means of temporary fencing or hurdles; cattle are not liable to become hoven while feeding it in its stage of its growth; on good land it has been known to reach the height of three feet and even more, producing as much as 12 tons of green food per acre, which, when well dried, will yield 3 tons the most valuable hay on the farm. The first sowing takes place soon after harvest as possible in England, upon land designed for the wheat crop the next autumn, with the winter variety of seed, which is easily distinguished from the summer tare, as a smaller, rounder, and blacker; these will bear the severity of the winter; rye is often mixed, to enable the crop to stand up, when it attains a considerable height, but a sprinkling of wheat has been found to be best for this purpose, as it remains longer succulent in the summer. The crop from this sowing will be for cutting for soiling in May, and the stalks left in the ground, will afford a second growth for sheep-feed; but as the tare is a fallow crop, it is the best management to cut all off and plough the land up as soon as the crop is removed, well working and cleaning it during the summer, preparatory to re-sowing, early in the autumn, after a dressing well prepared compost, if this has not been given to the tares—a far better arrangement for both crops. The next sowing is with the summer variety of the tare, as early in March as the season will admit, and that has been ploughed preparatory in the autumn or winter; again in April another crop is sown, and if necessary, two other sowings might take place, the last so late as the end of June, that so a succession of this most valuable crop might be secured for the whole of the summer, and until the end of September. Such crops produce immense quantities of manure, which is carried from the sheds and composted for dressing others: turneps, for instance, can be sown on the land from which the first crop of tares has been carried, and fed off in time for re-sowing in the autumn. It must not be forgotten, that the richer the land, the greater will be the crop of tares, and none will pay so amply for manure: when the crop is very heavy, there is less chance of obtaining good seed, and if that be the object, it is recommended to mow the first crop early for soiling, to permit the seed and growth to stand for seed, which is sometimes a precarious business, nothing being more uncertain: I have purchased seed at a guinea and a half a bushel, and sold the next year's produce obtained from it at six shillings a bushel! When the seed is moderate, the quantity sown is two bushels or two and a half per acre, but whatever the quantity may be, it will be repaid in the crop, if the land is in good heart. As much as 30 bushels of seed per acre has been obtained, but 15 bushels, and often half that, is more common. Under a heavy crop of tares, the land will be found perfectly clean and mellow, and will turn up like an ash heap: and there is no objection with me, that the crop may be raised with success in this country, if well cultivated on good soil, rather stiff in its nature and lying cool.

With regard to the value of the tare for soiling, it has been calculated that ten times the stock might be kept on them than on any other commonly cultivated crop; horses require no corn or any other food, and cows give more butter while feeding on them than on any other food whatever. Is it not strange that no regular experiment on an extensive scale has yet been made on such an invaluable crop in this country."

Hussey's Reaping Machine.

In our July number we mentioned that one of these machines had arrived in this city, and that the farmers in this vicinity would have an opportunity of witnessing its operation. But, unfortunately, the proprietor did not arrive till after the 1st of August, when nearly all the wheat was cut, and a good field for the purpose could not be found. A trial was, however, made on the farm of Mr. Whitney near this city, and witnessed by a number of farmers and citizens. The ground was very unfit for the purpose, being quite rough, and containing numerous stumps, so that the machine was exhibited under great disadvantages. Still it did good execution, and convinced all who were present that on ordinarily smooth land it would prove a great saving of time and labor in harvesting grain. It cuts remarkably clean—in fact not a straw that stands in its way can escape; and, from what was shown of it here, there was no reason

to doubt that under favorable circumstances it would cut fifteen acres in a day.

We regret that a more public and extensive trial could not be made here the present season; but hope that many of our readers will have an opportunity of witnessing its performance next year. In the meantime we copy from the Farmers' Register some account of its operations in Virginia. After speaking of an experiment made on very unfavorable ground, William B. Harrison, of Brandon, says:

"The third day, however, we removed them to a more favorable site, where the beds were wide, the furrows shallow, and the wheat heavy, and I very soon became convinced that Mr. Hussey's reaper did not deserve to be classed with the humbugs of the day. By this time the horses and hands employed had become better trained, and the work was beautifully done—better indeed than I ever saw done by the most expert cradler and binder, "with every appliance and means to boot," to enable them to do the work well. Less wheat was left on the ground traversed by the machine, either standing or cut, than I ever observed in any wheat field before.

"I wish I could speak as strongly in favour of the reaper as a time saving machine, but the truth obliges me to say that I cannot. Still I think that it will save time; but the question is, how much? A very difficult question it is, too, and by no means so easily solved as might at the first glance be imagined. Indeed, so much depends on the locality, the length of the rows and the heaviness of the crop, (the reaper operating to most advantage in heavy wheat,) that the time saved is constantly varying; and to approximate the truth, therefore, is as much as can be expected. Something, indeed, a good deal, depends upon the fact, whether good cradlers have to be stopped in order to run the machine; good policy, however, would always suggest the propriety of stopping the worst.

"It is not enough to ascertain the number of binders required to run the machine, in order to determine the time saved. Say eight hands are required for this purpose in heavy wheat, and where the rows are pretty long, and such situations are the most favorable to the reaper, and six where the wheat is lightest and the rows short, and a good deal of time consequently lost in turning. Are six cradlers saved in the former case, and four in the latter, estimating the driver and raker, who ought to be good and efficient hands, as of equal value with cradlers? Certainly not; and for this reason. The reaper cannot be started as long as there is any dew on the wheat in the morning, nor can it operate after much has fallen in the evening. At such times the hands that attend the machine have to be employed in some other way; and moving from one kind of work to another is always attended with more or less loss of time. Nor is this all. In shocking wheat after the machine, some loss of time is also incurred. Where we use the cradles, the binders follow immediately behind them, and then come the pickers up as well as the shockers, and the whole work goes on together. The reaper, however, when operating in long rows, as it must do to work to advantage, scatters the work so much, leaving it in long narrow strings, that shockers cannot find constant employment in following it. We have found it necessary, therefore, to stop a part of our cradles, once a day, in order to bring up the shocking after the machine, which certainly occasions some loss of time. Still I think on the whole that the securing of our crop has been somewhat expedited by the use of these machines; and if binders could have been hired to operate them without stopping the cradles for the purpose, our harvest would have been very materially shortened; and the loss of wheat would unquestionably have been much less.

"It would add greatly to the value of these machines, if the ingenious inventor, Mr. Hussey, could devise some way to make them cut damp straw; so that they might be kept at work all day. Whatever Mr. Hussey has not accomplished, however, is, I am sure, owing to the intrinsic difficulty of making the improvement desired; for the wonder with me is not that he has achieved no more, but that he has done so much.

"The reaper compares most advantageously with cradles in cutting heavy wheat that stands well, cutting it quite as rapidly as it would a lighter crop, when the cradles would not do; or in cutting fallow wheat that inclined altogether one way. The fallow wheat, however, must be cut the way it inclines, the knife going under it, and it is laid beautifully as it falls from the machine, for the binders; but the machine must

go back without cutting. I am not of opinion that the reaper will answer in all situations, or will even supersede the use of the cradle altogether; but I incline to think that it may be used to great advantage in securing parts of almost every large crop; at least on level land.

After using these machines repeatedly, I have not been as yet able to get either of them to cut more than an acre per hour, and, by the way, that is quite expeditious work in heavy wheat. Before trying the reaper, I had supposed that good scythemmen would average more than 2 acres a day in good wheat, but I am now convinced that this is quite as much as can be done. My overseer, Mr. Adams, who superintended the machines, and is quite a judicious man, entertains the belief that 1 1/2 acres might be accomplished by the reaper in an hour, with fast horses and superior driving. It is probable too, that the experience of another season might enable us to effect more than we have yet done. But still I doubt if an acre and a half an hour can ever be counted on for many consecutive hours.

An observant gentleman of Charles City, and a practical farmer too, who has one of these machines which he worked last year, informed me recently that it would cut down sixteen acres of wheat a day, or would do the work of eight cradles. The testimony of this gentleman is every way entitled to credit, and justice to Mr. Hussey seems to require that it should be mentioned. I presume of course that some allowance was made for the time lost in the morning and evening, when the straw was damp."

Another trial was made by R. B. BOLLINO, of Sandy Point, who remarks:—

"I feel satisfied that the principle is a good one, and may be successfully applied to the object intended, and that the machine is destined when the inventor shall have better perfected its mechanical arrangements, which he can, with his greater experience, easily do, to be an invaluable acquisition to the farmers of the wheat-growing region of country. With three mules, a man to drive and one on the machine to rake the wheat from the platform on which, as it is cut, it falls, we estimated that rather more than one acre per hour was reaped. By Mr. Hussey's calculation the machine must cut one acre in every two miles that it travels through the wheat; 15 acres therefore by this calculation, may be reaped in a day with one machine, pulled by three mules with two men only to drive and rake, by travelling thirty miles, a distance not too great on level land, through large fields, where there would be but few turns. The cutting of the machine where the wheat was rankest was the best, leaving not a straw scarcely standing after it, and rendering gleaming entirely unnecessary. The wheat for the "pickers up," or binders, was deposited more evenly and in much larger quantities together, than after the cradle, and with these advantages to the pickers up, eight were not always able, when the wheat was rank and abundant, to gather, tie, and remove the sheaves from the track of the machine, as it passed around the square. The machine does not cut well early in the morning, when the wheat is moist; it cuts best when and where a cradler would do least—in rank wheat and in the hottest period of the day. I have concluded to procure two for the next harvest, satisfied that much manual labor thereby may be saved, at a critical and important season to the farmer, when labor is always scarce, and especially on the lower James River at that time.

The Editor of the Register remarks—"Both these trials were undertaken at our request, and we are confident that both the individuals used every care to have full and fair trial made, and the facts and results accurately noted. It is unnecessary to add that nowhere could such confidence be better placed."

Yucca Gloriosa.

There is, at the present time, in the garden of Mr. Brynton, of Harriet, near Bury St. Edmunds, a large specimen of the above plant with two flower stems, on one of which are upwards of 400 blossoms. Some one lately recommended the application of nitrate of soda to Dahlias. A friend of ours tried it in a very weak solution (about 1 oz. to a gallon of water) and applied it once to each root in the dry weather of June. The effect has been a rich and powerful foliage. It is not too late to try it with great caution, guarding against the chance of excess.—*Leamington (Eng.) Spa. Chron.*

A Letter from Illinois.

Messrs. Editors:—The following is an extract of a letter written by a gentleman of considerable travel and long residence through the great west, and so far as respects your portion of country we are prepared to attest to the correctness of his remarks, and you may confer a favor on such as may wish to migrate to the west by giving this a place in your paper.

Yours, &c.,
FREDERIC BRACKETT.

Brackett's Mills, Illinois

"In all my acquaintance through the far famed west, I have not found a section of country that in every respect so well unites all the great requisites of the farmer as that portion embracing the south part of Edinboro and the north part of Clay counties, on the west side of the Little Wabash river, in the State of Illinois. There the prairies are small, averaging only from one to three miles wide; high, dry, and extremely fertile; and the rivulets or small creeks which divide these small prairies are bordered with as good timber as I ever saw in the United States. They also afford great quantities of valuable rock, both of the limestone and freestone, and inexhaustible water.

This is the only prairie country in which I have ever seen all these great advantages in such abundance. Spring water is common both in the prairies and timber land, and excellent well water is obtained by digging from fifteen to thirty feet, any where in the country.

The first year, the prairies here are somewhat harder to plough than old blue grass pastures; they are then planted in corn, and without any further cultivation they yield from fifteen to forty bushels per acre. The next year and onward they are extremely light and productive in all kinds of grain and vegetables suitable to the climate, thus is seen at once the great advantage that result to persons who locate in the west;—no clearing of farms, only fence and plough; and the country being entirely free from stagnant water I have no doubt of its general health. It is worthy of remark that all this part of the country is entirely free from that distressing disease called the milk sickness.

Notwithstanding an almost unparalleled drought from the middle of May until the first of September, corn in this vicinity will yield at least fifty bushels per acre this season. I earnestly recommend this portion of country to yourself and friends, but what you do you had better do soon, as the land will doubtless be purchased rapidly.

Strange as it may appear there is yet more than nineteen twentieths of this beautiful and fertile country remaining to be purchased by the Government at \$1.25 per acre. It has been overlooked by travellers until lately, for want of roads passing through it,—but it is now settling rapidly.

Yours truly,
A. B."

Sketches of Travel.

In a recent journey as far east as Madison and Cienango counties, that which struck our attention most, was the great number of rural visitors on the road, journeying, almost without exception, in expensive steel sprung carriages and buggies, with elegant saddle camps, the horse or pair shod with brass mounted or plated harness, the dress and baggage of the travellers in keeping with the equipage.

Twenty years ago when we passed through this country our spring carriage was looked on as a singular *curiosite*, to be wondered at rather than admired, much less to be desired. Ox teams were then more common than horse teams, I doubt whether there was a farmer then within ten miles square, who could boast of a spring carriage or a plated harness. The farmers would then have been content with a team

for Six Point to buy salt, by furnishing each, a horse, with a certain quantum of rope and leather called a *backlog*.

If I was asked what has produced this great change in the social condition of our Rural population, I should say, it was varied and increased production. The birth or introduction and increase of the mechanic arts in the county has not been a wide behind the progress of agricultural industry; it may be said that from the nature of their mutual wants, they have mutually stimulated each other. Thus has Hamilton grown up with its endowed seminaries and schools,—and log city has been converted from a little city of logs as its significant early name implies, into one of elegant mansions, Grecian cottages, extensive factories, and workshops.

There is not so general an appearance of rural thrift in the counties of Madison and Cienango, as in our own Seneca, but with their cold rough hills, and wet hollows they have better pasturage, more butter and cheese, more cattle, and the sweetest water in the world, we felt that such water in Seneca county could not fail to establish a perfect temperance reform.

The hop yards of Madison have of late almost entirely disappeared; over production reduced the price so low that the culture is generally abandoned; the consequence is that this year the price is unusually high. It is said that one man will clear \$1,000 on ten acres of hops this season. He applies to his hop grounds all the manure of a large distillery, by the aid of which he is alone enabled to realize such large profits. Hops require a cool moist climate, but dry and very rich land.

Waterloo, Sept 18, 1841.

Indian Corn, the King of Edibles.

A Farmer from Oneida county, now on a visit here, says that our farmers strangely overlook the advantage of our warm dry climate for Indian corn—he says that they seldom fail to get 60 bushels to the acre there on an old sward, if they only have sun and dry weather enough to ripen it; he has seen 60 bushels raised to the acre this season, without the aid of manure, but it was well tilled with hoe and cultivator, two implements "but little used" he thinks in our corn fields. Even in the south part of Oneida county a great grass region, corn stalks in the bundle are worth and nearly \$5 per acre.

When I see a farmer peddling a load of pumpkins through our village, boasting of their superior size and quality, verily thanks I to myself, that man boasts of his own shame—the pumpkin growing farmers may have pumpkins, but they will have no corn this year. The kindly influence of a warm sun, when it has done wonders for the thrifty industrious farmer's corn, has proved too strong a stimulus for the late planted, half-manured, and worse tilled corn, of the mere pumpkin grower.

Perhaps there never was a season when corn repaid the labor and attention bestowed upon it better than this year; on the other hand never did the neglected field yield less. I have seen some fields where the weeds far outweighed the stalks, and others of like soil, where the stalks were worth more per acre, than the grass from our best meadows.

Although grass and potatoes, in consequence of our long drought are not half a crop, I have no doubt but that if our Indian corn had been early planted on rich land and the earth kept loose by the hoe and cultivator, the crop this season would have been far above the average.

I have observed that the stalks this year, after the corn is ripe are full of a spongy matter, both horses and cows will even eat them with avidity.

Whether from bad farming or some other cause, it would seem that we learn New York is far from being a

quondam character as a wheat growing region. But if I mistake not, its reputation as an Indian corn growing country has always been too low, merely from the fact that its culture has been neglected for the more profitable production of wheat. But now when we have no more of nature's own virgin soil to insure large crops of wheat at little expense, we trust that more attention will be paid to that much abused prince of edibles for both man and beast, Indian corn. *Waterloo, Sept 18, 1841.* S. W.

Wheat Culture.

Messrs. Editors—It appears to me that the culture of wheat has not received that attention from agricultural writers which its importance demands. I think it would be of great benefit to your readers if our wheat growers would more generally give us the results of their experience, and their mode of practice in this branch of farming. There appears to be much diversity of opinion on most points connected with this subject, and for one I should like to know the opinion and practice of the most successful wheat growers in this country; particularly with reference to the manner of preparing the land, the time of sowing, quantity of seed, and mode of preparation, if any.

As far as my own experience goes, I think I have obtained the best crops by following the land, with three times ploughing; thrown into ridges of seven or eight pees wide sown from the eighth to the sixteenth of September; five to five and a half pecks of seed to the acre; prepared by sowing in hoe water from twelve to sixteen hours before sowing; the seed harrowed in. I have some seasons sown my wheat about the first of September, and I when that has been the case I have almost invariably suffered more or less from the ravages of the R. I think early sowing renders wheat more exposed to this evil. Such is my practice, and if any of the correspondents of the Farmer can suggest improvements on it, I shall be happy to learn and adopt them.

"Old Genesee," August 1-11.

M. N.

REMARKS.—We thank M. N. for calling the attention of our readers to this subject, and we unite with him in the request that others will favor us with a description of their practice in wheat cultivation. We hope however they will be more particular than our friend M. N., and not forget to mention the kind of soil, depth of ploughing, kind of wheat, and the quantity of produce; and not omit to sign their names.—Eps.

The following suggestion we believe to be of great importance. The advantage of a wheel over swing ploughs, was fully demonstrated by the accurate and repeated experiments of Prof. Pacey in Scotland. Ploughs of nearly the same actual weight were found to differ in the strength of the draught, required to move them on the surface of the ground, as four to one, when without, in one case, and with a wheel, in the other. This great difference must be obvious, when it is considered, that the chief weight of the plough is brought by the draught upon the wheel which otherwise lies to drag heavily along the ground. The friction occasioned by this dragging, it is plain, must be greatly increased, when fifty or a hundred weight of earth is constantly pressing upon the mould-board. As very few of our ploughs in this region are furnished with wheels, we beg leave to call the attention of farmers to this subject.

For the New Genesee Farmer
Wheel Ploughs.

Messrs. Editors:—It is rather late in the season to talk about breaking-up ploughs. But I consider it of much importance, and hope it may draw out something from our brother farmers, that will not be forgotten before another spring.

We all know that the breaking of the "fallow ground" is the hardest job that we have in preparing the ground for the seed. It is important then that we manage this business to the best advantage. We have in our country a great variety of "patent ploughs," some of which we think good ones, and all undoubtedly real improvements upon the old fashioned ploughs. Of the merits of any particular pattern I shall not speak. I will only say, to my brother farmers, get the best

you can find. It costs no more to make or buy a plough than a bad one.

It there is an article of gearing which I consider of great importance in ploughing, that I am sorry to see not yet in general use, at least in this part of the country. I refer to the wheel under the end of the beam, or a ganger. It is important that the land be ploughed as nearly even as may be. With the wheel you can manage this to your liking.

It is well ascertained that the team will perform the labor much easier with the wheel than without. Some say that two horses with the wheel will perform as much and with as much ease as three without. I am not entirely satisfied that there is this difference, but there is no doubt a great difference in the use of the wheel. My plan is to put on three horses, when let the plough go in according to the strength of the team, I care not how deep. I think that we have not been in the practice of ploughing deep enough.

It may be well to describe the manner of fastening the wheel to the beam. There are several different ways of doing it. Some mortise a hole through the end just back of the clevis, large enough for a stout iron, which is split at the bottom, or another is added, and spread so as to receive the wheel. Another should be secured from wearing on each side of the beam, by fastening on wide stout band iron, or hole through of the same size. The end of the great runs through the beam has several holes right up, so that it can be raised or lowered at pleasure. I fasten through the beam with a bolt. Another way, and which I like the best, is to take two iron pins of sufficient size, bend them in a half circle form, with holes for the gudgeon of the wheel running in, at the lower part of the circle; one end of each should have several holes in to raise or lower the wheel. In order to do this, the bars must be made of course. The wheel should be about 2 feet in diameter and about 2 inches broad. The iron or three horses should be made on purpose for the use, with a set to hand, and an extra amount of iron where the wheel is used, so that the plough will dig into the earth. I have two beams for making plough, one for three horses and one for two. It is a short job to shift them. The counter is generally used, that it will probably be of no use to a farmer's means. But I have written more than I can say. A FARMER.

Oans County, August, 1841.

For the New-Genesee Farmer.

Murrain in Cattle.

A grain of preventin is worth pounds of cure. I have given my cattle for several years past, plenty mixed with equal quantities of house ashes. If they have been troubled with the murrain, I believe it will effectually prevent it—only give as much as they will eat.

Cold Water

It may be safely drunk in hot weather, provided it is well first wash his temples and wrists with it. It is a sure job for years (with the above precaution) to prevent the least injury.

For the New-Genesee Farmer.

Disorder in Hogs.

For this head a correspondent in the last number of the New-Genesee Farmer, who signs himself W. carefully calls for information concerning a certain disease which sometimes attacks his hogs during the winter.

It is for that the wheel may not sink in soft ground, and that the iron may not be so much worn, it should be made of a larger size than the wheel, and it may be well to have a small hole in the wheel to be bored through, etc. etc. to admit a larger wheel.

ing the hot season of the year. I have reason to attribute the lameness he complains of, to the closing of the *issues* of the hind legs; which I think is caused invariably by inflammation produced by high feed, such as corn and barley meal, without first undergoing the process of fermentation. Having had several hogs attacked in the same way some three or four years ago, while being fed with the above-mentioned food, and every expedient in the way of common dosing proving inefficient, we had recourse to a neighbor of ours who had had experience in pork-making; he immediately informed us of the cause; we caught the hogs, and by a thorough rubbing of the pores or *issues* of the legs with a *cob* they were made well in twenty-four hours.

No. Cortland Sept. 21, 1841.

ENGLISH NEWS.

Liverpool Grain Market.

Sept. 3.—We had rather more inquiry at this morning's market for wheat and flour, both fine and in bond, and in the few sales which have taken place the prices of Tuesday last were obtained. Oats and corn meal were each dull of sale, but at no decline on their previous value. Other articles in the trade met with but little attention, and no change in prices from the quotations of Tuesday last.

The Weather and Crops.

The beautiful weather has made a great and unexpected change in the harvest, a good deal of all sorts of grain has been secured in good order, and many farmers in the West have cut all their wheat; but on the Downs, the quantity of wheat and green stuff in the hands, has induced the farmer to use every moment he could to secure that crop, and hence we see long pieces of wheat still standing out. Another week of fine weather will secure, pretty nearly, an average crop of wheat, but of course there are exceptions.

Brighton Paper.

The wheat crops come to hand much heavier and better than was expected. The forward oats have been got in well, and the backward crops look promising. The late fine weather is expected to work great improvement in the barley. The peas that have been harvested turn out well, and the beans are flourishing.

Middleton Gazette.

The harvest has been generally good in the neighborhood of Newark, and in some places a good deal is housed; but the rain of Tuesday night has greatly retarded the harvest.

Lincoln Gazette.

The harvest of Tyle side has commenced, and will be general in this neighborhood in another week. No new wheat has yet appeared in Newcastle market, but it may be expected that supplies will be shown on Saturday next. It is generally considered that the wheat in the northern counties will be better in quality than that of the greater part of the southern districts, where the weather has been more unfavorable than with us. The weather has been very warm and dry since our last.

Time Mercury

The weather is very fine. We need scarcely add that the farmers have been "making hay while the sun shines," and that the harvest is drawing to a close in our locality. The accounts as to the yield are very contradictory, some maintaining that it is an average crop, and others that it is nearly so.

Worcester Chronicle.

The harvest has become very general in the eastern divisions of this county; we observe fields cut on Paleney, Thononboth, Skaton, East Barns, Barnhill, Onwellmuns, West Parkertun, Bardsmill, Newmans, East-Bloodhouse, Newhouses, Litchfield, West-Barns, Bell, &c. The Barley and oats seem of an average bulk, the wheat generally "stooks" light. The weather has been very wet, but should it clear up, next week harvest will be general.

Worcester Courier.

Pickles.

About this season of the year, the good mothers and wives throughout the country, tax their ingenuity to the utmost to make pickles of every thing that comes within their reach. Nothing escapes them. They pickle potatoes, and cucumbers, and peppers, and tomatoes, and beans, and nasturtiums, in short, every vegetable they can lay their hands on, and that is in an advanced state of various immaturity. Such a preserving of brass beets, and such a scaring,

and putting, and summering and storing, as is going on from one end of our happy land to the other, is a caution to young folks, for if one of these youngsters happen to kick up a row in the midst of this busy and bustling, and thus interrupt the harmonious clanging of pots and kettles, he is almost certain to have his little roundly pickled very handsomely, and at the very moment when he least expected or desired the favor.

We have just hit upon a receipt for making a glorious pickle, which we copy for the benefit of house-keepers generally. It is like all other pickles, about as indigestible as the doctor or the undertaker could wish, and would give Old — himself the grapes in five minutes if he were to swallow it.

MAXIMS.—These are made of green muskmellons, as late in the season as possible. The common muskmellons make the best mangoes. A small pecco is cut from the side, and the seeds carefully scented out; it is then soaked in salt and water three or four days; when taken out it is sprinkled on the inside with powdered cloves, pepper, nutmeg, and filled with strips of horseradish, cinnamon, small string beans, small pieces of flag root, insutimans, small onions, radish tops, &c. The crevices are filled with whole mustard seed.

The excessive hotness of these diabolical compounds, which prevails more particularly among the younger portion of the fair sex, is at once the cause and evidence of ill health. We have known more than one of these lowly creatures of nature destroy her health and life, by the use of these unnatural stimulants—actually pickle herself to death!

We advise the young men a short time since to marry, every mother's son of them, and we now advise him to be particularly careful of marrying girls who are very fond of pickles, and will eat a half gallon per tub of them at every meal.

If they do not take our advice, and marry animated vinegar crabs, they may, perchance, escape being poisoned themselves, but they will assuredly have a wretched time of it in this world, with their sickly, peevish, half dead wives.

The danger we run in making these assertions, is great. The ladies will all be in arms, or rather in tongues, against us. But we do not fear to encounter it. We write for the benefit of posterity, and if the present race will not do us credit for our good intentions, the next will.—Hannibal Journal.

"Pearl Barley" of the West.

The editor of the (British) Western Farmer has politely sent us a small sample of what he calls "Pearl Barley." He says respecting it:—

"A new kind of barley has been introduced into Wisconsin by an emigrant. A gentleman at Green Bay, last spring, obtained a quantity of the seed and has raised 150 bushels. The seed came from Russia, and is a large plump kind, and weighs considerably more than our common barley. A bushel weighs 69 pounds. It makes fine bread, and is nearly equal to wheat. It was sown on the 15th of May, not harvested in July, and with proper cultivation, it will yield from 50 to 40 bushels to the acre.

We have a small quantity of it in our office, and invite the agricultural public to call and examine it. It is the best article that has ever come under our observation. At our request, a quantity of it will be sent to Oliver Newberry, of this city, and Wm. S. MAXWELL, Esq., of Ann Arbor, for sale."

The above named barley is not a new kind, but one which we have long known by the name of *Tico-Roval Naked Barley*. It bears long heads, and handsome grain which threshes out of the chaff like wheat. Small quantities of it have been sold at the Rochester Seed Store for several years past, but its cultivation in this country has never to our knowledge been found advantageous. Lawson, in the Agriculturist's Manual says, "this variety has been introduced to the notice of agriculturists at various times and under different names, but its cultivation has always been abandoned, or at least, never carried to a great extent. The straw becomes very brittle and tender towards the period of ripening, so as to be unfit for support of the ears."

From Manning's Cook's of Fruits

One of our best European Pears, the "Duchess of Angouleme," when grown as a dwarf produces a fine large fruit, but a small and greatly inferior when grown upon a standard.

Chemical, or Prepared Manures.

It is sometimes asked, and that too in a way indicating a belief that the question cannot be satisfactorily answered, what are the advantages that science has conferred on Agriculture? more than intimating that knowledge, so essential to all other pursuits, is of no value to the farmer. It is a sufficient reply to all this, to simply point to the articles named at the head of this paper; chemical, or prepared manures. For the present we shall confine ourselves to a single class, those derived from urine and night soil, or of which these furnish the most important part.

It may be said that the use of night soil has been known from the earliest ages as a manure. This is true, but its use has always been limited, owing to prejudices arising from its disagreeable nature, and its offensive odor. The celebrated Swedish chemist, Berzelius, was among the first to call the attention of moderns to these substances by his analysis of them, which gave the following results:

Night Soil, 100 parts.	Urine, 1000 parts.
Water, 73.3	Water, 937.60
Vegetable matter and animal remains, 7.0	Urea, 30.19
Bile, 0.9	Sulphate of potash, 3.71
Alumina, 0.9	Sulphate of soda, 3.16
Peptone and extractive matter, 2.9	Phosphate of soda (com.), 2.94
Salt, 1.2	Muriate of soda (com. salt), 4.13
Insoluble residue, 14.7	Phosphate of ammonia, 1.65
	Muriate of ammonia, 1.59
	Acetate of ammonia, 17.14
	Animal matters, 17.14
	Earthy phosphates & phosphate of lime, 1.60
	Silica and meues, 0.35

The intelligent farmer will see at a glance that the matters enumerated in these tables constitute most efficient fertilizers, and in spite of their repulsive nature, the Flemish farmers have long been in the habit of mixing these stercoraceous matters with water, which, applied with much labor to their fields, gave a fertility unknown to the rest of Europe. Some 28 years since, Davy suggested to his countrymen, the English, that night soil was a very powerful manure, liable to decompose, soluble in water, and in whatever state it is used, furnishes abundant food for plants. He found, by experiment, that quick lime destroyed the disagreeable smell, and ascertained that it might be dried, pulverized, and delivered by drills at the time of sowing the seed. The manufacture from night soil of the valuable manure called *poudrette*, belongs to the French. Nearly 40 years since, a chemist, M. Brdet, obtained a paper for his *poudre vegetale*, manufactured from the cesspools of Paris, and such was his success that similar manufactories were erected all over the country, particularly in the vicinity of the large cities, so that what was once a nuisance, is now deemed of the greatest value.

In 1814, the French Royal Society of Agriculture granted a gold medal to Madame Yibert Dubouli, who obtained a patent for 15 years for her "Alkaline Vegetable powder." Her plan consisted in fermenting the most liquid parts of those matters, and mixing them with slaked lime afterwards, so as to form a powder more superior and more durable in its effects to common *poudrette*.

In 1818, the first manufactory of "Urate" properly so called, was commenced near Paris, by the chemists Douat & Co., and the product was submitted to the examination and test of a committee of chemists and agriculturists, in which were included some of the ablest men of France. This committee reported that they had found the preparation so powerful on the fattest soils, that they recommended it should only be employed by skilful and discerning farmers. On good soils, or in large quantities, it gave such a growth of straw as to be fatal to the maturity of the grain. The whole matter collected from the cesspools of Paris, is now converted into *poudrette* and *urate*, and is used by the farmers and gardeners, principally within a circuit of 30 miles around Paris.

A new preparation called "*engrais animalize*," or disinfected night soil, has recently been entered upon at Paris, and a large manufactory has also been established at White Chapel, near London. It is made by mixing the night soil with a considerable quantity of finely pulverized charcoal, and then drying the mass at a very gentle heat. Thus prepared it resembles the friable mould, rich and dark, of an old hot bed, and is totally devoid of smell. The English farmers, if we may judge from their reports and journals, are highly pleased with this manure, particularly as a dressing for turneps, giving them a quick growth at the start, which is of great importance with this root. There is another preparation called "Owen's Animalized Carbon" principally brought into England from the Baltic, one ton of which is consid-

ered equal to 25 bushels of crushed bones, while the cost is but little more than half as much. It probably differs little from the *engrais animalize*, except that it contains more carbon, and, of course, is a less powerful manure.

There is a chemical preparation called "Seed Manure," prepared by Messrs. Hodgson and Simpson, of Wakefield, England, the composition of which is a secret, but the base of it is, doubtless, urate, mixed with a portion of saccharine matter, ammonia, salt, and nitre. Their directions are as follows, and by following them Mr. Milburn and others have experienced the best effects on their crops.

"Dissolve 28 lbs. of this manure in a pail by adding water in small quantities stirring it at the same time, until the mixture is of the consistence of cream; it is then poured over the seed intended to be sown on an acre of land and the whole repeatedly turned over, so that it appears one uniform mixture; the seed is then to be spread out thin, on the floor to dry, for ten or twelve hours, and mixed with a sufficient quantity of soil or any kind of ash, to render it sufficiently friable or dry to be sown by the hand or by the drill."

Prof. Johnson in his valuable papers on manure, has the following remarks on these chemical preparations of night soil, particularly the carbonized class, which, when properly made, he seems to consider preferable to any other of its mixtures.

"The preparation of the Messrs. Pottevin of the *engrais animalize* at London, is the same as that of M. Payen at Paris. It combines, and successfully too, the great object of driving off the water of night soil by a gentle heat, after all its gaseous matters have been absorbed, by mixing it with a portion of newly prepared carbon, in the finest possible state of division, than which, no known substance has such great powers of absorption of all gaseous matters like those which abound in, and impart the disagreeable odor of night soil. The presence of the carbon in the manure thus prepared, is valuable in two ways; it gradually combines with the oxygen of the atmosphere, forming in the state of carbic gas, the food of plants; and at the same time, all the gaseous matters of putrefaction, with which it is saturated, are thus preserved, so as to be used, for the use of the roots of the cultivator's crops; nothing is lost, the emission of the gases from the slowly dissolving charcoal, being so gradual, as to be almost, if not entirely, imperceptible to the senses."

The justly famous preparation, called as above "Urate," may be very successfully imitated by the common farmer who will take the pains to provide a reservoir or cistern for the preservation of urine, with which, when wanted for distribution with his seed, he must mix gypsum or plaster till the urine is absorbed, and the mass sufficiently dry to sow with the drill or by hand. This is one of the most powerful preparations on dry or sandy soils that can well be imagined, and is one of which every farmer may avail himself to a greater or less degree.

There are at the present time, two manufactories of *poudrette* and *urate* in the vicinity of New York; and there is most abundant proof that it constitutes here as elsewhere the most valuable class of manures. That such manufactories will become common in the neighborhood of our principal cities and towns, where alone the materials are to be found, as the value of such manures, both for the efficiency and portability are better understood, we have no doubt. Their use is rapidly converting the vicinity of the principal European cities into a garden, and the use of these materials, which have constituted the greatest nuisances and were most productive of diseases, into manures, will not have a better effect on the soil, than on the health of those congregated masses of human beings. *Alb. Cultivator.*

Tomato Figs.

PATENT OFFICE. July 10, 1841.

DEAR SIR—The medicinal qualities of tomatoes have greatly increased their cultivation, and every new preparation of the article is deserving consideration. A sample of "tomato figs" has just been deposited at the Patent Office, of a superior quality. From the taste I should suppose all the good qualities of the fruit are retained. In appearance, the drupe of tomatoes resembles one of figs so nearly, that they might easily be mistaken for the same.

The sample is deposited by Mrs. Steiger of this city, and the recipe transmitted with it is enclosed for publication. It is deeply to be regretted that since the introduction of the day are open to communications, but so many valuable improvements are lost to the world, barely for the want of publicity. Ours may

have dried the tomatoes with a recipe, however less successful.

Very respectfully, H. L. ELLSWORTH.
Hon. J. S. Skinner.

RECIPE.—Take six pounds of sugar to one peck (or 16 lbs.) of fruit. Scald and remove the skin from the fruit in the usual way. Cook them over a fire their own juice being sufficient without the addition of water, until the sugar penetrates and they are clarified. They are then taken out, spread on dishes flattened and dried in the sun. A small quantity of the syrup should be occasionally sprinkled over them whilst drying; after which, pack them down in boxes treating each layer with powdered sugar. The syrup is afterwards concentrated and bottled for use. They keep well from year to year, and retain surprisingly their flavor, which is nearly that of the best quality of fresh figs. The pear-shaped or single tomato is a newer the purpose best. Ord nary brown sugar may be used, a large portion of which is retained in the syrup.—*American Farmer.*

For the New Genesee Farmer.

TRUE GLORY.

BY DEWITT C. ROBERTS.

Man seeks content on every shore—
Where deserts spread—where oceans roar!
What reck he danger, toil or blood,
By famine, shipwreck, field, or flood?
What houts it where his footsteps roam,
If he seek not the prize at home?
Deluded man! vain dreamer! cease!
Say? what can set the mind at ease?
Can gold-dust scraped from Africa's sands—
Can diamonds wrought by servile hands—
Can rapine, war, or murder yield
Aught, save to Fame—a battle field?

Back to thy honest toils again!
Go! speed the plough and till the plain,
Thy bristling grain, in thick rows set,
Shall rival e'en the haycock—
Thy maize, arrayed along the land,
Shall image many an armed hand—

Thy gold, the yellow maize shall be;
Thy gems, the dews that deck the sea;
Such be thy glory—such thy wealth;
Thy rich reward, content and health—
Nor prouder spoils e'er won the bay,
Or deck'd a Roman triumph day!

July 25th, 1841

Anti-Corn Law Agitation in England.

Papers by the Britannia bring us the accounts of the opening or first days' session of the great Anti-Corn Law Conference of Ministers, at Manchester, on the 17th of August. More than 650 Ministers had announced their intention to be present. The people of Manchester vied with each other in hospitable arrangements to entertain the reverend gentlemen. The Conference assembled in the Tower Hall, the benches of which were completely filled. The Rev. Dr. Aikin was called to the chair.

In his opening address he spoke of the present meeting as without a parallel among the councils and addresses recorded in ecclesiastical history. Ministers Christ from all parts of the Empire, not in hostile array, sect against sect, and party against party, with the narrow lines of sectarian demarcation, but occupied with an object greater than that which could hard engage the minds of the most eminent Christians. They had met at the call of suffering humanity, which reached their ears, not from a foreign land, but from the green valleys and populous streets of their own beloved land. At the outset, however, they were met by the question, "What have Christian men, and have all, Christian ministers, to do with temporal politics?" But when they became the denizens of another kingdom, were they to abandon the duties of this? It was not necessary, when they became Christians, that they should cease to be men. For his own part he would have considered himself a traitor both to religion and humanity, had he refused to obey the summons to attend the meeting.

What was the present situation of the empire? Here was a country great in arts and arms—the school of science and literature—the mart of literature—the cradle of luxury—the emporium of the moral world—occupying the highest position amongst surrounding nations, and shedding its light over the most distant lands. Yet this country, possessing within itself, an inexhaustible resource, whilst it was the richest in it

world, was in one sense, also, the poorest. Its population, instead as it was with ardor, and unrivalled for its industry, was unemployed, and in want.—Looms were silent—manufactories were closed—commercial men looked at each other in consternation and despair! What was the cause of this extraordinary state of things? It was to be found in the laws which prohibit the exchange of labor for food. The eyes of the country were turned upon Manchester. It was necessary, therefore, that those assembled should stand clear from all imputation, and it was most desirable that they should avoid committing themselves to any distinctive line of party politics, which might compromise them in public opinion. Let them adhere firmly to principle, but avoid giving offence to any one—uniting to the courage of the lion the gentleness of the lamb.

Dr. Pye Smith followed with an energetic appeal to the sympathies of his audience. He contended that the Corn Laws were a part of that vicious system of legislation which had its origin in the night of ignorance and barbarism. Some person objected to take part in the proceedings of the Conference because they said it was interfering in a matter of fiscal regulation. Such ought not so to be received. He protested against the doctrine that ministers of religion ought not to interfere with politics. The alternative now presented to the country was this—removal of iniquity, or the ruin of the nation.—*Emancipator.*

Irrigation.

The effects of running water flowing over grass lands, is so highly beneficial that every farmer should ascertain whether there is not some portion of his lands which may be cheaply irrigated. We say cheaply, because the price of lands in this region is not high enough to justify such outlays as are often profitably made in England and on the continent of Europe.—The waters of many a small stream in our hill country, might by a few hours work with the plough, be carried along the hill-side in such manner that they would percolate through the slight embankment and nourish a vigorous growth of grass on all the sloping ground below the ditch or canal. This is cheap manure—applying itself year after year—and long maintaining the fertility of the soil unimpaired. At the base of the hill it will often be necessary to open a drain for the water which finds its way down. Should it come to a flat and cold soil, as it often would, at the termination of the descent, that soil would be injured. While flowing water is favorable to vegetable growth, stagnant water is baneful. Wherever the farmer can cause water to flow over his grass lands without stagnating up in them, he will find great benefit from the operation. The following article from the Southern Agriculturist, will be read with interest, though it describes processes more expensive than most cultivators will be ready to adopt.—*N. E. Farmer.*

WASHINGTON, April 2, 1841.

To the National Institution for the promotion of Science:

Since the brief statement of the advantages of irrigation appeared in my discourse delivered before the institution in January last, I have received so many applications for information on the manner of watering land, that I am induced to believe a more extended notice of the subject may be acceptable and useful.

The numerous and abundant rivers, streams, and brooks, which traverse our country in every direction, afford great facilities for irrigating the soil, and thousands of acres of barren land might thereby be rendered as productive as any in the United States.

The thin soils, which drain and dry easily, profit most by the use of water, and are the least productive without it. The gravelly, sandy land of Chile produces by irrigation, upwards of thirty bushels of wheat to the acre, and the poor lands in the neighborhood of Mexico, are made equally productive by this process. The great advantage, however, to be derived from the free use of water is not so much in the increase of grain, as in that of grass crops. A water meadow attached to a farm, gives the farmer an abundance of manure for that portion of his land which he keeps in tillage; for he may convert into dung the whole of the hay it produces, while it requires nothing in return but watering.

In the Carolinas and Georgia, the low lands bordering on the rivers are irrigated as high up as the influence of the tide extends for the cultivation of rice. The water is admitted into ditches parallel and perpendicular to the river, and thence distributed by feeders over the whole surface, so as to draw the land, by opening the sluices when the tide is rising; and after keeping it there as long as is deemed necessary, it is

let off at low tide. This method might be practiced with great advantage on all the tide-water rivers throughout our country, where the banks are low enough to admit the water at high tide. Flat lands that have not the advantage of tide water, are the most difficult to irrigate successfully, for it is essential that when the water is let off, the land should be drained perfectly dry; otherwise it will produce coarse grass of inferior quality.

Lands that have a gentle slope, even steep hill side, are better adapted for irrigation, as they admit of the water flowing over them without covering the top of the plants, thus giving them the advantage of air and moisture. A gentle current is considered more advantageous than stagnant water, and the land thus situated will always drain dry when the water ceases to flow. On level land it is necessary to conduct the drain so far that it may enter the river low enough to ensure a sufficient fall to dry the land.

Where the stream is rapid and the fall great, it is not necessary to construct any dam; but simply to top the river high enough up to lead the water along the highest part of the field; but where the current is sluggish, the water must be raised by a dam erected at the point where it is to be used.

There are two methods of watering lands. The one by dividing the field into regular beds, and the other by what is called catch work, which is resorted to where the form of the ground is irregular. It varies therefore with the circumstances of the land it is proposed to water; but the conductors, feeders, and drains, must be laid so as to profit by the natural movements of the soil both to water and to drain it.

The first thing to be done by the farmer who desires to irrigate his fields, is to take an accurate level of the ground which he intends to water, so as to compare the highest part of it with the height of the water to be used. The surface of the water must be eight, twelve, or twenty inches higher than that of the land, according to the distance of one, two, or three hundred yards from the one to the other. The main conductor is then to be cut from that point as straight as it can be, to lead to and continue along the highest side of the field.

If the land has any swells on its surface higher than the rest, it will be necessary to give to each of them its own conductor, with feeders branching from it, to convey the water over that portion of the field. The width of the conductors must depend upon the quantity of water they are required to convey; and be deep enough to receive the middlest portion of the stream; for although the land will profit by being covered with clear water, it is more enriched by the deposit of turbid streams. Each conductor is to be provided with a sluice to regulate the admission of the water. In case the river does not run in such a direction as to allow the water, after flowing the land, to be discharged directly into it, a main drain must be cut along the lower part of the meadow to receive the surplus water and convey it to the river. This should be of the same dimensions as the principal conductor. The portion of meadow to be watered by each conductor is next to be divided into beds from thirty to fifty feet wide, the feeders, which branch at right angles from the conductor, running along the centre of them, except where the ground falls two ways, when it may be necessary to make the feeders nearer to one drain than the other. A bed two hundred yards long will require a feeder where it leaves the conductor to be twenty inches wide, and gradually diminishing in width to twelve inches the extremity. A drain is to be made between every two feeders, and parallel to them of the same dimensions, but reversed form; the upper part being ten or twelve inches, and the drain gradually widening to twenty inches, where it terminates either in the main or in the river. Supposing these works finished and ready to go into operation, the manager opens the sluice to admit the water into the conductor, where he adjusts the stops in such a manner as to supply the feeders. He next regulates the stops in the first feeder, so that the water shall flow regularly over its sides from one end to the other. He then repeats this process in the second feeder, and so on, until all the feeders are adjusted. The stops may be of pieces of board or of turf panned down, if necessary, taking care to keep the heads of the pegs below the surface of the water, otherwise they are apt to collect weeds and trash.

The profits arising from irrigation are so great that they will justify a considerable outlay. The works, therefore, ought to be well and durably constructed; the dams and sluices of the best materials, and able to resist the sudden rising of the water. The beds which are already stated, are to be from thirty to fifty feet wide, should be raised from one foot to fourteen inches

in the centre, so that the water will fall gently off from the feeders which run along their summits to the drains.

I have endeavored to give such a description of the process of irrigation as will at least enable a farmer to judge of the practicability of watering any portion of his land, if not to execute the work himself. Those who seek for further information on this important subject, may consult the works of Boswell, Wright, Smith and Johnson, London's Encyclopedia of Agriculture, and Stephens' Practical Irrigator. The construction of works for irrigation belongs, however, to the civil engineer, and it is to be hoped that those of the United States will turn their attention to the subject.

Our extensive lines of canals may, for the most part be converted into conductors, and the water be beneficially used to fructify the country through which they pass. If a blessing awaits the man who makes two blades of grass grow where only one grew before, the irrigator will be thrice blessed—for well watered land will produce at least three times as much grass as the same quality of soil under dry culture.

J. R. POINSETT.

Indian Corn and Sugar Beets.

We have certainly never had a more continued and scorching drought in this vicinity than that with which we are now visited. The clouds sometimes roll up and present all the usual signs of rain; but it would seem that the dry and heated surface possesses a power of repulsion, or rather a lack of attraction, for the sun again breaks out with its wonted fires, and the clouds disappear as if they were in the

"Deep bosom of the ocean buried."

Pasture is dried up; potatoes, even those which were planted early, are no thing. But it would seem that a kind Providence has given us, in addition to winter grain, two articles of food for man and beast, which from their early rapid growth and large conducting leaves, are capable of subsisting and thriving well for a long time, without other external moisture than the dews of heaven.

We have now Sugar Beets from 1 to 6 inches in diameter growing only 12 inches apart, they were transplanted early in June. We have corn planted 15th May in drills 3 feet apart; 8 to 12 inches apart in the drills, with 1 full ear and a nubbin on almost every stalk. Such a growth of Sugar Beets and Corn we have never had before in the same space of ground, in any one season. A masterly farmer in the vicinity corroborates on a large scale our small experience he also says that his clover bears the drought well.

We have no doubt but that the green stalks and Sugar Beets raised on a single acre would feed more cows at this time than all the pasture within a mile square.

A summer drought to some extent seems to us to be an annual occurrence in the champion regions of Western New York. Hence the importance of a more general cultivation of these vegetable productions which thrive better in dry than in cold wet seasons. It strikes us that this kind of cultivation should obtain more and more, around our now rapidly increasing villages, along the canal and railroad routes, where manure is cheap and plenty, and the laborers are not few.

S. W.

Waterloo, August 22, '41.

How to Cure Corn.

Cut it off at the ground, as every good farmer will do, then draw it off an instant it up against the crooks of the fences around the field, from one to two feet thick. It will cure much better and quicker in this way than if stacked in the usual manner, it is a saving of time; and the ground will be clear for putting in wheat if desired.

M. N.

REMARK.—If the field is not very small, we apprehend it will require the stalks to be placed more than one or two feet thick around the fences, unless the crop is very light, or the fences of other fields are useful.—*Ens.*

Driving Nails Into Hard Wood.

We have lately seen another experiment of driving nails into hard seasoned timber, fairly tried. The first two nails, after passing through a pine board, entered but about one inch, and then doubled down under the hammer; but on dipping the points of the other six or eight nails into lard, every one was driven home without the least difficulty.

Carpenters, who are engaged in repairing old buildings, sometimes carry a small lump of lard or tallow for this purpose on one of their boots or shoes.

M. B. BATEHAM, Proprietor. } VOL. 2. ROCHESTER, NOVEMBER, 1841. NO. 11. } JOHN J. THOMAS, M. B. BATEHAM, Editors.

PUBLISHED MONTHLY.

TERMS,

FIFTY CENTS, per year, payable always in advance. Post Masters, Agents, and others, sending money free of postage, will receive seven copies for \$3,—Twelve copies for \$5,—Twenty-five copies for \$10. The postage of this paper is only one cent to any place within this state, and one and a half cents to any part of the United States. Address M. B. BATEHAM, Rochester, N. Y.

Terms for the Next Volume.

Depending on an immense circulation, we shall not increase the price, although our expenses are greatly increased. But we shall have to insist on a more strict construction of our terms. 1st. Payment must in all cases be remitted before the paper will be sent, as we cannot keep so many accounts and collect the amounts. 2d. No commission or discount can be allowed to Postmasters and other Agents, unless the money sent is at par value here. Uncurrent notes of all solvent banks will be received in payment where no commission is desired. Please to remember that all subscriptions for this paper must commence with a volume. Many persons have requested us to violate this rule lately, but we always send the back numbers of the current volume, or else let them wait and begin with the next.

Engravings--Portraits of Animals.

We intend in our next number to give a spirited portrait of the beautiful Short Horned Bull, "Atcher," the property of J. M. Sherwood, Esq., Auburn, which took the first premium at the State Fair. We have also ready for the engraver, portraits of two superb heifers belonging to J. B. Dill, Esq., Auburn, both of which took premiums at the Seneca county Fair; also of several fine animals belonging to J. C. Hathaway, Farmington. We intend these portraits shall excel any pictures that have appeared of late. But our readers must bear in mind that they cost us a great deal of money and we shall call upon them to lend us a helping hand in a month or so.

Still Another Agricultural Paper in Boston!—We noticed last month the Farmer's Journal, and now we have before us several copies of the Boston Ploughman, a lively weekly sheet, edited by Wm. Buckminster, the former editor of the Boston Cultivator, which paper he left on account of some misunderstanding with the proprietors. Mr. B. makes an interesting and useful paper, worth more than \$2 a year, the price of subscription.

Hints for the Month.

The principal work at this season consists in finishing the out-door work, and preparing for approaching winter. Cellars should be properly secured from frost. Potatoes in heaps and elsewhere, should receive their final and full covering. The same care should be given to beets. Ruta bagas, if not harvested, should be speedily—taking special care to ventilate the heaps as recommended and described on former occasions. Pumpkins, where farmers have them plentifully, as all good farmers ought to have for milch cows, should be preserved from frost, or they will soon be good for nothing, instead of being sound for use through winter. Tools should be collected from all quarters, and be carefully housed. Do not forget the plough, harrow, cultivator, cart and wagons, horse rake, spades and shovels, hoes and picks, wheel-barrow and hand carts, and whatever else of a perishable nature. Plough all ground, intended for spring crops, now, "practicable." See that drains are in proper order to perform their work effectively as soon as the first thaw may occur. Plan and sow garden seeds, of all plants which

endure the frosts of spring, and early crops will be the result. Remember the wood pile for winter use, and have plenty.

And whenever the weather is pleasant and open, do not fail to plant ornamental and fruit-trees wherever they are needed—and the former at least are needed everywhere. If you cannot plant many, plant a few—keep at it—a little at a time will accomplish a great deal by perseverance—"non desairo!" as the young latimet said—"many a little makes a mickle."

Effects of the Drought and the Latter Rain.

At page 133, we gave some account of the late drought; but its effects in conjunction with the latter rains, on some fruits, have been very singular. Nearly all the pears on the south side of a large *Summer Bon Chretien* tree, which were most exposed to the sun, withered and shriveled with large wrinkles. When the rain came however, the hollows swelled, and the surface became even; the pear took a new start; and though not so large as those that ripened earlier in the season, they still continue green (10 mo. 25,) more than a month after the usual period.

A tree of the *Rousslet de Rhims* is now in full bearing with pears not one half the usual size. These are spread however, regularly over the tree. If they were worth gathering, they might pass for winter pears, though they usually ripen six weeks earlier than the present time.

The *Blue Gage* shows a still greater difference in the time of ripening. More than two months ago, the fruit began to crack and drop from the tree; and though small on account of the superabundance, it was delicious. After the rain that immediately succeeded the drought however, the fruit ceased to fall; and much of it now, even at this late period, remains on the tree. We have no recollection of any similar instances.

The effects of drought and hot sun-shine on different fruits is not regular—the ripening of some being hastened, of others retarded, while a third class is not materially affected either way. The *Gravenstein* apple has matured earlier than usual, but the *Strawberry* apple later. Grapes have been hastened—peaches retarded.

A *Julienne* pear tree during the drought, dropped all its leaves; but when that was over, it revived, and one branch is now in full flower.

This variety is more impatient of drought than some other kinds. A sprout from the stock, had shot up unobserved, among the branches; but when they dropped their leaves, this sprout was detected by appearing in full foliage, green and vigorous.

"Why is it that the love of flowers takes such deep hold of the heart?" Why! Why it is because they are the emblems of love. Show me one who does not feel his own heart expand as he waters the expanding beauties of some delicate flower, and you will show me one who knows nothing of that pure and perfect affection of the heart which binds the human soully together."

To the Readers of the New Genesee Farmer.

It will be seen, by a notice on the last page, that the co-partnership which was formed one year ago between myself and C. F. Crossman is dissolved, and I am again sole proprietor of the New Genesee Farmer. I take this opportunity, therefore, to tender my acknowledgments to the numerous friends of the paper for the favor which they have shown it, and especially to those kind friends whose writings have contributed so largely to its popularity and success. After two years of incessant effort, I am exceedingly gratified with the present condition and future prospects of the publication. My health is somewhat impaired, so that it is necessary for me to seek relief or assistance; and believing that the aid of some person can be obtained, who is better qualified to do it justice, I have determined to relinquish the charge of the paper as soon as I can place it in suitable hands. Several well known individuals have been conferred with on the subject, and it was hoped that the new arrangement could be announced in this number, but it is found necessary to defer it till the next. In the meantime, a new Power Press will be obtained, and other facilities got in readiness for commencing the new volume in superior style. In order to complete the arrangements, I find it necessary to go immediately to Boston and New York, so that I shall be absent from home for two or three weeks. M. B. BATEHAM. Rochester, Nov. 1, 1841.

Prospectus for Next Volume.

Not having completed our contemplated arrangements, we have concluded to defer sending out a prospectus, till next month; but we wish to assure our friends that this paper will go ahead next year—no mistake. It will be improved in matter and appearance—price only 50 cents. So, reader, when you call for your next number, be prepared to hand your Postmaster half a dollar for us, and don't forget to ask your neighbor to do likewise.

For the New Genessee Farmer.

Foot ail in Sheep.

Messrs. Editors:—Noting an article in the last Genessee Farmer on the subject of foot ail in sheep, in which the writer says he has prevented the disease by paring off the under side of the hoof, I am induced to trouble you with a word on that subject.

I do not know but paring the hoof in the manner he suggests may be beneficial, but I doubt altogether that it produces the effect the writer supposes. I think he mistakes the nature of the disease; I do not consider it to originate in the ball of the foot—the part covered by the envelop which the writer would pare off, and of course do not believe, as he supposes, that the disease is generated by the filth collected in the foot, and proceeed and retained there, by that part of the hoof which grows over the sole of the foot.

The disease commences between the claws of the foot, at the spot where the horn of the hoof unites with the flesh. At its commencement it exhibits the appearance of a slight inflammation, if chafed or scalded. The animal at this stage is slightly lame. It soon becomes a sore, with slight maturation, which is somewhat feid. It now attracts the maggot fly and is soon filled with maggots—unless destroyed, they consume shortly the entire ball of the foot. If the fore foot is diseased, being brought into contact with the side of the animal when in a lying posture, it deposits on the side some portion of the feid discharge. This attracts the fly, and the sore is soon alive with maggots, which eat through the leg in a few days, thus causing the death of the animal.

Now I have no idea that the theory of the writer alluded to above is at all correct, nor that his remedy of paring the hoof is a preventive of the disease.

I suppose the disease originates in natural causes—first it is immediately induced by an acrid state of the fluids of the animal—that in certain seasons and locations it will prevail, and at other times will not; that the discharge from the large pore or issue which exists in the leg just above the parting of the claws being diseased and acrid, scalds the flesh between the claws—which is always tender—the part becomes inflamed—a feid maturation ensues—the fly is thus invited to his work, and soon completes the mischief—What may be the remote cause of the disease is not certainly known; whether the wetness or dryness of the ground, or the food of the animal, or some noxious or poisonous herbage; any or may not be concerned in it. I cannot say any more than I can tell why the influenza or other epidemics should prevail at certain times and not in others, or why all the members of a family in a certain circumstance I know, should not be alike affected by it.

The disease seems to be, with us, one of modern introduction. We have known it only a few years—it is not endemic, and the part of wisdom is to discover its causes, if possible, and to know how to apply preventives—so induce of time, to learn the nature of the disorder, so as to apply suitable and efficient remedies.

An opinion prevails, that it is infectious. I do not yet believe it is either contagious or infectious—either communicable by the presence of a diseased animal, or by water deposited on the ground and received by a sound foot by treading thereon. I have no idea from observations hitherto made, that the disease is infectious. It is possible, I allow, and therefore I reserve for experiment, separated the diseased from the sound. But I have found no unexpected increase of new cases, when they have been all together, nor has there appeared to be any diminution of new cases when they have been separated. When the animal has been long confined to low moist ground, and the season has been wet, I have imagined this might be the originating cause. Again, when the season is

been uncommonly dry, as during the past summer, and the disease has prevailed, conclusive evidence is furnished that the character of the season in this respect is not the cause. At one time I have imagined that poverty of condition might bring it on, and at another time this opinion has been met by the fact that sheep fit for the butcher's stall have been equally affected with those that were poor and thin.

I have been conversant with sheep husbandry for many years, but have known nothing of this disease until within four or five years past. In reflecting on the subject, I can realize no difference in the cure and management of my own flock between the last five years and any former period, except that formerly it was my practice to keep in their pasture, troughs always supplied with salt, protected by a rail over the top, supported by stakes, so that the animal could have access with the head to the salt, but could not get into it with the feet to soil and mangle it. This practice has been neglected for a few seasons past, and salt has been put out occasionally to the flock during the season. Whether this change has had any influence in causing or aiding the disease, I know not. I can however, realize no difference in the circumstances for many years, except on this respect. Although we consider it necessary for the health and comfort of the animal, and that nature will dictate just the amount needed when a supply is always at hand, still it is by no means certain that the want of such supply will cause or aid the disease—we can only say it is possible. If the theory is correct and reasonable that the local disease commences in an acrid discharge from the pore or issue above the foot, and if an unobstructed use of salt would have a favorable influence on the fluids and secretions of the animal, then perhaps its free use during the summer might prevent the appearance of the disorder.

This disease is not necessarily mendable or fatal but it is an inconvenient and troublesome malady and requires some labor and attention to subdue it.

As to the remedies. Lime—being a powerful antiseptic should be employed as a preventive and remedy in the first stages of the disease. Let the flock be made to pass through a small bed of lime once a week from the last of June until the first of September. Collect them into a stable or pen, and make it necessary in going out or in for them to pass through a passage some three or four feet wide, and twelve or fifteen feet long, the floor or bottom of which being covered with finely slack lime, about four inches deep. It will enter between the claws, give healthy action to any small sores and correct any acrid discharge, thus preventing the invasion of the fly. In place of this, a little Blue Vitriol, finely powdered, and applied to the diseased part, will immediately dry up and heal the sore. If the foot is badly diseased, and maggots are present, pare the hoof so as to expose them and apply spirits of Turpentine which will instantly dissolve and soon destroy them—use a probe to be certain that they are all removed. And then apply the blue vitriol to the diseased part. As the foot in this case will be sore and tender for some days it will be necessary, in order to prevent a return of the fly until it becomes sound, to apply turpentine to the foot, extending the turpentine two or three inches above the hoof to prevent the fly starting up from approaching it. It will also be necessary to examine the hoof carefully once in three or four days until it becomes perfectly sound. I think much of the use of lime, as above suggested, both on account of its efficiency and the facility of its employment. I use for this purpose the common portable sheep rack in which hay is fed in winter, about twelve or fourteen feet long and two and a half wide. I nail to it a temporary partition and put in the lime four inches deep, placing it close the

gate of door or the stable or pen in which the sheep are enclosed, and leaving the cattle they pass in a few moments through this passage of lime. I recommended this practice urgently to farmers who either have the disease in their flocks, or who fear and dread its approach. I have made these suggestions, Mr. Editor, in the hope of drawing the attention of farmers to this subject, that flocks hitherto sound, may, if possible, be so preserved, and that those which are diseased may be restored and a recurrence of the disorder be prevented. A FARMER.

Dayton, October 11, 1844.

Early and Late Fruit—Village of Aurora.

Lovers of fruits and flowers, and the early things of the garden, were you ever at Aurora, on the eastern shore of Cayuga Lake? It is a quiet, unobtrusive village, where the rich live in great simplicity—the poor, with decency and order. Here are green pines by the lake, ripe peaches and apples in July; the most delicious plums and peaches in August; and, at this time, such high colored ring-stone peaches, grapes and apples, as few other places can boast.

'Tis said that when D. T. comes down from his parading in a Great Falls two miles east, he exists as yet in the precocious vegetation of this late-warm spot with a slight tinge of envy, for his own present christianity rejects the feeling, 'tis only an emotion of regret, that Flora and Pomona could not be thus propitiated at his more elevated location.

I have often heard it said that peaches did not thrive on a clay soil, but here are the best peaches in the world growing in great variety, on a hard calcareous clay relieved by stable manure alone. The trees are never pruned, the soil around them is kept loose and entirely clear from grass and weeds.

Reader, if you never saw a village where fences and loc's work, and, to say to prove that the fruits and flowers from biped degradation go to Aurora: Here are Fall Pippins, Pound Sweets, and Bush's Non-such, lying in heaps—all who run may cut with impunity, the balance is left to the cattle.

It has been said that a poor man cannot live in Aurora, but the following anecdote will show that a poor man's widow is of quite a different opinion. A few years since, a laboring man of this village removed with a family to Indiana, where he afterwards died of a congestive event, leaving his wife and child in debt and ruin. The shrewd widow immediately wrote to her former neighbors at Aurora, soliciting their charity; the result was that a purse was made up for her relief, which was remitted to her by mail; when the widow opened the letter, she held up the safety fund bills to the astonished gaze of the longing hosts, saying there was more where that came from, and that every dollar of this, should be expended in paying her passage, and that of her children back to Aurora. She did come back in the cheerful month of November, but started from finding a cold reception, the remnant of one half her sufferings, sufficed to embalm every feeble heart in the village; a general contribution took place, and furnished a bed, another chairs, a third a table, knives, forks, &c. &c. The widow had her little ones now the comfortable and industrious poor ones of Aurora, who are only poor in comparison with the general thrif which surrounds them.

There is an Academy well endowed, and what is more, equally well taught and managed. A stranger would almost mistake himself at times in a fleet of steam boats, or on a boat of a man of war; so often, both late and early, does the bell strike, summoning the classes to recitation. 'Tis said that the only punishment the principal inflicts on a dull scholar, is to recommend him to go where he will be required to study.

October 2, 1841.

An Important Discovery in Agriculture.

The following article from the N. Y. Evening Post... is so new, and if not a very important discovery... to which it grows. There appears to be much... ability in the arguments, but for various reasons... we declined to thank the account is somewhat ex... aggerated. Still, it is well worth some experiments,

we have no doubt many of our readers will be s... interested for themselves next season. The Partridge, a P... or paper published at Paris, 58, S... a novel discovery is described, which, it... will work a great change in an important depart... of agricultural labor. It is communicated to... Paris print, by Charles Bonard, and M. B... round, date their letter at Brest, August, 1841. It ap... that while they and some of their tenants, who... their own estates, were engaged in conversation... the subject of agriculture, it was observed by one... of them, that that branch of industry was suffering... from the want of capital and enterprise, than... from other, and that nothing was to be done without... ure, which was every day becoming more scarce... an expensive. This remark led to an inquiry into... the modes of manure, and particularly as to what... reason nature had made in those uninvigorated... s, where there seems to be a vigorous and luxur... it grow, with out artificial assistance.

In observing nature unassisted, or unobwarded... by the hand of man, in vegetable reproduction, it... found that when the seed is ripe it falls upon the... and then the plant which has produced it... its leaves, or falls itself upon it, in decay, and... ers in it protects it from the weather, and gener... it has commenced, and the young plant is able to... w up in health and strength, and full development, ... commence the same routine of seed and of re... duction.

From this it follows that, in nature, every plant... duces its own soil or humus, and that the earth... serves to bear the plant, and not to aid or nour... it in vegetation. The nourishment of plants is... supposed to be derived from air and water, heat... light, or electricity, in different proportions, adapt... to the different varieties of vegetable nature. With this general notion in their minds, and con... sidering what to be, in present circumstances, one... the most important vegetable substances, they de... ed to try experiments, and in October last, under... the following operations: In a field which had been sown with rye, because... land was deemed too poor for wheat, a plot of 12... ure yards, untilled and left without manure, was... rained sowed over with the grains of wheat, and... neat straw was laid upon it closely and about one... inch in thickness. In a garden, also, which had been... neglected several years, a few square yards of ear... here tilled over, and the surface being made close... and level, some grains of wheat were scattered on this... arden surface, and a layer of straw one inch in... epth, was carefully laid over it and left, as in the for... er case, to take its chance without ulterior atten... tion. And, in order to make doubt impossible con...

cerning the more secondary functions of mineral earth... in vegetable reproduction, twenty grains of wheat... were sown upon the surface of a pane of glass inc... covered with some straw, as in the other case.

The germination of the seed was soon apparent and... most healthy in development. "The winter has been... rigorous," says these correspondents, "for this part... of the country, and the earth has sometimes been fro... zen in one solid mass to a depth of six inches in the... garden when the wheat was sown, and this has hap... pened several times during the winter, to the great... injury of many plants, and even the entire destruction... of some; while the spots protected by the straw were... never thoroughly encased, nor were the grains of... wheat at, though lying on the surface under the straw... at all affected by the cold. During spring excessive... droughts prolonged, and several times repeated, have... prevented vegetation on the common plan from flour... ishing in healthy progress, while our little spots of... wheat have hardly felt the inconvenience of excessive... dryness, for the earth protected by the straw has never... been deprived entirely of moisture, and our blades of... corn were flourishing, when all around was drooping... and uncertain. To conclude then, we have thorough... ly succeeded in our practical experiment, and the... wheat produced is of the finest quality. "The straw... was more than six feet high, and in the ears were 50, 60, and even 80 grains of wheat of full development, the... admittance of all who saw them, and particularly... those which grew upon the pane of glass, and which... were quite as healthy and as large as those which... grew upon the common earth. It must be observed... also that there was not the smallest particle of earth... upon the glass, and that the plants were left entirely... to themselves, without being watered or attended to... in any way whatever, from the time of sowing to the... time of reaping.

The cause of this success, they think, may be ex... plained in the following manner:

"Straw being a bad conductor of heat, and a good... conductor of electricity, maintains the heat of the plant... in a medium temper ture, and prevents the earth from... being deprived entirely of moisture. The moisture of... the earth or the substratum, being continual, facilitates... the gradual and constant absorption of carbonic acid... gas from the surrounding atmosphere, and hydrogen... and carbon, the chief elements of nourishment to ve... getables, are thus economized in regular supplies... when they are constantly required, and pass into... combination with oxygen from the roots up to the... stems and branches of the plants in which they are... stimulated, and the oxygen throws off in exhalation... from the leaves. The straw decays but slowly, and... thus furnishes its substance by degrees to the young... plant in due progress and proportion. (such as the... aliquid ingredients, for instance, of the pod of cap... sible) so that the decomposition of the straw comes... hands to the four phases of fermentation in progres... sion from the saccharine to the alcoholic the acid and... the putrid states, analogous to those of infancy, b... dding youth, and senility of die life.

"We observe that our blades of wheat have but a... very few roots, and these are short and hard, some... thing like a bird's claw; and this agrees with the... remarks of Mons Raspail, who states that the most... healthy plants in ordinary vegetation have the least ex... tensive of roots and fibres.

"Another important observation, also, is, that... weeds and parasitical vegetation are prevented by this... method, for the straw chokes every other plant but... that of its own seed. Many other interesting obser... vations might be made on these experiments, but we... refrain, at present, from troubling our readers; but... if any of them wish for further information on this... subject, we shall willingly afford them every facility... The importance of the general result will easily be... come apparent without further comment, and a revo... lution in the present modes of agricultural labor is a... necessary consequence of this discovery. No tillage... will now be required, nor any artificial stimulants in... manure and other more or less extensive combina... tions with regard to soil and culture. In fact, it... would be tedious to enumerate the various advant... ages that may result in practice from this casual ex... periment, and therefore, we proclaim it simply to the... world that all may profit by it."

As this experiment can be easily tried, we hope... some of our farmers will put it to the test, and com... municate the result. We shall certainly try it on a... small seven by nine lot of ground, which is the larg... est that is vouchsafed to a dweller in the city.

Culture of Silk.

It is indeed "an ill wind that blows nobody any... good." The subsidence of the Mulberry speculation... is followed by closing attention to the manufacture

of silk. The immense quantity of trees lately propa... gated for speculation, essentially aids those who now... embark with a view of pursuing the Silk Culture as... a steady business. The vice of speculation is thus... rendered tributary to honest industry; and we confi... dently predict that the crop of silk, in three or four... years, will prove that, whatever evils may have deluged... the country through the speculating mania, the... "mulberry fever" is followed by healthy and efficient... action in the great cause of rendering our country in... dependent of foreign nations for an ample supply of... Silk.

We congratulate thousands of thrifty farmers upon... the pleasant and profitable employment which the silk... business affords to the females and children in their... families—affording means and inducements to indus... try, that may essentially serve those families through... out life—promoting comfort and independence, and... yielding returns that would guard against pecuniary... distress, should the ordinary means of support be cur... tailed by the loss of husband or father, or by other re... verses in fortune. R.

Ontario County Agricultural Fair and Cattle Show.

It was our intention to have attended this exhibition, but... having been denied that privilege, we copy an... account of the proceedings from the *Ontario Reposi... tor*, by which it will be seen that the right spirit was... manifested, as usual, in that noble county:

The annual Fair and Cattle Show of the Ontario... County Agricultural Society, was held in this village... on the 12th instant. Notwithstanding the rain fore... bode winter the day previous, and on the morning of... the Fair, there was by far the largest collection of... people ever assembled in the county. The number... has been variously estimated at from five to ten thou... sand.

A spirit of enthusiasm seemed to animate the im... mense crowd, make creditable to the members of the... Society and propitious to the cause of agriculture in... our county. It was, on the whole, a proud day for... the Farmers of "Old Ontario." The exhibition was... graced by a large collection and variety of the best... specimens from their fields and gardens, as well as of... their useful animals and domestic manufactures.

[The list of premiums will be found in another col... umn.]

At 1 o'clock P. M. as many as could crowd the... spacious court room but perceptibly diminishing the... numerous throng in our sunless and shaded there, and... descended to an interesting process from G. C. Wilson, Esq., which, we believe, is to be published.

After Mr. Wilson had delivered his address, on... motion of Timothy Badt, jr. of East Bloomfield, it... was unanimously resolved, that the thanks of the... members of the Society be tendered Mr. Wilson for... his interesting address, and that he be requested to... furnish a copy for publication.

The members of the Society then proceeded to the... choice of officers for the ensuing year, when the fol... lowing gentlemen were chosen:

- John Green, of Canandagua, President.
- Charles Goffrey, of Seneca, 1st Vice-President.
- Heman Chipin, of East Bloomfield, 2d do.
- Peter M. Welch, of Manchester, 3d do.
- Joseph Phelps, of Geneva, 4th do.
- Walter Otley, of Phelps, 5th do.
- Joseph G. Bingham, of Richmond, 6th do.
- Wm. W. Graham, of Canandagua, Recording Secretary.
- Oliver Phelps, of Canandagua, Corresponding Secretary.
- James D. Benson, of Canandagua, Treasurer.

TOWN MANAGERS OR COMMITTEES.

- Canandagua**—Wm. Burling, jr., Charles Shep... ard, Jacob S. Van Hook, John Townsend, Henry How... ard.
- Canadise**—Hiram Colegrove, Frederick West... brook, Robert Armstrong, Sylvester Austin, Josiah... Jackson.
- East Bloomfield**—Timothy Badt, jr., Theodore... Savage, Myron Adams, Bam Bradley, Flavius J... Benson.
- West Bloomfield**—R. W. Peck, R. H. Worth... ton, B. Z. C. Lott, Jasper C. Leck, Ot... Factory.

Bristol.—Francis Mason, Erastus H. Crow, Anson Packard, Wm. T. Coddling, Phineas Kent.

South Bristol.—James Farmely, jr., Simri Collins, John Stetson, Allen Brown, Franklin Crooker.

Gorham.—David Pickett, Ephraim Blodget, Nathaniel Smith, Hiram Harkness, Colliester Merritt.

Hopewell.—Cyrus Gates, Andrew M. Bush, Eben Benham 2d, Theodore Crosby, Ephraim Watkins.

Manchester.—Nicholas Howland, Abner Barlow, jr., Edmund B. Dewey, Manning Redfield, Jedediah Dewey, jr.

Naples.—James L. Monier, Bronson K. Lyon, Alanson Watkins, Ephraim W. Cleveland, Josiah Porter.

Farmington.—Russell M. Rush, Joseph C. Hathaway, Wilmarth Smith, Percz Hathaway, Welcome W. Herendeen.

Richmond.—Hiram Pitts, Noah Ashley, Edward Swan, Zaebariah Longory, William F. Reed.

Phelps.—Elias Cost, William Post, Spencer Hildreth, Wm. Dickenson, Charles Scott.

Seneca.—Phineas Pronty, John Devereux, George Fordon, Abraham A. Post.

Victor.—Jared H. Boughton, Wm. D. Dickenson, Thomas Embury, Samuel Rawson, Henry Pardee.

The President then read the reports of the several committees.

LIST OF PREMIUMS awarded by the Ontario Agricultural Society, at the Fair held on Tuesday the 12th of October, 1844:

HORSES.

Best Stud Horse kept in the county 6 months preceding the Exhibition, \$7, to P. W. Dickey, of the town of Phelps.

3d best do. \$3, to A. C. Butler, Phelps.

Best Stud Horse over 4 years old, raised in the county, \$7, to John Post, Seneca.

2d best do. \$5, to Benj. Washburn, Gorham.

3d best do. \$3, to Samuel Scott, do.

Best pair matched Horses, not over 7 years old, \$7, to Marvin Gage, of Gorham.

2d best do. \$5, to W. W. Herendeen, Farmington.

3d best do. \$3, to Charles Godfrey, Seneca.

Best single Horse, not over 7 years old, \$5, to Samuel Greenleaf, Canandaigua.

2d best do. \$3, to Jos. Gorlinghouse, Richmond.

Best Mare with Colt 1 year old past, \$5, to Ephraim Walkins, Hopewell.

2d best do. \$3, to Wm. Outley, Phelps.

3d best do. \$2, to Nathaniel Smith, Gorham.

Best 3 year old colt, \$5, to A. M. Bush, Hopewell.

2d best do. \$3, to Samuel Remington, Canandaigua.

Best 2 year old colt, \$3, to J. Wolverton.

2d best do. \$2, George Gooding, Bristol.

CATTLE.

Best Bull, \$7, to Tim. W. Gooding, Canandaigua.

2d best do. \$5, to J. C. Hathaway, Farmington.

3d best do. \$3, to B. Thomas, Canandaigua.

Best pair 3 year old steers, \$5, to W. W. Herendeen, Farmington.

2d best do. \$3, to Myron Adams, East Bloomfield.

3d best do. \$2, to Lemuel Bannister, jr., Phelps.

Best pair 2 year old steers \$5, to Harvey Pratt, Hopewell.

2d best do. \$3, to J. S. Jones, East Bloomfield.

3d best do. \$2, to Silas Harris, " "

Best pair of 1 year old steers, \$5, to Seymour Reed, Bristol.

2d best do. \$3, to Dinforth Booth, Manchester.

3d best do. \$2, to S. P. Harvey, West Bloomfield.

Best 1 year old heifer, \$5, to Robert Higham, Canandaigua.

2d best do. \$3, to Thomas Bell, Gorham.

3d best do. \$2, to Anson Packard, Bristol.

Best Milch cow, \$5, to E. Hale Canandaigua.

2d best do. \$3, to Heman Chapin, East Bloomfield.

3d best do. \$2, to J. C. Hathaway, Farmington.

Best Bull calf, \$5, to Tim. W. Gooding, Canandaigua.

2d best do. \$3, to Heman Chapin, East Bloomfield.

3d best do. \$2, to J. C. Hathaway, Farmington.

Best heifer calf, \$5, to Anson Packard, Bristol.

2d best do. \$3, to J. C. Hathaway, Farmington.

3d best do. \$2, to " "

Best pair of Working Oxen, \$7, to James Sears, Seneca.

2d best do. \$5, to O. Morse, Canandaigua.

3d best do. \$3, to F. J. Bronson, East Bloomfield.

SHEEP.

Best Ram, reference to carcass, \$5, to Geo. Cayward jr., Hopewell.

2d best do, reference to carcass, \$3, to Guy Collins, East Bloomfield.

Best Ram, reference to fleece, \$5, to W. B. Dickerson, Victor.

2d best do do \$3, to Jared Hathaway, Farmington.

Best 6 Ewes, reference to carcass, \$5, to C. B. Meek, Canandaigua.

2d best do \$3, to George Cayward, Seneca.

Best 6 Ewes, reference to fleece, \$5, to Jared Hathaway, Farmington.

SWINE.

Best male Swine, \$5, to H. Hubbard, Canandaigua.

2d best do \$3, to Amasa Carter, East Bloomfield.

3d best do \$2, to E. Humphrey, " "

Best Sow, \$5, to John Jones, Canandaigua.

2d best do \$3, to Amasa Carter, East Bloomfield.

3d best do \$2, to J. S. Hart, Hopewell.

Best Litter of Pigs, \$5, to F. A. Spaulding, East Bloomfield.

2d best do \$3, to John Jones, Canandaigua.

3d best do \$2, to James D. Bemis, Canandaigua.

PLOWING.

Ploughing with horse team, $\frac{1}{4}$ of an acre, to be within an hour, \$7, to William Burling, Canandaigua.

2d best do \$5, to Charles Godfrey, Seneca.

3d best do \$3, to Colliester Miller, Gorham.

Ploughing with ox team $\frac{1}{4}$ of an acre, best within an hour, \$7, to George Hewson, Seneca.

2d best do \$5, to A. Jones, East Bloomfield.

3d best do \$3, to Daniel Parshall, Canandaigua.

DOMESTIC MANUFACTURES.

Best 10 yards of Cassimere, \$5, to N. P. Brewster, Farmington.

2d best do \$3, to M. Norton, Farmington.

Best 50 lbs Butter, \$5, to Percz Hathaway, Farmington.

2d best do \$3, to Thomas Bell, Gorham.

3d best do \$2, to Boni Bradley, East Bloomfield.

Best 20 yds Flannel, \$5, to Edward B. Dewey, Manchester.

2d best do \$3, to Thayer Gauss, East Bloomfield.

3d best do \$2, to William Outley, Phelps.

Best 20 yds Carpet, \$5, to John Lapham, Farmington.

2d best do \$3, to Franklin Beebe, East Bloomfield.

3d best do \$2, to A. B. Rapalje, Farmington.

Best 20 yards of Woolen Cloth, \$5, to E. B. Dewey, Manchester.

2d best do \$3, to William Bryant, Manchester.

3d best do \$2, to William Outley, Phelps.

Best 100 lbs Cheese, \$5, to Uri Beach, East Bloomfield.

2d best do \$3, to John Lapham, Farmington.

3d best do \$2, to P. Hathaway, " "

Greatest quantity of reeled Silk \$5, to A. Hathaway, Bristol.

Next do do \$3, to M. Newton, East Bloomfield.

Next do do \$2, to A. N. Buck, Manchester.

Best 5 pounds Cocoons, \$5, to Jonathan Buell, East Bloomfield.

2d best do \$3, to A. Hathaway, Bristol.

3d best do \$2, to H. Munson, East Bloomfield.

Best ounce Black Sewing Silk, \$5, to Walter Whitney, Hopewell.

2d best do \$3, to Jos T. Shaw, Canandaigua.

3d best do \$2, to William Blodget, Gorham.

Best ounce Sewing Silk, assorted colors, \$5, to Walter Whitney, Hopewell.

2d best do \$3, to H. Munson, East Bloomfield.

3d best do \$2, to W. Blodget, Gorham.

DISCRETIONARY PREMIUMS.

3 Shawls 3 dolls to Justus H. Sanger, Canandaigua ;

1 do 1 doll to E. B. Dewey, Manchester; 1 Lamp Stand 1 dollar to Boni Bradley, East Bloomfield; 1 Red Silk Coverlid, 2 dolls to Charles Scott, Phelps;

4 blue and white Coverlids, 2 dolls to William Outley, Phelps; 1 red do 1 doll to T. Palmer, Gorham; 1 blue do 1 doll to W. Outley, Phelps; 1 plated Bit and Stirrups, 1 doll to S. W. Gregory, Canandaigua; 1 Lace Cap, 1 doll to Thomas Bell, Gorham; For Stocking Yarn 1 doll to F. Penoyer, East Bloomfield; 1 Green Hearth Rug 2 dollars, to Mrs Hannah Sanburn; For blue and white Mittens, 1 doll to Frederick Penoyer, East Bloomfield; For fancy do 1 doll to ———;

For Hearth Rug red and black, 1 doll William Bryant, Manchester; For black Stockings 50 cts to W. Whitney, Hopewell; For White do 50 cts to W. Outley, Phelps; For blue and white Coverlid, 1 doll to A. B. Rapalje, Farmington.

Cayuga County.

The first annual Fair of the Cayuga County Agricultural Society was held at Auburn, Oct. 13th and 14th. The Auburn Journal says—"There was fine display of cattle, horses, sheep and swine presented for competition on the first day; and on the 2d a goodly variety of the products of horticulture, vegetables and fruits of the garden and orchard; as well as domestic manufactured goods of wool, silk and cotton. The result so far, has been highly gratifying to the friends of the most important interest of the county--Agriculture--as it has shown conclusively that Cayuga is little behind the best counties of the state in the true sources of wealth."

We intended to publish the complete list of premiums, but find our space will not permit.

The Committee on Silk reported that the best specimen of Cocoons was presented by Mr. Joseph Wood, of Montezuma, and the premium of \$2 was awarded to him. There was also presented by Z. Fitch, and H. Polhemus, two lots of sewing silk of superior quality, manufactured in the State Prison. The silk is equal to any Italian silk now in use. The opinion of the committee is that the growing of silk might be made profitable.

David Thomas, Chairman of the Committee on Fruits, remarked, that "considering the pleasure with which our citizens receive a present of fine fruit the Committee are not a little surprised at the indifference and neglect manifested in the cultivation of the superior varieties."

Great crop of Corn.—"The committee on grain awarded to Joseph F. Osborn, the first premium of \$5 for the best crop of corn, presented by specimens, both in quality of seed and quantity produced, which is 1 bushels 11 pounds to the acre.

The second premium of \$5 for quantity, (121 bushels 15 lbs. to the acre,) was awarded to James Sherman, of Springport. The seed we conceive not of the best kind."

We should feel obliged if some friend would send us a particular account of these corn crops--soil, culture, kind, mode of measurement, &c.—Eds.

Cortland County.

The third annual Fair of this Society was held at Cortland Village on the 5th ult. The Democrat says "The day was uncommonly clear and pleasant, and the display of animals was larger and far finer than on any preceding occasion." Judging from the published report we should think that the number and amount of premiums offered were entirely too small to excite spirited competition; but we presume this will be improved hereafter. We observe that our friend Col. H. S. Randall, the worthy Corresponding Secretary of the State Society, carries off the palm in most kinds of Cattle and fine woolled sheep:

Great Yield of Corn--Close Planting.

A Scotch farmer residing in the town of Soda, Wayne county, N. Y. informs us that he raised, the past season, 400 bushels of Indian Corn on 4 acres of land, notwithstanding the dryness of the season. He attributes his success mainly to his manner of planting, and thinks that farmers generally plant too thinly. His mode is, to plant in rows 3 feet apart, and drop two grains in a place only 15 inches apart in the rows. The variety used is the Red Blazed Flint. The soil is sandy loam, and 100 loads of manure were put on the 4 acres. The corn was ripe and cut sufficiently early to sow the ground with wheat.

AN OBJECT OF AMBITION.—It may not be in your power to excel many people in riches, honors, or abilities; but you may excel thousands in goodness of heart. Hitherto turn your ambition. It is an object worthy of it.

Niagara, Warren, Livingston, and several other County reports, were received too late to be noticed this month.

Genesee County Agricultural Fair.
 This exhibition was held at Alexander on the 13th and 14th ult. We were not able to be present on the day, but were informed that the display of cat-vas very good, and gave evidence of considerable improvement. On the second day the cattle hadly left, but we noticed a fine lot of grade animals of different breeds belonging to the Messrs. Heston, of which are very beautiful. The large herd of Improved Short Horns belonging to Peter A. Remsen, we also witnessed with great pleasure. We were informed that Mr. Remsen had some fine cattle, but by no means prepared to see so large a number of such excellence. We hope to give a more particular account of them hereafter.

The Ploughing Match excited a good deal of interest usual; but the work was performed in too much haste to be done well. We would advise the farmers hereafter to offer premiums for those who perform the work in the best manner within a given time.

The exhibition of Domestic Manufactures &c. was equal to our expectations, or very creditable to the wives of Genesee, although a few families deserve great praise. We noticed, in particular, a very fine assortment of useful and elegant articles exhibited by Mrs. Worden Mattison, of Darien, consisting of silk gloves and hose, sewing silk, linen thread and work, domestic cloth and linen diaper, the latter affording a greater display of skill and industry than is often produced by one family. Other articles deserve to be noticed, but our space will not allow us to enumerate them.

From what we saw of this Fair, we are constrained to say we were disappointed with Old Genesee.—A rich agricultural county is capable of doing better things, and ought to be one of the very foremost in the march of improvement. We were greatly surprised when the President of the Society informed us that they had not raised a sufficient amount to be able to draw their full quota of funds from the State. This fact alone affords conclusive evidence that something is wrong; and the officers will have to put forth efforts to awaken interest in the subject.

We have no desire to dictate, but from what we have seen we are fully satisfied that Alexander is not the most suitable place for holding the Fairs, and that some of the best towns in the county refuse to cooperate because they are held there. It appears to us there are many reasons in favor of holding the Fairs at Attica. In the first place we believe the citizens of that place would contribute liberally towards the funds of the Society, and with the co-operation of the rich Western and Eastern towns which now keep aloof, there would be little difficulty in raising at least a sufficient amount to secure the full portion of State aid. We are aware that some of the Southern towns might be aggrieved, but if we are correctly informed there are but few of them that have heretofore rendered much assistance, so that but little would be lost in that direction. Besides, Batavia is the centre of business and attractions, has excellent accommodations and is easy of access. So that a much larger attendance would always be secured there than at Alexander. We presume the officers of the Society will consider this matter, and that such arrangements will be made for the coming year as will redound to the credit of this Empire county.

For the New Genesee Farmer.

GENTS.—I send you a brief notice of the proceedings of the Genesee County Agricultural Society, at the annual Exhibition and Fair, held on the 13th and 14th of October, 1841. The show of cattle and horses was very fine, being a large gain over last year's Exhibition. The show

of sheep and hogs, was very slim, and a great falling off from last year. It was far from creditable to so large a county, and will probably be remedied at our next Fair.

The Mechanics seem to have taken little or no interest in our meeting. Premiums were offered for almost every kind of mechanical production, but there were only a very few kinds exhibited.

The household arts were, if possible, still worse represented, and the Ladies of old Genesee have much to answer for in allowing themselves to be so poorly represented. I feel confident it will not be so again.

On the second day the ploughing match came off, and was by far the most exciting part of the whole exhibition. The ground to be ploughed was one eighth of an acre, and the premium to be awarded to the person doing it the best in the shortest time. The ground selected was a pasture on the flats. Four teams entered at first, and their performances were as follows:—1st, 13 minutes 50 seconds, 2d, 14 m. 25 sec., 3d, 14 m. 35 sec., 4th, 16 m. 20. The second took the premium. The team and plough were owned by L. E. Heston, ploughman, Mr. Brownell.—Had all the ploughs been equal to Mr. Heston's it would have been a very close contest. The plough is manufactured by Smith & Co., at Batavia, and is called the "Scotch Improvement." It is a decided improvement, upon the ploughs of this county at least, and must prove a great acquisition. There is no farm implement of more importance than the plough, and yet there is almost as much improvement to be made, as there was from the old bull plough to the one now in use. Two other teams entered subsequently, and did the same quantity, in 12 minutes and 10 seconds, and 13 m. 35 seconds.

I think the arrangements for the ploughing match were defective, inasmuch as it should have been the best within a reasonable time, say 25 or 30 minutes. It would then enable weaker and lighter teams to compete, as it would not be so much time as workmanship, and that after all is the true test of good ploughing, time being only a secondary object. I hope such will be the order next year.

There was also a defect in the arrangement relative to the cattle. No person should be allowed to exhibit cattle unless each animal is tied to a stake.

The speeches should also be made the first day, and the premiums awarded and paid the second day.

All these things will be made right after a little more experience, and farmers must not complain if the management of the Society is not perfect the second year.

I am sorry to say that there is not as much spirit manifested by the farmers as there ought to be, nor have they come forward as liberally as every person had reason to suppose they would. There was a large concourse of people, but nothing when compared with the assemblage in other counties. I regret exceedingly that we were not able to draw from the state all the money to which the county was entitled. We have not received our portion into sixty-one dollars. It does not tell very well for the "Empire County," that out of its 7,000 farmers, there could not be found enough to raise the sum of \$179 00. The premiums will all be paid, but still it would have been much better if there could have been something in the treasury for another year.

It was resolved to keep the two counties, Genesee and Wyoming together as one society, and officers were elected the same as though the county had not been divided.

Premiums Awarded.
BULLS.
 Devonshire, M. Vernon, T. G. Goodwill, E. P. Beck, 2 premiums. Durhams; B. Murphey, P. A. Remsen, 2 premiums. Best Bull of any age com-

mon or crossed, C. Carter, Durham, out of native Devonshire, got by Weddel's imported Young Rover. This bull shows in an eminent degree, the great superiority of a cross with good Durhams. Z. Cone and L. E. Heston each drew premiums in this class.

OXEN AND STEERS.
 P. A. Remsen, L. Fisher, S. W. Kingsley, L. E. Heston, and C. Tompkins.

COWS AND HEIFERS.
 P. A. Remsen, 2 premiums, J. Heston, and E. Stevens. Devonshire; E. P. Beck, 4 premiums.

COMMON OR CROSSED.
 W. E. Heston, D. Malory, and L. E. Heston.

HORSES.
 J. Jenne, C. Barrett, S. W. Kingsley, B. Benedict, H. Dunham, S. H. King, L. E. Heston, and C. Barrett.

HOGS.
 E. P. Beck, E. J. Pettibone, H. Brown, and L. E. Heston.

SHEEP.
 George Shapman, C. Hannum, 2; E. P. Beck, 2.

CULTURE.
 H. Brainard, best acre of Corn, 97 bushels—best acre of Potatoes, 400 bushels—best 3 acres of Spring Wheat, 27 bushels, per acre. Mr. Brainard had no competitor.

DOMESTIC ARTS.
 E. Serantom, for Reeled Silk; E. Bishop, Flannel; E. Murdock, Sewing Silk; E. Byington, Woolen Yarn; Mrs. W. Mattison, Silk Hose; Z. Cone, 25 lbs. Butter; Mrs. T. Riddle, Carpet; Levi Hall, Saddle; T. Yates, Fine Boots; W. Sillery, Ladies' Walking Shoes and Slippers each.

DISCRETIONARY PREMIUMS.
 The following discretionary premiums were awarded:—

An Ottoman made by Miss Matilda Butler, Alexander, \$1—Hat, manufactured by P. Durant, Batavia, \$1 50—Work Bag Miss Sarah Jenne, Bethany, \$1—Linen Lace Cap, Linen figured Tablecloth, Linen Thread, a fine specimen of Sewing Silk, and Cocones, by Mrs. and Miss Mattison, of Darien, \$4—28 lbs. Maple Sugar, very fine by Mr. Mattison, \$1—Woolen Rob Roy Shawl, manufactured entirely by Miss Farnham, Alexander, \$2—Beautiful specimen of Reeled Silk by N. D. Hart, \$2—Elegant Hearth Rug, Mrs. E. G. Spalding, Alexander, \$1 50—Gig Harness, double work Harness, travelling Trunk, Valice and Carpet Bag, by Wm. Manly, Batavia, \$5—Very fine specimen of Penmanship, by A. S. Pratt, Alexander, \$1—Very excellent article of Leather, by Wm. Geer, Alexander, \$2—On a number of Fowls raised by Mrs. Palmer, of Attica, called the Top Knots, which were very fine, \$2.

OFFICERS FOR ENSUING YEAR.
 President, T. C. Peters, Darien; Vice Presidents, E. Bishop, Attica; L. DeWolf, Middlebury; John Jenne, Bethany; H. Ramsdell, Batavia; C. Rich, Alexander; E. P. Beck, A. Sheldon, R. Rich, LeRoy; P. Dickey, Elba. C. P. Turner of Batavia, Recording Secretary. P. Follett of same place, Corresponding Secretary. L. E. Heston of Batavia, Treasurer.

I had intended to have made some remarks on the different breeds of cattle, but this article has been so much longer than I expected that I shall reserve them for a future number. Yours &c.,
 Darien, October 16, 1841. T. C. P.

Premium Ploughs.
 In justice to the manufacturers, we remark, that the plough which gained the first premium at the ploughing match in this county, was the Whiting plough, made by A. J. Langworthy, of this city; and the one which gained the second premium was the improved Livingston county Plough, made at Caledonia

Monroe County Agricultural Fair.

The annual exhibition of this Society came off in this city on the 15th and 16th of October. The display of animals, of every class, was better than we anticipated, although we met quite a few old Monroe...

The Ploughing Match excited much interest, as witnessed from the thousands of farmers and teams who thronged the ground to witness it. Twelve teams, with skillful ploughmen, entered for the contest...

The exhibition of Horticultural productions, implements, domestic manufactures, &c., was quite respectable, but did not fully meet our wishes or expectations. We do not believe there is any lack of industry or skill among the farmers...

It gives us peculiar pleasure to observe the very general attendance of farmers and their families at these exhibitions. At all places which we have seen or heard from, the Agricultural Fairs are most numerously attended. Who can estimate the amount of benefit that will result to the country...

We regret to notice a disposition, on the part of some, to find fault with the decisions of the Committees in awarding the premiums. Those who serve in this capacity have a best, an arduous and thankless task, and after performing it with faithfulness and integrity...

The reports of the various Committees render it unnecessary for us to prolong our remarks; but we cannot close without expressing a desire that all will read the excellent address of Mr. South, which may be found in our columns this month.

Premiums Awarded by the Monroe Co. Agricultural Society for 1811. HORSES.

The Committee on horses remarked that the ere governed more by the appearance and action o

the animal's than by any reference to their blood or pedigree. After careful examination and comparison of the numerous fine horses exhibited, they agreed to award premiums to the following, as those which were judged to be the best of their judgment appeared to combine the most of those qualities requisite for usefulness, durability and elegance.

- For the best Saddle Horse, (Imported Horse)
Alfred J. Thomas, Weadon... \$10 00
2d do, J. K. Balenue... 7 00
3d do, Wm. T. one... 5 00
Best Pair Matched Horses, G. Perka... 7 00
2d do, A. Lane... 5 00
3d do, H. Olmsted... 3 00
Best Mare, John Ayrault... 7 00
2d do, Wm. Tom... 5 00
3d do, Wm. Blunnie... 3 00
Best 3 years old Colt, (by Alfred) H. Padlock... 5 00
2d do, (by Alfred) H. E. Fow... 3 00

HERON BROWN,
CHAS. D. GODFREY,
HARRY OLMSTED } Committee
CATTLE.

The Committee on cattle report that owing to the large number of superior animals exhibited, they found it difficult in some cases to decide which was entitled to the greatest merit; but after mature deliberation, and the exercise of their best judgment, they decide to award premiums as follows.

- For the best Bull, (Durham Short Horned, American Comet, Thomas Weadon... \$10 00
2d do, Ramsdell & Cole... 7 00
3d do, (Albion, Wm. C. Cornell... 5 00
Best Pair 2 years old Steers, John Ayrault... 5 00
2d do, Stephen Leggett... 3 00
Best Pair of Fat Oxen, John Ayrault... 7 00
2d do, John Bosley... 5 00
Best Pair of Working Oxen, John Ayrault... 7 00
2d do, John Legg... 5 00
3d do, Gideon Ramsdell... 3 00
Best Milch Cow, (Durham Short Horned)
Gazelle, Thomas Weadon... 7 00
2d do, Wm. C. Cornell... 5 00
3d do, — South... 3 00
GEORGE SHEFFER,
JACOB STRAWN,
JOHN BURNS, } Committee.

SWINE.

The Committee on Swine remarked that the exhibition of this class of animals was highly creditable to the Society and the county. Many very hearty fairs, besides those for which premiums were awarded, deserve special notice. Among these was a sow with six pigs...

- For the best Pair, Berkshire (Hane Moore) \$7 00
2d do, Nathaniel Hayward... 5 00
3d do, Amos Sawyer, (Berkshire)... 3 00
Best Sow, (with pigs, Leicester) T. Watson 5 00
2d do, do, Amos Sawyer... 3 00
GIDEON RAMSDELL,
JOHN FULLER,
EDWARD CHAMPENEY, } Committee.

SHEEP

The Committee on Sheep report that they discharged their duties with all the care and faithfulness of which they were capable. For the honor of the county, and put early for that of the farmers owning so numerous beautiful animals exhibited on the occasion, the Committee take pride in saying they were all very choice and desirable lots of sheep. Besides those for which premiums were awarded, the Committee desire to mention as worthy of special notice, a small lot of Merino Ewes, owned by Elphinst Day, of Oxford, and of Merino Bucks, owned by his son; and some Merino Bucks, owned by Gideon Cobb of Brighon,—Premiums were awarded as follows.

- For the best Buck, reference to entries,
Leicester, Simon Lewis... \$5
2d do, John Bette... 3
Best do, Pierce, Miss Lamont... 5
2d do, Jesse Harmon... 3
Best 3 Ewes, reference to entries, (Co. Swold)
Wm. C. Cornell... 5
2d do, Samuel Down... 3
Best 3 Ewes, reference to faces, Mr. Day... 5
2d do, M. Snyder... 3

2d do, Samuel Lewis... 3

THOMAS WILLCOX,
JOHN ROBINSON,
ARTHUR CLARE, } Committee
FIELD CROPS.

The Convention on Field Crops, respectfully request that they have attended to applications for premiums, in this department, from the following Gentlemen who have, by evidence satisfactory to the Committee, established their claims to the honor having raised on their respective farms the following products, viz:

WHEAT.

- James Beatty of Greece, an average of 53 bushels and 20 lbs. to the acre—6 acres.
George Sheffer, of Watford, an average of bushels—7 1/2 acres.
Samuel Shadbolt, of Chili, an average of 75 1/2 bushels—9 acres.

CORN.

- Robert D. Marlin, of Chili, an average of 94 bushels to the acre.
Ebenzer Gooding, of Henrietta, an average of 90 bushels to the acre.
Lyman B. Langworthy, of Greece, an average of 80 1/2 bushels to the acre.
James Hart, of Sweden, at the rate of 93 bushels to the acre on one acre and a half.
Abram Cushman, without vouchers, present memorandum, sowing 18 bushels to the acre.

POTATOES.

- Owen McGinn, of Greece, 4 bushels to the acre.
George Sheffer, 312 bushels to the acre.
Samuel Davidson, of Greece, 280 bushels to the acre.
Ebenzer Gooding of Henrietta, 217 bushels to the acre.
F. P. Root, of Sweden, 1200 bushels Ruta Baga to the acre.
George Sheffer, 652 bushels Carrots to the acre.
" " 1100 bushels Mangold Wurzel.
" " 1160 bushels of Sugar Beet.
" " 502 bushels of Ruta Baga do.
Charles Felt, Chili, at the rate of 720 bushels to an acre, which being short of the present seasons cannot claim a premium.

The Committee, in accordance with the above have awarded

WHEAT.

- To James Beatty, Esq., of Greece, the first premium \$10—quantity 53 1/2 bushels to the acre.
George Sheffer, Esq., Watford, 2d do \$7—Samuel Shadbolt, Esq., Chili, 3d do \$5—2 1/2

CORN.

- Robert D. Marlin, Chili, first premium, quantity 94 bushels to the acre. Ebenzer Gooding, Henrietta, 2d do, \$5—30 do. L. B. Langworthy, 3d do, \$2—80 1/2 do.

POTATOES.

- Owen McGinn, Greece, first premium, \$5—quantity 310 bushels to the acre. George Sheffer, Watford, 2d do, \$3—12 do. Samuel Davidson, Greece, 3d do, \$2—280 do.

ROOTS.

- F. P. Root, Sweden, first premium, on Ruta Baga, \$7—quantity, 1200 bushels to the acre. Sheffer, first premium on Mangold Wurzel, 1000 do. Do, do; Sugar Beet, \$5—1160 do.

The season having been an unfavorable one for production of large crops, the competition for premiums has necessarily been confined to a small number. These, however, it is thought, do no discredit to specimens exhibited, to the soil or culture of Monroe. Little regard has been paid, by many of the applicants, to the rules prescribed for certifying the Committee, the necessary facts in regard to

measure of the land and the mode of ascertaining the product, and the Committee have reported, in one or two instances, applicants who doubtless might have claimed premiums but for this neglect. The important duty of furnishing a description of soil mode of culture, expense, &c. has been neglected by several of the applicants— they have however promised to supply the defect in all cases where premiums are awarded. The Committee would respectfully recommend that all who may be disposed to contend for premiums hereafter, procure in due time the proper directions in regard to these particulars.

LEWIS BROOKS,
NICHOLAS REED,
ELISHA HARMON, Jr. } Committee.

(A report of the mode of cultivation, soil &c. of the grain and crops will be published hereafter.—E.S.)

PLOUGHING MATCH.

The committee on ploughing, report that twelve (twelve) teams entered the field for competition. The contest was very spirited, and was witnessed by a large concourse of spectators. The work was mostly performed in good style, and the committee were highly gratified at the display of skill in this important art. Besides those to whom premiums were awarded, the committee would mention that Mr. Robinson and Mr. Chapman, of Henrietta, deserve much praise for their skilful ploughmanship. The premiums were awarded as follows:

- 1st Premium to S. J. Lewis, of Buffalo, \$5
- 2nd do. Edward How, C. H. do. 3
- 3rd do. Chas. B. Pratt, Buffalo, 3

B. HARMON, Jr.,
Chairman of Committee.

IMPLEMENTS.

The Committee to whom was referred the examination of farm implements, &c., report that the number of articles presented for their inspection, was very small, and does not reflect much credit on the manufacturers in this county, who it is well known are second to but few in this business. Some meritorious articles were exhibited without competition, and therefore are not entitled to premiums. (Hazen's Sowing Machine was exhibited, in operation, during the Fair, and elicited great praise, but as it was not present at the time of inspection, the Committee omitted to mention it.) They decided to award premiums as follows.

- To Andrew J. Langworthy, for the "Lockin Plough," it being considered the best green-ground Plough, \$5
- To F. D. Wright, for the Green's Plough, considered the 1st or 2nd for sowing or cross ploughing, 3
- To A. & J. Ward, for the Agricultural Pump, a very useful article for forcing water or boiling food for animals, a discretionary premium of 3
- To A. J. Langworthy, for an exhibition of various cast iron horticultural implements converted into a table iron, a discretionary premium of 3

MARTIN SAGE,
ABEL BALDWIN,
L. B. LANGWORTHY. } Committee.

BUTTER, CHEESE &c.

The number of competitors in this class was not large, but the articles exhibited were of very excellent quality. The Committee awarded premiums as follows.

- For the best Butter, to David Frost of Carthage, \$3
- 2nd do. Jacob Sherman, Chlo. 2
- Best Cheese, Alfred Fitch, Bagn. 3
- 2nd do. Wm. Sternberg, Henrietta, 2
- Maple Sugar, Alfred Fitch, Bagn. 2

CALEBK. HOBBIK,
N. B. MERRICK,
H. E. ROCHESTER. } Committee.

On Silk and other Domestic Manufactures.

In this department there was quite an interesting exhibition, although the number and variety of articles were too small to reflect much credit on the housewives and daughters of the farmers of Monroe. The

committee have omitted to notice some articles, owing to the want of competition, and others from want of merit. Some of these for which premiums were awarded, were deserving of the highest praise. The committee award to

- Mrs. A. Goodell, for the best s. wing silk, \$3
 - Mrs. Anna Robbins, for 2d do. 2
 - Mrs. Eliza Bingham, for best silk hose and other articles, 3
 - Mrs. Theodora Beckus, for 2d do. 2
 - Miss Lucretia Goodrich, for 2 very handsome blanchet-shawls, 2
 - Mrs. Lyman Potter, for two fine pieces of carpet, and a beautiful hearth rug, 2
- M. P. PARKER,
ALEX. GILSEY,
MATTHIAS GARRET, } Com- mittee.

HORTICULTURE.

The Committee on Horticulture report that the display of Fruit, Vegetables and Flowers was very respectable, and in some respects extraordinary, considering the lateness and unfavorableness of the season. The Apples, Grapes, and Quinces were very fine and standard. But the most conspicuous and beautiful object in this department was a large and splendid pyramid of Dahlias, from Alexander Kelsey, Esq. consisting of about forty varieties of blooms, the colors very beautifully arranged. A table of elegant green house plants, and several large bouquets of Dahlias and other cut flowers, from Moses Elwanger & Barry, also added much to the beauty of the exhibition. The garden vegetables were mostly of fine quality, but the competitors were not as numerous as they should be. Premiums were awarded as follows.

- D. Hamford, best ear. Apples, \$1 00
- H. Carby, " " Pears, 1 00
- S. W. Lay, (discretionary) Pears, 1 00
- Mathias Garret, best Potatoes, 1 00
- L. B. Langworthy, best Peaches, 1 00
- Z. Barry, " Quinces, 1 00
- Do. " Grapes, 2 00
- M. Garret, 2d " Muskmelons, 1 00
- Mr. Dooly, " " " 2 00
- Wm. Webb, " " Watermelons, 2 00
- Alfred Fitch, " " Squashes, 2 00
- F. T. Young, (discretionary) Pumpkin and Squashes, 1 00
- A. L. Jones, best Egg Plants, 2 00
- Wm. Hamilton " " Beets, 1 00
- T. Bickel, " " Carrots, 1 00
- Wm. Webb, " " Parsnips, 1 00
- Z. Barry, " " Turneps, 1 00
- Wm. Webb, " " Subst., 1 00
- Sam'l Steifer, " " Cabbage, 1 00
- Wm. Hamilton " " Onions, 1 00
- Alex. Kelsey, " " Dill, Nast., 5 00
- Elwanger & Barry, 2d best do. do. do. 2 00
- Do. best cut Flowers, nast., 2 00
- Do. 2d do. do. do. do. 2 00

M. B. BATEHAM,
H. M. WARD,
N. GOOSELL. } Committee.

Eric County Agricultural Society.

Premiums awarded by the Eric County Agricultural Society, at their Fair and Cattle Show, held in Buffalo, on the 6th Oct. 1841:

HORSES.

- 1st Stallion, Stephen Ostrom, Chaucer, \$10
- 2d do. Basinell Strong, Buffalo, 6
- 1st Mare and colt, Sam'l Hudson, Saclain, 10
- 2d do. do. Aaron Gould, Hamburg, 6

[The Committee noted with great pleasure, the fine display of matched horses belonging to Jacob S. & Charles Miller, of Buffalo. Finer could no where be shown in the State.]

CATTLE.

- 1st full blooded Bull, L. F. Allen, Black Rock, \$6
- 2d do. do. Warren Granger, do. 4
- 3d do. do. A. & J. M. Arthur, do. 3
- 1st mixed do. George Bruce, Lancaster, 4
- 2d do. do. Jos'h Hutchison, Amherst, 3
- 3d do. do. J. D. Van Allen, Black Rock, 2
- 1st 2 yr. Durham do. Amos Chilcote, Hamburg, 3
- 2d do. do. do. Orlando Allen, Black Rock, 2

- 1st do. Devon do. Aaron Gould, Hamburg, 3
- 1st common Bull, Aaron Parker, Hamburg, 6
- 1st yearling do. John Webster, " 2
- 1st yoke working Oxen, John Collins, Black Rock, 10
- 2d do. do. do. Jesse Vaughan, Cheektow- waga, 7
- 1st 3 yr. Soree, South Salisbury, Hamburg, 6
- 2d do. do. Chauncey Abbott, " 4
- 1st full blooded Cow, L. F. Allen, Black Rock, 6
- 1st mixed Durham Cow, Sylvester Chamberlain, Buffalo, 4
- 1st mixed Devonshire Cow, Aaron Gould, Ham- burgh, 4
- 1st common Cow, Alex. Hitchcock, Cheektowaga, 6
- 2d do. do. Peter Curtis, Buffalo, 4
- 1st 2 year old Durham Heifer, William S. Reese, Evans, 4
- 1st common Heifer, Peter Curtis, Buffalo, 5
- 1st yearling Durham Heifer, Orlando Allen, Buffalo, 3
- 1st do. common do. Joseph Chry, Buffalo, 3
- 1st mixed Calf, Wm. Hamilton, Hamburg, 3
- 2d do. do. Warren Granger, Black Rock, 2

HOGS.

- 1st Berkshire Boar, A. B. Allen, Black Rock, 8
- 2d do. do. Manuel Henshaw, Hamburg, 5
- 1st Sow and 6 Pigs, A. B. Allen, Black Rock, 6
- 2d do. do. do. Lewis Eaton, " 4
- 1st Sow, A. B. Allen, Black Rock, 5
- 2d do. do. A. B. Allen, Black Rock, 3

SHEEP.

- 1st fine woolled Buck, Arnold Green, Lancaster, 5
- 1st South Down do. Wm. Bullock, Egan, 5
- 1st Leicester Buck, Charles W. Nason, Hamburg 5
- 1st full Leicester Buck, Jos. B. Knoll, Aurora, 5
- 1st 6 South Down Ewes, W. M. Parker, Lancaster 5
- 1st 6 Leicester Ewes, Chas. W. Nason, Hamburg, 5

FARM CROPS.

- 1st 4 1/2 acres Wheat, A. & J. McArthur, B. Rock, 5
- 1st 2 acres Barley, Jesse Vaughan, Cheektowaga, 4
- 1st 2 acres Corn, Moses Case, Alden, 4
- 1st 4 acre Carrots, Lewis Eaton, Black Rock, 3
- 1st 3 acre Ruta Baga, Lewis Eaton, B. Rock, 3
- 1st 4 acre Sugar Beet, A. Decker, Black Rock, 3
- 2d do. do. do. R. L. Allen, Black Rock, 2

BUTTER, CHEESE, ETC.

- 1st 5 Cheeses, Isaac Allen, Collins, 3
- 1st 25 lbs. Butter, Aaron Parker, Hamburg, 3
- 2d 25 lbs. do. Jesse Vaughan, Cheektowaga, 2
- 1st 10 lbs. Honey, John Webster, Hamburg, 2
- 2d 10 lbs. do. L. F. Allen, Black Rock, 1
- 1st 5 bush. Winter Apples, Lewis Eaton, B. Rock, 2
- 1st 5 do. Fall do. B. W. Hodge, Black Rock, 2

HOUSEHOLD MANUFACTURES.

- 1st piece Flannel, Im. McCull, Aurora, 4
- 2d do. do. H. S. Turner, " 2
- 1st Woolen Blankets, Moses Case, Alden, 4
- 1st Counterpane, Lucy Foster, Hamburg, 3
- 2d do. do. Aaron Parker, do. 2
- 1st Woolen Shawl, Cynthia Paine, Aurora, 3
- 2d do. do. Aaron Parker, Hamburg, 2
- 1st pair Women's Woolen Stockings, do. do. 1
- 1st pair Women's Worsted Stockings, H. S. Turner, Aurora, 4
- 1st pair Men's Woolen Stockings, W. L. Parker, Lancaster, 1
- 1st do. Woolen Mittens, Miss E. Henshaw, Ham- burgh, 2
- 1st lot Cocoons, Henry P. Russell, Black Rock, 2
- 2d do. do. Harvey Clark, Lancaster, 1

MISCELLANEOUS.

- 1st.—Matt's agricultural stove and cauldron, Dud- ley & Thompson, Buffalo, 3
 - 1st.—Plough, Joseph H. Smith, Buffalo, 3
- The following articles would each have received a first premium, had they not been excluded by the rules of the Society, as not being among the advertised list of premiums, viz:
- A beautiful worked lace veil, by Miss Wakely, of Lancaster.
 - An elegant worsted worked Bell Rope, by Miss Johnson, Buffalo.
 - A superior patent Lock, manufactured by J. W. Davock, Buffalo.
 - A pair of superior Woolen Blankets, from the factory of Hencock & Dunck, Buffalo.
- WARREN BRYANT,
Recording Secretary.

THE MECHANICS' FAIR in this city commenced on the 12th and continued open till the 15th ult. The exhibition was highly interesting and was attended by a large number of visitors. More about it hereaf- ter.

DURHAM SHORT HORN COW "GYPSEY."

The property of William Fuller, Esq., Skaneateles.

GYPSEY is from the herd of the late S. Van Rensselaer, Esq.; is seven years old, past. She proves herself valuable for stock. Mr. Fuller has had three heifer calves from her in three years, and all of them promise to make fine animals. She is remarkably easy kept, thrives readily and is a very good handler. It is not known how much milk she would give through a season, as she has always suckled her calves. Mr. Fuller's mode of raising them is, to let them run in the pasture with the cow, the first summer, then treat them the same as the rest of his stock.

(The above drawing was taken at the Syracuse Fair, and is believed to be very correct. Mr. Fuller has not had an opportunity to inspect it.—Ers.)

Mr. Allen's Importations of Stock.

Mr. A. B. Allen paid us a short visit a few days since, on his way home from England. He has been very successful in the purchase and importation of some very superior animals. The first shipment was per packet ship Mediator, and consisted of Berkshire swine of very large size. One of these "stood three feet high, of great length, and would fatten to weigh about 800 lbs." Another shipment was per packet ship Wellington; and last a general assortment accompanied by himself, per the Hendrick Hudson, embracing some very large swine of the Yorkshire and Kentworth breeds, which, it is stated in the Farmer's Journal, will fatten to weigh 1600 lbs., but Mr. Allen thinks the maximum about 1300. (Large enough in all conscience, and we think Mr. A. can now easily even the Kentuckians.)

[From the New York Commercial Advertiser.]

IMPORTED STOCK.—We are happy to announce the return from England of our friend A. B. Allen, Esq., of Buffalo, who has visited Great Britain upon an agricultural tour, and inspected all the principal herds of the Kingdom. Perhaps we have no one who could have done this to better advantage. Mr. Allen has long been devoted to the breeding of cattle, and has raised some beautiful Durhams and pigs, such as we have never seen surpassed. He now brings home from his excursion a large collection of South Downs, Yorkshire, Kentworth and Berkshire pigs, Shepard's dogs, Dorking fowls, English pheasants, &c. He has under his care some valuable sheep, worth \$500 per head, for Mr. Stevenson, Bishop Meade, of Va., and F. Retch, Esq., of Otsego co., N. Y. Mr. Retch's lamb is a South Down, only six months old, and weighs 152 lbs. It is indeed an acquisition to our state, and we doubt not will be a source of profit to its importer. Mr. A. came a passenger in the Hen-

drick Hudson, Captain Morgan. The last named gentleman brought out a very fine Durham cow for his own farm on the Connecticut.

Oneida County.

The Cattle Show and Fair of this county, was held at Hampton, on the 20th and 21st ult. [§]The Roman Citizen says respecting it, "although the weather was unfavorable, the extent of the exhibition exceeded all expectation, and the village of Hampton was filled to overflowing in every nook and corner. It has exceeded all our most zealous friends had dared to hope—and it has, moreover, we trust, put to silence the evil forebodings of those, who have prophesied evil of this Association, designed to do so much good to the Farmers and Mechanics of this county. The display of working Cattle, Cows, young Cattle, Sheep and Swine, was very fine. In the Dairy Department, Oneida has done her duty. The samples of Butter and Cheese, were such as to challenge competition. In Domestic Fabrics, there was a sad deficiency but we trust it will not be so another year.

There were many fine horses exhibited, though great improvement is needed in breed of horses, and some matched and draught horses, as well as Studs, and breeding Mares, were of the choicest description.

The amount of premiums paid, was \$614."

The report on Field Crops, we deem valuable for the purpose of comparison:

"To Elisha Pettibone of Vernon, best acre of winter wheat, 37½ bushels, sample exhibited of the very best quality, \$15 00; Julius Curtis, Westmoreland, best acre of corn—11 bushels 36 lbs. \$15 00, the corn was excellent from sample. Elisha Shaw, Rome, 2d best acre corn, 83 bushels 16, very good corn, \$5 00,

Nathaniel S. Wright, Vernon, best acre of oats, 16 bushels, 3 pecks, \$15 00; Jay Pettibone, Vernon, best acre barley, 50 bush. 5 lbs. \$10 00. Benjamin P. Johnson, Rome, best half acre potatoes, (Silver Lake) quality and quantity combined, 106 bushels, \$10 00. James Phinney, 1st best half acre quantity alone, 192 bushels, \$10 00.

Lyman Stoddard, Westmoreland—2d best ½ acre—as to quantity—178 bushels, \$5 00:

Benjamin P. Johnson, Rome—Best ½ acre Ruta Baga—213 bushels, \$10 00.

The officers regretted that they were obliged to exclude the crop of Corn of Stephen Scott of Lee, which yielded 97 bushels and 40 lbs. to the acre—and the crop of Oats of Elzer C. Burton of Lee, which yielded 84 bushels 20 lbs. per acre."

Gmission.

The mark (†) was omitted in two places where it ought to appear in our last. The first is the article on *The Pear Tree* p. 147 and the next is *Driving Nails into Hard Wood*, at p. 159.

Died—The Canadian Farmer and Mechanic which we noticed last month is said to have died—from want of care and nourishment.

New Genesee Farmer.

We doubt whether there is any thing of which the "Empire State" has more occasion to be proud, than of its Agricultural Literature. The Cultivator at Albany, and the Genesee Farmer at Rochester, are both noble repositories of agricultural science, and with their immense circulation, must have a mighty influence on the farming interests of that and the neighboring States. As their successive numbers come before us, we cannot but admire the richness of their contents, not to be reflected on the beneficial results, that must flow from such an extensive diffusion of agricultural knowledge.—Maine Temperance Gazette.

ROCHESTER, NOVEMBER, 1841.

To Readers and Correspondents.

Several communications are unavoidably deferred this month, in order to make room for the reports of Fairs &c. We trust however, that this number of our paper will not be found deficient in interest, even to our most distant readers.

The second communication of C. P. T. "on the importance and utility of the dissemination of knowledge among Farmers," is received, and shall have a place in our next. The author informs us that a want of time prevented him from furnishing it several months ago, as was intended.

The Peas received from Chs. E. Norton, So. Berwick, Maine, are called Knight's Tall Honey Peas; they are the best variety known for the table, but grow so tall as to make them objectionable to many.

The specimen of Wild Pea from Asa A. Burnham, Esq., Cobourg, is the *Lathyrus venosus* of botanists. It is not often, though occasionally, found in these parts. The flowers are quite ornamental, resembling the Sweet Pea of the gardens, to which it is nearly allied.

S. C. is informed that we know of no process by which good wine can be made from the native Frost Grapes.

"Monroe," and some others who wish to draw us into an endless Chess controversy, shall receive attention next month.

Trial of Ploughs at Syracuse.

The late trial of ploughs at Syracuse, under the direction of the State Committee, it was reasonably expected, would be attended with most important results. When it is considered that the yearly cost of ploughing in the State, amounts to millions, it becomes evidently a matter of no small magnitude, if that cost can be diminished one third or one half.

In offering a few remarks on that trial, it may be well to state, that the writer, although of the Committee, was unavoidably absent when the decision and report were made, which he has not seen, consequently no other of the Committee is responsible for any thing here said.

That the trial was unsatisfactory, none can deny. The failure of the Committee to meet previously, and make necessary arrangements, caused a confusion at the time of the trial, which alone would have prevented complete success. Most of the members of the Committee who were present, were appointed to fill vacancies on that day, and consequently had no time to inform themselves of any particulars relating to the subject. Suitable ground had not been selected, and its unevenness rendered the strength for draught so constantly varying that it was impossible to determine it accurately. The Dynamometer was very imperfect, though exhibiting with some accuracy the relative draught of each plough. Only one kind of soil was tried, which was so much drier than is usual in ploughing, that it was not a fair test of the operation generally. The Committee had full opportunity to examine the construction and operation of each plough, so far as it could be done by a single trial in dry sward, and that their decision is not far from the truth, is to be taken for granted. We doubt much if a finer collection of ploughs or even so fine a one, was ever be-

fore seen. The improvement in one year alone, has been very great. And we hope that the unsuccessful competitors will not be discouraged in presenting their ploughs again next year, when it is hoped a fuller trial may be made. It was to be regretted that some ploughs entered, were, in consequence of the rain and confusion, not tried, among which were an excellent plough from Stephens Cook of Onondaga county, and the celebrated Howard plough, from M. B. Bateham of Rochester.*

One of the ploughs was rough from the furnace, some had the mouldboards painted, some were well scoured by use, and others were even ground sharp at the point; all of which tends to vary the result.

As the object always in pointing out errors is to avoid them in future, the writer respectfully suggests the following points, among others, to be observed in future trials.

1. Let suitable ground be selected beforehand; it would be better to pay a sum of money for its use, than to have that which is bad. One field should be clayey, another medium loam, and another sand; a part sward, a part stubble, and a part recently ploughed and harrowed. Let it be the most even and uniform that can be found, for the trial of the dynamometer. The ploughs may be tried on rough or stony ground without this instrument.

2. Every plough should be scoured bright by previous use, and have no additional preparation by grinding or otherwise.

3. The relative force exerted in ploughing different widths and depths by the same as well as by different ploughs, should be carefully measured by the dynamometer. Especially the force required in cutting through, and below, the grass roots in green sward, and in running so deep as to lift the subsoil; and the comparative friction on long and short mouldboards, in light, and in adhesive soils.

4. The quality of the work done by each is to be particularly noted.

5. One ploughman, and one team should be used for the whole. If one of the Committee be the ploughman, all the better.

6. It is of the MOST VITAL IMPORTANCE, that the trial be not made on the days of the annual fair. To attend properly to all the above particulars, two or three hours are the very least that could in any wise be in justice bestowed on each plough; more time would be desirable. If fifteen ploughs were entered, as was the case this year, several days would necessarily be spent in their proper examination. Some other time should therefore be taken, and an agreement be previously made with the members of the Committee, to be faithfully at all times on the spot, which they would doubtless be willing to do, for the sake of securing a full, faithful, and indisputable decision, on the merits of this kind of instruments in agriculture.*

* Great credit should be given to Mooers and Slater, proprietors of "Barnby and Mooers' side-hill and level land plough," for their persevering experiments with the dynamometer, to determine the form for the most easy draft for a good mould-board, with other improvements.

If any apology is necessary for the length and somewhat too scientific nature of the following article, we think the importance of the subject in relation to the wheat growing interests is a sufficient one.—Eds.

From the Albany Cultivator.

The Hessian Fly and other Wheat Insects.

EXPLANATION OF THE ENGRAVING.

1.—Wheat stalk with the larva of the Hessian fly deposited—three of the stalks punctured by the Ichneumon, *Ceraphron*—natural size, 3/20ths of an inch.—a. a. larva and pupa.

2.—Section of the wheat stalk, with the larva magnified.

3.—Larva advanced to the pupa state, magnified.

4, 5.—Male and female Hessian fly, *Cecidomyia destructor*, magnified—6 antenna of the female.—7 antenna of the male.

8, 9.—Male and female Ichneumon, *Ceraphron* de-

structor, magnified.—10 antenna of the male.—11 antenna of the female.

12, 13.—Male and Female wheat worm fly, *Cecidomyia tritici* of Kirby, magnified.

14.—Section of a grain of wheat with the young wheat worm within it magnified.

There is, perhaps, no period of our agricultural history, when the ravages of the Hessian fly have attracted more attention than during this season; the memorial to Congress of the individual who professes to have discovered a remedy, and who is asking for a compensation; the reference of this memorial to the Committee on Agriculture at the very moment that efforts are making to establish a National Society; the observations of MARGARETTA MORRIS, attracting the attention of so many eminent men and so many acute observers, joined to the extent of the insect's depredations, and to the advancement of agricultural science in all its departments, except entomology, have combined to attract this attention. Among other contested questions, arising out of the discussion, is the identity of this destructive race, *Cecidomyia destructor* of Kirby with the wheat worm of New England, the *Cecidomyia tritici* of the same author. The circumstance of the great Linnæus ranking but one species, under the name of *Tipula tritici*, is itself a strong indication of their identity. Whether future investigations will enable us to restore the system and the nomenclature of this great Swedish naturalist, time alone is to determine. I frankly acknowledge that I dislike innovations upon such perfect systems, and think, as the Iberian would say, that the two insects are identical; but while we should brown upon all attempts by man of science to introduce new names for the purpose of extending their own pretended discoveries, we should be equally disposed to encourage accurate investigation into the true character, habits, transformations and operations of insects:

"The sacred sons of vengeance, on whose course
Corrosive lumina wait, and kill the year."

Having recently returned from a visit through a wheat country where its ravages have been severely felt, and found that farmers have many more words than I was respecting it; that there is much confusion

In their views, some calling it "the insect," without ever thinking of inquiry whether there are two, others describing what is unquestionably the Hessian fly in the name of the "wheat worm," without knowing whether the worm became an insect, and some vice versa; while some are ignorant enough, but they are not very faint of number, to confound it with a grub, or with an insect of the beetle tribe, known to the south as the weevil, which infests the grain, and the worm.—I have wasted myself almost as much as enough to write on this sort of ignorances, and to be minute in pointing out whether the descriptions can be so remote as to make them either generic or identical, but as I am not, and like all other men are prejudiced in favor of my own opinions, the attempt will only be an approximation to the truth. It is necessary to remark that the Hessian fly, (*Cecidomyia striatella* of Kirby,) is the only one known south of Canada. It is a singular case, tending to the confirmation of the affirmatives of a supposition, that the Hessian fly and the wheat worm in the same stage of their existence, are produced by a parasitic insect of the order *Hymenoptera*, (the winged,) belonging to the genus *Cecropion* of *Levitella*. This is the quantity taken for the wheat fly or Hessian fly, from the circumstance of its being frequently found in vast numbers during the devastations committed by that insect, and many have been deceived by the supposition of its evolution from the pupa of the Hessian fly, under their own eye; when in truth it is only proper for us to have from the total destruction of our wheat by the rapid increase of the fly, and beings of that vast class of insects, included by Linnæus under the name of Ichneumon; it is as it is deposited in the larva of the Hessian fly, through a process made by her minute ovipositor in the stem of the wheat; and this parasite has given rise to the common name of Ichneumon, the whole ground for it, that the Hessian fly pierces the wheat stalk for the purpose of depositing its egg in the manner I have endeavored to illustrate in the above figure, when it is the inevitable consequence of the destruction of the fly, and of the death of its seed almost for ever, and is indeed a wonderful display of that instinctive faculty by which the genus *Cecropion* is enabled to find the true place of deposit, where its young, protected by the indurated covering of the fly in its pupa or larval state, has occurred, and the latter is killed. If the wheat happens to be uninvulnerable to the Ichneumon, or if any other cause prevents its effecting its operation at the proper period, the following season is always a dreadful one to the wheat grower, as the fly upon an average has about eight or ten young, whose ravages over the whole face of the wheat growing region are even more extensive with their increased numbers.

In the British Farmer's Magazine, vol. 3, p. 193, we are told that the *Lucca* of the *Cecidomyia tritici*, the acknowledged wheat fly of New-England, are produced upon the *Cecropion*, an Ichneumon fly, which deposits its eggs in the body of the larva of the wheat fly. "I could not determine," says the very good sense author of that notice, "whether it really deposits its eggs in the winged body, but there can be no doubt of the Ichneumon piercing the winged fly, as it is doing the same injury to the pupa fly; it is possible the fly might destroy the pupa, as well as to deposit eggs in their bodies." We will see presently that the use of the words *Lucca* and *Lucca* in the above extract, indicate strongly, that if the writer has not the Hessian fly before him, he has not the wheat worm of New-England; and he uses the terms "*Cecidomyia tritici*" in the same sentence.

I think myself fully justified in asserting, that the punctures often observed in the wheat stalk, (as made only by the Ichneumon, because I have frequently been with Thomas Say, when pursuing his investigations upon this insect, and have seen and assisted in stripping down the glumes or hull of the wheat stalk, examining the ideal or punctured larva, and the living *Cecropion*; and the circumstance furnishes additional testimony to the truth of Mr. Say's Mr. Morris' discovery, that the fly deposits its eggs on or in the grain, and not in the stalk. It seems indeed impossible that the Hessian fly should effect the latter object without puncturing the stalk or stripping down the hull; but it is not so clear an impossibility that it should be found in the root. Whether it had on the leaf, and on in the root, it must have grown with the growth of the plant; and in the latter, it will probably be found more difficult to provide a remedy. If the Hessian fly and wheat fly both deposit their eggs on the grain, it shows that some of their habits are similar, and that the one most probably passes through the same process in its transformations.

I frankly acknowledge that Margaretta Morris' ob-

servation received no favor in my eyes. I thought it well ascertained that the Hessian fly deposited its egg in the stalk or culm, that her dimensions exceeded a grub rather than conviction. Having been so much in the company of Say, and having relied so much upon his accurate habits of investigation, my mind was not to be shaken by a woman; but it is not the last time that I have been compelled to yield to the opinions of the young and the ignorant faculty that remains in, that the Hessian fly is not to be seen in the state of a worm, nor the wheat fly in the stalk or culm, by any person who is willing to become a voucher for the fact. The insect, whose operations are watched so attentively, may therefore have been the *Cecidomyia tritici*, which it is, commonly the opinion of all New-England, deposits its egg on or in the berry; and then, "*ecce! patens appella*, make its next appearance in the glume of leaf, in a minute, thin, bodies in the earliest stage of their existence, transparent, homogenous, contractile, without vertebra, or indented tentacles, feeding in the berry until it is all eaten.—While on the contrary, the Hessian fly in all its earlier stages is found within the stalk; its larva when first produced from the egg, is white, its tail very acute, and abruptly attenuated, the head invaginated; the upper surface of the body exhibiting a gassy or hyaline aspect, with an internal vascular like a greenish line; underneath it shows thick white clouds, which as it advances to the pupa or fixed state, becomes marked so as to exhibit regular transverse segments; when taken from its early membranaceous covering it seems perfectly inert; but when the pupa is a lined with its full stature, it assumes a dark reddish brown color, like the fly itself, with its jointed covering firmly knit together, I have known it to start and roll over several times on being removed from the wheat stalk. If the insect was a grub, it would be described by Margaretta Morris as a grub, rather than the name of depositing its egg until it became a larva in the culm or stalk, or if its progress was marked from the later state until the egg was deposited on the berry, so as to say with certainty that it was deposited by the same insect that was hatched from the larva that occupied the culm, then I think the identity of the two is placed almost beyond controversy. It is plain that the water in the British Magazine could not have applied the terms *maggot* and *larva* to the worms described by Judge Bach.

We have now arrived at what seems an insuperable impediment to reconciling the two insects as congeners, viz: the larva from the egg, or a living active worm in the one case, and an inert vulnerable larva in the other; and I must be permitted here to make the remark, with perfect deference to the judgment, the accurate observation and excellent intention of that great and good man, Judge Bach, that he has largely contributed to our scientific views upon this important subject. In looking over the early volumes of the Cultivator, I find all his information received from older sources, most of it from British writers, and some from very inaccurate correspondents—not one valuable from a man of scientific investigations.—In vol. 1, p. 2, he describes the wheat worm as a maggot, and larva goes so far as to describe the exact mode of applying it together, giving from authorities nearly forty remarkable drawings of the full grown worm, in the very act of burying its eggs within the kernel of the wheat where it had attained maturity. The whole of this article commenting and adopting a report to some English Society, said to be from the pen of Mr. Bauer, is evidently a libel on the fact, not only of the wheat fly or *Cecidomyia tritici*, whose existence is disputed, with the insect then making such disastrous displays of its power; but to show that the injury was not to be imputed to any thing belonging to the class *insecta*. That the Judge was so obliged to make this assertion is manifest from the subsequent numbers of the *Cultivator*, p. 115, where he confounds it, through the agency of a correspondant, with the weevil; and in vol. 3, p. 65, he admits it to be a *swamp-beetle*, and says it is *soa tritici confusum* added with the *is, &c.*; and finally on p. 115, he arrives at the same conclusion as other naturalists, and makes it a fly, depositing its eggs on the wheat, but dropping when in the pupa state upon the ground where it remains during the winter. As all the prevalent notions of the wheat worm deriving its existence from the wheat fly, have originated from the or some equally loose foundation, without any accurate or properly defined and investigated, I shall take the liberty of thinking that the wheat worm is the *Acobis pombarius*, which is said to have been so destructive in Scotland in the year 1831, (Country Times, May 17, 1830.) I believe all the flies that infest the wheat, if in fact there are more than one, under the order *Diptera*, Mr. Bauer (and Judge Bach) endorses his opin-

ion calls his worm the *Lucca tritici*, which in plain English, means a fly *chewing* or *gnawing* over the wheat,—and at the same time introduces a name of a worm laying its egg in the grain, and is distinguished by its young brood, as described in the figure; the Judge is actually enough adopting the figure and rejecting the Latin, cautioning his readers against the opinion of a fly originating so much insect and argues in favor of the worm.

But the whole argument derived from the deposit of larva in the one case, and of a living maggot being in the other, may be put on the debor side of our profit and loss account, when we know that there are a considerable number of insects of the order *Diptera*, and a large number of the *Lucca*, that are oviparous and viviparous in the same stage or period of their existence, i. e. they produce young ones alive in the spring, and then lay eggs all autumn. Whether the Hessian fly or the wheat fly possess this power, I am not a naturalist enough to decide; that they neither of them produce living animated contractile worms, I am fully satisfied, as well from all the analogies of nature as from the writings of those who favor such an opinion in the columns of the Cultivator. They have had no more success in convincing me of such an opinion, than they would have had if they had traced the genealogy of the House of Habsburgh—or the transmission of wheat and chess to the same source. When the two insects attain what is called the perfect or full state, they are so exactly similar that I am at a loss to make the necessary distinctions; and if there is any, it probably arises from the one being hatched from the egg and larva in the grain of the wheat, the same as in, and the other remaining over the winter, and growing with the wheat stalk. The following very significant remark of Say, who had Kirby's Entomology before him, is worth noting upon this subject: "When several of them (*Cecidomyia destituta*) are contiguous on the stem plant, be precise on the body of the larva is the grub, and an equality in the form of the body is the consequence."

It is admitted by all scientific writers, that in both species of the *Cecidomyia*, the antennæ are filiform, with joints subequal and globular; wings membrane and horizontal, and proboscis slender or moving with a song; the tarsi and palpi are the same in form and number. Having myself never seen any but what I thought the same insect, and having no compound microscope, but only a small magnifying glass, my description of the Hessian fly would of course be not very minute, but the head and thorax are black; wings a dark brown, larger than the body; the abdomen itself is brown and is covered with short black hairs. This description is from the living specimen. Now what says Kirby, who describes both insects, and carry other writers who endeavor to describe the *Cecidomyia tritici*—but the head and thorax are black, body of a dark orange hue—wings brownish, tinged with slender hairs, membrane not horizontal; shorter and wider than those of the Hessian fly and approaching more to the sub-cylindrical; the whole insect is somewhat less than the Hessian fly. He represents it as having a song or purring instrument, which we have not yet detected in the Hessian fly, but which it is very probable the latter also possesses.

If I should follow the example of Judge Bach, reject the writings and adopt the drawing of the wheat head from Kirby, it would be very easy to show that every grain obliterated in the wheat is a true *Lucca* of a fly; the jointed segments, membranaceous covering, and general aspect indicate this very strongly; and the circumstance of its being preyed upon by the Ichneumon, corroborates the opinion. Hortensius.

Cultivator, Pa. 7 no. 24, 1841.

Agricultural Address at Rochester.

The Address delivered before the Monroe County Agricultural Society was listened to by a large and evidently highly gratified audience. A riveting-tandem the hour was late, and many farmers had a long way to go to their homes, none seemed to regret the time occupied, or wish it were shorter. At the close it was unanimously resolved that a committee be appointed to wait on the Speaker and request a copy of the Address for publication. We do not often deem it expedient to occupy our columns with agricultural addresses, but this one contains so much important truth, so well adapted to the times, and so eloquently expressed, that we think we should do our readers injustice by refusing it a place in the Farmer. We

wish every one of our twenty thousand readers would read it, and we believe none who do so will regret the space or time it occupies.

Rocky, Monday morning, Oct. 18.

E. D. SMITH, Esq.—Dear Sir: The undersigned by a resolution of the Society, were appointed a committee to request a copy of your address, delivered before the Agricultural Society on Saturday, for publication, in obedience to which we now respectfully request the favor of a copy thereof for the purpose aforesaid.

L. BROOKS,
M. B. BACCHAN,
HENRY M. WARD,
Committee.

Rochester, Oct. 19, 1834.

Messrs. Lewis Brooks, M. B. Bacchan, and Henry M. Ward—

Gentles—I have received your polite note requesting a copy of my address for publication. The request implies an application to the address which I fear the public will deem undesired. The address was hastily prepared, upon a short notice and in the midst of pressing professional and engine news, and I should greatly prefer not to be re-iterated and published; but upon reflection I have concluded that if it is proper, I am address was in any degree profitable, the interests of agriculture, I am hardly at liberty to withhold it. I beg leave to say however, what is well known, gentlemen, to you, but may not be to all who may read the address, that the opinions expressed in it have this confirmation in my presence; that I removed from this city some two or three years ago, on my return to my adopted town where I now actually reside and cultivate such a farm.

I am yours &c,
E. DARWIN SMITH.
—
ADDRESS

Delivered before the Monroe Co. Agricultural Society,
By E. Darwin Smith, Esq.

Mr. President and Gentlemen of the Society.—The first object of man is to provide for his subsistence. The second object of his reason will be to determine how this can best be done. I must were not the least which a man should be a higher purpose. I understand what a sufficient provision for his natural wants—no hindrance or impediment to his higher aspirations, the necessities of his nature would require of him but a moderate exertion, and the character of his employment would be a matter of much indifference. But such a state of things would not exist in our country. The necessities of his nature would require of him but a moderate exertion, and the character of his employment would be a matter of much indifference. But such a state of things would not exist in our country. The necessities of his nature would require of him but a moderate exertion, and the character of his employment would be a matter of much indifference. But such a state of things would not exist in our country.

When, therefore, man looks around him to carry out to primary instance of his nature, as a rational being possessed of an immortal spirit, he naturally seeks for such employment as will best enable him to provide for his physical wants, and at the same time be most conducive to his happiness here, and most subservient to the grand end of his being. He finds in the simple domain of Agriculture—by the sweat of his brow he shall eat his bread—that he must dig his soil, not from the earth. For the most of mankind there is no other alternative. The inquiry the naturally arises, is the employment of the agriculturist best adapted to promote the true interest and happiness of man? The affirmative of this interrogatory, it is my purpose to illustrate. All the members of man's species centre in good health. To a disease or weakly man, when his eye is addressed to the pleasure can man see any objection? To a pale, emaciated, and stricken being, what is there in the magnificence of a palace, or the pride and pomp of wealth, in the graces of society, or in a more than a thing more than a painful and transient emotion of pleasure. Where, then, do we find good health—the chief blessing in exchangeable—a so great a degree as among the cultivators of the soil? The laboring man knows nothing of the dissipation, the gong, and the numerous other pleasures that fill the salubrious and the magnate.

Laboring man's open strength and invigorates his constitution, gives a keener relish to his food, and a sweeter sleep, utterly unknown to the luxurious idler.

He may be without some of what the wealthy and effeminate of the cities call *luxuries*; but he has a simpler taste and fewer artificial wants. The wealthy inhabitant of the city may live in splendor, surrounded by his retinue of servants—the farmer, like the patriarchs of old, lives in simplicity, a servant unto himself.

A luxurious dinner may detain the youth man of the city two or three hours at the table. More frugal of his time, and more rational in his taste, a simpler meal satisfies the farmer. The evening may see his wife alter dinner, and a brighter his evenings at the theatre, or other places of amusement. The pure cold water of the bubbling spring is the luxurious drink of the farmer, and his evening amusement is gathered in the bosom of his family, improving instruction to his children, and receiving happiness in return from their diligent attention, from the interesting developments of their budding intellects, and from the many testimonials of gratitude and affection which this simple, pure, warm young hearts prompt them to exhibit.

So far then, as *good health and more animal enjoyments* are concerned, the cultivators of the soil have plenty the advantage over any other class of men.

But it is not chiefly in these respects that I claim superior advantage, in the employment of the agriculturist to promote the true happiness of man.

The greatest source of happiness among men is far above the mere gratifications of sense; it lies in the cultivation and development of their mental and moral powers.

So far as *mental power* is concerned, it is a well settled truth that the increased physical strength which manual labor confers, imparts also additional vigor to the mind. Hence the capacity for mental improvement exists to a higher degree with those who labor than with those who do not. But it may be said that the agriculturists have not the same time to devote to the cultivation of their mental powers as some other classes of men. This is not necessarily so, so far as primary education is concerned. There is no reason why the farmer's children in this country should not be as well educated as those of any other class, and so far as more common school education is concerned, they generally are. When the farmer has a good education at his setting out in life, he will generally be constantly adding to his store of knowledge, by reading and reflection. It is doubtless true, that a farmer who necessarily requires him to be constantly employed, cannot make the same advances in the sciences, as the man of wealth and leisure. Neither is it essential to his happiness that he should do so. In the present state of our world society there must be a diversity of pursuits—the exigencies of society require it.

It is not best or fit that every man should attempt to be his own physician, his own tailor, cobbler, and shoemaker. Greater excellence is attended in the various departments by these divisions, and community is of course much better served.

Now I ask, not of the farmer that he should specially excel in any department, but his own; that it may be expected, *but I do ask* that he have a fair start at the beginning—but he be as well educated at such age as the rest of the community; then I say that his employment is most favorable to mental improvement.

The farmer leads a quiet and peaceful life. He has more time for reading and reflection than the merchant, the mechanic, or any class of business men, except such as are necessarily obliged in the way of the professional man. The merchant, the attorney, or other business man of the city is in a constant whirl of activity and excitement. His store or his workshop, his ledger, his notes at the Bank, the protests he receives or fears, the fall or rise of stocks, the fluctuations of trade, the competitions, and trades, and bustle of business, the dust and the plow for great gain, and the apprehensions of sudden loss from the bankruptcy or fraud of others, or any accident, and hurry away his mind. This class of men read much less than the farmers of the country. They may take their two or three daily newspapers and other periodicals; they glance hastily over their contents and then throw them aside, to make time to think of them. They differ but in the case with the farmer. He takes his weekly or semi-weekly paper for general intelligence, and his agricultural paper, and perhaps others. He reads them carefully at morning, noon, and evening, and peruses well their contents. Besides this, he has much time for historical, scientific, and miscellaneous reading. As he follows his plough, as he herds his cow, or makes a cow, his mind is busy with what he is reading.

But if the farmer reads less than the business man of the city, it is not those that read the most, that know the most, but those that reflect the most.

Whoever, among professors and literary men, has had occasion to mingle with the farmers of this country, at least in Western New York, and spend a night now and then at a farmer's house, cannot fail to have been delighted, perhaps surprised, at the extent and variety of the farmer's information, at the strength and vigor of his thoughts, at the neatness and force of his understanding. Some have seen the sparkle of experience on more than one occasion, and he is proud to pay this tribute of respect where he thinks it is justly due.

But if the farmer equals, if not surpasses, most other classes of men in intelligence, he feels not behind any in virtue. His employment is peculiarly favorable to piety. "For him the spring doth its dew set." He notes each declining sun—the marks of his rising dawn. When he sees that he has his trust in Providence for his gratification. He watches it as it grows, and grows up, knowing that his puny arm cannot make even a blade of grass to grow. If the earth is dry and parched, he looks to Him who hath set his bow in the cloud, and hath promised the early and the latter rain. More than to other men, each day's labor obliges to the farmer his dependence upon a Supreme Being. To most other classes of men it matters not, whether he see the glances of the tempest howlers, or the rain descending in torrents, their daily avocations are the same. Not so with the farmer.

Like the farmer, based upon the bellows of the unshod ocean, he is constantly at the mercy of the elements. His fields of grain, one unpropitious shower, one storm of hail, or one unkindly frost, may destroy.

When, then, autumn comes, and brings every favorable breeze with its blessing, and the gales in his ear no longer rattle, must not his heart exult with gratitude to Him "who ride a upon the whirlwind and direct the storm?"

The farmer may be a good citizen. He is too busy to be vicious; he has no time for plotting mischief and wrong; he is removed from the temptations to crime; he is the centre of a social and a moral force; his every action is known to his family and his friends; his ambition will lead him to be useful; his position makes him independent, high minded, and patriotic.

The occupation of the agriculturist is supposed by many to be unfavorable to the cultivation of taste and refinement of manners. This is not so in any just and legitimate sense. If attention to the propriety of dress and the frivolities of fashion—of sporting substances to show, and substituting the artificial for the natural—of a passion for vain and frivolous amusement; of a contempt for all unprofitable employment, if a paltry attention to *exclusiveness and caste*, to taste for trifling and senseless conversation, and an exclusive regard to the needs and artificialities of *birth, or wealth, or position*, constitute superior refinement of manners or of mind, then I confess the farmer, and the farmer's sons, and the farmer's daughters, are destitute of taste and refinement.

But if *good sense*, elevation of thought, respect for mental and moral worth, and a palpable discerning of it, a sensibility to all the beauties of nature, and of art, if an admiration of what is grand and sublime in the works of the Creator, or magnificent, or great, or noble in the works of genius, or in the developments of mind, constitute or indicate good taste and refinement, these belong to the cultivators of the soil; and one well educated farmer's family possesses more genuine good taste, refinement, and patriotism, than all the gentlemen and ladies which the Parisian million and millions have ever made.

If the views I have presented are just and correct, how intrinsically respectable is the employment of the farmer!—and yet it is quite obvious that these views are not generally entertained or practically regarded—and why is it so? Certainly the greatest department of human industry—that which Providence has allotted for the most of mankind ought not to be devalued. That it is to any extent devalued and undervalued is the result of opinion and prejudice that ought long since to have been exploded. It is one of the errors that have come down to us from a feudal age—and monarchial governments—that to labor is not respectable. Because in the countries of the old world the farmer is *vile* or a *serf*—subject to the capriciousness of some arrogant *robber*—the opinion seems to be entertained by many who all or to give a tone to society in this country, that to labor with the hands is disreputable or alien to true gentility.

Hence, the age is characterized by a general struggle to escape from labor—the notions of the age seem practically to regard *idleness* as the only state of hap-

piness or respectability. How false the idea! how egregious the mistake!

Those who are raised to a condition of ease and independence seem virtually to despise those who are compelled to earn their subsistence by the sweat of the brow—not that many will admit this—not that many really think so when they trouble themselves to think at all upon the subject—yet many such persons actually do treat the laborer as though he were an inferior. This is radically wrong. It is no dishonor to be a laborer. It is noble—it is best—it is wisest for man. It is a necessity imposed upon him by the Author of his being, *more in mercy than in chastisement*. It is unfortunate to be ignorant—perhaps a reproach, so far as the means of improvement are neglected—but to labor with his hands no man should be ashamed. It is the false pride of a weak mind to feel it is any degradation to labor. To work—what is it but to fulfil man's duty and destiny—to promote his health—invalidate his body, develop his powers, and perfect his nature.

The desire to escape from labor is particularly indicated by the rush that has been for years going on and is still going on into the learned professions and into mercantile pursuits. How many a farmer in this county within the last ten years has listened to his son again: his own better judgment—and strained himself to his utmost to set up that son in trade, or to aid him to buy city lots—or western land—and how many families have been ruined by this greedy desire to accumulate property rapidly—as though wealth were the chief good. How many a father too, who had earned a handsome property by his own hard labor and honest industry, has been stripped of his all, and been obliged in his old age to leave his long cherished home and seek a place to lay his bones in the far west, because his son wished, by trade or speculation to get quickly rich, that he might escape labor. But this is not all; how many a father has selected his most weakly son, whom he thought too feeble to labor on the farm, and sent him to school and college to get his living by a profession; as though men can live by their learning alone, and acquire that learning without the severest and most depressing toil. How many lives have been thus sacrificed? But if any think that professional men escape labor, they are most egregiously mistaken. When all the professions are so over-crowded and surcharged, as at present in this country, no man can get a live blood honestly, in any profession, without the greatest exertion and the most laborious application. The professional man who attains eminence, or even respectability in his profession, labors harder than the commonest hodman. Unlike the farmer or the mechanic, his task is not done at the setting sun. The midnight lamp witnesses his toil, and his wasted health and his enfeebled body testify the price he pays for whatever of distinction he requires. No—fellow-citizens, you may assure your sons that no professional man reposes on a bed of roses.

It is not my purpose to exult the employment of the Agriculturist at the expense of other occupations.—Far be it from me to depreciate the mechanic arts, or any other department of industry. The exhibitions of the last few days in this city, have presented many works of skill, ingenuity and taste, to excite an admiration, and make us proud of our relations as neighbors and friends to the mechanics of this county.—The Mechanics' Fair just held in this city, reflects much honor upon the mechanics concerned in it—honor upon Rochester—honor upon the county of Monroe.

But then, I must insist that the artisan is not generally surrounded by influences so happy—so elevating and so ennobling as the farmer. He is ordinarily pent up in crowded cities—“those festering sores upon the body politic.” But he has even there some advantages over farmers—principally, however, in the facility with which he can associate with others in the same condition. The mechanics can often meet together, and by means of their Trades, Union, and other Associations, are doing much to elevate themselves as a class. These societies, the offsprings of free institutions, indicate the existence of a noble impulse pervading the popular mind—an impulse that is calculated to break down the social barriers and radical inequalities that exist in society, and place all men upon the republican ground of a common equality.

It is in the same spirit and for the same purpose that Agricultural societies are formed. Such societies are eminently calculated to elevate farmers as a class. Their object and purpose is to remove, as far as practicable, the disadvantages attending their dispersed condition. They seek to bring together those who follow a common occupation and have a common in-

terests. They serve to promote acquaintance and social feeling—to excite emulation and to stimulate activity and enterprise. These societies now, through the munificence of the State, are springing up in every county, and are calculated to do great good—every farmer should sustain them by his aid and his influence.

It is true that the premiums which these societies are able to award are but trifling—but they can be increased and will be, as farmers more generally contribute to their funds. But it is not the premiums that our members chiefly look to. These cannot be awarded to but few—and diversity of opinion may arise and doubtless will exist in regard to the discrimination which the various committees must necessarily make. The committees may err—but what of that?—the principle of improvement is the point at which we aim. If but twenty farmers in the county give increased attention to the cultivation of their farms, by reason of this society, much is attained.—The experiments, discoveries and improvements of these twenty farmers may do incalculable good. Let but one half the farmers of this county come into this work, and let the *New Genesee Farmer*, (which permit me to say should be a constant visitor in every farmer's family in this county,) herald monthly the improvements and discoveries which would be made—and what important results for the farming interest of his county, and this whole country would be produced.

The American farmers have a noble field for cultivation. In their hands is the destiny of this nation. “To them is committed the ark of man's hopes”—and it remains a fearful problem to be solved “whether they will faint by the way or bare it on in triumph.”

Farmers of Monroe—Are you prepared to meet your high responsibilities? In the heart of one of the finest sections of country in the world—occupying a soil of unsurpassed fertility—with hardly a waste acre of land in your county—where luxuriantly grows all the fruits of a temperate climate—possessed of extraordinary facilities for the marketing of your surplus products, and for the diffusion of intelligence and the interchange of social affections—what may not the world expect of you in advancing the important interests of Agriculture, and in carrying forward the great cause of human rights and christian philanthropy?

Who can tell but that from this Fair, an impulse may be gathered which in the process of years may result in converting this county into another Paradise, and in rendering its inhabitants the most enterprising, the most intelligent, and the most enlightened in all America.

The Fair at Syracuse.

Before this paper reaches our readers, most of them will doubtless have seen pretty full accounts of the Cattle Show and Fair of the N. Y. State Ag. Society, held at Syracuse on the 29th and 30th of Sept.: and as our columns are very much crowded this month, we have concluded not to give any detailed remarks concerning it. The exhibition was a very good one, and in some respects it did not quite equal our expectations, it exceeded them in others, so that upon the whole we were highly gratified, and became fully convinced that the annual Fairs of the State Society may be made eminently useful, as well as interesting. The attendance of farmers was very great—and the bringing together of such an assemblage of intelligent and public spirited Agriculturists, from all parts of the country, cannot fail to produce the most beneficial results. It is proposed to hold the Fair at the same place next season, and if that is agreed on we felt quite safe in predicting that it will be a most splendid affair.

We were greatly disappointed at the late Fair, in that there were no cattle or stock of any description from the Western counties. Our Western friends are greatly at fault in this thing, and we will not attempt to serenade them from the censure which is justly cast upon them. It is true, the expense of transportation was great, and, in one case sickness was a partial excuse, still these are not sufficient. The Eastern stock owners expected and desired competition from the West; and while we give them great praise for their noble and efficient zeal, we are obliged to

confess that our favorite Western New-York will stand disgraced until by proper exertion she retrieves her character. All we can say for her is, we believe that she will be well represented next year, and that a goodly share of the premiums will go to pay the expense of transporting Western animals.

Want of space, this month, compels us to omit some of the remarks connected with the reports of Committees; also the resolutions and proceedings of the Society. We may give some of them next month, together with the list of premiums on Field crops, and Butter and Cheese to be awarded at the annual meeting of the Society to be held at Albany on the 18th and 19th of January, 1842.

Award of Premiums.

CATTLE.

Class I.—BULLS—3 years old and over.

To John M. Sherwood, Auburn, for his bull 'Archer,' bred by F. Rotch, Butterfield, 1st prize.
To E. P. Prentice, Albany, for his bull 'Nero,' bred by himself, 2d prize.
To C. N. Bement, Albany, for his bull 'Astoria,' bred by himself, 3d prize.
To Silas Gaylord, Skaneateles, for his bull 'Splendid,' 4th prize.
“There were several other animals [in this class] on the ground, possessing in the estimation of your committee, high grades of excellence, and they only regret that the premiums were not more numerous. Among these, your committee particularly noticed the animals of Messrs. McFotyre, Van Bergen, Fonda, and Sears.”—Report of the Committee.

Class II.—BULLS—2 years old.

To John Johnston, Fayette, Seneca co., for his bull 'Royal William,' bred by G. V. Sackett, Seneca Falls, 1st prize.
To Thomas A. Clark, Chittenango, for his bull 'Young Warden,' bred by Thomas Hollis, Gilbertsville, 2d prize.
To D. D. Campbell, Schenectady, for his bull 'Rotterdam,' bred by himself, 3d prize.
To Nicholas Garner, Burlington, for his bull '—,' bred by himself, 4th prize.

Class III.—BULLS—1 year old.

To Moses Kinney, Cortlandville, for his bull 'Daniel Webster,' bred by G. V. Sackett, Seneca Falls, 1st prize.
To Enoch Marks, Navarino, for his bull 'Brutus,' 2d prize.
To Benjamin Stoker, Cortland co. for his bull '—' 3d “
To Joseph Baker, Onondaga co. for his bull '—' 4th “
“Your committee beg leave to express their regret, that though the exhibition in classes II. and III. were very numerous, yet but few of the animals were in what they considered common store order; which rendered the effort of comparison with such as were high bred very difficult.”—Report of Committee.

Class IV.—COWS.

To John M. Sherwood, Auburn, for his cow 'Stella,' bred by F. Rotch, 5 years old, 1st prize.
To Ezra P. Prentice, Albany, for his cow 'Daisy,' 3 yrs old, bred by himself, 2d prize.
To John M. Sherwood, Auburn, for his cow 'Daisy,' 12 yrs old, 3d prize.
To John M. Sherwood, Auburn, for his cow 'Pansy,' 5 yrs old, 4th prize.
To Corning & Southam, Albany, for their Hereford cow 'Matchless,' imported, an extra prize, equal to the highest premium awarded on cattle.

“Your committee further report that a new and beautiful race of cattle were presented for their examination, the Herefords, imported by a distinguished breeder of cattle, residing in Albany county, which they take pleasure in recommending to the attention of those who desire to improve their stock. Your committee recommend a special premium of twenty dollars for the Hereford cow Matchless as we consider her a very superior animal; and they would also suggest the propriety of offering and awarding premiums for the best blooded animals of each individual breed, Improved Short Horned Durhams, Herefords, and Devons, at their next annual agricultural meeting, in addition to premiums offered for the best animals of any breed.”—Report of Com.

Class V.—TWO YEARS OLD HEIFERS.

To John M. Sherwood, Auburn, for his heifer 'Sylvia,' bred by F. Rotch, 1st prize.
To E. P. Prentice, Albany, for his heifer 'Diana,' bred by himself, 2d prize.
To Corning & Southam, Albany, for their Short Horn and Hereford heifer 'Eliza,' imported, 3d prize.

Class VI.—YEARLING HEIFERS.

To Ezra P. Prentice, Albany, for his yearling calf 'Charlotte,' bred by himself, 1st prize.
To John M. Sherwood, Auburn, for his yearling calf 'Norma,' bred by H. S. Randall, Cortlandville, 2d prize.
To John M. Sherwood, Auburn, for his yearling heifer 'Dianthe,' bred by J. A. Vander, Burlington, 3d prize.
To William Fuller, Skaneateles, for his heifer calf '—,' bred by himself, 4th prize.

“All the animals on which the above prizes were awarded, with the exception of the Hereford cow and the Short Horn and Hereford heifer of Messrs. Corning & Southam, were thorough-bred improved Short Horns.

Class VII.—GRADE COWS.

To William Ward, Canastota, for his 8 years old half blood Holderness cow, 1st prize.
To W. H. Southam, Perch Lake Farm, for his half blood Durham cow, No. 1, 2d prize.
To W. H. Southam, Perch Lake Farm, for his half blood Durham cow No. 2, 3d prize.

To W. H. Sotham, Perch Lake Farm, for his half blood Devonshire cow, 4th prize.

"The best grade cow which came under our observation, belonged to G. V. Sackett of Seneca Falls, but he being one of the committee, generously withdrew her from competition."—*Report of Com.*

Class VIII.—GRADE HEIFERS.

To H. S. Randall, Cortlandville, for his roan heifer, bred by himself, 1st prize.

To G. V. Sackett, Seneca Falls, for his red and white heifer, bred by himself, 2d prize.

To G. V. Sackett, Seneca Falls, for his roan heifer, bred by himself, 3d prize.

To H. S. Randall, Cortlandville, for his red and white heifer, bred by himself, 4th prize.

Class IX.—NATIVE COWS.

"The committee on native cows would report that very few cows, and those of an inferior quality, were to be found in the pens; and they probably not intended for exhibition. They regret that the farmers in this vicinity should have refrained from taking advantage of the very liberal encouragement offered by this society, by the false impression that cows were going to be brought from a distance which would have eclipsed the cows of this neighborhood. We are unwilling to believe that there are not cows in this village and vicinity that would have honored the exhibition, and been a credit to the state. They regret that a matter so important as the improvement of our native cows does not excite more attention. Such cows must of necessity be the ground work of much of the improvement in cattle. If a farmer has a cow possessing some excellent qualities, he is prepared to improve in any desirable point. The general dissemination of high blood animals renders such crossings easy and cheap; and it is a matter yet at issue whether such crosses will not make the most desirable animal for the common farmer. We want the best native cows for such crosses, and the committee are of opinion that the Executive committee of the State Society are holding out liberal encouragement for active competition in the matter of improving our native cattle. In conclusion, we would add that we hope that no future committee will be under the necessity of reporting no competition, but let the farmer, the lawyer, the merchant, and mechanic, bring forward their best cows, and render it a matter of nice discrimination to decide between them."—*Report of Committee.*

Class X.—WORKING OXEN.

To Caleb Gasper, Marcellus, 1st prize.

To Samuel Allen, jr., New Haven, 2d prize.

FAT CATTLE.

To P. N. Rust, Syracuse, for the best yoke of fat oxen, one of which was bred by G. V. Sackett, 1st prize.

BULL CALVES.

To Ezra P. Prentice, Albany, for his thorough bred Improved Durham bull calf "Homer," 6 months old, bred by himself, 1st prize.

To Samuel Phelps, Ira, for his grade Devonshire, 2d prize.

TO BREEDERS.

To Francis Rutch, Butternuts, as the breeder of the best bull, 1st prize.

To the same, as the breeder of the best cow, prize.

To the same, as the breeder of the best 2 years old heifer, prize.

[The premiums to breeders having been offered by Mr. Rutch, he declined receiving more than a certificate of the Award, leaving the money (\$30) with the society, to be offered in premiums for the same purpose next year.]

HORSES.—Stallions.

Nathan A. Cooper, New York city, for his bay horse "Messenger," got by Membrino, dam imported Messenger, 1st prize.

J. B. Thompson, Fayetteville, for his bay horse "Young Membrino," got by Mr. Thorn's Eclipse, dam by Membrino, 2d prize.

P. & G. Warren, Manlius, for their grey horse "Messenger," got by Elbe Messenger, dam Queen Ann, 3d prize.

Caleb Gasper, Marcellus, for his bay horse "Gasper," pedigree not known—4th prize.

MARES.

Samuel Townsend, Canterbury, for his bay mare "Lady Syracuse," by "Onondaga," out of the "Lady of the Lake," 1st prize.

W. Colton, Lenox, for his grey mare, 2d prize.

Wm. Cook, Lyander, for his bay mare, 3d prize.

SHEEP.

Class I.—LONG WOOLED.

Cornig & Sotham, Albany, for their imported Cotswold buck, No. 1, 1st prize.

Cornig & Sotham, Albany, for their imported Cotswold buck, No. 2, 2d prize.

Cornig & Sotham, Albany, for their imported Cotswold buck, No. 3, 3d prize.

Robert S. Mason, Gilbertsville, for his pen of 3 Leicester ewes, being the only ones in this class, presented for exhibition, 2d prize.

"The committee would make honorable mention of three ewes presented by Mr. Henry Cliff of Onondaga, which were a cross between the long woolled and the short woolled varieties, but inasmuch as they did not come exactly under the class they were requested to examine, they could not award a premium to Mr. Cliff, which, under other circumstances they would have been very happy to have done."—*Report of Com.*

Class II.—MIDDLE WOOLED.

Francis Rutch, Butternuts, for his South Down Buck, 1st prize.

Uri Jackson, Jr., Butternuts, for his South Down Buck, 2d prize.

* This calf was sold by Mr. Prentice, at the Fair, to Mr. Dunn, of Lyons, for \$250 cash.

John Snook, Skaneateles, for his South Down Buck, 3d prize.

Francis Rutch, Butternuts, for his pen of three South Down ewes, 1st prize.

There being no others presented, the other premiums were not awarded.

Class III.—FINE WOOLED.

Daniel Marsh, Pompey, for his buck, 2d prize.

Chester Moses, Marcellus, for his pen of ewes, 2d prize.

"The committee have first to express their great disappointment, on account of the very few sheep exhibited for premiums on this highly important occasion. And second, the indifferent character of those which came under their examination.

In reference to the first remark, it is unnecessary to say, that the disappointment, and we may justly add, chagrin, now no less entertained by the immense body of spectators than by the committee—and it is evidently hoped and expected, that on no future occasion of this kind will like disappointment again occur. The state of New York has within its borders no less than five millions of sheep, and how astounding will it appear abroad, when the fact is made known, that but barely seven sheep were exhibited of the class coming under the cognizance of the committee! When it is a truth, and well known, that no state in the Union can produce so great a proportion of sheep producing fine wool compared with the whole number within 1000 miles. The causes of this meagre display, however, are several and very obvious; and first, the expense of transportation, but more particularly, the groundless expectation of great competition and consequently an apprehension of failure to obtain an award.

This should not be so, for if many are disappointed, let it be noted and remembered, that on all future occasions of this kind, animals characterized by general excellence will meet with ready sale, and at prices much exceeding those in the immediate neighborhood where they belong. This remark is confirmed by the large number of wool growers who have come here at this time—and many from a distance—to make purchases of the class of sheep under consideration.—*Report of Com.*

SWINE.

C. N. Bement, Albany, for his Berkshire boar, Rip Van Winkle, 1st prize.

Jesse Campbell, Sullivan, for his Berkshire boar, 2d prize.

P. N. Rust, Syracuse, for his Leicester boar, 3d prize.

Samuel Hecox, Lyons, do do do 1st do

C. N. Bement, Albany, for his Berkshire sow, 1st prize.

Anthony Van Bergen, Coxsackie, for his Berkshire sow 2d prize.

William McKnight, Syracuse, for his Berkshire sow, 3d prize.

L. G. Collins, Butternuts, for his Berkshire sow, 4th prize.

ON PLOUGGS.

Howard Delano, Mottsville, 1st prize.

E. G. Holladay, Dansville, for the Locklin Plough, 2d prize.

Elijah Wilson, Vernon, for the Livingston county Plough, No. 1, 3d prize.

Chester Dexter, Utica, for the Wisconsin Plough, 4th prize.

Moses & Slater, Ithaca, for their double mold-board side-hill plough, an extra prize, equal to the 1st premium.

Stephens Cook, for an improvement in the Onondaga Plough an extra prize of \$5.

"The committee appointed by the executive board to examine and test the valuable properties and improvements in the plough, beg leave to report, that they have had a most arduous duty to perform. Near 20 of them were presented for our inspection, and the committee are free to say that they never have seen so great a number of remarkably excellent ploughs together before, and have to regret that they are circumscribed in their award of premiums, when they are confident so many are entitled to the favor of the society.

After as careful an examination of the subject as we have been able to give, and a trial of ploughs by the dynamometer, we have awarded the first premium of \$30 to Howard Delano, for a very beautiful and highly finished plough, with a new form of a cutter in place of the common comb, with which we consider an improvement well worthy of a fair trial among the farmers of the county.

The second premium of \$20, the committee have awarded to E. G. Holladay, for his plough, already favorably known as the Locklin Plough, and which the committee found to work by trial with the dynamometer with great ease of draft and steadiness.

The third premium of \$10, the committee award to Elijah Wilson, for a very fine well made and well proportioned plough, called the Livingston county Plough, No. 1.

The fourth premium, a diploma of the society, the committee award to Chester Dexter of Utica, for his Wisconsin Plough.

The committee have also determined to award an honorary premium equal to the first premium on ploughs (\$30), to Moses & Slater, for a newly invented double mold-board side-hill plough, which the committee believe will prove a very valuable acquisition to the farmer for many other purposes besides side-hill ploughing, it having performed admirably handsome work upon a level surface.

The committee also award a premium of \$5 to Stephens Cook for an improvement made by him in the mode of fastening the land side of the Onondaga Plough, including a very good mold.

The committee cannot close without saying that owing to the unpleasantness of the day, and the want of time, they were unable to devote that attention to this important subject, that this most important of all agricultural implements require, and we most earnestly recommend to the society to devote more attention to this matter another year, and we hope that the competitors who have been unsuccessful this year, will not be discouraged, but will continue to press forward in this grand work, recollecting that the committee distinctly say that the whole collection of ploughs exhibited, were such as do great credit to American manufacturers of agricultural implements."—*Report of Com.*

CULTIVATORS AND DRILLS.

C. N. Bement, Albany, for the best Cultivator, 1st prize.

Anthony Van Bergen, Coxsackie, 2d prize.

Calvin Olds, Veranoit, for a Drill Barrow, 2d prize.

THRASHING MACHINES.

A. Douglass, Skaneateles, for Thrashing Machine, 1st prize.

Henry Olds, Syracuse, 2d prize.

D. G. Stafford, " 3d prize.

HORSE POWERS.

Norman Ackley, Rochester, Dibble's Horse power, 1st prize.

David G. Stafford, Syracuse, 2d prize.

Archibald Douglass, Skaneateles, 3d prize.

STRAW CUTTERS.

Jonathan S. Wilcox, Auburn, for 'Gilson's Machine,' 1st prize.

J. S. Wright, Jordan, 2d prize.

W. B. Abbott, Syracuse, 3d prize.

HORSE RAKES.

But one was exhibited, and as there was no competition, the 2d prize only was awarded to A. Holtbrook, Whitesboro'.

SOARING MACHINE.

Julius Hatch, Rochester, for a machine for sowing seeds and plaster, a prize of \$10.

PITCHFORKS.

Lewis Sanford, East Solon, a premium of \$5, for half a dozen, of superior manufacture for strength and finish.

PASSING MILLS.

Orrin Hefron, Dryden, 1st prize.

James Beel e, Sullivan, 2d prize.

John Gilbert, Utica, 3d prize.

AGRICULTURIST'S FURNACE.

Jordan L. Mott, New York, for his Agriculturist's Furnace and Caddron, a silver cup.

SMUT MACHINE.

Jirch Durkee, Utica, for 'Grimes' Patent Smut Machine,' a premium of \$20.

ROOT CUTTER.

Wm. Thorburn, Albany, for Fowk's Machine, a prize of \$2

SAMPLES OF GRAIN.

Rawson Harmon, Jr., W. Kentland, for samples of 21 different varieties of wheat, exhibited in the berry, and in the head on the stalk, a premium of \$10.

M. B. Hatcham, of Rochester, for 12 varieties of imported wheat, a premium of \$5.

Seh Starr, of Sullivan, for the best specimen of Spring Wheat, \$5.

John Townsend, of Albany, and to Wm. Inell, of Volney, for two best specimens of Indian corn, \$5 each.

ROOTS.

The committee on Roots notice with commendation, samples of Potatoes from J. F. Osborn, Port Byron; Wm. P. Buel, Albany; and Wm. Inell, Volney.

Samples of white carrots, from C. N. Bement, The Hills Farm, and Wm. P. Buel, Albany—Yellow do, from John Bairdridge.

Samples of Mangel Wurzel, from J. P. Osborn, and Red Beets from Rufus Casser.

Also a very fine sample of Onions, owner's name unknown.

FRUITS AND FLOWERS.

Premiums of Books on Horticulture were awarded to David Thomas, Aurora, for a lot of about forty varieties of apples, pears, peaches, plums, and grapes, some of them of new and valuable varieties, presented by J. J. Thomas, nurseryman, of Macedon.

Dr. Beaumont, Lyons, for several baskets of very fine and excellent grapes, including the Grey Tokay, Golden Chasselas, Scuppernon, Purple Royal Chasselas, Isabella, and Sweet Water the quantity of which the society had an opportunity of testing at the dinner table, "in committee of the whole."

Samuel Hecox, Lyons, for a lot of sixteen varieties of foreign and domestic grapes, very fine and well ripened,—of which Mr. Hecox raised above fifty bushels the present season.

James Wilson, nurseryman, Albany, for a beautiful bouquet, and a large lot of Dahlias of splendid varieties.

Wm. P. Buel, Albany, for a miniature parterre of Dahlias of very perfect and well chosen varieties of great beauty, and twenty-four kinds of well selected varieties of apples of fine growth.

Ezra Cornell, Ithaca, for a basket of fine Red Cheek Malheur Peaches, some of them measuring more than 7 inches in circumference.

James Cochrane, Oswego, for a basket of foreign varieties of grapes, among which were the Chasselas, Sweet Water, Frontignac and Pinon Noire, a hardy variety with a vinous and pleasant fruit—also a basket of Silver Clingstone Peaches.

Mr. White, of Oswego county, for a basket of fine apples of known varieties.

J. F. Osborn, Port Byron, for 29 varieties of cultivated apples, of well selected sorts, together with three varieties of cears.

Mr. Cresse?, Onondaga, for a basket of fine grapes, including the Isabella, Alexander, Munier, an Sweet Water, well ripened and large growth.

Mr. Huntington of Onondaga, presented a large basket of apples, of beautiful form and fine flavor.

M. B. Hatcham, proprietor of the Rochester Seed Store, presented two seven year pumpkins, raised by H. N. Langworthy, of Irondequoit, in 1857 and 1858.

John Richards presented the vine and products of one seed of the Cotton Watermelon, amounting to 1-in number, and weighing over 300 lbs.

Those to whom Prizes were awarded, and who have not received them, can obtain them by application to E. P. Prentice, Esq., Treasurer, or to L. Tucker, Secretary, Albany.

The Report on Silk and the remarks of the committee on Horses, together with some other matters, are unavoidably deferred till next month.

Free Trade--British Corn Laws at the Low-est Scale of Duty.

A writer in the October number of the Democratic Review, produces a long elaborate, but rather slashing article under the above head, in which he says that the effects of restriction on trade in the shape of a national tariff is to "produce a mere transfer of labor and capital, to take money from the pockets of one class of men to put it in those of another; what one class has gained another has lost. One method of industry has been encouraged while all others have been depressed. Labor and capital in a particular department have been rendered more productive by diminishing and exhausting their energies in other departments. In what way has industry been stimulated? What general advantage has there been in this? By diminishing its productiveness in ninety nine branches in order that the hundredth may be raised to the average productiveness of what the others were before!" &c. &c.

Well may the writer of the above article call to his aid the forgotten and one sided evidence given in before the British House of Commons, to support his doctrine; since all the results of practical experience on the subject in our own country strike at the very root of his theory. We will not go beyond our own manufacturing town to prove, that since the manufacture commenced, of those articles which are protected by the compromise tariff real estate has risen 50 per cent--both the consumption and the price of all agricultural production in the vicinity have increased in still greater ratio, giving a correspondent increase to the wages of the mechanic and the laborer, and multiplying the number to a ten fold extent since from these manufacturing establishments which are favored by a tariff, being prejudicial to the general trade, they give it its greatest stimulus, by the aid they give to the farmer in the purchase of his staples, and to the laborer and mechanic in the employment they receive.

We have our extensive woollen company here, which could not have had an existence, but for the protection given by the compromise tariff--at this time their cloths are selling in N. Y. at remunerating prices, to an extent which alone does more towards equalizing the exchanges of this county, than all the other staples sent to the same market, if we except flour, and yet the amount thus disposed of is not a tithe of the home trade. And what has produced all this--we answer, manufacturing industry judiciously stimulated by moderate protection, in the shape of a national tax on the correspondant imported article, from the over populated old world.

The advocates of free trade have supposed that the repeal of the British Corn Laws would be a great boon to the United States, what is the result now when the duty on wheat in England is reduced to three half-pence a bushel. The continent of Europe supplies her cheaper than we can. Such is the price of labor in the United States, such the demand for the home consumption--for manufacturing New-England--that should England want two or three days rations of bread from us--the price in New York would rise a dollar or two on the barrel of flour. When flour in New York is above 85, Europe can successfully compete with us in the sale of bread stuffs in most of the foreign markets--let us then look to a home trade rather than a free trade for our sure and steady food of hope.

Walcot, Ct. Labor S. 1841.

For the Genesee Farmer.

Accommodations at Syracuse.

A MAN CHARGED A DOLLAR A MEAL.

It must be confessed, that it is no very easy task for the public house of one village, to accommodate several thousand guests. Take the people of Syria

case did their very best, at the late State Fair, none, I presume will question. But the extravagant charges made by the principal tavern, should not be passed in silence. If any thing will deter our farming citizens from attending such fairs, it is this *gratuit* and *honorable* way of emptying their pockets. Indeed, we are rendering ourselves altogether ridiculous, by preaching economy and moderation at all other times, and then recommending *that*, which is accompanied with profuse waste of money. Some of us well remember, of other similar societies broken down, and by costly dinners, merely; how much more so then, will it be in the present case, where after spending two or three days, and partaking of no better fare, certainly, than at our own ordinary farmhouse dinners, (good enough to be sure, we found ourselves very modestly charged at the rate of about a dollar a meal, including breakfast and supper, throughout. I am told that other houses were very reasonable.

But it is said that this high charge secured select company at the house in question. Not at all! The majority, I doubt not, neither knew nor suspected any thing till they paid the bill. But had they *all* known previously--why then--save me from such company! A company, not of the sensible, the intelligent, the wise. But rather of a selfish, and purse-proud, and needlessly wasteful, and would be thought rich. No wise man, no business man, will throw away money. There are calls enough for it elsewhere. An extravagant man is one generally who neglects to pay his honest debts, so far as my observation extends.

I would respectfully suggest, that the Executive Committee of the New York State Agricultural Society endeavor to remedy this evil in future, as they desire the prosperity and good of the Society, and to extend the benefit of its fairs to the farming community at large. And I would propose that an arrangement be made with public houses to give the preference of admission to *members*; this would induce many to join, for the sake of entrance, *and be the means perhaps of putting hundreds of dollars into the treasury.*

Having now done with the *exorbitant* side of the question, permit me to notice one instance of *praiseworthy* liberality, in the case of the Auburn and Syracuse railroad officer, who ran an extra train of cars each day, charging only a dollar for each passenger to Syracuse and back. And a horse to say also, while on the subject of rail-roads, that I was very sorry to see some time ago in the New Genessee Farmer, a recommendation of this kind pocket book travelling as *cheap modes for farmers.* Old Ben Franklin preached from a different text, touching economy--read Poor Richard.

A MEMBER.

From the Albany Cultivator.

Milking Properties of the Improved D. Cows.

Mrs. GAYLORD AND TICE--An esteemed friend, Mr. BARTLETT of Connecticut, has called upon my brother and myself, through the July number of your valuable periodical, to give some account of our herd of Short Horned cattle, and I must plead other and more pressing avocations as the only reason why he has not met with an earlier response. The object of Mr. Bartlett appears to be, to show that so far as our animals are concerned, they do not sustain COLMAN'S position, that Durhams are inferior to the native race for milking and dairy properties. Lewis P. ALLEN, Esq. to whom Mr. Bartlett has, in the June number of your paper, met the position taken by Mr. Colman with great ability and success.

Besides high grade, and some native, we have twenty-five thorough bred animals. By the term *thorough bred*, I mean animals which are themselves, or whose ancestry and sirentage recorded in Come's Herd Book, which furnishes for them full and unobscured pedigrees. Among these animals, we have one cow and three female descendants, the produce of two animals which were imported by Enoch Sibley, Esq. of his state, under the name of "Boston," and were bred by Robert Curry; one cow with two female descendants, the produce of Washington and Fuzzy, imported by the late Patton, and bred by Mr. Chapman, two females, the produce of Hurst, imported

by Joseph Lee; and one cow, the produce of Anabella, imported by the late Stephen Williams, and seven other female descendants of the last named animal.

One of these cows is sixteen, and two others thirteen years old. All of them are in good health and exhibit the appearance, so far as condition is concerned, of being young animals, and two of them have regularly bred up to this time. These facts do not contribute to prove that this breed of animals are too tender and delicate to endure our cold climate, as I have occasionally seen and heard it alleged.

The milk from nearly all of our cows is unusually rich, and the quantity much greater than we have been able to obtain from superior native cows with the same keep. My brother has regularly had good common cows on his farm for about twenty years, and he tells us without qualification this fact.

Our cows have not given us much milk, nor made as great a quantity of butter, as have some other Short Horns, yet one of them, in April last, on hay, made more than twelve pounds of butter in a week, and we have repeatedly converted the cream in small quantities from this cow, into butter in fifteen seconds. In June, upon grass alone, this cow gave 160 lbs. of milk in a week, being milked but twice a day; the milk at this time was converted into cheese, and consequently no butter made from her. Had she been milked three times a day at this period, I am quite confident that her product of milk would have reached 400 lbs. and of butter not less than 14 lbs. per week. We have another cow which averaged 45 lbs. of milk per day in June, and still another, (now quite old,) which a former owner assures me has yielded 28 quarts of milk per day.

We have also two heifers with their first calves, which averaged 37 and 35 lbs. milk per day throughout the month of June last.

I will readily admit that among the great mass of the common cows of the county, we occasionally find those which are very deep and rich milkers. But to the reliance, however, can be placed on their progeny for the same properties, whilst with thorough bred animals, by using bulls from deep milking families, the produce is quite certain to partake largely of the sire's and dam's.

It would indeed be remarkable, as Mr. Allen well observes, if, in traversing the whole of this State, on the discharge of his official duties, Mr. Colman, our late highly respectable Agricultural Commissioner, did not discover among the great mass of our common stock, some superior milkers and valuable dairy animals.

In the 4th vol. New-England Farmer, I find the following opinion given of the Short Horns, by Governor Lincoln, in a letter to Mr. Powell:

"I have now (of Denon's progeny) seven heifers in milk, four of them three years old, and three two years old; and for richness in quality and abundance in quantity, they are not excelled by the best cows of *any* age of the native stock." A heifer three years old, with her second calf, has not been dry since she dropped her first calf, having given 4 quarts on the morning of her second calving. For the dairy and the stall, I speak with the utmost confidence of their pre-eminence."

I have recently had an interview with the intelligent and persevering owner of the "Crown Point" herd of cattle, and Col. Jacques assured me that he attributed the rich dairy properties of his herd more decisively to the Short Horned Bull Cuckles, than to the native Haskins cow, from which his whole herd, as I understand, descended; and it would seem from Mr. Haskins's own account of the produce of this cow, as published in the 5th vol. New-England Farmer, that he must be correct in this opinion; she is therefore, so called as having made in two days 23 lbs. butter, which is 9 lbs. 11 ounces per week, being by no means a remarkable product when compared with that of many of the Short Horns.

In Mr. Allen's valuable communication, he has given the product of six short horn cows, viz. in 400 lbs. milk and butter from three animals, in butter alone from one, and in milk alone from two animals.

The butter from the four animals varies from 11 1/2 to 22 pounds per week, making the average of the four cows 15 lbs. 6 oz. per week.

The milk from the five cows is from 28 to 55 quarts per day, averaging for each animal more than 32 quarts per day.

Besides the product of these six cows, I find the produce of butter from six more Durham cows, as follows viz:

Mr. Haskin's cow, 10 lbs. butter in 1 week, } Var. P.
Mr. Currier's cow 37 1/2 do. do. in 22 weeks, } Farmer,
Mr. Currier's cow 333 do. do. in one year, } vol. 7, p.
Mr. Currier's cow 333 do. do. in one year, } 149.

 My object is that the pure Short Horns, with good keep, (and no animal will thrive when starved) is much more valuable than any other race, for the snuffles, for the public and for the dairy; yet it our fathers have reared a better race, without system and without the least care in breeding, I shall bow with submission, regret the cost of my error, and hereafter "tread in their footsteps."
 WELLS LATIROP.
South Hadley Falls, Mass., Aug. 19, 1844.

Salt in Michigan.

The following article from the Grand Rapids Inquirer, contains interesting and important facts for our Western Readers:

"SALT.—We congratulate our fellow-citizens of Grand River Valley, and of Western Michigan, upon the fortunate result of the endeavoring of Mr. Lyon to obtain salt water at this place. His efforts were crowned with success equal with his wisdom, and in one particular far exceeding his imaginations. For about eighteen months the work has been progressing, waste, unimpeded, and all hoped, but few were sanguine of success. A circular pit of about 300 feet in diameter, some feet below the surface, but for a long distance after nothing further seemed to be gained, and many began to think they had been cheated for naught. The works were continued until the shaft had been sunk 641 feet, when the evidence was seen that a preparation of boring was suspended, and tubes sunk to ascertain the quantity and quality of the brine.—On Saturday last (the 25th) the tubes were put down to the depth of 300 feet, but little over half the depth of the well, water to the joyful surprise of all present here, of the quality of one bushel of salt to four 511 grains of brine, ascended and poured out of the tube with a rapid force. It is estimated that the tub is might be carried fifty feet higher, and the brine yet escape. What is the quantity of the brine which will immediately discharge, it is difficult to ascertain, but is estimated from 5 to 8 gallons. This, without the use of a pump, or any means of elevation, we deem unparalleled in the history of mines.

It is intended to sink the tubes still lower into the salt well, and to see the evaporation that the brine often and will be much stronger, as it is further disconnected from the fresh fountains above. Mr. Lyon, as we esteem, will commence boiling immediately, as soon as he can obtain kettles and place them.

Again we congratulate our readers on this valley—we receive a fountain of wealth in our midst, which will enable us to forget the cold, and snap our fingers at the broken and abandoned Bibles. What may we not expect, anticipate in our salt, our plaster, our pine, the fertility of our soil, our immense water power, our coal, and our navigable river. Where can we find a combination of sources of wealth in Michigan or the west?"

From the Western Farmer and Gardener's Almanac for 1842. Causes of Decay in Peach Trees, and its Prevention.

To the early settlers of the West, the peach was a "cheaply and easily procured luxury." The kernel was sown in the fore-corner, and grew and produced a fruit and health to all, with but little care or culture, bearing large and regular crops of fine fruit, in a number of seasons.

This being the case, why do we find so much difficulty at the present day? How do we account for this? Here success is then, and for our frequent failures now?

In early times, when the whole face of the country was thickly timbered, our winters were less severe than the present day. Our climate, made hot by Green Bay's winds, in the case in regions the country is improved, and at the same time the peach trees are not so abundantly watered.

In a field to show, the fall-wind cans had a ruinous effect. The kernel was taken from the fruit of an abundant tree; thus being of course selected when the seed was good—thus the mild rot, excited by the stock it grew, was avoided. The kernel was planted where it was meant to stand—the young tree experienced mutilation and checks too often received in transplanting. It was left to grow pretty much in a set nature, by which the stem was shaded from the numerous effects of the full blaze of a summer's sun; to us trees, like the beech, will not do well if so exposed. The soil was rich and good, and kept the tree in a

vigorous and growing state. The climate being generally small, was in a great measure protected from late spring frosts. The disease called "yellow" had not its own rank, nor had the peach insect, the "Alysiya eximosa" of naturalists.

Now, trees are bought from the nursery men, the older and the larger, the better! The stocks, too often produced from the kernels of indifferent or even unhealthy peaches; allowed to grow two or three years before they are headed; dug up, without care, and scarce a root, and certainly not a fibre, left for their support; the stems branched and chafed, and closely pruned to proportion them to the mutilated roots. They are kept out of the ground for a length of time; conveyed to the planting ground unprotected; and there set out, in little holes, dug out of the soil, in thin, poor soil, where they are left to struggle through a year or two of a misanthropic existence. In the nursery-row, the top of the one protected the stem of the other; but now there is no such defence. The puncture deposits its eggs, which are left to hatch, and the worms to commit their ravages undisturbed. And being generally planted in an open, southern exposure, the frost in-fall, swept too soon, and here destroyed by the first severe frost.

Let us now state what we consider to be the proper practice.

Select a piece of rich, new land; if a tolerably still land, with a shallow contour of level mould, on the north or north-east side of a hill, rear a large water-course, the crops will be more abundant and sure, the soil not so highly elevated as if grown in a sandy soil.—Though it deeply and carefully in the soil, and in addition, mark out the holes, and have them dug down to the sub-soil, or at least two inches deep, and six feet in diameter. If you intend planting trees of a nursery man, which is the cheap course, if you have one within reach, in which you can depend, go as early as possible in the spring, and select young, healthy trees, not more than one year from the bed, and two from the kernel. Have them taken up very carefully, so as not to destroy even a rootlet that can be avoided; dip the roots in sludge, if you have to carry them more than a mile, and plant them without delay. Throw a cone of the surface soil into the hole, after loosening the bottom with the spade; drive a stout stake into the centre, to which to fasten the tree; then place the tree close up alongside of the stake, and while you stand throw in the surface soil round the roots, strike the tree gently, so as to allow the earth to run in and fill up every vacant space; taking care to spread the roots out a liberally, and to plant it but very little, if any, deeper than it stood before. Treat the ground lightly; and after pouring a couple of buckets-full of water round the tree, and fastening it firmly to the stake with a soft band, you may consider the operation of planting completed as it ought to be. It is perfectly folly to purchase trees and plant them, as they are usually planted. If the soil is not naturally rich, manure it if it ever, but do not put any round the roots of the trees—rich compost or mould from the wood-yard or stable yard, may be placed immediately round the roots.

If it is intended to grow the trees from the kernel select good ones, the produce of healthy trees. Bury them in about two or three inches of soil, as soon as practicable after they are taken from the peach. If they are in quantity, mix them with double their bulk of earth, and ridge them up in a side part of the garden, covering the whole with a inch or two of soil, and leave them over winter. Towards the end of February, or first of March, examine them, and plant out such as have opened but without removing the shells. Put three or four where they are intended to stand; and in July or August, separate them with the kind of fork you wish. In the fall or spring, all can be removed but one. Never put off separating till the second year. For their first treatment, see the article on budding. A peach orchard should be treated in some such manner as potatoes, beets, melons, sweet potatoes, &c., and if necessary to sow it down, let it be like clover; taking care to keep a space round the trees. If six or eight feet in diameter, free from grass and weeds. Trees never do well, bear or thrive, in a meadow or blue-grass soil.

For some years past, the insect called the "Peach-borer," or "Peach-tree worm," has occasioned the ruin of thousands of trees in the west. See article on their history, and the precautions to be used.

New Boots.

A pint of linseed oil, two ounces of bees wax, two ounces spirits of turpentine, and half an ounce of Benzoin pitch,—dissolved together, and then applied to new boots, will render them water-tight with

out becoming stiff. The Correspondent of an exchange paper, says he has used this composition many years; and believes that *his shoemaker's bill has been reduced by one half*, so conservative are its effects on the leather.

Botanical Etymology.

When Deau Switt suggested that the name of *Indrancha* (in Hoyer) was derived from *Andra* *Melchior* Scotchman, he was in error; but when Professor Eaton attempted to make out *Adiantum* from the Greek, he was in error, —though we consider it (if possible) the greater burlesque of the two.

A few words will explain our meaning. About twenty-five years ago (more or less) Professor Rafinesque changed the name of the plant *Corydalis flavogata* to that of *Adiantum rhizosa*; and Dr. Donnellson says (what we had understood before) that the new genus was "dedicated to Major John Adlum, a distinguished cultivator of the vine," who resided some years before his death near the city of Washington, and whose name and character to us had long been familiar. With part of his father's family associated (mother, brother, and sister) we were personally acquainted, so that no shade of uncertainty or doubt can hang over the reality of that family name.

In the 8th edition of the "Manual," or "North American Botany," published last year, we find however, at page 214 that *Adiantum* comes from the Greek:—*a* (without), *lanca* (dart), a straight cleaver." Now will not the learned author of the "Cyclopaedia of Literature," give this circumstance a fitting place in his next edition?

Sugar from Corn Stalks.

William Webb has addressed a letter to the President of the New Castle county Agricultural Society, in the State of Delaware, dated Wilmington, 9th mo, 25, 1841, recommending the manufacture of sugar from corn stalks; and we learn from the Pennsylvania Freeman, that the specimens exhibited (including molasses) were much admired for their flavor and appearance.

During the Revolutionary war, when our commerce with the West Indies was nearly annihilated, we can remember that molasses was prepared from this material, by pressing out the juice in a cider mill, and boiling it down; but though sweet, it was rather unpalatable, not having been properly purified. No doubt can exist however, of well ripened corn stalks abounding in saccharine matter; and boys in the art of chewing them, soon discover that the *smaller and redder are always the sweetest*.

In accordance with this fact, W. Webb recommends planting the corn in rows two and a half feet apart, leaving the stalks to stand in the rows only three inches from each other. No care is allowed to grow or open; and on this pretension he considers the success entirely to depend. In reference to this improved method, he says, "In the end I obtained from a small piece of ground, at the rate of 100 lbs. of sugar per acre; but other experiments made since, have conclusively shown that had a different mode of planting been adopted, the product would have been increased ten fold."

The crop will generally be fit to take up in September. The stalks are then cut up at the root, stripped of their leaves, and taken to the mill, where the juice is pressed out between iron rollers. Lime water about the consistency of cream, is then mixed with the juice, one spoonful to the gallon. It is left to settle one hour, and the scum is poured off into holders, which are covered until the liquid approaches nearly to the boiling point, when the scum must be taken off. It is

then boiled down as rapidly as possible, taking off the scum as it rises. As the juice approaches the state of syrup, it is necessary to slacken the fire to avoid burning. The boiling is generally completed when six quarts are reduced to one; it is then poured into coolers, or moulds, and set aside to crystalize."

He contrasts the manufacture of sugar from corn stalks and beet roots as follows:

1st. The corn is clean and agreeable to work with, while the beet is not.

2d. The machinery for extracting the juice from beets is not only more costly, but is more liable to get out of repair.

3d. The beet juice contains a much greater proportion of foreign and injurious matter; decomposition commences almost immediately after it is pressed out; and if allowed to go on to any extent, will entirely defeat the making of sugar.

4th. The proportion of saccharine matter contained in equal quantities of corn and beet juice is as three to one in favor of the former; therefore the same difference will be found in the amount of fuel necessary in evaporation.

5th. Beet sugar when obtained is inferior in quality, and loses a larger per centage in refining."

Geology of North Sherbrooke, U. C.

We received, in August last, a communication of a very interesting character from E. Wilson of North Sherbrooke, U. C., on the Geology of the District, where he resides. We have only to regret that it is of a character more purely geological than comports with the object of our paper. We had designed to give some portion of it, but have thought it would prove more satisfactory to our friend, the author, to forward the whole article to Professor Silliman, for publication in his Journal. We quote, however, the following in relation to the effects of the violent earthquake, which, according to the words of the Jesuits, in Quebec, deranged a large tract of country, in U. C. Mr. W. says, "With the exception of a few veterans I find no trees in my broken neighborhood older than about 210 years. I have counted the annual circles of the White Pine, the stump of which was 6 feet 3 inches by 4 feet 9 inches across, and found it (about ten years ago) 221 years old, so that it began its career 231 years ago. Now, as it happens ever in tempests that sweep the forests, that only small trees are left standing, a young tree struggling to get up in the forest is neither large nor easily thrown down at the age of 61; for such must have been the age of one now 240 years old, in the year 1665, that is 176 years ago. I counted the annual rings of a sugar maple less than six inches in diameter, and found it 89 years old." It seems very probable then that the earthquake of 1665 prostrated the older trees of the forest. The fact would account for the age of the trees now existing. It should however be enquired whether over this wide country the trees of the forest have a much greater age than those mentioned by Mr. W. D.

Seneca County Fair.

This Fair was held at Ovid, Oct. 21st and 22d. We have not yet seen the report, but the Ovid Bee says, "notwithstanding the unfavorable weather, the show of fine Cattle, Horses, &c. was such as to do credit to the county." We deeply regretted our inability to attend this Fair, especially after receiving the following polite invitation, which we take the liberty to publish on account of the just sentiments it contains.

WATERLOO, Oct 16, 1841.

M. B. BATHAM, Esq.: Dear Sir—I am requested by the officers of the Seneca County Agricultural Society, to invite you to attend the Agricultural Fair to be held at Ovid, on the 21st and 22d inst., and als

that you invite such of your friends as would be likely to attend. Perhaps there never was a time like the present, when the efforts of all influential good men were so necessary to arrest that growing deterioration in the public morals, incidental to late speculation and extravagance, and the consequences they have entailed on community.

We feel that those efforts cannot be better directed than in encouraging a thorough system of Rural Economy, whereby man may be made honorably useful and intelligently happy, in the successful pursuit of this, almost the only calling, which has no temptation adverse to the precepts of religion and morality.

Very Respectfully Yours,
SAM'L. WILLIAMS, Cor. Secy.

Gen. Harmon,--Wheat Culture.

Gen. R. Harmon jr., of Wheatland, in this county, exhibited at the State Fair at Syracuse, 21 varieties of wheat, in samples both clean and in the straw. He exhibited the same at the late Fair in this city, but as it did not come under the particular inspection of either of the committees, no mention is made of it in the reports.

The Stump Pulling Machine.--Colonel Drake of Owego informs us that the patent right for this machine, of which he was the proprietor, expired in August last; and any person who wishes to construct them is welcome to do so.

WESTERN Farmer's and Gardener's Almanac, for 1842.--By Thomas Albee, Cincinnati.--Also "Bee Breeding in the West," by the same author. Price 25 cts. each--\$2 per dozen, for sale at the Seed Store and Bookstores in Rochester.--Nov. 1.

YOUNG'S Farmer's Almanac for 1842.--We have just published the "Farmer's Almanac for 1842," containing 36 pages, printed on fine paper, with appropriate cuts, Agricultural remarks, cures, valuable tables, anecdotes, recipes and miscellany, for sale at wholesale and retail prices upon the most reasonable terms.
G. W. FISHER & CO., Exchange st. oct15

MOTT'S PATENT AGRICULTURISTS FURNACE.--Manufactured by M. C. Wedd, No. 53 main st., Rochester, N. Y.--This article was constructed in consequence of a suggestion from the American Institute--that a simple, portable, and low-priced Furnace was much wanted by farmers, for boiling or steaming food, preparing maple or beet-root sugar, and for many mechanical purposes.

It is so formed that a space from one to two inches is left between the boiler and the casing that surrounds it, causing the heat in its passage to the pipe, to encircle all parts of the boiler even to its upper edge. The American Institute awarded a silver medal at their late fair.

The following is an extract from the Cultivator extra for December:--"AGRICULTURISTS' FURNACE." [Fig. 96].--"A good, cheap, and durable boiler has long been sought for by the farmer. Potash kettles, cauldrons and boxes, with sheet-iron bottoms set in brick, have been used, as well as steam boilers, of various descriptions; but they all take up considerable room, are clumsy and burdensome. For the last seven years, I have tried all the above named articles, and have laid them by, and substituted one of "Mott's patent Agriculturist's Furnace and Cauldron."

"It will be readily perceived that it has many advantages over those set in brick. It takes up but little room, is light, and may be placed on the floor, and requires no foundation to support it. Besides being portable, it may be removed from place to place, as occasion or convenience require; two men are sufficient to remove it. It can be made to boil full of vegetables in 20 minutes, and the second filling in 20 minutes. In this I was happily disappointed, for I had always supposed that brick retarded the heat better than iron, and after being once heated, would require less fuel to keep it boiling. Another very

important consideration, and will go far to recommend it, is, that it requires much less wood than one of the same size and form set in brick, or even the box, with a sheet iron bottom, so highly recommended in some of the former volumes of the Cultivator. Although wood may be plenty, it takes time and labor to procure it.

"Steam boilers may answer in very large establishments, but I have found them very inconvenient, as every farmer is not engineer enough to manage it, and the consequence was an occasional explosion or collapse, and in either case an expense and considerable trouble was incurred.

"Some five or six years ago, I tried a copper boiler--a cylinder within a cylinder, the furnace in the centre, surrounded by water, very similar and on the same principle as the one figured in the 13th number of the current volume of the New England Farmer, as Doctor Warren's Patent Cylinder Vegetable Steamer, but I found it very expensive to keep it in order, and abandoned it.

(Signed) C. N. BEMENT."

Three-Hills Farms. C. N. BEMENT.
17 They will be sold at New York prices, adding transportation 1/4 barrel \$12; 1 barrel \$29; 2 barrel \$30; 3 barrel \$30; 1 barrel \$30. The Mechanics' Fair awarded a silver medal for this; and the Agricultural Society \$3.

Also, for sale at the same place Wedd's celebrated Hot Air Cooking stove, for which was awarded a silver medal for the best cooking stove, at the last fair in this city. The public are invited to call and see it.

DISSOLUTION.--The co-partnership heretofore existing between the subscribers was dissolved by mutual consent on the 1st day of October. All accounts and affairs relating to the Seed Store and Genesee Farmer, will be settled by and with M. B. BATHAM, who will continue the business as heretofore. All matters relating to the Farm or Seed Garden, will be settled by C. F. CROSMAN, who will continue the business of growing seeds.

Rochester, Oct. 20, 1841. M. B. BATHAM, C. F. CROSMAN.

GARDEN SEEDS in Boxes.--C. F. CROSMAN respectfully informs his country friends and customers, that he will at the usual time, be prepared to supply them with fresh assortments of garden seeds, of his own raising or selection, such as he is confident will give satisfaction. Rochester, Oct. 1, 1841.

MULEY SEED, wanted at the Rochester Seed Store.

APPLE TREES FOR SALE. The subscriber A has constantly for sale at his nursery on Main st. one mile east of the bridge, Rochester, a choice assortment of grafted apple trees, of large size, warranted of the kinds represented, and embracing from 30 to 40 of the best varieties for summer, fall, and winter use. Price \$25 per 100. Orders from a distance containing remittance or good city reference, will receive prompt attention, and the trees will be shipped or delivered according to instructions. Rochester, Oct. 1, 1841. ELECTUS BOARDMAN.

GILSON'S STRAW CUTTER! DECIDEDLY the best Machine known in these parts, for cutting fodder, for sale at the Seed Store Price \$20. M. B. BATHAM.

THE CASH SYSTEM.

Subscribers are reminded that this paper is published in the CASH SYSTEM, and this number completes the volume. Those who have not paid for the next volume, are required to remit payment before any more papers will be sent them, (Correspondents excepted.) Hand the half-dollar to your Post Master when you get this No. from the office. See terms, &c., on last page.

New Arrangement--New Editor.

It is with feelings of no ordinary degree of satisfaction that I announce to the public, that HENRY COLMAN, of Massachusetts, has consented to remove to Rochester, and take the editorial charge of this paper. As an agricultural writer and orator, Mr. Colman is so well known to the public, that nothing more need be said at this time on that subject. The readers of this paper, and the friends of agriculture in this State especially, have reason to congratulate themselves on his arrangement; and Western New York may well feel proud of the honor conferred upon her. Mr. Colman will advocate the interests of the whole country, without sectional prejudice or partiality; but at the same time, the district in which he resides will of course derive the greatest benefit from his influence, and should make the most exertion to

Give Him a Hearty Welcome!

Mr. COLMAN has been assured that the friends of agriculture in Western New York and the GREAT WEST would lend him their co-operation and support; that through the medium of the Genesee Farmer, he could hold monthly converse with a VAST HOST of the tillers of the soil, and that the profits of the publication would afford him a liberal compensation. LET HIM NOT BE DISAPPOINTED. Take your horse and call on your neighbors—get them all to subscribe, and they will thank you for it hereafter.

The officers and friends of the numerous

Agricultural Societies

should make especial efforts to circulate the paper in their districts or counties. Experience proves that THIS IS THE ONLY WAY to have useful and spirited associations. Farmers who do not read such papers never make good members of agricultural societies.—Their MINDS are not interested in the subject, and they do not rightly appreciate their profession. Let the friends of the cause in the Empire State remember this, and act accordingly; and the spirit of improvement which began to manifest itself so generally the past season, will soon produce most glorious results.

M. B. BATEHAM.

To Correspondents.

Several communications were received too late for insertion in this number, and various matters requiring editorial attention are unavoidably deferred.

☞ We hope our friends will improve these long evenings and stormy days, so as to send us accounts of their past season's operations.

The Syracuse Hotel.—We have received a letter from Mr. Rust, proprietor of the principal Hotel at Syracuse, complaining of a communication in our last. It shall have a place next month, with explanations.

The Index and Title Page for Vol. 2, will be found in the middle of this number. Those two leaves should be taken out, and placed in front of the first number, then the whole volume stitched together. Those who have the 1st and 2d vols. should get both bound in one. The first volume can still be furnished if desired.

Post Masters

In this and the Western States, will receive prospectus and a specimen No. of the Farmer; they are respectfully solicited to remit names and payments to us, (as allowed by law.) Our most sincere acknowledgements are due for past favors of this kind.

Papers to Europe.

Subscribers who wish to send the Farmer as a present to their friends in Europe, are informed that we send quite a number of copies every month. The price is 75 cents per year. (This pays the American postage.)

A Card.

At the desire of Mr. BATEHAM, the subscriber announces to the friends of the New Genesee Farmer his engagement to remove to Rochester, and take, on the first of January ensuing, the exclusive editorship of this work. It is not without a just diffidence that he undertakes this enterprise; but, with honorable intentions, he is persuaded that in the generosity and public spirit of the New York agricultural community, he shall find a welcome. He leaves the good old Bay State, the land of his nativity and the sepulchre of his fathers, not without many strong emotions; but he does not feel that in going to New York he is going from home. He has been long acquainted with New York and her citizens; and has taken always the deepest interest in her enterprizes and improvements. He has always regarded her agricultural progress and success with

admiration; and now that in addition to the common ties of friendship and political fraternity the two States are to be linked together by iron bonds in the great interests of internal trade and commerce, he deems his removal much less a separation from home and the friends of his youth.

In going into New York, he feels that he is going among old acquaintances. He had many years the pleasure of an intimate friendship with the late lamented Bael; and he is happy in standing in the same relation of mutual respect and esteem with the present enlightened and indefatigable editor of the Cultivator. Her Allens and Thomases, and Wadsworth and Gaylord, and Rotch and Vicks, and Ball and Blydenburgh, and Beekman and Grove, and Bement and Hall, and Walsh and Van Rensselaer, and Dunn and Corning, seem to him like old and tried friends, united by a bond too sacred to be polluted by any base and selfish interest; the bond of a common devotion to the advancement of an Improved Husbandry, and the social, intellectual, and moral elevation of the rural and laboring classes.

He goes to New York to continue the labors to which forty years of his life have been devoted; and to unite his humble efforts more closely with theirs in this common cause, the cause of human comfort, of good morals, of private and public good. He will be most happy to be recognized as a joint laborer. He goes to New York with no assumption of authority either to teach or to lead. Nothing is farther from his thoughts. He goes not to drive the team, but to draw in the team; and while he has wind enough left, he promises, without goading or whipping, to do his best to keep the draft steady, and his end of the yoke square. He has no higher earthly ambition than that it may be said of him, when the bow is pulled from his neck, "he has done a good day's work."

The object of the present note, is merely to make his bow to his New York friends; and to say that he hopes for their better acquaintance; and that when he calls again, somewhere about New Year, he shall, "if the old folks are willing, respectfully ask leave to stay all night." He has now just dropt in, and won't intrude

Respectfully, HENRY COLMAN.

Boston, 27th Nov., 1841.

Premium Pitchfork.

When at the Syracuse Fair, Col. H. S. Randall presented us one of the Premium Pitchforks manufactured by Lewis Sanford of East Sotoh, Cortland county, N. Y. For beauty of form and finish, and especially for the quality and temper of the steel, we have never seen its equal. It is quite a curiosity; we wish the maker would send a thousand this way—they would sell rapidly.

Hatch's Sowing Machine.

Mr. Hatch requests us to say, that in accordance with numerous requests, he is now engaged in manufacturing the Machines at this place, and will be able to supply orders in time for spring sowing.

If you wish to be wise, it is wise to wish.

Apples.

We should estimate the difference of *product* between common seedling apple trees and the best selected varieties, to be not less than ten to one in favor of the latter; but the difference of *value* will appear much greater if we take into view the *quality* as well as the *quantity*. An extensive orchard of seedling trees, originally; and great numbers growing in a hedge, fully bear us out in these conclusions.

The fruit of seedling trees, is not generally so deficient in *number* as in *size*, though both deficiencies often occur; and in wet summers many apples, which would be of good size in dry seasons, become black knobs in consequence of the *Lichen*? which spreads over them in the form of scabs.

It is remarkable that pomologists have generally neglected to notice this circumstance. Have all of them lived in drier climates than ours? Be this as it may, some fine varieties are scarcely worth cultivating in Western New-York, solely on this account. The *Queen* apple may be given as one instance, and the *Autumnal Sweet* as another—both fine fruits in dry hot summers, and both without doubt, better adapted to a lower latitude.

On the other hand, *russets* with scarcely an exception, are free from this smut. We are also inclined to think that apples with thick skins, like the *Black Gilliflower*, more generally escape than those with a thinner integument. It is not improbable however, that some variation from this rule may be found.

The value of apples as food for milk cows, and for the fattening of swine, is becoming more extensively known; and it may serve to console such friends of Temperance as were once largely engaged in cider-making. We find that we have never too many, though we make no cider except for vinegar or apple sauce. Many years ago in a dry season, we first tried the experiment of giving bruised apples in *measured quantities* to our cows; and their milk was greatly increased. Our hogs also grew fat by feeding on this fruit, without any labor of ours, except to see that a sufficiency falls. As the weather grows colder however, they gradually lose the relish for this food, especially when they get something better.

It has long appeared to us that farmers might save themselves from much expense, by planting out small orchards expressly for the keeping and fattening of swine. We recommended this measure to the public more than twenty years ago. By selecting the earliest apples and such as ripen in regular succession, food might be provided in abundance for them during a period of three months. A little swill enriched by milk or meal however, is a valuable auxiliary.

More than four hundred kinds of apple trees are advertised by some nurserymen; and among them are doubtless great numbers of which we know nothing; but we are not acquainted with any apple better adapted to such an orchard than the *Sweet Bough* which begins to ripen in harvest. It bears every year with us, and every year alike—a full crop without breaking down. The tree is rather compact in its form, not spreading wide, and *one hundred and sixty* might grow on an acre. The fruit continues to drop from it for more than a month, and sometimes for nearly two months.

In planting out such an orchard however, there ought to be earlier apples than the *Sweet Bough*, such as the *Yellow Harvest*; and some later. We want apples for swine, several weeks after the *Sweet Bough* is commonly gone; and among the multitudes that ripen at this season, the farmer cannot be much at a loss to select some that are always productive, and always good.

In another article we have mentioned the *Gravenstein*—“esteemed the best apple of Germany and the

Low Countries.” We have waited two or three years after the tree began to bear, without propagating it, so that we might fully and fairly test its fruit; and we have now arrived at the conclusion that it is *first rate* in every respect. The tree grows freely—a model of thriftiness without any wild luxuriance. It bears well, and the fruit is large, fair and excellent. More than one taster has exclaimed—“I never ate a better apple.”

Its excellence is the more remarkable on account of its being one of the *very few* European sorts that suit our climate. Some years ago we received from Buel & Wilson, a considerable number of such as are most highly recommended by Lindley in his Guide to the Orchard and Fruit Garden; but with this solitary exception, they are not worth cultivating here. It is true that the *King of the Pippins* is beautiful, but it is too austere for our purposes.

Several things are necessary to constitute a variety of the *first class*. The *fruit* may be fine, but the *tree* comparatively unproductive. Such for instance is the case here with the *Neatown Pippin*. It is easier to raise five bushels of the *Sweet*, or the *Spitzenburgh*, than one bushel of the former kind. It is a first rate apple in well grown specimens, but there our eulogy must end.

Ripening of Late, or Winter Pears.

At page 82 of our current volume, we mentioned the effects of an increase of temperature in ripening winter pears. This fall, when we gathered in our *Virgalicus*, part were put in a warm room, and part in an out house. The former ripened much sooner than the latter.

Steven's Genesee pear was much later than usual in coming to maturity. They turned yellow about the commencement of our autumnal frosts, and fell from the tree; but remained hard while they lay on the ground exposed to the cold. On bringing them into a warm room however, they soon became melting.—The *Beurre Diel* and several others, under similar treatment, were attended by similar results.

Neither apples nor pears ought to freeze; but the nearer they are kept to that temperature without freezing, the better they will keep; and we have no doubt that some autumnal pears may be kept until winter, or even until spring, in an ice house.

Many apples may be frozen hard without material injury, if the warmth be afterwards applied very gradually. For instance: if they are taken in a frozen state, not exposed to the sun, and buried in the ground. The intensity of the frost is of less consequence, than the manner in which it is removed; and if frozen apples were packed in ice, it is not improbable they would keep all the year.

But what we want chiefly to inculcate at present is, that the *time* that winter pears ripen will very much depend on the temperature in which they are kept.

To Mark Names on Fruit.

The Charleston Transcript recommends putting wax on the sunny side of half-grown peaches and nectarines, “in any desired shape or form;” and the wax will hinder the sun from coloring the part that is covered. When the fruit is ripe the wax may be removed.

A more convenient method however, may be adopted for marking pears and apples. Write on the fruit when it is gathered, with a black lead pencil, or a small stick not sharp enough to cut the skin, and the bruised part will soon change color. Where the fruit is not deeply colored, the writing will be as plain as if done with ink, and perfectly indelible. We have found this method very convenient and useful.

The Mediterranean Wheat.

We observe that the attention of farmers in the south-eastern part of Pennsylvania, is becoming more and more turned towards a new kind of wheat called the *Mediterranean*, the merits of which have been variously estimated; but as we have not seen this sort, we shall confine ourselves to laying the opinions of others before our readers.

From a writer in the *Farmer's Cabinet*, (Vol. 6, page 69,) we quote the following:

“Its diminutive ears, and short straw, its inequality of sample, and inferiority of flour, render it to me, a very exceptionable variety; indeed I wonder how any good manager would be content to grow ears two inches in length, yielding only twenty grains on an average, with straw so weak and short as to fall before the crop is ripe, and diminishing the size of the dung-hill nearly one half. I have examined many crops of this peculiar species of wheat, and am convinced in my own mind, that it is the real “*Tres mois*,” or French spring wheat, which as its name imports, becomes ripe in three months from the time of sowing, and of which I have seen hundreds of acres growing in Europe, particularly in the Channel Islands, Guernsey and Jersey, where it is valued chiefly on this account, a character for earliness which it has sustained in this country and climate; coming ripe under the same circumstances, ten days or a fortnight earlier than any other variety known amongst us; thus probably escaping the rust which is pretty sure to fall on the late ripening wheat; but wherever it is sown in Europe, it is considered a very inferior crop, and is cultivated only on land that is either too poor or ill-conditioned to warrant more than half a yield of other varieties.”

In the same paper, *Jabez Jenkins* of West Whitelond, in Chester county, says in regard to the same kind of wheat:

“It appears to have escaped the *Hessian fly* and the rust. On a rich lot of two acres, I have harvested 1491 sheaves of usual size. The crop on two large fields is not heavy, owing it is thought to too large a growth of timothy that had been sown with it, but the yield is tolerable and the quality good.”

A correspondent of ours near Downingtown in the same county, says in a letter lately received:—“Our wheat in eastern Pennsylvania, will average about two thirds of a crop; but the lately introduced wheat called the *Mediterranean* has yielded nearly a full crop wherever it has been sown; and as yet it has escaped the attacks of the *Hessian fly* and the mildew. It makes good bread, though somewhat harsh, and weighs from 62 to 66 pounds to the bushel.”

Another of our correspondents in Bucks county, who resides more than forty miles from the former, under the date of 9 mo. 27, says: “A kind of red chaff wheat with large kernels not unlike rye in shape, and called the *Mediterranean*, has been sown in this vicinity for several years past. It is not liable to the ravages of the *Hessian fly*, nor affected by rust or mildew, like other wheat; and does not require such high manuring. It is fully as productive, and in many instances more so than our other sorts of wheat. It can be sowed early without danger of the *fly*, and it is fit to harvest a week or more before the usual time. The flower made from it this season, is better and whiter than any we have had in our house for a long time. A very deep rooted prejudice prevails with many, against it, without ever giving it a trial.”

We should like to know whether this kind of wheat has been introduced into Western New-York, and if so, in what estimation it is held?

Review.

“THE ORCHARD: including the management of wall and standard fruit trees, (and the forcing pit; with selected lists and synonymes of the most choice varieties.” By Charles M'Intosh. London, 1839, (Price unknown.)

This is a large duodecimo, very neatly printed, and containing eighteen handsomely colored plates, and numerous wood cuts, all executed with much taste.

and skill. It has good descriptions of *one hundred and thirty-six* varieties of the Apple, *eight* of the Apricot, *fifteen* of the cherry, *twelve* of the fig, *five* of the filbert, *nineteen* of the melon, *seventeen* of the nectarine. *seventy* of the pear, *twenty-six* of the peach with notices of many others, *thirty* of the pine apple, *forty* of the plum, *twenty-one* of the strawberry, *twenty-one* of the grape, and imperfect descriptions of several other kinds. These descriptions are valuable, from the care taken by the author to seize on distinctive and permanent characters only. Some of them, of four lines, enable us much better to identify the fruits, than a whole page of loosely written stuff, from some writers of former years. We give the following as specimens of the authors descriptions:

"Gravenstein. Originated at Gravenstein, in Hollstein, Germany, and with the Courtpaudee Plat, is the best apple the continent can boast of. Size, large; form somewhat oblong, with angles terminating in the crown; color, yellowish green, marked with red on the side next the sun; stalk, very short; eye, wide, sunk in a deep basin; flesh, pale yellow; flavor, very high and vinous; duration, from November till April; habit, extremely healthy, rather a shy bearer; merit, one of our first-rate desert fruits."

"Gansel's Bergamot. [*Syn.* Brocas Bergamot, Bonne Rouge, Joe's Bergamot.] Originated about 1768, from a seed of the Autumn Bergamot, at Daneland Hill in Essex, the seat of General Gansel. Size, large; form, oval roundish; color, dull brown all over, rather deeper brown next the sun; eye, small; stalk, short and fleshy; flavor excellent; duration, November and beginning of December; habit, although of English origin, it is much too tender to succeed as a standard; its merits, however, claim for it a place on the wall of every good garden."

The author, in addition to his own extensive and thorough knowledge, has availed himself of the assistance of Robert Thompson, of the London Horticultural Society, under whose eye a greater number of fruits have been proved and minutely examined, than that of any other person. For this reason especially, the list of synonymes is very valuable.

A number of blunders, typographical and substantial, occur here and there, which we pass by, and merely give the following queer statements:—

"It is no unusual thing to see an American peach orchard containing one thousand trees growing as standards, as the apples do with us, and after the juice is fermented and distilled, producing one hundred barrols of peach brandy. *The Americans usually eat the pines or clingstones, while they reserve the melting or free-stones for feeding their pigs.*"

"In the United States the stones of the peach are sown on a seed bed, [&c.] In the fourth or fifth year, they produce fruit, and thus thousands of sub-varieties are produced; *not one perhaps in ten thousand is fit for the table.*" &c.

The work is however, so far at least as the practical part is concerned, written with great judgment and accuracy, and notwithstanding the peculiarities of culture in England, it cannot fail of being of great value to every American cultivator of fruit. An edition, adapted to this country, would be still more valuable.

For the New Genesee Farmer.

Shall Agricultural Societies be Sustained?

MESSRS. EDITORS:—A few days after the Fair of our County Agricultural Society, I was accosted in one of the streets of our village, by a very respectable farmer, with the following question, viz: "Would it be any, and if so, what advantage to me, to join the Niagara County Agricultural Society?" "Or, what is the use of such Societies?"

Being under an engagement at the time, and the circumstances not being exactly suitable for the discussion of so important a subject, I propose to answer the question through the medium of your useful paper. But I do not expect at all to advance any thing new, to the general agricultural reader. The subject has been presented in most inviting forms, and in the most glowing colors, by able and experienced writers; but the great body of the farming community have not read such articles, neither have they read any thing of the kind, except it were casually or incidentally. There has been a most remarkable stupidity and indifference on this subject. A general opinion or impression seems to have prevailed, that all was known that could be known of either practical or scientific agriculture; and therefore, instead of profiting by the experience of one another, we have rather sought to find fault with every thing not according to our previously conceived opinions. In short, Mr. Editor, as you have doubtless long since learned, we, as a community, are a most *self-sufficient, self-willed, self-conceited* race, always ready to teach, but never desiring to be taught!

Now what shall be done to break this charm? If you write *at* such you will not write *to* them, for they will not pay *one cent per week* for the best monthly agricultural paper which can be furnished. As an evidence of this fact, (if report do not lie,) the "Empire County" containing seven thousand farmers, on the evening of the first day of their Agricultural Fair & Cattle Show, had furnished but eighty names as members, at a fee of 50 cents each! Eighty out of 7000! one out of every ninety. We mistake very much, if the "Empire County" does not furnish more worshippers of *Bacchus* than that!

But we most sincerely rejoice, that a better spirit prevails in some of the counties of the 'Empire State.' That here and there a green spot can be seen—that a waking up, and looking about, begins to be manifest. But I have wandered too far from my subject. The question to be answered, was—What is the use of Agricultural Societies?

1st. They serve to correct one of the greatest evils in the general management of our farmers, viz: that of cultivating too much land. The average crop of wheat throughout Western New York, will not probably exceed for the last two years, 15 bushels per acre, corn 30 bushels, potatoes 100 bushels, and grass 1½ tons. Query. What would be the cost per acre, to make these same lands produce double the quantity, or the same quantity from one half the number of acres? The influence of Agricultural Societies is to test this question. By the act of our legislature to aid Agriculture, &c., funds are provided to be paid in premiums to those who raise the greatest quantity of produce at the least expense. The inquiry will arise in every mind, "How shall I manage such a piece of corn, for example, that I may obtain the greatest number of bushels at the least cost? How many times shall I plough it? How much, and what kind of manure shall I apply to it? How often, and in what manner shall I hoe it? How much horse labor shall I use, and what implements shall I use with the horse? The plough, cultivator, or neither? And again, how shall I harvest the crop?" Such like inquiries will naturally suggest themselves, and we shall adopt that course, which, in our various opinions, will be most likely to produce the desired result. And when we have found the best course to enable us to obtain a premium for the best crop, we have also the best course to enable us to enrich ourselves.

It will be noticed that the provisions of the act referred to, require the payment of the premium, *not* for the *greatest quantity* raised on an acre of land, but for the *greatest quantity at the comparatively least*

expense. I may put a hundred loads of manure to an acre of land, and spend the whole season in the tillage of that acre, and obtain therefrom 100 bushels of corn, or 400 bushels potatoes, or 50 bushels of wheat; when if I were to charge that crop with all the expenses thereof, it would perhaps cost me more per bushel than my neighbors crop would him, at one half the expense. Thus we see, that the most *economical* course is the one to be sought for, and not merely the raising of the greatest quantity per acre, but the raising of the *greatest crop at the least comparative expense.* The same principles are to be recognized in the matter of raising and fattening of stock. The object is not to see who will produce the largest or fattest calf or ox, but what stock will fatten at the least expense; and what kind of feed is most profitably fed to cattle or swine. Also, the same rule should be applied, in awarding premiums for agricultural implements.

Now suppose our whole farming community, I mean *every farmer*, should carefully read an agricultural paper, should join the county agricultural society, and should apply himself, by reading, reflection, conversation, and experiment, for a course of ten years, according to the principles set forth in the said act, what do you suppose, Mr. Editor, would be the result? Should we not see the effect on the very face of nature? and especially on the face of *man*? Should we not see it in our buildings, in our fences, as well as in our crops? Should we not *feel* it in our very bones, as we return from our daily labor, to the house, on which no man has any claim for the erection thereof, and where with the happy family, we enjoy the fruit of our labors, and where no constable or sheriff can "molest or make us afraid."

Again. The operation of agricultural societies under the present law, will lead farmers to keep accounts of their expenses and profits; a consideration of no small importance. He thus ascertains, not only what his wheat, corn, oats, potatoes, &c. cost him per bushel, but which is the most profitable crop. And the same practice carried out, will lead him to keep an account of his expenses for the support of his family, for his hired labor, improvements on his farm, buildings, &c.

Again. The formation and support of societies is the most efficient means of improvement in all the useful arts. It encourages a spirit of enterprise and emulation, it diffuses a knowledge of useful experiments, affords opportunities of social intercourse, and serves to dispel those illiberal feelings and groundless jealousies, which often exist in communities, and block up the avenues of friendly feeling and pleasurable enjoyment in a neighborhood.

The fruits of such societies, will be the improvement of our agricultural implements—the introduction of improved breeds of stock into every town and neighborhood—a proper rotation of crops will be better understood—manures will be greatly increased and more understandingly applied—and a general spirit of inquiry will be awakened, and a spirit of commendable competition will be encouraged. We not only calculate and reason that such would be the case, but these statements have been proved true to a demonstration, in the operations of many societies, both in this country and in Britain.

Yours, &c., as ever,
Lockport, Nov., 1841. NIAGARA.

Next to the love of flowers is the love of birds.—Teach your children in mercy to spare the nests of the harmless little birds, and if you have a heart to be thankful, it will rise up in union with the little songster's coral, to think your lot is cast in such a pleasant vale of flowers and singing birds. These are some of the many things provided to lighten the toil of labor, and it is only a vitiated taste acquired from a false system of education, that prevents us from deriving a great deal of happiness from such small accompaniments of the journey of life.

IMPROVED SHORT HORN BULL "ARCHER."
THE PROPERTY OF J. M. SHERWOOD, ESQ., AUBURN, N. Y.

Obtained the first Premium at the Fair of the New York State Agricultural Society, at Syracuse, September 29th, 1841.

"ARCHER," is in color mostly white, with a roan head and neck—his body has some roan spots—was bred by F. Rotch, Esq., Butternut, Oneago Co., N. Y. Calved, 15th of June, 1837. Sired by ROTLO.

Dam, Adaliza, by Frederick, (<i>Herd Book</i>) 1060.		Rotlo, sired by Patriot, (<i>Herd Book</i>) 542.

*. We regret that the absence of Mr. SHERWOOD has prevented him from inspecting a proof of the above Engraving. We have spared no pains to have it correct.—EHS.

Allegany Co. Agricultural Society.

At a meeting, held for the purpose, in Angelica, October 6th, 1841, an Agricultural Society was formed for the County of Allegany. The following persons were elected officers for the ensuing year:

WILLIAM G. ANGEL, President.

Vice Presidents.—John Ayres, George Lockhart, Orra Stillman, James Wilson, jr., Andrew Baker, William Van Campen, Stephen Wilson, jr., John Bales, Martin Butts, Stephen Mundy, Rodman Freeborn, William A. Stacey, Edward H. Johnson, Peter Lery, David T. Hamilton, Josiah Utter, Isaac Van Austin, John White, Jabez Burdick, Luther Couch, Samuel C. Clark, John Seaver, Asa K. Allen, Jacob Clendening, John Jones, James Perkins, James McCall, Abraham Middaugh, Jesse B. Gibbs, Jonah French.

Recording Secretary.—A. S. Diven.
Corresponding Secretary.—Ransom Loyd.
Treasurer.—Alvin Burr.

Managers.—Vial Thomas, Stepto Woodruff, Chas. Maxson, Brice Carr, Hiram Harmon, John Simons, William Brown, James Mithews, Eli Laure, Noah Smith, Elias Smith, Levi Latham, William Duncan, Moses Parsons, Stephen Wing, Hollis Scott, Samuel Jones, Reuben Weed, Hiram Wilson, Oliver M. Russell, Samuel S. White, Calvin B. Laurence, Isaac Andrews, Joshua Rathbone, Moses Smith, Orleton F. Messenger, Abram J. Lyon, William Knight, John Lockhart, Daniel Willard.

Wayne County Fair and Cattle Show.

At Newark, October 16, 1841.

We find the following remarks appended to the list of premiums in the Wayne Co. Standard:

THE FAIR.—Saturday was a great, a glorious day for Newark, and a proud one for this county. The Fair which came off here on that day, was, to say the least, more than ordinary. The weather during the week preceding Saturday, was April-like, showers and sunshine, with a considerable more of cloudy murkiness than sunshine, and consequently the roads were somewhat wet and muddy. These circumstances seemed to impress our villagers in the morning with the belief that the Exhibition would prove to be rather a "slim affair"—yet contrary to the expectations and forebodings of all, and in accordance with their wishes, the overhanging clouds withheld their showers, and the attendance of people and the number of stock and articles exhibited were far greater than had been anticipated.

The Wayne County Agricultural Society is yet in its infancy. It is, to three quarters of the farmers of this county, what may emphatically be termed a "new thing;" yet with its present flattering prospects, and the awakening interest that it is apparent is being taken in it, bids fair to be one of the first agricultural associations in the State.

Murrain in Cattle.

"A Grain of prevention is worth a pound of cure," So says your correspondent N. in the October num-

ber of the Farmer, and in that I perfectly agree with him. I think it is probable that *ashes* may be of some use as a preventive of Murrain, but from my observation, I believe that *salt petre* is a much better article for the purpose. The proper quantity is, a peice about the size of a large kernel of corn, given once a week. A neighbor of mine has used this mode of prevention for twenty years, with almost entire success.

When cattle are attacked with this deadly disease, I would recommend giving them, say, 2 oz. of Gum Gamboge, dissolved. This is a powerful physic; and it is very necessary to get something to pass the animal. I believe that the Dry Murrain always precedes the Bloody Murrain, and is the cause of this last and most fatal disorder, which is often quite prevalent in the Western country.

WILLIAM WALLACE.

Barcelona, Richland Co., Ohio.

Annual Meeting of the State Society.

We invite the attention of our readers to the notice in another column, of the Annual Meeting of the N. Y. State Agricultural Society, at Albany, January 18th and 19th, and to the list of Premiums then to be awarded. All who can, should attend.

Culture of the Premium Crops.

We intend in this and forth-coming numbers to publish the statements respecting the mode and expense of culture, value and use of product, &c., of the numerous extraordinary crops for which premiums have been awarded the past season. From the publication of this kind of information we believe will result some of the greatest benefits to be derived from agricultural societies. We cannot devote much space to the subject this month, but will commence with some Root Crops.

RUTA BAGA.

Crop raised by F. P. Root, of Sweden, Monroe Co.—1200 bushels per acre—Soil, black vegetable mould—rather moist—previous crop, Wheat. The ground was ploughed once in the fall and twice in the spring, previous to sowing. Only a part of the land was manured—that part produced the largest roots. The seed was sown on the 16th of June. (Other particulars not stated.)

Crop of Ruta Baga raised by Geo. Sheffer, of Wheatland, Monroe Co.—552 bushels per acre—Soil, black clay loam. (Genesee Flats,) bears drouth and wet extremely well. Previous crop, corn; no manure. Sowed at the rate of two pounds of seed to the acre; in rows 2 feet and 3 inches apart, and left the plants 6 to 10 inches apart in the rows. Consider the roots worth 12½ cts. per bushel—feeds them to sheep, principally.

SUGAR BEETS AND MANGEL WURTZEL.

Raised by Geo. Sheffer, of Wheatland—1100 bushels Sugar Beets,—1000 bushels Mangel Wurtzel per acre—Soil the same as above; previous crop, Potatoes; manured with 25 loads of well rotted manure per acre, ploughed under in the fall. Ploughed once in the spring when ready for planting—middle of May. (Manner of preparing the ground, planting, &c., the same as described hereafter for Carrots.) Sow three pounds of seed per acre. Feed these roots to my cows and other cattle—consider them worth about the same as Ruta Baga.

CARROTS.

Raised by George Sheffer—653½ bushels per acre. STATEMENTS.—The soil on which I raised my carrots, is a black heavy loam; (Genesee Flats,) not liable to suffer much from drouth or excessive moisture. The previous crop was potatoes. Twenty-five loads of well rotted manure were applied per acre, and ploughed under in the fall. It was then left till the time of planting—20th of May; I then commence and plough a narrow land on one side of the field—this I harrow and roll immediately, before it becomes dry, which leaves the surface fine and smooth for planting. I then mark out the rows, two feet apart, with an implement made for the purpose, resembling a heavy rake with two pegs or teeth 2 feet apart, which is drawn across the field by a man, first putting up three or four stakes to measure with and go by, so as to make the rows straight.

I sink the seed 18 hours, then roll it in white plaster before sowing. Two pounds of clean seed are requisite for an acre. I measure off the ground and ascertain how many rows there will be, before I commence sowing; then I measure the seed and calculate the quantity per row; then a boy drops the seed by hand along the drills calculating the requisite quantity for each row. Another person immediately passes along with a hoe and covers the seed ½ to ¾ths of an inch deep, with fine carb, smoothing it down firmly with the back of the hoe, which leaves the rows distinctly visible and greatly facilitates the first weeding.

As soon as the plants show the third leaf, I hoe and thin them, leaving them from 3 to 6 inches apart. I keep them clean of weeds during the summer, and about the 1st of November I harvest the crop—dig

them with a spade and put them in a cellar.

The following is as nearly as I can estimate the expense of raising and value of my crop, of one acre of carrots.

Preparing the land and planting, 5 days work.	
Hoeing and thinning 1st time, 9 do.	
“ “ “ 2d “ 6 do.	
“ “ “ 3d “ 6 do.	
“ “ “ 4th “ 4 do.	
Digging and securing crop 10 do.	
Say 40 days labor at 75 cents per day,	\$30.00
Two pounds clean carrot seed,	3.00

Expense of crop, - - - \$33.00

I feed my carrots to horses, and consider them worth at least half as much as oats.

Say 653½ bushels at 1 shilling and 3 pence	102.10
Value of the tops for fall feeding, at least	10.00

Total value of crop.	112.10
Deduct expense, as above,	33.00

Nett profit of the crop, \$79.10
GEO. SHEFFER.

Wheatland, Monroe Co., N. Y.

Remarks.—Our readers will perceive that Mr. Sheffer has omitted to reckon the rent of the land and the value of the manure used for the above crop. These items we should judge, would reduce the nett profit to about Sixty five dollars. A liberal sum for one acre.—Eps.

☞ (Other premium crops next month.)

Culture of Silk in Families.

We have received a communication of some length from Thomas Lefevere, of Venice, Cayuga county, detailing in full his first experiment in the culture of silk on a small scale, which on its limits will not permit to give entire. Our correspondent did the whole of the work himself, and kept an accurate account of the time required in attendance upon the worms, an abstract of which is here given, with cost and proceeds:

Time feeding, &c.	103 hours.
Fixing frame, &c.	7 "
Gathering cocoons and picking them clean	3 "
Drying them.	2 "
	115 hours
which at 10 hours a day are 11 days 5 hours—	
which at only 50 cts a day is	\$5 75
1 year interest on cost of trees.	50
	\$6 25
	Cr.
Half a bushel and 2 quarts cocoons, at	\$3 00,
The Auburn price.	1 75
State bounty.	26
	\$2 01
Loss.	\$1 21

The mulberry used was the white Italian and Mul-ticulis—mostly the former—and our correspondent adds, “I find by this experiment 10,000 worms would be full employ for one person, which, if no casualties occurred, would produce 3 bushels of cocoons; these at the Auburn price would be 9 dollars, and the state bounty would be \$1.55, making \$10.55 for the labor of one person for at least 40 days; allowing nothing for trees and attending them, interest on their cost, and on the ground, &c. and without any allowance for time in obtaining the state bounty. And even it it could be attended to by the wife and children of a farmer, to save expense of hiring, even then the pay is so small as not to be worth the additional labor—leaving out the loss by neglect that the butter and cheese would sustain—as most females, particularly the wife, have as much work as can usually be accomplished. From this trial I am fully persuaded that silk cannot be raised in a small way in a farmer's family, to any advantage—though it may perhaps answer better on a large scale as a business by itself, as with many other things.”

We would merely remark, that with all the disadvantages of a first experiment, imperfect fixtures, &c.,

we think this is perhaps quite as successful as could have been expected. The silk business must of course be like every other pursuit—it must require thorough experience, strict economy, close application, and everything in good order, to be profitable—and those who expect to jump at once into wealth by this means, will find themselves as greatly mistaken, as the farmer would, who, without knowledge, without tools, without seed and without live stock of modern kinds, should dive at, into the wilderness, and attempt at once to compete successfully with the products of our large markets.

Agricultural Fairs—the Right Spirit Reviving.

The Autumn of 1841 has been peculiarly distinguished by the attention that has been given to the cause of Agriculture. The great Fair of the State Agricultural Society at Syracuse, the Fair of the American Institute, in this city, numerous Fairs of county Societies in this State and of other Agricultural Societies in the State of Massachusetts, Connecticut, Pennsylvania, and several other States, have exhibited products of the soil, and improvements in the mode of cultivating it, never before equalled in this country. These assemblages have also encouraged, attended and conducted by the very ablest and best of men in the country; and we cannot doubt have sent abroad a spirit that will exercise a most wholesome influence upon the pursuits, the habits, and character of the people of this country.

The natural business of the American people is agriculture. It is the basis of our wealth and independence. This is evident from the extent, fertility and productiveness of our soil. The national and individual welfare of our people requires that agriculture should keep the position which nature has assigned it, in advance of all other callings. We would not depress manufactures and commerce, but would let them depend upon the products of the soil, and be sustained thereby. It is impossible that they should be successful to a proper extent, if regulated by any other standard.

It is gratifying, therefore, to see the lively interest every where awakening in the cultivation of the earth. It is an honest, and independent and a healthy business. It was grossly neglected a few years since: farms were sold in city lots on speculation, instead of being planted, as they should have been, with corn, potatoes and turnips; our people were so deluded as to buy grain from the shores of the Black Sea, rather than raise it on their own land. Depravity of morals, commercial ruin and general distress followed as the inevitable consequences of this great error. We are glad to see the people returning home from their wanderings, filling their barns, and houses and stores with the products of honest industry, and rejoicing in the steady independence of thrifty farmers. Long may it be before our fertile “potatoe patches” and “cabbage yards” are again laid waste by being surveyed and lithographed into uninhabitable cities.

It is the duty of the press and of our public men to encourage the movement of what may be considered our great national business, agriculture. There is no danger of overdoing it. Who ever heard of over-trading in this branch of business? No matter how extensive our surplus products may be, there will be a market for them in some part of the world. The business of exporting and exchanging them will support a vast commercial interest, and a large manufacturing interest will also grow up as a natural and necessary incident. But agriculture must take the lead; in it is the origin of all prosperity: before we begin to trade we must produce something to trade with; and we must produce the raw material before we set up factories to improve it.

No matter, therefore, how much we stimulate by proper means the cultivation of our soil, there is no danger but that commerce and manufactures will follow fast enough of their own accord. They are more balde than agriculture to excess and over action. Their results are more splendid, and ambitious adventures are more easily captivated by them. There is a constant tendency, especially in commercial affairs to go too fast. No apprehension need therefore be felt lest the business of agriculture should get too far ahead; the difficulty is in keeping it sufficiently advanced. Let commerce be regulated by it, dealing only in the surplus values produced in the country, and looking to no fictitious and temporary stimulants, and how soon the business of the country in every department would become settled, stable, regular and permanently profitable. We should hear of no more ruinous revolutions and fluctuations, and should have no troubles with a depreciated currency.—N. Y. SUN.

Livingston County Fair and Cattle Show. (At Geneseo, October 25d, 1841.)

The Secretary informs us that, although the day was stormy, and the roads muddy, the exhibition was such as to make it a meeting of great interest. The display of stock was unusually large and fair. The numerous pens and ample grounds set apart for the exhibition were at an early hour filled, and the committee for that purpose had to construct a range of new pens to contain the incoming throngs of cattle, sheep and swine. A great many very noble specimens of stock were exhibited. A fine pen of Holderness owned by Mr. Skinner of this town; a Teeswater of Mr. Kemp of Groveland; several Devons and a great many Durhams from several towns were exhibited. The improved Short Horn Durham breed seemed most in favor. There was also a fine show of Swine; of the Berkshire, Leicesters, and Byfield breeds and crops.

The Butter exhibited was very abundant and of nutchless quality. Some very beautiful specimens of Needle Work. Domestic Cloth and Carpeting were also exhibited and excited much admiration.

Upon the whole, the exhibition, considering that it was the first of the kind, was highly creditable to the county. And if the Society follow up this first effort with becoming zeal the next exhibition, which will embrace a greater range of articles, will show that Livingston will not be more famous for the fertility of her valleys than for the richness and variety of her productions.

The following Premiums were awarded:

- 1st best Bull 2 years old and over, \$15, David M. Smith, Avon.
2d best Bull do \$3, F. A. Le Roy, Caledonia.
3d best Bull do \$5, Holloway Long, York.
Best Yearling Bull \$5, David Brooks, Avon.
2d best Yearling Bull \$5, John R. Murray, Mount Morris.
Best Bull Calf \$5, Daniel H. Fitzhugh, Groveland.
Best Pen not less than 3 Calves \$5, Thomas Tyler, Geneseo.
2d best Pen not less than 3 Calves \$1, David Brooks, Avon.
Best Cow \$10, David Brooks, Avon.
2d best Cow \$5, Thomas Newbold, Caledonia.]
Best Heifer 2 years old \$5, Isaac Casey, York.
2d best Heifer 2 years old \$3, Roswell Stocking, York.
Best pair Working Oxen \$10, Roswell Root, York.
2d best pair Working Oxen \$8, Allen Ayrault, Geneseo.
Best pair 3 year old Steers \$5, Holloway Long, York.
Best pair 2 year old do \$5, George Root, York.
Best Stallion \$10, David Brooks, Avon.
2d best do \$5, Robert Whitley, Avon.
Best brood Mare \$8, Pell Teed, Leicester.
2d best do \$4, Reuben Squier, Geneseo.
Best Spring Colt \$5, Pell Teed, Leicester.
2d best do \$3, Reuben Squier, Geneseo.
Best pair Matched Horses \$10, William A. Mills, jr. Mount Morris.
2d best pair Matched Horses \$5, Ja's. S. Wadsworth, Geneseo.
Best long Wool Buck \$6, Mr. Oliphant Mt. Morris.
2d best do \$4, Thomas Parsons, York.
3d best do \$2, Richard Peck, Lima.
Best fine Wool Buck \$6, Roswell Root, York.
2d best do \$1, Charles Colt, Geneseo.
3d best do \$2, Reuben Squier, Geneseo.
Best Pen not less than 5 long Wool Ewes \$5, Allen Ayrault, Geneseo.
2d best do do William Squier, Geneseo.
Best Pen not less than 5 fine Wool Ewes \$5, Charles Colt, Geneseo.
2d best do \$3, Reuben Squier, Geneseo.
Best Boar \$8, N. Hathaway, Geneseo.
2d best Boar \$5, T. Tyler, do
Best breeding Sow \$5, William W. Wadsworth, Geneseo.
2d best breeding Sow \$5, Sullivan Drew, York.
Best Plough \$5, E. G. Holliday, Sparta.
2d best Plough \$3, none offered.
Best firkin of Butter \$1, David Brooks, Avon.
Best 20 lbs. Roll do \$2, Mr. S. A. Hooper, York.

- Best 50 lbs. Cheese \$3, Thomas Tyler, Geneseo.
Best pair fat OXEN \$10, William A. Mills, Mount Morris.
1 DIXON, 3 Ottomans, needle work, \$2 50, Mrs. Campbell Harris, York.
1 worked Chair and 1 Screen, needle work, \$2 50, Mrs. John Young, Geneseo.
Plaid Flannel \$3, Mrs. O. D. Lake, Mt. Morris.
Black and White Flannel 2, do
Moscow stripe Flannel 3, and Fall Cloth 2--\$5, Mrs. Esther Harris, York.
2d best fulled Cloth \$1, Lyman Turner, Geneseo.
Stocking Yarn \$1, Mrs. Cornelius Shepard, Geneseo.
Skeins Silk \$1, Mrs. McVean, York.
2 pieces Carpeting \$1, Pell Teed, Leicester.
Entry and Stair Carpeting \$4, Mrs. G. Nowlen, Geneseo.
Specimens of Glass \$2, Mt. Morris Factory.
Best fine Wool Lamb \$3, Charles Colt, Geneseo.
Best Leicestershire Lamb \$2, William Squier, do.
2d best do do \$1, Richard Peck, Lima.
Best Yearling Colt \$1, Jonathan Miller.
Best 2 year old Colt \$2, Robert Wnaley, Avon.
Best improved Fanning Mill \$1, Pell Teed, Leicester.
Improved Clevis \$1, E. G. Holliday, Sparta.
Immediately after the reports of the committees were read and the foregoing premiums were declared, the Society proceeded to the choice of officers for the ensuing year.
The following officers were elected:--
JAMES S. WADSWORTH, President.
EDWARD A. LE ROY, }
RUEL L. BLAKE, } Vice Presidents.
PAUL GODDARD, }
C. H. BRYAN, Recording Secretary.
FELIX TRACY, Corresponding Secretary.
ALLEN AYRAULT, Treasurer.
MANAGERS.

Holloway Long, York. Jeremiah Horsford, Leicester. William A. Mills, jr., Mt. Morris. William Scott, Sparta. Harvey S. Tyler, Springwater. John Henderson, Conesus. Augustus Gibbs, Livonia. Asahel H. Warner, Lima. D. H. Fitzhugh, Groveland. Ira Merrill, Avon. Charles Colt, Geneseo.

Niagara Co., Fair and Cattle Show, At Lockport, Oct. 25d, 1841.

The following account of this exhibition from the pen of our old friend "Niagara," accompanies the list of premiums published in the Lockport paper. We are happy to learn that this fine county is also waking up to a sense of her true interests.

Although this was the first attempt at any thing of the kind ever witnessed in this county, and though the roads were exceedingly muddy in consequence of recent rains; yet the gathering of the enterprising farmers and others of the county was very numerous, even beyond the expectation of any. The day was favorable, for the season of the year, and the multitude were apparently never in better spirits. As such a meeting was a novelty with us, many attended merely as "lookers on;" yet words, actions and looks, bespoke unusual gratification and pleasure, and this "farmer's holiday" was pronounced by more than one, a proud day for Niagara. Political and sectarian distinctions were apparently unknown or forgotten, and an expression of kindly, fellow feeling was uniformly manifest. The show of animals, although not as numerous as in some of the eastern and middle counties of the state, was very respectable, not only in number, but in grade and appearance, and afforded the most gratifying evidences of improvement, and that our farmers and herdsmen are not asleep, or indifferent on the subject of cattle husbandry.

The cattle exhibited were nearly all of them crossed between the Short Horn, Devonshire and the native breeds. Although the frosty nights, rainy days, and muddy roads, had rendered their appearance less sleek and beautiful than it otherwise would have been, yet we venture the opinion that many of them would not suffer in comparison with the best animals in some of the older counties. There were several calves of improved breeds which excited much attention, some five or six yoke of working oxen were presented, of the most stately and beautiful appearance, and were much admired.

The number of horses, &c., on the ground was very satisfactory, and better pairs of matched working horses, such as the farmer wants, can hardly be found.

Of the swine exhibited, some were specimens of very good Berkshires, Chinas, &c., but the show was not very numerous, nor as good as may be expected in future years. Enough was to be seen however, to

convince the observer that our pork makers were disposed to improve their breeds of porkers.

The different varieties of sheep, were several of them represented. The Merino, Saxon, Bakewell and South Down were by no means indifferent specimens of these varieties, some of which attracted much notice. One buck introduced by Mr. Hess, of Somerset, was very much admired on account of the fineness of the wool and size of the carcass. A full blood South Down Buck exhibited by Mr. J. Witbeck, of Cambria, presented a good combination of the most desirable qualities for the farmer, viz: a superior quality, and a fair quantity of wool, with a size of carcass and a nobleness of form showing a strong and vigorous constitution. There were others perhaps equally deserving, which I did not particularly notice.

The show of vegetable products, such as beets, carrots, pumpkins, squashes, &c., were such as to prove that the soil and cultivation of Niagara, (some parts at least,) are not surpassed any where. A sugar beet exhibited by Mr. E. W. Smith, raised on as hard and clay soil as can be found, weighed 22½ pounds, showing what may be done by cultivation. Several specimens of cauliflower, also raised on the same ground, were most splendid. Whentfield and Cambria furnished pumpkins weighing 40 pounds and upwards. Squashes large enough to fill a half bushel measure, were exhibited by Mr. Atwater, of Lockport.

The specimens of wheat and corn, oats and potatoes, were admirable. As fine samples of wheat as can be found in the world, were exhibited; corn and oats at the rate of 90 bushels per acre, and potatoes at the rate of 400 bushels per acre, and that too, without any reference to an agricultural exhibition, give some evidence at least, that our border county contains the soil, and the cultivators thereof, which will not suffer in comparison with many others much more celebrated. Notwithstanding great credit is due to our yeomanry, to our breeders of cattle, horses, sheep and swine, yet, a meed of praise not a whit less, is due to the "ladies of the farm house," many of whom graced our numerous assemblage, not only with their presence but with the work of their hands. The exhibition of carpets, flannels, woolen yarn, stockings, socks, &c., were all respectable, and some of them very much admired. But in the article of butter, there were many samples of superior excellence. One of the viewing committee remarked to me, that he had served in the same capacity 14 years, in the eastern counties, and that he never had seen so many, as perfect samples of butter,—a fact reflecting much credit upon this branch of household manufactures.

When we consider that this was the first effort of the kind ever attempted by us; that our society was not organized till near the last of June,—that the list of premiums was not made known till the middle of July, so that its stock, or vegetable could have been raised, or cultivated in reference to such premiums,—what may we not expect when our society shall have attained years of maturity and experience.

Yours, &c.,
NIAGARA.
Lockport, October 25, 1841.

The election of officers for the ensuing year, which took place on the day of the Fair, resulted as follows:

- WM. A. TOWNSEND, President.
DAVIS HURD, } V. Presidents.
JOHN GOULD, Jr. }
WM. PARSONS, Secretary.
WM. O. BROWN, Treasurer.
Executive Committee.
CAMBRIA—Thomas Comstock, D. W. Cispey, H. McNeil.
HARTLAND—C. H. Skeele, Abner Kittridge, Harry Harrington.
LOCKPORT—Joel McCollum, Jacob Gaunt, Rivera Stevens.
LEWISTON—Asahel Lyon, Rufus Spaulding, Eh Pflayer.
NIAGARA—Parkhurst Whitney, C. H. Witmer, Eliphalet Gillet.
NIWANE—James Wisner, Peter McCollum, T. W. Merritt.
PORTER—J. C. S. Ransom, J. Clapsaddle, Jacob Most.
PITTSFORD—John Baker, George Hawley, Aaron Parsons.
ROYALTON—Wm. Freeman, Erastus Hurd, W. Carpenter.
SOMERSET—M. S. Douglass, Peter Hess, J. W. Babcock.
WILSON—Daniel Dwight, Daniel Holmes, Mergan Johnson.
WHEATFIELD—N. M. Ward, J. Sweeney, H. Miller,

The Farmer.

If I was asked who belonged to the privileged order in our land, I should reply, the farmer, for no other reason than that he is rarely ever the victim of those fluctuations of trade and the currency—and that he is entirely relieved in the sale of his products from the vils of that credit system to which almost every other class of the community is subjected.

Whether the price of the necessaries of life be high or low, it is all the same to the farmer so far as he produces them for his own consumption. His surplus, unlike the wares of the tradesman, or the products of the manufacturer and the mechanic, will always command cash, and on that account it is at all times free from those assessments which the credit system never fails to impose on the capital and products of the other classes of community; in fact it is always the farmer's own fault, and it can never be said that it was an evil incidental to his profession, if he is ever found linked with bankruptcy, or his substance diminished by bad debts.

Look at the poor unfortunate miller and the produce-buyer, growing up under the hot-bed influence of Banks, which gives an additional stimulous to their already too active gambling spirit. They are the farmer's victims.

Look at the clergyman, faithful and gifted as he may be in teaching those lovely lessons which make an godlike; yet is he hardly sure from one year to another of a place whereon to lay his head.

Look at the lawyer, now starving, unless he can get practice in that juryless court, whose title burlesques the name of equity.

The merchant and the trader encumbered and paralyzed by competition, bad debts, embarrassment, and propley. A victim of the credit system and bank failures.

The mechanic, felony eating out his substance or disgracing his fair fame, in the shape of a States Prison brother; often reduced to the hard necessity of asking his employer rich before he can get his pay; his career is too often one of labor and embarrassment. But the farmer with the staff of life in his barns, sheep in his hills, and pigs in his pen, laughs to scorn the petitious ills of life; 'tis true, he has his cares, but without them he would be much to be pitied. If every thing was done to his liking without his own supervision, the devil or some demon passion would become his master,

"Making his abundance, the means of want."

The industrious, provident farmer has the earth for his chemical laboratory, which, in common with its glowing vegetable surface teaches him many lessons. *Vera s'ha handmaiden*, and *Ceres* and *Pomora* shed their bounties upon him, making him nature's nobleman.

S. W.

Items.

Condensed from Exchange Papers, &c.

GREAT HEIFER.—A heifer, raised by Col. Paxton, of Columbia county, Pa., was recently exhibited at Philadelphia. She weighed three thousand pounds, half blood Durham, and was sold to her present owner for one thousand dollars. She is five years old. This shows the great advantages which farmers would derive from crossing their native cattle with good full-blood Durhams.

INDIA COTTON.—A lot of 100 bales of cotton was sold in the summer in London at 8½d. per lb., being the first shipped from Madras, from the new English plantation.

CARRIAGE SPRINGS MADE OF AIR.—Allen Putnam, of the New England Farmer, says that H. L. Ellsworth, (who is at the head of the patent office,) informs him that he lately signed a patent for a man to construct springs for rail cars so that the passenger-

may read and write without any inconvenience; and that he rode in a car, constructed with such springs, containing 80 passengers, which fully answered the expectations and promises of the patentee. It appears that the spring is made by using upright 12-inch cylinders, containing air condensed to one-thirteenth of its usual bulk, on which a piston rests; but how the air is kept completely confined by this piston, while the latter plays freely, we cannot fully understand, as it is unexplained.

CORN OIL.—In Indiana, where corn is worth only 10 cents a bushel, lamp-oil is made from it, by grinding the corn, and fermenting it with malt; the oil rises, and is skimmed from the surface, and the meal fed to hogs.

TREES.—In Japan, there is a law, that no one can cut down a tree, without permission of the magistrate of the place and even when he obtains permission, he must immediately replace it by another.

CHEAP ROOFS.—A correspondent of the Farmer's Cabinet, says, that if rafters, are covered with kiln-dried half-inch boards, closely fitted at the edges, and these with sheathing paper, (such as is used under the copper of ships,) with a coating of tar added, an excellent roof is formed that will last many years. That the following composition was used in this way for a roof, twenty years ago, which is now as good as when laid: Eight gallons tar, two gallons Roman cement [water lime], five lbs. resin [resin we presume], and three lbs. tallow; boiled and very thoroughly stirred, laid on the roof very evenly with a brush while hot. Sprinkle this while hot with sharp sifted sand, when cold apply another coat of tar, and of sand; and one coat of tar in six years.

An incombustible wash for the above is made by mixing six quarts of dry, water, slacked, sifted lime, with one quart of fine salt, and adding two gallons water, boiling and skimming it. Add to five gallons of this, one pound alum, half a pound of copersass, and slowly half a pound of potash, and four quarts fine sharp sand. It may now be colored as desired, and applied with a brush. It is said to be as durable as stone, will stop leaks, exclude moss, and is excellent on brick work. Try it.

BUDING ROSES.—Dr. Van Mons buds roses in June, so that they grow, and frequently blossom the same year. He prepares the young and unripe wood by separating the leaves, leaving only the foot stalks; two weeks after the buds are swollen and fit for insertion; at the time the bud is put in, the stock is cut off six inches above it. They are bound with bass matting, previously drawn through a solution of alum and white soap, and dried, which completely excludes water.

TO REMOVE OLD PUTTY.—In taking out broken window glass, nitric or muriatic acid will soften the putty at once.

TRANSPLANTING EVERGREENS.—Pines and spruces are justly considered a great ornament in door yard scenery, and few ever succeed in transplanting them successfully. The following mode, copied from Downing's late admirable work on Landscape Gardening, though not altogether new, is excellent, and we hope many will be induced to practice it at this season of comparative leisure. "The trees to be removed are selected, the situations chosen, and the holes dug, while the ground is yet open in autumn. When the ground is somewhat frozen, the operator proceeds to dig a trench around the tree at some distance, gradually undermining it, and leaving all the principal mass of roots embodied in the ball of earth. The whole ball is then left to freeze pretty thoroughly, (generally till snow covers the ground,) when a large sled is brought as near as possible, the ball of earth containing the tree rolled upon it, and the whole transported

to the hole previously prepared, where it is placed, in the proper position; and as soon as the weather becomes mild, the earth is properly filled in around the ball." When skillfully performed, says Downing, this is the most complete of all the modes of transplanting, and the trees scarcely show, on the return of growth, any effects from removal.

Germinating Seeds Under Colored Glass.

The following remarks by "Mr. Hunt, the Secretary of the Royal Polytechnic Society," in England, relate to a most curious discovery; and, one which may prove very useful to the cultivators of rare exotics. We hope some of our readers will be stimulated to repeat the experiments, and to send us the results.

"It is scarcely necessary to explain that every beam of light proceeding from its solar source, is a bundle of different colored rays, to the absorption or reflection of which we owe all that infinite diversity of color which is one of the greatest charms of creation. These rays have been long known to possess different functions.

"The light which permeates colored glass partakes to some considerable extent, of the character of the ray which corresponds with the glass in color; thus blue glass admits the blue or chemical rays, to the exclusion, or nearly so, of all the others; yellow glass admits only the permeation of the luminous rays, while red glass cuts off all but the heating rays, which pass it freely. This affords us a very easy method of growing plants under the influence of any particular light which may be desired.

"The fact to which I would particularly call attention is, that the yellow and red rays are destructive to germination, whereas under the influence of violet, indigo, or blue light, the process is quickened in a most extraordinary manner.

"The plants will grow most luxuriantly beneath glass of a blue character; but beneath the yellow and red glasses the natural process is entirely checked. Indeed, it will be found that at any period during the early life of a plant its growth may be checked by exposing it to the action of red or yellow light.

"It is with much satisfaction that I find the results to which I have arrived, corroborated by Dr. F. R. Horner of Hull."

Blue glass for hot beds could be very conveniently employed.

How to Have Good Peaches—Indian Corn.

Much has been said and written about preserving the life and fecundity of peach trees. From the great success attending the recent practice which has come under my observation, I am inclined to believe that keeping the ground under the trees clear from grass and weeds, and loose and mellow by continual working, with a judicious application of manure, will do more towards preserving the tree and improving the flavor of its fruit, than all the nostrums in the world.

It is said that the coffee tree can only be made profitably fruitful, by adopting the above plan. A coffee planter would as soon allow his yard and planting patches to overrun with weeds as his coffee grounds.

I am much gratified to see of late a more lively interest in the better cultivation of that King of the vegetable kingdom, Indian corn. If it is true, that stalks alone, can be more profitably cultivated for sugar than sugar beets, as affording more saccharine matter, and requiring less outlay of capital and expense in the manufacturing process, then truly a happy new era has arrived in the rural economy of the north and west, which will give wealth and independence to the great corn growing region of the great West.

The red blazed is the favorite variety of corn among the masterly corn growers of Onocida Co.—it has a small cob and large kernel. It is earlier than the Dutton, and grows larger in Seneca than in Onocida county.

S. W.

OLD'S CORN PLANTER.

Messrs. BATHAM & Co.—I have for about two years been engaged in getting up a machine, under the broad name of Corn Planter and Seed Sower; which has been secured by letters Patent; and although awarded the Scott's Legacy Premium, (\$20,) by the Franklin Institute at Philadelphia, I was not satisfied that it had attained to its highest state of perfection. I have therefore, instead of introducing it to the public at large, confined it to narrow limits, and made it my unflinching object by day and by night, by actual experiment and deep study, to bring it to its greatest perfection. How far I have succeeded, the reports of the late Fair of the State Agricultural Society of New York, at Syracuse, and of the American Institute at New York, will satisfy the public mind, better than my own attestations.

The above cut is a representation of my double corn planter, which plants two rows at once, and makes the rows both ways, to be drawn by a horse. Similar letters refer to similar parts—a represents the forward wheel, b the blank places on the hand wheels to show where the bills are, c the plough, d the coverer running with an angle of 45 degrees, replacing the earth thrown out by the plough, e the nut gear of the dropping wheels, g the cups, with movable bottoms to increase or diminish the quantity of seed at pleasure, h the boxes containing the seed, i the tube to convey the seed to the plough, k the slide or gate to regulate the depth of seed under the dropping wheel.

I have also machines for planting one row of corn, horse power, which may be arranged to drop the corn any distance apart, from a continued drill, to hills of five feet or more. It will also drop two or more kinds of seed in the same row, at given points, and may be applied to dropping the fine manure in the hill with the seed. The same principle applies to the hand drills, for sowing or planting the seeds for the various root crops, &c. I have also a plan for sowing wheat in drills or broad cast, which will apply to all grains and grass seed, together with the fine manures. I have appointed J. Scott & Co., 21 Cort and street, New York, agent to manufacture and sell the above described machines, where they can be seen at any time. All orders from any part of the United States, post paid, directed to them, will be promptly attended to. Those wishing to obtain machines for the coming spring, will do well to order them soon. I intend myself, Providence permitting, to travel through the western and southern states this fall and coming winter, to introduce the above articles where they may be wanted.

Editors of agricultural papers generally, and all papers friendly to agricultural improvements, are invited to give the above each notice as they may think practicable. They will also confer a favor to the subscriber by sending him a copy containing their quotations and remarks, directed to his residence.

Marthaugh, N. Y.

CALVIN OLDS.

5th. One elegant reticule, 1 purse, 2 pair mitts, all of net work, manufactured from yarn prepared from flax.

6th. One piece of cloth, 1 apron, 2 handkerchiefs, together with yarn enough already colored to make 20 yards of cloth, all of which articles and yarn well prepared from flax, and is the work of her own hands; she informed the committee that her cocoons measured one hundred busels; the manufacturing, all performed with household implements only. Enterprise, industry, and success like this, should not pass the committee nor the Society, unheeded or unrewarded.

By the Agent of the State Prison, at Auburn:

A fine sample of sewing silk from convict's labor, which for uniformity and equal ty of filament, lustre of staple, brilliancy of colors and taste of putting up, would not discredit an Italian factory, and is to the State of New York, an encouraging earnest of what we may expect with the advantage of a few years' experience.

The committee recommend that a premium be awarded to Mrs. D. Carter, of East Bloomfield, for samples of 100 skeins of sewing silk of 71 different shades, samples of fringe and silk prepared for weaving, 1 pair silk hose, 2 pair mitts, 1 purse, a piece of cloth from silk flax, a premium of \$20.

To Mrs. Melora Shove, Onondaga, for 100 skeins of sewing silk, a premium of \$10.

To Mrs. Harvey Baldwin, Syracuse, for specimens of Needle work, a prize.

New-York Agricultural Society.

Annual Meeting, Jan. 18 and 19, 1842.

At a meeting of the Executive Committee, held at Albany, on the 20th October, A. WALSH, Esq. of Lansingburg, in the chair, it was unanimously resolved, that the Premium list for Field Crops Butter and Cheese, be enlarged and amended so as to read as follows:

PREMIUMS ON BUTTER AND CHEESE.

Table listing premiums for butter and cheese. For the best sample of Butter, not less than 100 pounds, \$30. For the second best, \$20. For the third best, \$10. For the best sample of Cheese, over one year old, not less than 100 pounds, \$20. For the second best, \$10. For the best do., less than one year old, not less than 200 pounds, \$20. For the second best do., \$10.

The butter offered for premiums may be presented in tubs, jars or firkins. Each lot must be numbered but not marked, and any public or known mark must be completely concealed, nor must the competitors be present. In default of either of these requisitions the claimant will not be entitled to a premium.

The claimants for premiums on butter, must state in writing, the number of cows kept on his farm; his mode of keeping; the treatment of the cream and milk before churning; the mode of churning, winter and summer; the method of freeing the butter from the milk; the quantity and kind of salt used; whether salt-peter or any other substance has been employed; the best time for churning and keeping butter in hot weather; and the best mode of preserving it in and through the summer and winter, and in what vessels.

Those who present cheese for the premiums offered, must state in writing the number of cows kept; whether the cheese is made from one, two or more milkings; whether any addition is made of cream, the quantity and kind of salt used; the quantity of rennet used and the mode of preparing it; the mode of pressure and the treatment of the cheese afterwards.

PREMIUMS FOR FIELD CROPS.

Table listing premiums for field crops. For the best acre of Wheat, \$20. For the second best, \$10. For the best acre of Barley, \$15. For the second best, \$8. For the best acre of Rye, \$15. For the second best, \$8. For the best acre of Oats, \$15. For the second best, \$8. For the best acre of Indian corn, \$20. For the second best, \$10. For the best acre of Potatoes, \$15. For the second best, \$8. For the best acre of Sugar Beets, \$15. For the second best, \$8. For the best acre of Ruta Baga, \$15. For the second best, \$8. For the best acre of Carrots, \$15. For the second best, \$8. For the best acre of Peas, \$15. For the second best, \$8.

Those who present claims to premiums for farm crops must state in writing the following particulars: the condition of the soil at the commencement of cultivation for the crop; the previous cultivation, pro-

Report of the Committee on Silk, At the Fair of the N. Y. State Agricultural Society at Syracuse.

The committee on Silk Culture have examined samples submitted for inspection by the following persons:

THOMAS MELLE, of the town and county of Madison:

1st. Four skeins of reeled silk, of different numbers of filaments to each thread, and fed on different varieties of mulberry.

2d. Several varieties of cocoons, fed on different varieties of the Morus multicaulis, and made by different kinds of worms, as the Peanut, Sulphur, Orange, and Two Crop.

3d. A fine, but small, sample of sewing silk.

4th. He showed a sample of the trees and leaves of a variety of Mullerry which he calls Morus Oregona, which he represents as possessing excellences not to be found in any other; his cocoons were very fine, and his samples of silk showed an elegant lustre; his trees were very small, but their leaves large, and taken all together were meritorious. However much the Committee may have been pleased with Mr. Mellen's samples, they would have been more gratified had they been larger.

By Mr. ROSS, of Brighton, Monroe county:

A small sample of sewing silk, manufactured very handsomely, dyed and put up with taste and success worthy of encouragement to all new beginners.

By Mrs. MELORA SHOVE, of the town and county of Onondaga:

A large sample of sewing silk, successfully manufactured, and that upon the common spinning wheel and reel, handsomely skeined, after having been beautifully colored, and all this without instruction, evincing much perseverance and crowned with corresponding success.

By Mr. LEONARD, of Carthage, Jefferson county:

1st. A sample of beautiful flax from the pierced cocoons, together with samples of knitting yarn manufactured therefrom, a valuable article.

2d. An elegant sample of reeled silk with a large sample of sewing silk, all handsomely manufactured in his own family, and upon the ordinary spinning wheel and reel—the sewing of beautiful and various colors, a very successful experiment.

3d. Samples of Sulphur and Orange cocoons, fed on Multicaulis and were a fine size and firm. Mr. Leonard also exhibited a model of a feeding frame, combining much that is useful with some that is new. The ingenuity, perseverance and success of Mr. Leonard commends him to the approbatory notice of the Society, and a worthy example to all who may feel disposed to enter upon the silk culture.

By THOMAS GOODRILL, of Utica, Oneida county:

1st. A specimen of outside flax, perfectly neat and clean, but not boiled out, in fine order for manufacturing.

2d. A sample of flax from pierced cocoons boiled, free from gum, and drawn out in roping form and wound in balls without twist, and about the size of oranges, which he is instructed is the form and condition for the article to be marketed.

3d. Very fine specimens of cocoons in point of size and firmness, from the Orange, Sulphur, and Peanut varieties.

4th. A sample of reeled silk, a worthy article for lustre, evenness and strength, wrought on the Piedmontese and Dennis' silk reels.

5th. A Multicaulis tree of the present year's growth (and not far from the average growth of his lot) nearly nine feet high, with leaves accompanying it, (although plucked from it,) measuring thirteen by fourteen inches.

6th. One bent of his Cabinet Feeding and Winding Frame, full size.

This Frame, in the opinion of the committee, possesses advantages which should recommend it to the attention and consideration of silk growers. It is a neat and compact structure, occupying little room, requiring less labor in tending, and rendering greater facilities for winding, than most articles of this kind in use.

By Mrs. DARUS CARTER, of East Bloomfield, Ontario county.

1st. A sample of fair cocoons of the Peanut variety.

2d. A large sample of sewing silk, pretty well manufactured, and very successfully dyed, exhibiting (as she informed us) seventy different shades of color.

3d. A very handsome piece or specimen of Black Fringe.

4th. One pair of ladies' stockings, black, and a pair of mitts.

luct and manure used upon it; the quantity of manure the present season; the quantity of seed used; the time and manner of sowing, cleaning and harvesting the crop; the amount of the crop determined by actual measurement; and the expense of cultivation. The land shall be measured by some sworn surveyor, and the claimant of the premium, with one other person shall certify to the above particulars.

Applicants for the premiums on butter, cheese and farm crops, must make known their determination to LUTHER TUCKER, Albany, (if by letter, post paid,) on or before the first of January next, and the parcels deposited in such place in Albany as the Ex Committee may hereafter direct, on Tuesday morning the 18th of January, before ten o'clock, at which time the committee will proceed to examine the lot offered for premiums.

Hints for the Month.

Winter is now upon us—and the farmer must be diligent to secure what he has gained by the labor of summer. Flocks and herds need close attention, or they will soon lose much that has been gained by half year's care.

Animals thrive rapidly in warm weather—this driving may be continued through winter, by creating artificially the advantages of summer; for instance,

The green and succulent food of summer is imitated by feeding roots copiously;

The comfort of summer may in some degree be conferred by having good stables and other shelters;

And other things may add materially to these, no be frequent asling of food; the free use of good water; and constant supply of pure fresh water:—

To feed an animal on dry food exclusively, would be like feeding a man on dry Indian meal, which would be rather hard;

To deprive it of shelter, would be like making a man sleep in the snow drift, which would be rather odd;

And to deprive a man of drink and condiment, he would think was rather short allowance. All would have a tendency to thin off his flesh; and what would reduce the flesh of a man, would tend to reduce the flesh of an animal. A want of comfort is a waste of cash.

Horses that have run to grass all the past season, should not be kept on dry hay and grain; the danger of disease, so common at this season, would be greatly lessened, if they had a liberal supply of roots. They soon learn to eat all kinds.

Be very careful not to waste fodder—have good racks and feeding troughs.

Chop up cornstalks finely for cattle; the body of the stalks, usually wasted, is the richest part. If Wm. Veldt of Delaware, can make 1,000 lbs of sugar from an acre of cornstalks, after the leaves are stripped off, such rich and sugary fodder should not be brown away. Salt it and meal it, and they will soon eat it.

Straw, or coarse hay, sprinkled with brine, is readily eaten by cattle, and the salt does them good.

Thresh your grain soon, before the rats eat it.

Repair broken tools, and procure new ones, of the very best construction only.

Read the New Genesee Farmer for the past and present year, make a memorandum of every thing worth practising, arrange these memoranda for every week next season, and put them into actual operation as each proper season arrives. Pursuing this course, will make, in a few years, any man of decent common sense a first rate practical farmer. Try, if you have any doubt,—and if you have not, try.

☞ Don't forget to send your half-a-dollar for the next volume of the Farmer, and ask your neighbor to do likewise.

Dry Feet.

Observing in the last New Genesee Farmer a preparation for "New Boots," and believing the protec-

tion of the feet from damp and wet, a matter of much importance, as well conducive to health as to comfort, I take the liberty of giving a better composition. It is in fact the same receipt, (which I found a year ago in another agricultural paper,) but so much improved upon that I think it worthy of record.

The tar on (or rather in) the soles, I have used for a great number of years, and have found that it not only made my boots water proof, but nearly proof against wearing out. The receipt is as follows, and is to be used for the "uppers" only.

- Neats-foot oil, ½ pint.
- Beeswax, 1 ounce.
- Spirits Turpentine, 1 do.
- Tur, 1 do.
- Burgundy Pitch, ½ do.

To be slowly melted together and well incorporated by stirring, taking care not to set the mass on fire, as the articles are all highly inflammable.

The boots being damp, the composition is to be spread on with a small brush, taking care to cover the seams well, and then allowed to dry. The application to be renewed until the leather is saturated.

The above is for the "upper leathers"—for the soles, tar alone is the best application, to be put on while hot, the boots also having been by the fire, so that the soles are quite warm. If there is no grease or other foreign matter on the soles, three or four, and sometimes more, coats will sink into the leather. It must also be used until the soles are completely saturated.

Boots whether "new" or old, (provided they are sound) will, by the above, be rendered entirely water proof, and the leather not only retain its elasticity, but become soft and pliable, and less liable to crack, as well as much more durable.

Nor will there be the objection that there is to boots rendered water proof by linings of gum elastic; for these being also air tight, the feet are kept, when exercised, in a constant state of perspiration, which is very uncomfortable as well as prejudicial to health.

The trouble of preparing boots after the above directions is very trifling, and any one once having tried it, and experienced the comfort of being all day in the snow and slush without having wet feet, will never fail to continue the use of it.

Cazenovia, Nov. 30, 1841.

[We borrow the following dialogue from the New England Farmer, but hope our readers will consider the sentiments our own, and addressed to them individually.]

Lend us a Hand.

Farmer A. Yes, Mr. Editor—I'm not very busy now—I'll give you a hit. What do you want done.

Editor.—I want you, now that you have got your fall work well done up, and can spare a little time, to write out an account of your process in reclaiming that meadow of yours, where you now cut 2½ tons of English hay per acre.

Farmer A. I thought you asked for a hand—that I could have lent; but you seem to be calling for head work, and that's quite another affair; I don't know about that.

Editor. I want the hand *in* the pen.

Farmer A. At the pen that's where it don't work very well; it's too stiff for pen work—let it go to the shovel, or spade, or hoe, and it feels at home, and will work well, and the head will work with it down in the ditch; but when you come to put the huge paw upon white paper, the head won't work right, and the fingers don't move right. I don't know, Mr. Editor, about my helping you.

Editor. Well, suppose none of you practical men write, how shall I make up such a paper as you want? The facts which common farmers give to one another through the papers, are the most instructive and useful part of our weekly sheet; and if you want tell what you have done, and farmer B. won't tell what he has done—if all the others all the way down the alphabet won't tell—why then the editor can't furnish all that you want—he can't furnish what you want

most. He can theorize and give advice, and extract from other publications; but he can't get hold of the important facts, unless you—yes, you, and others like you, will "lend a hand" and a head too. Come, now, farmer A., give us a few lines, and set a good example.

Farmer A. Fact, Mr. Editor, what you say takes a little of the starch out o' my fingers. I never see'd the matter just in that light afore. I want to know how neighbor D. raised his hundred bushels of corn to the acre; and how Mr. W. raised his 'leven hundred'd of taters. I'd like to have 'um write all about it; what kind o' land 't was—how much they plow'd it, dung'd it, and work'd on't. Yes, I'd sartnly like to know all about it. But as to my madder, Mr. Editor, why it's done pretty well, as to that. I do git a good crop of English hay where I did n't git nothing to speak on, and that poor stuff. I'd like to know how other folks work it, and if you really think, Mr. Editor, that my writing would set them at it—why then I'll try.

Editor. That's right, sir—that's right. Now, farmers, send in your statements, without further invitation.

Make Home Happy.

It is a duty devolving upon every member of a family to endeavor to make all belonging to it happy.—This may, with a very little pleasant exertion be done. Let every one contribute something towards improving the grounds belonging to their house. If the house is old and uncomfortable let each exert himself, to render it better and more pleasant. If it is good and pleasant, let each strive still further to adorn it.—Let flowering shrubs and trees be planted, and vines and woodbine be trailed around the windows and doors, add interesting volumes to the family library; little articles of furniture to replace those which are fast wearing out; wait upon and anticipate each other's wants and ever have a pleasant smile for all and each.

Make home happy! Parents ought to teach this lesson in the nursery, and by the fire side; give it the weight of their precept and example. If they would ours would be a happy and more virtuous country—Drunkenness, profanity, and other disgusting vices, would die away; they could not live in the influence of a lovely and refined home.

Does any one think, "I am poor and have to work hard to get enough to sustain life and cannot find time to spend in making our old house more attractive." Think again! is there not some time every day which you spend in idleness, or smoking, or mere listlessness, which might be spent about your homes?—"Flowers are God's smiles," and Wilberforce, and they are as beautiful beside the cottage as the palace, and may be enjoyed by the inhabitants of the one as well as the other. There are but few homes in our country which might not be made more beautiful and attractive, not to strangers only, but to their inmates.—Let every one study then, and work, to make whatever place they may be in, so attractive that the hearts of the absent ones may go back to it as the Dove did to the ark of Noah.—*American Farmer.*

It is not essential to the happy home that there should be the luxury of the carpeted floor, the richly cushioned sofa, the soft shade of the astral lamps. These elegancies gild the apartments but they reach not the heart. It is neatness, order, and a cheerful heart which makes home that sweet paradise it is so often found to be. There is joy, as real, as heartfelt, by the cottage fireside as in the most splendid saloons of wealth and refinement. What a lovely picture has Burns given us of the return of the cottager to his home, after the labors of the day.

At length his lonely cot appears in view,
Beneath the shelter of an aged tree,
The expectant wee things, toddling stagger through,
To meet their dad, with fluttering noise and glee.
His clean hearth stone, his thrif wife's smile,
The b-noing infant prattling on his knee,
Does all his weary carking cares requit,
And makes him quite forget his labor and his toil.

The luxuries and elegancies of life are not to be despised. They are to be received with gratitude to Him who has provided them for our enjoyment. But their possession does not ensure happiness. The sources of true joys are not so shallow. Some persons, like some reptiles, have the faculty of extracting poison from every thing that is beautiful and sweet; others, like the bee, will gather honey from sources in which we should think no sweet could be found. The cheerful heart, like the kaleidoscope, causes most discordant materials to arrange themselves into harmony and beauty.

Talk little and say much.

On the Different Breeds of Cattle.

To the Editors of the New Genesee Farmer.

GENT:—At the present time there appears to be a great diversity of opinions in regard to the different kinds or breeds of cattle which are best calculated for the farmers of our Northern latitudes. What conclusion can a disinterested person arrive at, if he is governed by the different articles which are penned on this subject? Were we governed by all that contend for the increased value of the different varieties of neat stock, we might arrive at a safe determination upon this point, yet but few of our farmers are able, and if so, willing to go into the rearing of those breeds which stand in higher order than our native stock, as all enterprising men are willing to be governed by the experience of those persons or nations that have excelled in that kind of business which is necessary in a course of farming operations. If we place due credit to all that have written on this subject, and no doubt from a thorough conviction of the truth of their observations in this branch of business, we shall find that all, or nearly so, vary in their observations according as they are interested, consequently we farmers must be governed by those who have two or more of the different kinds, &c.: Devons, Durhams, and Herefords which seem to stand pre-eminent amongst all distinguished breeders, both in England and the United States. Yet, in England, we find a variety of conflicting opinions in regard to the above breeds as in the States, for instance—in Cultivator, Vol. 8th, No. 1, page 16, we find a Mr. Price in England, challenging the Kingdom to produce as fine a stock of cattle as those reared by him, which were pure Herefords. But on reading further we find a Mr. Bates who was ready to meet him in his challenge by producing a stock of pure Durhams; but sickness of the former gentleman was the cause of the failure in the testing between the exceedingly fine qualities of those two stocks, which would have been a great point decided if disinterestedly upon their true merits. Mr. Bates remarks that he thinks the very best Short Horns, which are only a few, are capable of improving all other stocks in the Kingdom, yet he says the common Durhams are inferior to the Devons, Herefords and others, which is candid in him. It seems also, from the statement of Mr. Howard of Gainsville, Ohio, that in the year 1825, there were sent from England, as a present to the Massachusetts Agricultural Society a true Hereford Cow and Bull, from Sir Isaac Collin, of the Royal Navy, which proved a great acquisition to the stock of that country, and were highly appreciated by the teamsters from their fine horns, stately gait, powerful draught and beautiful mahogany color, &c.

In the same article which will be found in Cul. Vol. 8, No. 1, page 19, he says—"I will here remark that I knew many and owned several of the progeny of the improved Short Horn Bull Admiral (which animal was also sent as a present by the same Mr. Collin to the Massachusetts Agricultural Society) and I have no hesitation in saying that for the ordinary uses to which cattle are applied in the Northern section of our country I considered the stock of the Hereford Bull alluded to decidedly preferable." Next we hear from a very intelligent rearer of stock, Mr. Hepburn in Cul., Vol. 8, No. 2, page 32, in an article which says, "that an argument to prove that the Herefords are an aboriginal race is the largeness of the head and thickness of the neck when compared with the Devon cattle;"—Further he states, "were it not for the white face, thick neck, and large head, it would not be easy at all times to distinguish a light Hereford from a heavy Devon," &c. &c. His ideas are quoted from Youatt. I would here remark, that by some the Herefords are considered a distinct

race of cattle, by others a cross of the Devon, with some larger breed. From the best sources of information, I should think that they were most certainly a cross of the Devons with most probably the Durhams. In support of this I would also refer the reader to an article written by Judge Buell, in Cul., Vol. 5, No. 1, page 8, headed "Select Breeds of Cattle." He also, in the same article quotes from a British author in high terms of a cross between the Holderness and Durham for the dairy, and ends in these words: "The Devons were introduced into Berkshire county some dozen years ago, by Col. Dwight, and at the last fair in that county we thought the working cattle surpassed any we had before seen, and we attribute their excellence in a great measure to the Devon blood which we saw strongly developed in some of the finest individuals. We unhesitatingly recommend a cross of the Devons upon our native cattle, as a certain means of improving both their working and fattening properties." In the foregoing extracts which are only a few that might be cited from good authority, what course is it proper to pursue in getting certain and correct information, so that in improving our stock we shall not be disappointed but what we have the best animals for the county and latitude in which we live? I am aware that it is impossible to have a breed of cows which will keep fat and give great quantities of milk.

I would upon the whole, from the conflicting opinions and views of those who are interested in rearing and selling their stock, that farmers who are wishing to improve their stock, (and I doubt not but what all are,) that a course of inquiry be instituted from those gentlemen who have Bulls and stock to sell—setting forth by their own statements, and corroborated by the certificates of their neighbors, what has been the course pursued in feeding their improved stock, in comparison with their other stock, and the result accordingly. For instance, if a cow gives 25 quarts of milk per day on the same feed of another cow which gives only 20 quarts, then state the different results of butter made from the milk of each which may easily be done by the Lactometer which is a tube of glass graduated, which readily shows the per centum—as I presume all are aware that it is not the best cow in all cases which gives the most milk, as experiments go to show that in some cases the milk varies in goodness some 50 per cent, according to quality. In short, we want to arrive at the fact which breed of cattle will produce the most net profit from the same feed—requiring each breed to stand the severity of the climate alike. In conclusion I would ask of Mr. Sheffer which he considers the best breed of cattle, the Durham or the Devon? as I see in the report of a visit of Rawson Harmon jr., of Whentland, in the August number of the New Genesee Farmer that he has both kinds of Bulls on his farm.—Also state which of these two breeds he considers best for the majority of farmers in Genesee county. State fully which will stand our cold winters best, fed as is the case of the extensive wheat grower in this county.—Also which are the most profitable to raise for the eastern market, considering the keeping, &c. By answering these questions he will confer a favor on

Yours Truly,

Genesee Co., Nov. 14. A. SUBSCRIBER.

On the Importance and Utility of the Dissemination of Knowledge Among Farmers.

MESRS. EDITORS,—I owe an apology to you, if not to your readers, for the delay in further considering the subject proposed in my first article, which perhaps was hardly worth the space it occupied in your paper, and still less the attention of your numerous readers, though honored by an insertion.

I am aware that, in treating upon subjects about which there has been much said and written, there is

great danger of falling into old and beaten tracks, where nothing new can be introduced to attract the attention of the reader. If in the further remarks which I shall submit on the subject already introduced, I may be so fortunate as to present some considerations that will not have a "hackneyed" appearance, I shall consider that neither my time, nor your space, will be unprofitably occupied.

I propose to speak mainly of the importance of the dissemination of knowledge among farmers, as the greatest if not the only means of establishing a proper system of human economy in society, and as the surest method of procuring the greatest amount of social happiness. There would be but little to compensate for the toil and exercise of the mind and body in procuring something beyond a competency of food and raiment, if the demands of nature did not also require every man to provide for certain social duties and advantages. The elements which compose the best regulated and best organized society, experience teaches us, may be comprehended under the head of virtue and wisdom. This idea may be at variance with the prevailing notions of the day, still it is acknowledged by the candid and reflecting portions of community over whom custom as yet, has not had sufficient influence to make them mistake the true test of character. It is a popular, and may be said to be a prevailing delusion, to judge of the shadow instead of the substance of what in fact constitutes a character for worthy association. The modern notion of refinement, has set up an arbitrary rule, by which external appearance and outward show, accompanied by certain set forms of ceremony and etiquette, are made requisite qualifications for such as wish to mingle in what is called polished society. Thus it frequently happens, that the most worthy, are overlooked and neglected, from the fact, that the fashion of their dress, and their want of that grace which constitutes an exquisite bow;—the are called "awkward fellows" because they have not learned to play the hypocrite in those absurd notions with which community has already been too much spoiled. The dignity which always graces a man of refined talents, a bright intellect and a well stored mind, all, tending especially to qualify for social duties, are now looked upon by the devotees of fashion as secondary considerations, and by too many will pretend to take the lead in giving a direction to public opinion, as of little consequence. And it is to be regretted, that wealth, power and education are made the evil instruments to produce the advancement such a state of things, when, on the contrary they might be the means, and God who gives, grants them, for no other purpose, than as elements ministering in the establishment of sound principles, which insure true freedom of action, and the enjoyment of both body and soul.

The occupation of a farmer is looked upon, by the class alluded to, as disqualifying him for the high rank they have assumed for themselves, while the discernment and common sense of the man who tills the soil, forbids that he should desire such associations, envy their station, in preference to the peace and tranquillity of his own. Properly considered, there is no situation in life, in which a man may be placed affording him greater advantages, than that of a farmer. This proposition needs only to be reflected upon, order to become at once convinced that it is true. Where in all the other occupations in which men are engaged can there be found so much time for reflection, as where the mind is left free to form sound views without being contaminated by the evil associations of such as are not permitted to enjoy the blessings so favorable a retirement. It is a common error among farmers, that the business in which they are engaged, shuts them out from the enjoyment of advan-

ges so abundantly secured to other men. What are commonly called great advantages are by no means secured alone to any one class of society; indeed, there is but little worth seeking for, but what may be obtained by all who are willing to make the effort. The idea that a polished education is an indispensable requisite for the acquirement of knowledge, and that great learning will only enable one to possess intelligence, is not only erroneous, but a mischievous conception of the mind. For such as would arrogate to themselves the right of monopoly over the abundant streams which are pouring into the mind of every one, the lights of knowledge and intelligence, it is not surprising to hear them advance such an idea. Upon the importance of education we cannot however place too high an estimate, for the benefits which it has and ultimately must bestow upon mankind. But it is only when education is used as a means of enlarging the capacity of the mind and prepares an individual to fill some useful station in society, that the greatest good will result from it. And on the contrary, it used as the instrument of producing those sickly plants, too frequently sent forth from our schools of learning to play the fop or the pinner, it overloads society with a set of useless beings, that are a burthen upon it. From the knowledge of educated men Agriculture has not failed to receive important aids, but not, when compared with other things of less importance, its due proportion of benefits. When considered a science, as it truly is, it is easy to conceive that the study of it might profitably occupy the most polished mind, and perhaps there is not a science from which educated men, who strive to apply their knowledge to useful purposes, have derived greater pleasure, than from the study of the principles which cause the earth to produce all the wealth of which individuals or even nations can boast. I venture to predict, that no one who has applied his talent, education, or experience, to the examination of the most simple principles of husbandry, but what has found an ample scope for the profitable employment of either. But while such as are engaged in what are termed "professional pursuits," are obliged to become acquainted with the ancient languages, in order to be familiar with certain obscure terms and phrases, the farmer has no occasion to search out any but the most simple terms to gain all the knowledge his most ardent desires may demand. In the school of practice he has daily opportunity for gaining knowledge, while at the same time, experience and practical observation, will enable him to demonstrate every principle connected with the business of his life. Comparatively but few engaged in it, consider how important is the calling of a farmer, and many have settled down under the conviction that chance or necessity has compelled them to fill a station, if an opportunity had offered, their choice would not have dictated. From this, perhaps, more than any other cause, the but too prevalent idea has originated, that this class of our fellow citizens are set down as only worthy of the associations of the "second class." What error has failed to do in filling the minds of many with false notions, prejudice has not failed to accomplish the whole work: and therefore it is, that a more general dissemination of knowledge may be considered necessary.

In my next it will be my purpose not to deal so much as heretofore in general remarks, but shall endeavor to confine myself to a more particular application of the subject. Yours, &c.,
Batacia, Oct. 20th, 1841. C. P. T.

For the New Genesee Farmer
Annual Exhibition
Of the Massachusetts Horticultural Society—Horticulture in Monroe County, &c. &c.

It will doubtless be gratifying to the friends of Horticulture throughout the country, to hear something of

the late Annual Exhibition of the Massachusetts Horticultural Society, held on 23d and 24th of Sept.

From the report published in the October number of the Magazine of Horticulture, it appears that the variety of Fruits was greater than any ever before exhibited in the United States. Mr. Manning, of Salem, the greatest pomologist in America, sent one hundred and thirty kinds of Pears; Mr. Wilder, the President of the Society, fifty; Mr. Cushing, forty, and many other gentlemen, thirty, twenty and ten each. A magnificent pyramid of Grapes, comprising twelve varieties on a base of Peaches, Nectarines and Plums was presented by Mr. Haggertson Gardener to J. P. Cushing, Esq. The exhibition of vegetables was also unusually good. The Dahlia show far surpassed any previous exhibition of this splendid flower by the Society, and the number of Pot plants, Cut flowers, Bouquets, &c., was very great.

At the close of the exhibition the members celebrated the 13th anniversary by a dinner, after which several excellent addresses were delivered and appropriate toasts and sentiments were given,—of the latter we have selected the following, as our limited space will not admit of publishing all:—

Agriculture and Horticulture—The first nation's greatest wealth, the next, its greatest luxury.

The Cultivation of the Earth—It was the first act of civilization, is the basis of all other branches of industry and is the chief source of the prosperity and the wealth of nations.

The Primal Employment of Man—To dress the garden and keep it.

Horticultural Societies—"Fiscal corporations" whose capital stock is a well cultivated Bank of Soil, whose Directors are producers, whose depositors get cent per cent for their investments, whose exchanges are never below par, and which "operate *per se* over the Union."

The Massachusetts Horticultural Society—Its birth-day opened a new era in the horticulture of New England.

The Rose—While we acknowledge her as Queen at the court of Flora, we are happy to recognize among our guests the distinguished representative of that Queen, whose Kingdom have adopted in the Rose their Floral emblem.

Horticulture—The art which shows our paths with Roses—loads our tables with luxuries, and crowns our labors with the rich fruits of contentment and happiness.

Woman—"A seedling sprung from Adam's side,
 A most celestial fruit,
 Became of Paradise the pride,
 And bore a world of fruit."

We cannot but do justice in this brief notice to the report, which occupies nine pages of the Magazine, and much remains yet to be published. This Society is one of the most useful and flourishing of the kind, in the country. But 13 years ago since it was organized; their meetings were at first held in a small room; and by steady and persevering efforts worthy of all praise, they have gradually advanced so that now they occupy a spacious hall in Tremont Row, Boston. It would be impossible to estimate the advantages which have resulted from their labors, not only to New England, but to the country at large. Mr. Walker, a prominent member of the Society, in speaking of this, remarked, "who can recount its acts and the benefits thereof to the community and after generations? Had I the eloquence of a Cicero, it might be exhausted on this subject."

We would strongly recommend this subject to the attention of Cultivators in our own favored district. In view of such results the friends of Horticulture should want no other inducement to associate themselves together for the purpose of promoting Horticultural improvements. Every instance where proper attention is bestowed to this branch of industry, proves most satisfactorily that we possess the means, if we only avail ourselves of them, to excel both in quantity and quality of our Horticultural productions. At the

* Mr. Manning, the Pomologist, sent one hundred and thirty kinds of Pears.

late Agricultural Fair for this county the exhibition of garden productions was exceedingly limited, only about half a dozen exhibitors of fruit—two or three of flowers, and five or six of the more common sorts of vegetables. This, for the Horticultural department of the Fair for the whole county of Monroe, will be admitted by all to be far from what it ought to be, and argues forcibly the necessity of making some movement that will excite more general interest on a subject of such vast importance to the public. P.

From the Albany Cultivator.

The Short Horns as Milkers.

Mrs. GAYLORD & TRICKER—In the June No. of the Cultivator there appeared an article, signed Lewis F. Allen, in which the opinion was advanced, that the improved Short Horns were the stock best adapted for New England farms.

The ability with which this article is written, and the source from which it comes, ensures it great weight with your readers. But as this opinion is contrary to that of most agriculturists in this neighborhood, (the vicinity of Boston) I have been in hopes of seeing an answer to it in your paper by some one more familiar with this subject than myself.

That this stock is the best suited to the rich pastures and fertile lands of New-York and the Western states appears to be generally admitted. Are they equally well suited to the thin soils and scanty pastures of New-England?

In the fear of saying too much for his favorites, Mr. A. has given them less praise in some respects than we should readily concede to them. He compares them with our average native cows; we are in the habit of comparing them with our good dairy cows. The quantity of milk given by the Short Horns is computed with our average native cows is greater than Mr. Allen asserts. The quality of the milk is considered by us generally as inferior to that of the common cows of the country. Much of it would not, I think, sell readily for milk. This is contrary to Mr. A's experience with his Short Horns; and there are certainly among the grade cows many exceptions to it here.

Writers are too apt to forget that the most important question, and what we really want to know is, what stock or stocks will give us the best and cheapest milk, butter, cheese, and beef; and not what stock will give us the most per centum. If it costs three times as much to raise and to keep an improved Short Horn in our climate and on our soil as one of the native breed, although it gives twice the butter and cheese and twice the beef, it may be a poor stock for us.

No one here I think would be inclined to accept the wager offered by Mr. Allen at the end of his communication; for we do not contend that ten or twenty cows, which should be a fair average of the native breed of New-England, would give us much milk, butter and cheese as ten or twenty cows of a breed of nearly twice their size: when both lots had as much nutritive food as they could eat. That, our cows seldom have all the ear round.

Mr. A. refers to British publications to prove the superiority of the Short Horns. Following his example, I will quote the British Husbandry and Law, as the best British authorities I know of on this subject. In British Husbandry, ch. 36, on milk cows, it is said, "the breed most in esteem with the London cow keepers who sell the milk without making butter or cheese, is of the old Yorkshire stock, or a cross between the Tweeswater and Holderness, as producing the greatest quantity; for they are in that case reared in the house, and of course provided with an abundance of cut grass brewers' grans, and succulent roots; but when grazed, they require very good pasture, and are not generally considered to produce milk of a rich quality." But the breed which of all others appears to be gaining ground throughout the United Kingdom for abundant produce upon ordinary pasture is the Ayrshire kyloe.

David Low in his Elements of Practical Agriculture says, "by long attention to the characters that indicate a disposition to yield milk, the breed of Ayrshire has become greatly more esteemed for the dairy than other animals much superior to them in size and feeding qualities."

I hope to see this subject more thoroughly discussed in your journal by Mr. Allen and others, who, like him, speak forcibly what they sincerely believe.

A YOUNG FARMER.
University of Boston, Sept. 23, 1841.

ROCHESTER, DECEMBER, 1841.

Farewell--Till Next Year.

We feel so newhat reluctant to throw aside our present subscription book, containing as it does, the names of nearly twenty thousand of our esteemed friends!— But it can't be helped—and we hope to have the pleasure of recording them all again in a short time, with many more besides. We have got a larger and handsomer book for the next year, and all who wish the honor of having their names recorded in it, will send us FIFTY CENTS!

Uncurrent Money.

Bills of solvent banks in Ohio, Indiana, Kentucky, Pennsylvania, Canada, &c., will be received at par in payment for this paper, if sent free of postage and no commission deducted. Michigan and Illinois bills cannot be received at present. Bills of the Buffalo (Safety Fund) banks will be received from subscribers in Michigan and Illinois. (Till further notice.)

Travelling Agents.

We do not find it necessary to employ travelling Agents for this paper: but C. F. CROSMAN, will act as such when travelling on his general business in the country. He will carry out Garden Seeds of his own raising and Corn Brooms and Brushes of his own manufacture.

The Editors.

Mr. Colman is expected at Rochester by the latter part of December—in time to superintend the next No. of the paper. The present editors will continue their assistance, and the character of the work will not be materially changed.

It may be well to remind some of our readers that the articles which are found in this volume, marked thus, † are written by David Thomas, of Aurora, Cayuga Co., and those marked thus, * are by his son John J. Thomas, of Macedon, Wayne Co.

Henry Colman.

Much has been said in praise of HENRY COLMAN, by agricultural papers of late, but as many of our readers probably do not see other papers of the kind, we deem it proper to give an extract or two by way of introducing him to their acquaintance. As we do this without his knowledge or consent, no one can accuse him of egotism on account of it.

The first is from the Farmers Monthly Visitor, edited by Ex-Governor Hill, of New Hampshire.

"The Massachusetts Agricultural Commissioner. —There is no man in America more ardent in the cause of Agricultural Improvement than HENRY COLMAN, who is an ardent supporter of the Legislature of Massachusetts, and who visits different points in that Commonwealth with the view to impart the farmers and to present the results of his observations and labors to the public. For effecting this object, Mr. Colman travels in various directions among the yeomanry of the Commonwealth, with his horse and gig, wagon and in almost a plain attire as the workmen in the field. We have a few times seen Mr. Colman among the farmers at agricultural exhibitions and elsewhere; and the enthusiasm he exhibits on each agricultural topic cannot fail to inspire itself into the most sensible farmer and arouse all his energies. The conversational powers of Mr. C. are equal to those of the best man we ever met; his language flows like a stream of pure water; and like many guiding rivulets that ooze from the hills and fertilize the land below, so do his writings throw translucent light up on the subject he describes.

The Commissioner will find but few equals in the art of describing the pleasures and the advantages of

a rural life, and of rescuing that occupation on which all other occupations depend, from the neglect in which indolence or lack of enterprise attempts to obscure it."

The next is from the (Baltimore) American Farmer, the oldest agricultural paper in the Union, edited by John S. Skinner, a veteran writer in the cause.

"HENRY COLMAN—We draw three lines under this name, as we believe it is the printer's sign for large capitals! and because we would, in every way, do honor to an eminently useful man; and we know of no one whose labors of utility are more wide-spread, or likely to be more enduring than 'THE COMMISSIONER FOR THE AGRICULTURAL SURVEY OF MASSACHUSETTS.' There is originality, vigor of thought, and practical usefulness in his observations on the agricultural practices, and products, and capacities of his State, and his suggestions for the further development of its resources, that must strike every one, at whatever distance, who, by any chance, sees what he is doing."

The following is from the (Rochester) American Citizen, edited by Gen. WM. L. CHAPLIN, who is personally acquainted with Mr. COLMAN:

I am happy to announce to the farmers of Western New York, that Mr. Bateham has recently been able to secure the services of HENRY COLMAN, of Massachusetts, as a permanent Editor of the New Genesee Farmer. He also becomes a joint proprietor in the paper. Mr. Colman was for many years an eloquent and popular preacher. He is a well-trained scholar—richly furnished with information in the various departments of literature and science—a man of warm and generous impulses, and an accomplished gentleman. His pen is sprightly, nervous and instructive. Some years since, he became a practical farmer in one of the most delightful spots in the beautiful valley of the waning Connecticut in the upper part of Massachusetts. From that time he has cherished agriculture as a profession, with the loving enthusiasm of the most devoted artist. For a few years past he has been the Agricultural Commissioner of Massachusetts by the appointment of the Governor under an act of the Legislature; along with his keenness of observation, and his untiring zeal in the cause, he has enjoyed the amplest opportunities for acquiring and digesting a vast store of every-day available knowledge. It is hazardous nothing in saying, that it would be difficult, if not impossible, to find a man in the country whose qualifications are more happily adapted to give life and interest to an agricultural journal, than HENRY COLMAN.

He comes to Western New York, with the purpose of making it a permanent residence. In comparison with New England, he will find a new country, whose resources as yet are but very partially developed, and but imperfectly comprehended by the people. He cannot fail to be delighted in anticipation of what industry and ingenious husbandry will one day make this garden of the State. If by his written essays and oral addresses he can succeed in imparting to a few leading minds, but a tittle of his own enthusiasm in the pursuits of agriculture, a few years will produce a revolution in that department which will astonish us.

THE NEW GENESEE FARMER, AND GARDENER'S JOURNAL. VOLUME THREE—FOR 1842.

The Cheapest Agricultural Paper in the Union—8 Large Pages Monthly, (with engravings,) only 50 Cents per year!

HENRY COLMAN, EDITOR.

(Late Agricultural Commissioner of the State of Massachusetts, and Editor of the New Eng. Farmer)

Grateful for the extensive patronage which the New Genesee Farmer has received during the past year, the proprietor now has the satisfaction of announcing that he has made such arrangements for the coming year as to merit to be highly gratifying to the readers of the paper, and secure for it a still more extensive circulation.

Desiring to make it the most useful and widely circulating agricultural paper in the Union, the proprietor has engaged the services of the able and eminent agricultural writer and editor, HENRY COLMAN, well known as the late Agricultural Commissioner of the State of Massachusetts, and formerly editor of the New England Farmer. Depending on the co-operation and support of the friends of agriculture in the Empire State and the Great West, Mr. Colman has consented to leave the field where he has labored with so much honor and success, at Rochester, where, through the medium of the Genesee Farmer, he expects to find a more extensive field of usefulness.

The former editors and contributors will continue their assistance, and care will be taken to make the paper interesting and useful, not only to farmers, but to all persons engaged in rural or domestic affairs. With such a combination of talent, the New Genesee Farmer cannot fail to obtain an immense circulation—give a new impulse to the cause of

agriculture—promote the best interests of community, and tend to increase the wealth and prosperity of the Nation.—It is hoped, therefore, that every friend of agriculture—every well-wisher of his neighborhood and his county, will lend his aid, and not only subscribe himself, but induce his neighbors to subscribe also. The paper will be continued at its present low price, in order that its influence may be most widely extended. Its appearance will be conspicuously improved, and having now a Power Press exclusively for the work, greater promptness and regularity will be secured.—Careful clerks are engaged to mail the papers, so that it is believed there will be little cause for complaint hereafter.

Post Masters and their Assistants are authorized and respectfully solicited to act as Agents and remit subscriptions for the Farmer. The low price at which it is published will not allow of much pecuniary compensation to Agents, but it is believed they will find a reward in the benefits which result from the circulation of such periodicals in their neighborhoods.

Persons ordering papers are requested to strictly observe the Terms, and be careful to write plainly the names of subscribers, their Post Office, County, and State; and in all cases to send the money with the order, so that the perplexity of keeping accounts may be avoided.

M. B. BATHAM, Proprietor.

TERMS.—If current money is sent (such as New York or New England bills) commission will be allowed as follows:—

Seven copies, for \$3.00 } Payment always to be
Twelve do. for 5.10 } made in advance.
Twenty-five do. for 10.00 }

No commission will be allowed, if uncurrent money is sent. Address, BATHAM & COLMAN, Rochester, N. Y.

December 1, 1841.

FARM AND SAW MILL FOR SALE.—239

Acres of choice land 6 and a half miles from the center of the city of Rochester, about 600 acres under good improvement, and the residue finely timbered with White oak, Chesnut, and other timber suitable for sawing. The Saw Mill on this farm has been recently put in complete repair, and is rigged for either a single saw or a gang of 8 saws for sawing boat or ship plank. There is timber enough on the premises when manufactured into lumber, to pay for the farm. The buildings, besides the saw mill, are a comfortable dwelling house, and a large frame barn. About 35 acres are sowed with wheat this fall. To an enterprising man, no better opportunity can be offered for profitable investment, as the men and teams engaged in farming in the summer, can be advantageously employed in lumbering during the winter. \$2,000 will be required in hand, and the residue of the purchase money can remain on mortgage.

Apply to the subscriber at Rochester. GEO. W. PRATT, Oct. 23, 1841.

WESTERN Farmer's and Gardener's Almanac, for 1842—By Thomas Atlee, Cincinnati.—Also "Bee breeding in the West," by the same author. Price 25 cts. each—\$2 per dozen, for sale at the Seed Store and Bookstores in Rochester.—Nov. 1.

GARDEN SEEDS IN BOXES.—C. F. CROSMAN respectfully informs his country friends and customers, that he will at the usual time, be prepared to supply them with fresh assortments of garden seeds, of his own raising or selection, so that he is confident will give satisfaction. Rochester, Oct. 1, 1841.

ROCHESTER PRICES CURRENT.

Table with 2 columns: Commodity and Price. Includes items like WHEAT, CORN, OATS, BARLEY, RYE, BEANS, POTATOES, APPLES, FLOUR, SALT, PORK, BEEF, POULTRY, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, PEARL ASHES, POT, WOOL, HAY, GRASS SEED, COVER, FLAX, PLASTER.

Remarks.—Navigation is closed—the mills have stopped, and the roads are bad; of course very little business is doing in market, and the prices of produce are very unsettled. The principal article now offered is Pork, and the price of that is not very satisfactory to farmers' although we perceive it is as high here, in comparison with other places, as can be afforded. The latest quotations from Cincinnati are 2,25 per 100 lbs.
